THE ENCYCLOPEDIA AMERICANA

Flameng, Francois, frän-swä flä-män, French painter: b. Paris 1859. He began his art studies under his father, Leopold Flameng (q.v.), the engraver, and studied subsequently under Cabanel, Hedouin and Jean Paul Laurens. He is an artist of distinguished ability as a figure painter, and among the most striking works of his are: 'The Girondins Summoned' (1879); 'The Bowlers' (1886); and 'Grolier and Alus,' which last hangs in the Grolier Club of New York.

Flameng, Leopold, lā-ō-pōl, French engraver: b. Brussels 22 Nov. 1831. He began his studies in 1853, at Paris, where he became domiciled. He acquired great versatility in styles, both old and new, and did illustration work for periodicals and books, frequently for the 'Gazette des Beaux Arts.' His complete mastery of technique, and his artistic breadth of treatment render him one of the best line-engravers of the day.

Flameng, Marie Auguste, mä-rē ō-güst, French painter: b. Jouy-aux-Arches, near Metz, 1843. He has studied under Delaunnay and Puvis de Chavannes. He exhibited for the first time in 1870, and four years later began to paint coast and marine subjects. In this department he continues to maintain a high reputation and his picture in the Luxembourg, 'Fishing Boats at Sea' (1881), is a typical example of his vigorous handling, his fine color tone and briskness of movement in sea and air.

Flamingo, flā-ming'gō, a peculiar web-footed bird of the group *Phœnicopteri*, which may be regarded as intermediate between the storks and the ducks, the long legs and necks giving it a resemblance to the former, while the webbed feet connect it with the latter. There are six species of true flamingoes, widely spread over the warmer regions of both hemispheres. Our North American species (*Phœnicopterus ruber*), once common all along the southern shores of the United States, but now almost exterminated even from Florida, and ranging southward to the Argentine Republic, is light vermilion with brighter wing coverts. The other forms are rosy white (scarlet on the wing coverts) with black wing-quills. All have small goose-like bodies, but the long legs and neck give them a height of four or five feet. Their most extraordinary part is the bill, which is large, swollen and bent upon itself so that the upper half is turned downward when the bird feeds, with its head twisted and crown downward. The edges of both upper and lower jaw are furnished with small transverse plates, which serve, as in ducks, for a sieve, allowing the escape of the mud, but retaining the small worms, crustaceans, mollusks, fishes, etc., on which the birds feed. The upper surface of the tongue is beset on the sides and base with flexible, recurved, horny spines. Flamingoes live and migrate in large flocks, warning one another of danger by a loud trumpeting note, which is the signal for the flock to take wing. When flying, they form a triangle.

They breed in companies in mud-flats or inundated marshes, where they spend most of their time wading about, raising up the mud into a small hillock, which is concave at the top so as to form a nest. In this hollow the female lays her one egg, and hatches it by sitting with her legs doubled up under her. The young, usually two in number, do not fly till they have nearly attained their full growth, though they can run very swiftly and swim with ease almost immediately after their exclusion from the shell. This bird was held in high repute among the luxurious Romans; and Apicius, so famous in the annals of gastronomy, is recorded by Pliny to have discovered the exquisite relish of the flamingo's tongue, and a superior mode of dressing it. When taken young they soon grow familiar, but they are not generally found to thrive in the domesticated state. The European flamingo (*P. roseus*) is abundant in marshy regions of Spain and southern France, and is found as far south as Cape Colony, and as far east as Lake Baikal. In northwestern India it may be seen in flocks numbering tens of thousands. Another very similar species (*P. minor*), but of less size and with the chin feathered, is found from Madagascar around the whole circuit of the shores of the Indian Ocean. Three

other species are known in South America, [illegible] of the central Andes, the largest of the family, *P.* [illegible], of southern Peru and [illegible], and *P.* [illegible] of the region south of [illegible], which has greenish cheeks. In addition to the various ornithologies, the reader may consult an article by H. A. Blake, 'Nineteenth Century' (December 1887); Chapman and Buck, 'Wild Spain' (1893); and F. M. Chapman, 'Bird Lore' (1902).

Flaminian (flā-min'i-an) **Way,** the northern road which led from ancient Rome. It was constructed by Gaius Flaminius the elder in 220 B.C. during his censorship, and led from Rome to Ariminum (Rimini) on the Adriatic, 222 miles. Remains of it are yet extant in various places.

Flamininus, Titus Quintius, tī'tus kwin'shi-us flam-ĭ-nī'nus, Roman general: b. about 230 B.C.; d. about 175. Elected consul in 198, he undertook the conduct of the war against Philip II. of Macedon. By pretending that his object was to remove from Greece the Macedonian yoke, he detached many of the Greek states from Philip, and defeated him at Cynoscephalae (197) in Thessaly. By the treaty soon after concluded Philip surrendered all the Greek towns which he possessed in Europe and Asia, and paid a heavy contribution to the Romans. At the Isthmian games in 196 Flamininus proclaimed, to the great joy of the assembled Greeks, the freedom of those states which had been subdued by Macedon. In 195 he diminished the power of the tyrant Nabis of Sparta, after which he occupied himself in restoring internal peace and prosperity to Greece.

Flaminius, Gaius, ka'yus flā-min'i-us, Roman general: d. 23 June 217 B.C. He was tribune of the people in 232, consul in 223 and 217, and censor in 220. As tribune he carried against the opposition of the senate an agrarian law. In his first consulship he with his colleague attacked the Gauls beyond the Po, and was defeated. The senate then recalled the consuls, but Flaminius resisted the order by refusing to open the letter, and obtained a victory over the Insubrians. A triumph was refused him on his return, but he was rewarded with demonstrations of popular favor. The circus Flaminius and via Flaminia were the monuments of his censorship. In his second consulship he marched against Hannibal, and rashly giving battle, was slain near Lake Thrasymenus.

Flammarion, Camille, kā-mēl flā-mä-rē-ôn, French writer on astronomy: b. Montigny-le-Roi (Haute-Marne), 26 Feb. 1842. In 1858 he entered the Paris observatory as pupil, being transferred in 1862 to the Bureau des Longitudes, where he remained till 1866. Although still a youth, he had already published the first of his many works, namely: 'La Pluralité des Mondes habités' (1862; 30th ed. 1892); 'Les Mondes imaginaires et les Mondes réels' (1865; 21st ed. 1892); and 'Les Merveilles Célestes' (1865; 7th ed. 1881). For five years from about 1868 he made a study of the upper regions of the atmosphere during several balloon ascents. In 1882 he founded the monthly magazine 'L'Astronomie,' and in 1887 started the French Astronomical Society. M. Flammarion has gained considerable fame for original researches in astronomy, especially in connection with double and multiple stars, colors of stars, [illegible], and the proper motion of the stars; but is much better known for his excellent, well-written and accurate popular hand-books. Among his other works are: 'Études et Lectures sur l'Astronomie' (1867–80); 'Dieu dans la Nature' (1867; 22d ed. 1892); 'Lumen' (1872; 4th ed. 1890); 'Voyages en Ballon' (1870; 20th ed. 1889); 'Vie de Copernic' (1872); 'L'Atmosphère' (1872); 'Histoire du Ciel' (1873); 'Petite Astronomie' (1877); 'Les Terres du Ciel' (1877); 'François Arago' (1879); 'Astronomie Populaire' (1880); 'Les Etoiles et les Curiosités du Ciel' (1881); 'Le Monde avant la Création de l'Homme' (1886); 'Les Tremblements de Terre' (1886); 'Uranie' (1880); 'Qu'est-ce que le Ciel' (1891); 'La Planète Mars et ses Conditions d'Habitabilité' (1893). Several books have been translated into English.

Flam'steed, John, English astronomer: b. Denby, near Derby, 10 Aug. 1646; d. Greenwich 31 Dec. 1719. He began his mathematical and astronomical studies at an early age, and in 1675 took orders in the Established Church. He still continued his astronomical observations, and was in constant correspondence with scientific men. He found the astronomical tables of the day to contain large errors, and was anxious to make more detailed and accurate observations. This having come to the knowledge of Charles II., he was appointed astronomical observer to the king, and carried on his observations at the Queen's House at Greenwich, until the observatory was built for him in 1676. Here he passed the remainder of his life amidst his astronomical labors, which are considered as the foundation of modern practical astronomy. He was so ill supported that he had to teach for his own support, and erect instruments at his own expense. In 1684 he was presented with a small living, and his father dying in the same year, he was enabled to provide some needful apparatus at his own expense, which, on his death, was claimed by the government as public property.

Flan'ders, Henry, American lawyer: b. Sullivan County, N. H., 13 Feb. 1826. He studied law and since 1850 has practised his profession in Philadelphia. He has published: 'Maritime Law' (1852); 'The Law of Shipping' (1853); 'Lives of the United States Chief Justices' (1855–8); 'An Exposition of the Constitution of the United States' (1869); 'Law of Fire Insurance'; 'Adventures of a Virginian.'

Flanders (French, *Flandre;* German and Flemish, *Flandern;* Dutch, *Vlaanderen*), a former country or district of Europe, now included in Holland, Belgium, and France. It stretched from the Schelde, below Fort Lillo, west along the Hond, or West Schelde, and west-southwest along the German Ocean to the entrance of the Straits of Dover, near Gravelines, and was bounded east by the duchy of Brabant, south by Hainaut, and west by the French provinces of Artois and Picardy. The origin of the name is unknown. It occurs for the first time, but in a very restricted sense, in the 7th century. The erection of the territory into a county took place in the 9th century, and was made by Philip the Bold, king of France, in favor of his son-in-law, Baldwin, of the Iron Arm. It afterward passed to the united houses of Spain and Austria, and ultimately to the latter, but

FLAMINGO (*Phœnicopterus antiquorum*).

From a Photograph provided by the American Museum of Natural History.

underwent considerable curtailment by the conquests of the French in the west, when part of it became French Flanders, and is now included in departments Nord and Ardennes; and by the conquests of the Dutch in the north, who succeeded in including the most northerly portion of it in the province of Zeeland. The remainder still retains its ancient name, and forms the modern provinces of East and West Flanders, in Belgium (q.v.).

Flanders, East (Fr. *Flandre Orientale*), a province of Belgium, bounded north by Holland, east by the provinces of Antwerp and Brabant, south by Hainaut, and west by West Flanders; length, north to south, 34 miles; central breadth, east to west, 32 miles; area, 1,158 square miles. The surface forms an extensive plain, sloping gently eastward. It wholly belongs to the basin of the Schelde, which by itself, its tributaries, and canals connected with them, furnishes ample water communication. Its soil, partly of a sandy and partly of a clayey nature, is so industriously and skilfully cultivated that it has the appearance of a vast garden, and presents one of the richest rural landscapes which anywhere exists. The principal crops are wheat and flax, but almost all the plants which can be grown under the same latitude are cultivated with success. There are no forests properly so called, but owing to the general practice of planting hedge-row trees, there is no want of wood. In general, however, it consists of poplar and other soft-wood trees, and makes only indifferent timber. There are no minerals of any value, but manufactures have made great progress, and all the ordinary, as well as the fine tissues of wool, cotton, and flax, are well and largely made. There are also numerous tanneries, breweries, distilleries, soap-works, roperies, sugar and salt refineries, etc. The trade includes, in addition to these articles, flax, hops, and oil. For administrative purposes the province is divided into six arrondissements — Gand, or Ghent, the capital; Alost, Audenarde, Termonde, St. Nicolas, and Eecloo. Pop. (1901) 1,029,971.

Flanders, West (Fr. *Flandre Occidentale*), a province of Belgium, bounded north and northwest by the German Ocean, west-southwest and south by France, southeast by the province of Hainaut, east by East Flanders, and northeast by Holland; greatest length, north-northeast to south-southwest, 54 miles; greatest breadth, 48 miles; area, 1,249 square miles. The surface is generally flat, but a few low hills occur in the south and east, and a range of sand hills or downs lines the greater part of the coast. The most important crops are flax, both abundant in quantity and excellent in quality; oats, barley, hops, oil-seeds, tobacco, madder, and chicory. The cattle, of all sorts, are of excellent breeds; and fish, poultry, and game abound. The most important branch of industry is linen, ordinary and damask. Great quantities of lace also are made, and there are numerous breweries, distilleries, tanneries, dye-works, oil-works, soap-works, salt and sugar refineries, etc. The province is divided into eight arrondissements — Bruges (the capital), Courtrai, Ypres, Furnes, Thielt, Roulers, Ostend, and Dixmude. Pop. (1901) 805,236.

Flandin, Eugène Napoléon, nä-pō-lā-ôṅ ē-jen flāṅ-dăṅ, Italian painter and archæologist: b. Naples, Italy, 15 Aug. 1809; d. Tours, France, 1876. He published: ‘Etudes sur la Sculpture Perse’ (1842); ‘Etudes sur la Perse moderne’ (1842); ‘Relation du voyage in Perse’ (1843). In 1843–5 he traveled with Botta through the country of the Tigris, and illustrated his fellow traveler's ‘Monuments de Ninive,’ with drawings of the sculptures of Khorsabad. He finally made a full artistic exposition of Oriental life in his elaborately illustrated work, ‘L'Orient’ (1856); and also wrote ‘Histoire de chevaliers de Rhodes’ (1854).

Flan'drau, Charles Macomb, American writer of fiction: b. Minnesota 1870. He is the author of ‘Harvard Episodes’; ‘The Diary of a Freshman.’

Flan'drians, or **Flemings,** a subdivision of the Mennonite Anabaptist sect. They arose in the 16th century, and were rigid in their procedure. In 1630 A.D. the majority of them entered into a union, confirmed in 1649, with their more moderate brethren, who were often called Waterlanders.

Flandrin, Jean Hippolyte, zhoṅ ē-pō-lēt flăṅ-drăṅ, French historical and portrait painter: b. Lyons 23 May 1809; d. Rome, Italy, 21 March 1864. He worked under Ingres, and from him he imbibed that love of severe and definite form and that classical feeling which he used for his own ends in his religious painting. In 1832 he won the Prix de Rome by his ‘Recognition of Theseus’; and before his five years' residence in Italy was completed he had produced his ‘St. Clair Healing the Blind,’ now in the cathedral of Nantes. Henceforward he was mainly occupied with decorative monumental work, though he also executed many admirable portraits. In 1842 he began his great frescoes of ‘Christ Entering Jerusalem,’ and ‘Christ Going up to Calvary,’ in the sanctuary of the Church of St. Germain-des-Près, Paris, deeply impressive works, which already entitled their painter to rank as the greatest religious painter of the century. The choir of the same church he adorned (1846–8) with figures of the Saints and the Virtues. He also decorated the Church of St. Paul at Nimes (1847–9), the Church of St. Martin d'Ainay at Lyons (1855), and painted the frieze of St. Vincent de Paul, in Paris, with a noble series of saints and martyrs. In 1855 he began his last great work in the nave of St. Germain-des-Près, consisting of subjects from the Old and New Testaments, of which some were left uncompleted at his death, at Rome, 21 March 1864. His ‘Lettres et Pensées,’ with a memoir and a catalogue of his works, were issued 1865. See ‘Lives,’ by Poncet (1864); ‘Montrard’ (1876).

Flandrin, Jean Paul, zhoṅ pōl, French painter: b. Lyons 8 May 1811; brother of the portrait and historical painter Hippolyte Flandrin (q.v.), and a landscape painter whose compositions are of an ideal character and represent a survival of the classical school of Poussin and Claude.

Flan'nan or **Flan'nen Islands,** or **The Seven Hunters,** a group of small rocky islands in Scotland, in the Outer Hebrides, included in the county of Ross and Cromarty, about 15 miles west-northwest of Gallon Head. They are frequented by large numbers of sea-birds, and sheep used to be pastured on some of

them. There is a lighthouse of recent erection, standing at a height of [illegible] feet, the structure itself being [illegible] feet high, with a light visible [illegible] miles.

Flannel, a woolen fabric of more or less loose texture and various degrees of fineness, much used as an article of clothing both in hot and cold countries, and for outer as well as inner garments, being very commonly worn next the skin. Flannel made in Wales from the wool of the native mountain sheep has the highest reputation.

Flannel-mouth, a local name for the great Missouri catfish (*Ameiurus lacustris*). (See Catfish.) Another fish, one of the suckers (*Catostomus latipinnis*) is so called in the neighborhood of the Rio Colorado.

Flannen Islands. See FLANNAN ISLANDS.

Flash, Henry Lynden, American author: b. Cincinnati, Ohio, 20 Jan. 1835. He served during the Civil War as volunteer aide on the staffs of the Confederate Gens. Hardee and Wheeler; and later edited the 'Telegraph' and 'Confederate' in Macon, Ga. He was the author of 'Poems,' and of many popular ballads which appeared during the Civil War.

Flashlight, Electric. See FOG SIGNALS.

Flat Foot, or Pes Planus, a very common deformity of the foot due to a loss of the natural arch. A strong ligament holds the os calcis and astragalus in such a position that an arch is formed by the bones of the foot and the weight of the body is transmitted through that arch. There is a congenital variety that is said to be due to lack of the normal fatty pad in the hollow of the new born infant's foot. During the first five years of life this fatty pad takes the place of the bony arch and if the pad be lacking the arch does not develop. The acquired variety affects those suddenly called upon to stand for long hours upon the feet. A very large number of nurses and soldiers and policemen suffer more or less with this deformity in their early months of training. Rickets, knock-knees, sprains and badly set fractures of the leg may give rise to flattening of the arch.

The bones are not changed from their normal shape except in the very young, but their relation to each other is altered. There is also a stretching of the extensor tendons of the foot and the muscles and fascia of the sole. Besides the flattening of the foot there is a more or less marked turning out of the toes and a tendency to walk on the inner side of the foot. This gait becomes quite characteristic.

In the acute cases particularly there is apt to be severe pain in the spring ligament, the inner malleolus or the ball of the great toe. Because of this, the affection is very commonly thought to be rheumatism, gout, or disease of the bone.

The normal marking of the sole of the foot is an impression of the heel, a narrow margin of the outside of the foot and a broad line made by the ball of the foot. When the arch becomes weakened there is a gradual increase of the outer margin until almost the whole foot makes its impression. This simple test is of great value.

Congenital flat foot may be greatly improved if discovered in time by manipulative massage, bandaging and the use of supports until the bony arch is formed. Acute cases of flat foot in adults sometimes require rest for a time. Properly made shoes without braces frequently suffice to prevent a return of the trouble. Others require the constant use of felt or well-adjusted steel springs in the shoes. Exercises of the extensors of the foot, massage and electricity are of value.

The bad cases of deformity that cannot be corrected require operation under an anæsthetic, the joints being forcibly freed and kept in normal position by plaster cast for a period and then kept up by a support.

Flat'bush, New York, formerly a town in Kings County, Long Island, but since 1900, a part of the borough of Brooklyn, New York. Before being incorporated in the city Flatbush had a population of 15,620. The locality is of considerable historic interest, having been the scene of a part of the battle of Long Island, 27 Aug. 1776.

Flatfish, a fish of the *Heteromomata*, including the families *Pleuronectidæ* and *Soleidæ*, which are characterized by their greatly compressed form, distorted skulls and the habit of lying and moving on the side. They are somewhat related to the cod family, and inhabit the seas of all parts of the world, more than 500 species, classified in some 55 genera, being known to ichthyologists. All are oval or elliptical in outline, very thin and flexible, and habitually rest, half covered, or move sidewise along sandy sea-bottoms, some species near shore, or even ascending rivers, others only in deep water. They are carnivorous, taking as food mainly mollusks, worms, sand-dollars and the like, found in such places, for the crushing of whose shells they are provided with strong teeth, chiefly developed on the inferior side of the mouth. The flatness of these fishes is not a broadening laterally but a compression of the body whereby they become high and thin in a dorso-ventral direction, lie over on one side (usually the left), and have the head permanently twisted to the side uppermost in their customary position. This, however, comes about only with age. The very young flatfish are born in the normal shape of fishes, and swim in the ordinary vertical position, but soon begin to assume the adult peculiarities. This tendency causes profound changes in structure. The skull gradually becomes so distorted that its facial part is twisted at right angles to the plane of the cranial part, and both eyes, set close together, look upward, so that the fish has a seeing and a blind side. In order to get into this position the eye of the under side is rotated around, or in some species right through the young skull, when the fry is only an inch or so in length and the bones not yet ossified. The curious condition of the dorsal fin in the flatfish is nevertheless a greater mark of distinction. The external ethmoid bone belonging to the blind side is much enlarged, and sends back a process outside the eye belonging to that side to meet another process from the cranial region of the skull. Thus, says Cunningham, the eye which has migrated is enclosed in a complete bony orbit, while the other (lower) eye is merely bounded on its outer side by the jaw muscles. It is on this bony bridge entirely foreign to the anatomy of an ordinary fish that the dorsal fin is supported, and is able to extend from the tail clear to the snout, not passing between the eyes,

but separating the hidden from the exposed side. Similarly the ventral and anal fins form a continuous growth along the ventral keel, defining there the upper side from the lower. The lesser forward fins, like the mouth, are usually asymmetrical. They are able to swim well when they please, and sometimes appear at the surface, progressing with a curious sideways undulatory movement very graceful. This is a dangerous excursion, however, and flatfish as a rule cling to the bottom, trusting to be overlooked because of their close resemblance to the sand or mud.

The young flounder or other species is brown on both sides alike; but when it turns on one side and lies flat, the under side becomes nearly white while the upper assumes the color of the bottom upon which the fish habitually rests. This is an excellent example of protective resemblance. (See COLORATION, PROTECTIVE); and that it arises from the habits of the fish and is the effect of persistently keeping the under side in shadow, is plain from the fact, demonstrated by experiment, that when flatfish are confined in aquaria with glass bottoms, through which light is reflected upon the under side, color will develop there. Some flatfish are spotted, increasing their likeness to a pebbly bottom. All these circumstances make it evident that flatfishes originated from symmetrical ancestors related to those of the cod, but what were the inducing causes of the extraordinary changes that have characterized their evolution are not plain. Little help is derivable from palæontology for fossil flatfishes are extremely rare, the oldest known being a sole-like form from the Upper Eocene of southern Europe.

The group includes two families, the flounders (*Pleuronectidæ*) and the soles (*Soleidæ*). Jordan subdivides the former into three sections, namely *Hippoglossinæ*, halibut tribe; *Pleuronectinæ*, flounder tribe; and *Psettinæ*, turbot tribe. The soles are a small family distinguished by the hidden, adnate character of the gill-cover, the small, much twisted eyes and mouth, and the absence of teeth. The whole group yields excellent flesh, and furnishes some of the most important food-fishes of commerce as well as several regarded as especial delicacies. They are treated of at length in Goode's 'Fishery Industries,' Sec. I (1884); and in Jordan and Evermann's 'Fishes of North and Middle America' (1898). See FLOUNDER; FLUKE; HALIBUT; PLAICE; SOLE; TONGUE-FISH; TURBOT; WINDOWPANE.

Flathe, Heinrich Theodor, hīn'riн tā'ō-dōr flä'tě, German historian: b. Tanneberg, near Nossen, Germany, 1 June 1827. He attended the Fürstenschule in Meissen, studied philology and history in Leipsic and in 1867 was appointed teacher in the Fürstenschule at Meissen. His main achievement was the revision and rearrangement of F. W. Bottiger's 'Geschichte des Kurstaats und Königreichs Sachsen' (1867), which he transformed into a new work, for he not merely added new details, but rewrote much of the main argument. He has also among other works written 'Allegemeine Weltgeschichte' (1883).

Flathead, or (properly) **Salish Indians,** a tribe of Indians with uncompressed skulls, as distinguished from the «peaked-heads» who did compress their skulls, and who gave the others the name of Flatheads. These Flatheads are a superior tribe, originally dwelling around the Flathead Lake and River in northwestern Montana; much respected by the traders and explorers as at once very brave against their enemies (chiefly the Blackfeet) and honorably requiting friendly treatment. The famous Flathead mission, the most successful in the Northwest, was established among them in 1841 by the Jesuit missionary P. J. De Smet. They are now located on the Jocko reservation in their old territory, confederated with the Pend d'Oreilles and joined with the Kootenais, the whole numbering 1,280.

Flather, John Joseph, American mechanical engineer: b. Philadelphia, Pa., 9 June 1862. He was graduated from the Sheffield Scientific School of Yale, and after several years' experience in American and foreign machine shops was instructor in mechanical engineering at Lehigh University 1888–91; professor of the same at Purdue University 1891–8; and he has filled a similar post at the University of Minnesota from 1898. He has published: 'Treatise on Steam Boilers' (1889); 'Rope Driving' (1892); 'Dynamometers and the Measurement of Power' (1900).

Flat'tery, Cape. See CAPE FLATTERY.

Flat'ulence. See INDIGESTION.

Flatworms, worm-like animals of the phylum *Platyhelminthes*; especially those of the order *Turbellaria*, characterized by oval outline and decided flatness of body. See *Classification* in article ANATOMY; also PLANARIAN WORMS.

Flaubert, Gustave, güs-täv flō-bãr, French novelist: b. Rouen, France, 12 Dec. 1821; d. Rouen 8 May 1880. His greatest novel was his first, 'Madame Bovary' (1857). He next wrote a historical novel, 'Salammbô,' the scene laid in the most flourishing period of Carthage — a splendid description of ancient Punic life, but having lively interest as a story; 'The History of a Young Man' (1869), like 'Madame Bovary,' a pessimistic picture of social life; 'The Temptation of St. Anthony' (1874), a piece of imaginative writing dealing with philosophical problems; and 'Three Stories' (1877), which had a favorable reception. The posthumous novel, 'Bouvard and Pécuchet' (1881) is a satire on humanity in general. His comedy, 'The Candidate' (1874), failed on the stage. See Tarver, 'Gustave Flaubert' (1895); Faquet, 'Flaubert' (1899).

Flav'el, John, English Nonconformist: b. Bromsgrove, Worcestershire, about 1630; d. Exeter 29 June 1691. He was graduated at Oxford University, inducted into the rectory of Dartmouth, Devonshire, in 1656, but dispossessed and ejected for nonconformity in 1662. During the remainder of an active ministry he preached from house to house and wrote devotional works, which were long popular, and among which are: 'Husbandry Spiritualized' (1669); 'Divine Conduct' (1678); 'The Touchstone of Sincerity' (1697); 'The Soul of Man' (1698); etc.

Flavian Cæsars, flā'vi an sē'zarz, the Roman emperor Vespasian and his sons and successors, Titus and Domitian, who were of the house of Flavius.

Flav'in, a yellow or orange dyestuff. American flavin is got from quercitron bark, and proved to be the same as quercitrin.

Flax (*Linum usitatissimum*). The use of flax has a greater antiquity than any other commercial fibre. It was cultivated and manufactured by the Swiss lake dwellers in the Stone Age of Europe, well preserved specimens of straw, fibre, yarn, and cloth being preserved in the museums. This ancient flax, however, was from another species, *Linum angustifolium*. The Egyptians possessed and used flax thousands of years ago, and the Chaldæans and Babylonians carried its use to the highest state of textile development. Three thousand years ago the Phœnicians extended the culture, and the Greeks and Romans made it a household industry, and it became the aristocratic fibre. It is claimed that the ancient Mexicans knew of both flax and hemp, and its culture in this country goes back to the earliest date of our civilization.

A bast fibre, it may be considered, next to cotton, the most valuable and universally employed textile in the whole range of vegetable fibres. While the plant can be grown in nearly every portion of the temperate world, it is produced commercially in Great Britain and Ireland, Denmark, Sweden, Belgium, Holland, France, Germany, Russia, Austria, Spain and Portugal, portions of Africa and Asia, Japan and the Australian colonies. It thrives in Canada, the United States, and Mexico and in some of the South American countries. Good flax has been grown as far north as Alaska, and the flax of Archangel is famous.

Its cultivation was brought to this country by the American colonists, the records showing that considerable quantities were grown in eastern Massachusetts as early as 1630. Its growth was early extended to other States, though for the most part it was a household rather than commercial industry. In the fifties of the last century three quarters of a million pounds of flax were produced in the United States, Vermont, Connecticut, New York, and New Jersey leading in the culture. With the increased use of cotton fine flax culture steadily declined, and while, as late as 1869, 13,000 tons of flax were produced, a very small proportion was fine line, the bulk being mere tow for the bagging factories. A year or two later, when jute was admitted free of duty, the industry collapsed. At the present time we are growing flax to the extent of a million acres annually, but for the seed, for linseed-oil manufacture, and not for the fibre. The straw, which is rough and coarse, is largely thrown away, although in recent years attempts are being made to use the rough product for paper.

Good commercial fibre could be grown in many localities, notably in Michigan, Wisconsin, Minnesota, Oregon, and Washington. In a series of government experiments, conducted by the writer in the Puget Sound region of Washington, flax-straw was produced from which was hackled out a fibre valued by experts at $500 per ton. Very little line flax is produced at the present time, however, our commercial supply coming largely from Russia, Holland, Belgium, and Ireland; a little comes from Italy and Canada. Much of the "Irish flax" is grown in Belgium and sent to Ireland for preparation.

Nearly every country producing commercial flax has established grades and marks save the United States and Canada. In portions of Russia the grades bear the names of the districts where grown. The grades of Archangel flax are known by the terms first, second, or third crown, etc., and first Zabrack, second Zabrack, while Riga flax is graded from the standard K as HK, PK, HPK, HSPK, etc. Holland flax is graded by roman numerals or by double numerals, as $\frac{\text{II}}{\text{IV}}$ $\frac{\text{I}}{\text{V}}$ VI, VII, etc., Belgian flax also by numerals except Friesland flax, which is lettered, as D, E, Ex, F, Fxx, and so on to Gxxx. French flax is known by the districts where produced and Irish flax by the counties where the flax is grown (see 'Descriptive Catalogue Useful Fibre Plants of the World,' p. 222). Our importations of all kinds of raw and hackled flax last year amounted to 8,466 tons, worth $2,227,141.

The culture of flax requires a deep, well-tilled soil, in high state of fertility, such as moist, deep, strong loams upon upland; a wet soil is disastrous and clays are therefore avoided; and a soil filled with the seeds of weeds is equally fatal to flax culture. The land must be deeply plowed and reduced to fine tilth by harrowing and rolling. In the preparation of the soil, especially in Europe, a systematic rotation of crops is practised, flax occupying the same land not oftener than once in 5 or 10 years. Imported Riga seed gives the best results, although Belgian Riga (Belgian seed produced from one sowing of Riga seed) gives a fine fibre. The common seed of the oil-mills should never be used for fibre culture. When flax is grown for the production of seed alone, to be sold to the oil-mills, the ground is seeded at the rate of two to three pecks to the acre. For fibre culture one and a half to three bushels is the proper quantity per acre.

After the seed has vegetated and is about two inches high the weeding begins, for no fine flax can be produced if the crop is choked with weeds. Flax is harvested by pulling the straw out of the ground roots and all, the straw being laid in handfuls to dry, and afterward made into bundles, which are stacked in the field. Practice varies, however, in different countries as to the handling before the retting period. In Flanders the greatest care is given to drying and storing, in order to keep the flax clean and bright for the final process of retting.

There are three methods of soaking or retting the straw: Dew retting is the simplest and the least careful, the straw being spread over the field like hay, to be retted by the dew, and by the action of the elements. Pool retting is practised by immersing the straw in pools of stagnant water, the softest water giving the best results. The pools are dug in the ground for the purpose, though a great deal of the Irish flax is retted in "bog holes." Retting in running water is the third method, this form of retting being practised in Belgium; the famous Courtrai flax is retted in the sluggish and murky waters of the river Lys, the straw, in bundles, being placed in large crates and weighted with paving stones until the crates sink sufficiently to fully cover the flax. The flax of Courtrai, retted in the Lys, is the finest flax in the world. It is very light in color, clean,

and even, and shows a superior tensile strength. The flax is given two immersions, the straw being taken from the crates and carefully dried before the second immersion.

The first operation in cleaning or extracting the fibre is to pass the straw through a breaker, which loosens the woody portions of the stem, and reduces them to fragments, to facilitate the next operation, the scutching, which whips out the «chive» and all waste matters and leaves the pure flax fibre. In former times the scutching was done by hand, though now machinery is generally used. The scutched flax is subsequently hackled or dressed by repeated combings, which removes the short and broken or tangled fibre, these combings producing tow. Each hackling adds to the quality of the fibre, and of course to the cost. Flax is usually imported in the scutched form, the hackled flax known as «dressed line.» The cheaper grades of flax come from Canada and Russia, the medium and finer grades from Holland, Belgium, and Ireland. The product is used in the United States for threads, twine, and crash, as no fine linen is woven in America. Mexico produces some good flax, and there are linen mills in Mexico city which produce fair grades of fabric. For the details of flax culture and manufacture, consult 'Special Reports' (Nos. 1, 4, and 10), office of Fibre Investigations of the Department of Agriculture; 'Spinning the Threads,' by A. R. Turner, Jr., in Jubilee number of 'New York Dry Goods Economist,' and 'Etudes sur La Culture le Rouissage et el Teillage du Lin,' by Alfred Renouard. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; LINEN.

CHAS. RICHARDS DODGE,
Commercial Fibre Expert.

Flax'man, John, English sculptor and draughtsman: b. York, England, 6 July 1755; d. London 7 Dec. 1826. From his earliest years he exhibited and cultivated his talent for designing, and was also attracted by the picturesque conceptions of Greek mythology. He began to study at the Royal Academy in 1770, earning for some time a living by making designs for Wedgwood, the potter, and other persons. He went to Italy in 1787, and acquired the highest reputation by three series of designs, the illustrations to Homer, Æschylus, and Dante. He became a member of the Royal Academy 1797, and professor of sculpture there in 1810. The monument to Lord Mansfield in Westminster Abbey, the group of 'Cephalus and Aurora,' 'Psyche,' the group of the 'Archangel Michael and Satan,' are among his best works. He executed many exquisite bassi-relievi, compositions from Scripture subjects, and marked by some special religious sentiment. The monuments to Nelson, Howe, and Reynolds in St. Paul's are by his hand. One of his latest and finest productions is the 'Shield of Achilles.' The sculptures and sketches of Flaxman are now deposited and exhibited in a gallery called the «Flaxman Hall,» at University College, London. His 'Lectures on Sculpture' appeared in 1829, passed through a new edition in 1866.

Flaxseed, the seed of the flax plant (*linum*) largely used for domestic and medicinal purposes, produced in large quantities in the south of Europe, Egypt, parts of Asia and in the United States. (For a detailed description of the plant see FLAX; and for its commercial qualities other than seed, see FIBRE and LINEN.) The seeds of flax are dark brown, glossy, oval oblong, flattened, with acute edges, and pointed at one end. The seed is rich in an oil of such superior drying qualities as render it an indispensable ingredient in paint and varnish, and in the manufacture of linoleum, oilcloth, printer's ink, patent leather and other products and manufactures. The cultivation of the plant for fibre requires harvesting before the seed is fully ripe, which impairs the quality and reduces the quantity of the crop of flaxseed. The cultivation of flax for the seed requires a seeding of 2 or 3 pecks to the acre, and while it yields an increase of seed, the fibre straw is coarser; hence flax must be raised exclusively either for fibre or for seed. European countries cultivate flax for fibre, while the United States, Argentine and British India produce the world's commercial crop of flaxseed.

Introduction in America.— Flax for fibre was introduced in the United States soon after the landing at Plymouth. The seed for which there was obviously a limited domestic demand, gradually developed as an article of commerce. So long ago as 1791 the exports of flaxseed from the United States amounted to 292,460 bushels. In the same year began the manufacture of linseed oil in this country. In 1810 there were 283 linseed oil mills located in 14 States, 171 mills being in the State of Pennsylvania. The total annual output of these mills amounted to 770,583 gallons, representing 300,000 bushels of seed. In 1839 the first cargo of flaxseed ever brought into the United States was imported from Russia, and a few years later ships carrying ice to India brought flaxseed on the return voyages. From 1850 to 1870 India shipped a larger quantity of flaxseed to the United States than was produced in this country. From 1850 to 1860 half the entire crop here was grown in Ohio and Kentucky. The linseed oil mills divided or arranged themselves about 1891 into two groups, eastern and western. The former utilized the India imports of seed, while the western mills used the home product. In 1892 the United States took rank among the surplus flax-producing nations of the world and became an exporter of importance. In 1894 a short crop necessitated the import of 4,000,000 bushels. In 1903 there were 13 mills of large capacity in the Eastern States, 4 in Buffalo, 2 in New York, 3 in Philadelphia and other individual mills at Pittsburg and Allegheny, Pa., and Troy and Amsterdam, N. Y. These combined mills crush annually upward of 12,000,000 bushels of seed.

The Western Crop.— The flaxseed industry has migrated from its original western home in Ohio and Kentucky, State by State, until its present area includes North Dakota, South Dakota, Minnesota, Iowa and Wisconsin (known as the northwestern crop), and in Kansas, Missouri, Nebraska, Oklahoma and Indian Territory (known as the southwestern crop). Up to 1869, Ohio was the leading producing State. In 1879 Illinois produced the largest crop, 1,812,438 bushels. In 1889 North Dakota took the lead with a production of 7,776,610 bushels, and in 1902, out of a total production in the United States of 29,284,880 bushels North Dakota produced 55 per cent or 15,552,000 bushels. There are two varieties of seed produced in the West.

[illegible] of the Southwest yield [illegible] 17 pounds of oil to the bushel, while the [illegible] seed of the Northwest yields [illegible] pounds of oil to the bushel (56 pounds).

The manufacture of linseed oil in the West has become largely localized in cities on and near the Great Lakes. There were 5 mills in Minneapolis in 1902, 6 in Chicago, 2 at Toledo, and 1 each at Cleveland, Milwaukee, South Bend, Ind., and Redwing, Minn. In the northwestern States of Iowa, North and South Dakota, there are but 3 mills, the bulk of all the western crop going to Chicago. Flaxseed in its

[illegible] with pigments and gums and used as paint and varnish. The remainder is utilized in [illegible]ng linoleum, oilcloth, printer's ink, water-[illegible] not made of rubber, enamel for [illegible] few medicinal [illegible]. The oilcake, used only as a cattle [illegible] an extensive market abroad. It is [illegible] by European stockraisers, but little appreciated in America. About 80 per cent of the oilcake product is exported. Belgium alone bought 148,263,752 pounds in 1901. In the [illegible] year 1901–2 oilcake to the value of $[illegible] was shipped to foreign countries, and the average amount exported for five years prior to 1902 was 488,891,125 pounds. In the manufacture of linseed oil from flaxseed two processes are used, one known as the "old" or hydraulic press process, and the other as the "new" or naphtha process. The old process is in use generally throughout the United States, the new process being represented in 1902 by a single mill in Chicago. In December 1902 there were 40 linseed oil mills in operation in the United States. They contained 750 presses with a crushing capacity, if operated 250 days in the year, of 25,000,000 bushels, with an output of 70,000,000 gallons of oil.

natural state has no domestic uses on the farm, so that internal commerce involves the entire crop.

Flaxseed Products.— The principal product as understood is linseed oil. The residue after the extraction of the oil is the by-product the oilcake, a valuable cattle food, which, when ground, is known to commerce as linseed oil meal. Out of a crop like that for 1902 (29,000,000 bushels), there could be manufactured over 67,000,000 gallons of oil and upward of 1,000,000,000 pounds of oilcake. Of this vast quantity of oil the foreign demand only amounts to 100,000 gallons a year. [illegible] has many uses and the monopoly of its field is so complete it has no substitutes nor adulterants. Probably 75 per cent of the oil manufactured is com-

The value of the flaxseed crop as compared to the value of other crops raised in the United States in 1902, will be of interest:

Value of flaxseed crop	$30,814,661
Value of rye crop	17,080,793
Value of buckwheat crop	8,654,704
Value of barley crop	61,898,034
Value of tobacco crop	57,503,510

Flea-beetles, small leaf-beetles of the tribe *Halticini,* of the family *Chrysomelidæ,* differing from other forms of this family by their extraordinary leaping power due to the enormously developed hind femora. Many of them are injurious to vegetation from their habit of eating the starting leaves full of holes, causing the drying up and death of the plant; hence certain species are known, as "tobacco flea,"

"potato flea," "cabbage flea," etc. In their larval state some species live on the root system of various weeds, the adults doing the principal damage to useful plants. Some species are also leaf-miners, while a few feed on the upper surface of leaves like the young of common leaf-beetles, but most species feed on both surfaces. One of the best remedies is bordeaux mixture, doubly efficient when mixed with Paris green and administered in the form of a spray. See LEAF-BEETLES.

Flea-hopper, either of two species of injurious minute black bugs of the family *Capsidæ.* The commonest is the garden flea-hopper (*Halticus uhleri*), which feeds and breeds normally on clover, but attacks all garden vegetables, commonly on the under sides of leaves, which it punctures so as to cause the death of the tissue in small irregular white patches. It somewhat resembles a flea-beetle (q.v.), but is remarkable in being dimorphic, a portion of the females having well-developed wings, the remainder being short-winged. The best remedy is kerosene emulsion as an under spray, and the avoidance of planting susceptible crops after the cutting of clover fields. A related species is known as the false flea-hopper (*Agalliastes associatus*).

Flea-louse, one of the jumping plant-lice of the family *Psyllidæ,* familiarly represented by a pest of the pear-tree (q.v.). Some of the species make galls.

Fleabane. See ERIGERON.

Fleas, minute wingless insects with bodies covered by a strong armor of fine scaly plates and mouth-parts formed for sucking. They constitute the order *Siphonaptera* and are related to the *Diptera.* Everyone is familiar with these troublesome parasites of man and domestic animals, but few persons have studied them sufficiently to know the larval and pupal stages, or to recognize the fact that there are many species. Only recently has it been established that the flea most annoying to human beings in America is not the human flea of the Old World (*Pulex irritans*), but the so-called dog-and-cat flea (*Pulex serraticeps*). Both species are of cosmopolitan distribution, but the former is fortunately extremely rare in this country, while the latter is to be found everywhere. Observations conducted by the United States Department of Agriculture have shown that the development of these insects is hastened by a moist or humid atmosphere. The egg stage is very short, th larvæ, which are worm-like, spin cocoons in which the pupal stage is formed in from 7 to 14 days after hatching and the imago appears five days later, showing that in the warmest weather an entire generation may develop in little more than a fortnight. Fleas will develop successfully in any situation where they are not too much disturbed, as in rugs, mats, or in straw or litter on which cats or dogs have slept; and they are also carried from one place to another by rats and mice and other animals. Dr. C. F. Baker ascertained in 1895 that there were 47 valid species of fleas in the United States; and probably this number might be doubled if all of the parasites of our larger animals were known. While many persons are indifferent to the presence of fleas others suffer severely from their attacks. Very many alleged cases of "hives" have been found to be produced by fleas, and epidemics of fleas in restricted areas as, for example, in several neighboring houses, have been traced to the body of an animal which had died near by The fleas desert the dying body of their host, jump on the clothing of any person passing, and are thus carried from house to house. One means of protection against them consists in avoiding carpets, and keeping the floors painted and covered with rugs, which should be frequently moved, swept and aired. Household pets should be kept out of the house during the summer time; in fact, it is better to exclude cats entirely, because they cannot be washed and freed from parasites so readily as dogs. Rats and mice also carry these and other parasites. The best remedy for those who suffer from fleas is to apply ammonia as strong as can be borne and as soon as possible to the bite, which in some persons is followed by an eruption as big as a dime, attended by severe itching. The free use of baking soda would serve nearly the same purpose where ammonia cannot readily be obtained. Consult: Howard & Marlatt, 'Household Insects of the United States,' issued by the Department of Agriculture.

Fleece Golden, in Grecian mythology, the fleece of gold taken from the ram on which Phrixus and Helle escaped from being sacrificed.

Fleece, Order of the Golden, a military order instituted by Philip the Good, Duke of Burgundy, at Bruges, 10 Jan. 1429, on the occasion of his marriage with the Portuguese princess, Isabella. The order now belongs to both Austria and Spain. See GOLDEN FLEECE, ORDER OF.

Fleet, (1) A tidal stream, so called from the swiftness of its current, which flowed by the walls of old London city; the title is also applied to a creek; an inlet or arm of the sea, as North-fleet, etc. (2) Fleet Street, London. derives its name from the Fleet ditch. (3) The Fleet, or Fleet Prison, an historic prison in London, so called from its being situated by the side of the Fleet ditch. In it were confined persons committed by the ecclesiastical courts and the courts of equity, exchequer, and common pleas. It existed from the 12th century until its abolition in 1846. (4) Fleet books, the original records of the marriages celebrated in the Fleet prison, between 1686 and 1754. (5) Fleet marriages, marriages performed clandestinely and without banns or license by the poor chaplains in the Fleet prison, previous to 1754, when they were declared illegal by the Marriage Act.

Fleet'wood, Charles, English soldier: b. Northamptonshire, England; d. Stoke Newington, London, 4 Oct. 1692. He was of good family, studied law, was elected member of Parliament in 1646, and appointed governor of the Isle of Wight in 1649. He was made lieutenant-general of cavalry in Cromwell's army, distinguished himself at the battle of Worcester (1651) and married Bridget, Henry Ireton's widow, the daughter of Cromwell. He was put in command of the troops in Ireland, where he resided as Lord Deputy until 1655. He was appointed general of Richard Cromwell's army 18 Oct. 1659, but on the promotion of Monk in December 1659, he resigned. After the Restoration he retired to obscurity at Stoke Newington.

Fleetwood, George, English parliamentarian: b. in Buckinghamshire, England; d. in America about 1660. He represented his native shire in the Long Parliament (1647). He served the English war against the king, raised a regiment of horse for Cromwell's army and was by the latter raised to the peerage. By the government of Charles II he was condemned to death as a regicide, but on changing his allegiance, the sentence was mitigated to confiscation of his estates, and he emigrated to America.

Fleetwood, or **Brandy Station, Battle of.** Gen. Hooker, suspecting that Gen. Lee was gathering his forces on the upper Rappahannock for a movement northward, and informed that Gen. Stuart's Confederate cavalry was at Culpeper Court House, ordered Gen. Pleasonton, who was at Catlett's Station, to cross the Rappahannock at Beverly and Kelly's Fords, attack Stuart, and ascertain Lee's intentions. Pleasonton had the cavalry divisions of Buford and Gregg, and Hooker sent him two picked provisional infantry brigades of 3,000 men, under Gens. Ames and Russell, making in all, cavalry and infantry, an effective force of 10,900 men. Stuart had five brigades of 10,200 men. At daybreak 9 June 1863 Buford, with his cavalry and one brigade of infantry, crossed at Beverly Ford and encountered one of Stuart's brigades, under command of Gen. Sam Jones, and a severe contest ensued, in which the 8th New York cavalry, Col. B. F. Davis, was routed and its commander killed. A charge of the 8th Illinois cavalry drove Jones back two miles, where he joined Stuart and the two brigades of Wade Hampton and W. H. F. Lee. Meantime Gregg, with his cavalry division and an infantry brigade, crossed the river at Kelly's Ford, and pushing back Robertson's brigade, approached Fleetwood Hill from the east, as Buford moved on Brandy Station from the northwest. Fleetwood Hill is a few hundred yards north of Brandy Station, and a hard hand-to-hand struggle ensued at both points, with varying success. Buford held his own near Brandy Station, but Gregg, at Fleetwood Hill, was finally compelled to withdraw, leaving three of his guns in the hands of the enemy. Pleasonton, satisfied that a great part of Lee's army was in his front, recrossed the Rappahannock with about 100 prisoners. The Union loss was 484 killed and wounded and 382 missing. The Confederate loss was 485, of whom 301 were killed or wounded. This engagement marks the beginning of the Gettysburg campaign. Consult: 'Official Records,' Vol. XXVII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. Carman.

Fleischer, Heinrich Leberecht, hīn'riн lā'be-reнt flī'sher, German Orientalist: b. Schandau, Saxony, 21 Feb. 1801; d. Leipsic 10 Feb. 1888. He was professor of Oriental languages at the University of Leipsic 1836–88. Beside editing Ali's 'Hundred Sayings' (1837), and other works, he wrote a 'Critical Dissertation on Habicht's Glossary to the First Four Volumes of the Thousand and One Nights' (1836): 'Grammar of the Modern Persian Languages' (1875); 'Kleinere Schriften' (1885–8).

Fleming, George. See Fletcher, Julia Constance.

Flem'ing, John Ambrose, English electrical engineer: b. Lancaster, England, 1849. He was educated at the Royal College of Chemistry and St. John's College, Cambridge, and has been associated for many years with the progress of electrical science. He has published: 'Short Lectures to Electrical Artisans' (1885); 'Treatise on the Alternate Current Transformer' (1889–92): 'Electric Lamps and Electric Lighting' (1894); 'Magnets and Electric Currents' (1897); 'Waves and Ripples in Water, Air, and Ether' (1902); etc.

Fleming, May Agnes Early (Mrs.), Canadian story-writer: b. New Brunswick 1840; d. 1880. She was a prolific author of romances, mostly sensational, among them being: 'Guy Earlscourt's Wife'; 'Lost for a Woman'; 'Pride and Passion.'

Fleming, or **Flemming, Paul,** powl, German lyric poet: b. Hartenstein, Saxony, 5 Oct. 1609; d. Hamburg 2 April 1640. As an attaché of an embassy to Russia and Persia, he had an opportunity (1635–9) of studying many peoples. His 'German Poems,' which appeared in 1642, has been often republished.

Fleming, Richard, English prelate: b. Yorkshire about 1360; d. 1431. At first a supporter of Wiclif's doctrines he subsequently, when bishop of Lincoln, became staunchly orthodox and is remembered as the prelate who dug up and burned the body of Wiclif and cast the ashes into the Swift. He planned a college at Oxford to be a bulwark against heresy, but the present Lincoln College was, however, not founded till after the bishop's death.

Fleming, Sir **Sandford,** Canadian engineer: b. Kirkcaldy, Fifeshire, Scotland, 7 Jan. 1827. He went to Canada in 1845 where he constructed the Inter-Colonial Railway through Nova Scotia, New Brunswick and Quebec. He was engineer in chief of the Canadian Pacific Railway 1871–80, and has published: 'The Inter-Colonial: a History, 1832–76'; 'England and Canada'; 'Time and its Notation'; etc. He was knighted in 1897.

Fleming, William Hansell, American Shakespearian scholar: b. Philadelphia, Pa., 23 Aug. 1844. He was educated at Princeton University and has published: 'How to Study Shakespeare' (1897–9), and edited the 'Bankside Shakespeare.'

Flem'ingsburg, Ky., a town and county-seat in Fleming County, on the Covington, F. & A. R.R. Pop. (1900) 1,711.

Flem'ington, a town and county-seat of Hunterdon County, N. J., on the Pennsylvania, the Lehigh Valley, and the Central Railroad of New Jersey, 50 miles west of New York. Pop. (1900) 2,145.

Flemish Art. See Flemish School.

Flemish Bond, in bricklaying, a particular mode of disposing bricks in a wall, so as to tie and break joints. It consists of a header and stretcher alternately.

Flemish Brick, European brick used for paving; 72 will pave a square yard. They are of a yellowish color, and harder than the ordinary bricks.

Flemish Language and Literature. *Vlämisch* or *Duytsch*, the Low German vernacular

spoken by the Vlamingen or Flemings inhabiting the Belgian provinces of East and West Flanders, parts of Holland and the French department of Nord, is akin to the Frisian and to the Hollandish or Dutch which is its younger branch. The latter differs from Flemish in having been reformed and simplified, while Flemish retains the greater part of the archaic features of its 16th century spelling, pronunciation, and words and forms of speech of French and Spanish origin. Since Belgium became an independent kingdom in 1830, a strong desire has been manifested to foster Flemish traditions and to cultivate and promote its language and literature; before that date its history is identified with that of Dutch language and literature. (See HOLLAND.) Among early Flemish literature is the 'Spiegel historical' (historic mirror) of Jacob van Maerlant (1235–1300), a translation of 'Boece' or 'Boethius' by Jacob Velt of Bruges in the 15th century, and the 'Hive of the Catholic Church,' by Philip van Marnix (1569). The modern movement to rehabilitate the vernacular was largely due to the efforts of Jan Frans Willem who before the separation of Belgium from Holland had strenuously advocated its use as a literary language. With the able co-operation of such authors as Van Ryswyck, Ledeganck, Rense, Van Duyse, Blieck, Serrure, David Conscience and others, the movement made great progress, received official support, and was crowned with success in 1886 when the Koninklije Vlaamsche Akademie (Royal Flemish Academy) was founded and the use of Flemish, as well as French, was adopted as the legal and official language of the kingdom. Prominent amid modern Flemish literature is the verse of Ledeganck: 'De drie Zustersteden,' 'De Hut in 't Wowd,' etc.; of Ryswyck, 'Antigonus,' 'Eppenstein,' and 'Oorspronkelikje Verhalen'; of Van Beers, 'Begga,' 'Levensbeelder.' and 'Gevoel en Leven.' Among works of fiction are Hendrick Conscience's 'Artevelde'; Delcroix's 'Geld of Liefde' and 'Philippine van Vlaanderen'; Sleeckx's 'In 't Schipperskwatier' and 'Dirk Meyer'; and Sneiders' 'De gasthuisnon.' Other well-known novelists are Bergmann, Madame Courtmans, and the two poetesses, Rosalie and Virginie Loveling, poets also including Dantzenberg, De Cort, and Van Droogerbroeck. Representative drama is Sleeckx's 'Meester en Knecht,' and 'Zannekin.' Consult: Willems, 'Sur la langue et la littérature neerlandaises, par rapport aux provinces méridionales des Pays-Bas' (1818); Vercoullie, 'Spraakleer van het Westvlaamsch' (1894); Hamelius, 'Histoire politique et littéraire du mouvement flamand' (1894).

Flemish School, a school of painting which originated in Flanders in the early part of the 15th century, with the invention, or at least the first practice, of painting in oil. It has been generally attributed to Jan Van Eyck, who was accustomed to varnish his distemper pictures with a composition of oils. In course of practice he came to mix his colors with oil instead of water, which rendered them brilliant without the trouble of varnishing. From this and subsequent experiments arose the art of painting in oil. The chief early masters of the school were Jan Van Eyck and his brother and sister, Hubert and Margarete, Matsys, Mabuse, Memling, Weyden, and Moro; to the second period belong Rubens, VanDyck, Snyders, Jordaens and the younger Teniers.

Flensburg, flens'boorg, Prussia, a town in the province of Schleswig-Holstein, 20 miles from the town of Schleswig. It was a place of importance as early as the 12th century, but subsequently suffered much from wars and conflagrations. It is again prosperous, and is now the most important town in Schleswig. The industrial establishments include ship-building yards, sugar-refineries, tobacco-factories, soap-works, foundries, breweries, distilleries, etc. In 1866 it fell to Prussia, along with the duchy of Schleswig-Holstein. Pop. (1901) 48,992.

Flesh (or muscle) is composed of the proteids, myosin, musclin, myoglobulin, and myo-albumin, together with varying amounts of fats, salts, and nitrogenous extractive substances. Of the three classes of foodstuffs needed in the human economy, meat supplies most of the proteid and fat, while the vegetable kingdom supplies the carbohydrates. The proteids are more properly the tissue-building elements, while the fats and carbohydrates are more readily oxidizable, and supply the body with energy. Proteids must be taken as such, since the human economy cannot cause conversion of the other sorts of food into proteids. The minimum of these various substances for the proper preservation of life has not been positively determined, but approximately the average healthy man requires 100 grams of fat, 400 grams of carbohydrate, and 100 grams of proteid per diem. The necessary amount of proteid material can be obtained from the vegetable kingdom, and there is no doubt that some systems are better suited for this diet; but to the large majority of individuals a mixed diet, containing a certain amount of meat, is more readily taken care of. The meat proteids are usually more quickly and completely digested.

The nitrogenous extractive substances, ceratine, the xanthin bases, and the like, are also of value to the system because of their power of exciting gastric secretions and stimulating circulation. The various meat extracts contain a large proportion of these substances, and most of them have little else. An overabundance of meat very frequently causes a nervous, irritable condition. This is less true of the so-called white meats, a difference not to be explained on the ground that the white meats contain less of the extractives, since the opposite is the case. As a general rule the diet of the well-to-do in America is entirely too high in food-value, but particularly in the amount of albuminous foods. These constant errors find their expression in the well-nigh universal complaint of dyspepsia and so-called uric-acid disturbances. Such intoxications are almost sure to follow if more animal food is taken than can be digested and absorbed. Putrefaction of the unabsorbed food takes place, with generation of toxic substances and absorption of them into the general circulation.

Flesh-fly, any of a large group of showy flies (family *Sarcophagidæ*), the more familiar and typical members of which breed in decaying flesh. Some, however, pass their larval stages in dung, or decaying vegetables, or are parasitic in the wounds and sores of animals and man. Most of them look like large house-flies, sometimes bright with metallic blue or green, or gray

[illegible] with which these flies find and [illegible] their living [illegible] is regarded as an evidence that they are under the control of an impulse of a chemical character rather than merely following a sense of smell.

Fleshly School, The. See DECADENTS.

Fletch'er, Alice Cunningham, American ethnologist: b. Boston, Mass., 1845. She is the originator of the scheme by which loans are made to Indians in order that they may buy lands and build houses. She is now employed in the management of the Peabody Museum of American Archæology and Ethnology, and is the author of 'Indian Story and Song from North America' (1900).

Fletcher, Andrew, of Saltoun, Scottish political writer and patriot: b. Saltoun, Haddingtonshire, 1653; d. London, September 1716. Having distinguished himself in opposition to the court he deemed it prudent to retire to Holland; and on his non-appearance to a summons from the lords in council he was outlawed. In 1685 he joined the enterprise of the Duke of Monmouth. He subsequently joined the Scottish refugees in Holland, and when the revolution of 1688 took place returned to England with William of Orange, resumed possession of his estate, and became a member of the convention for settling the new government in Scotland. In 1698 he printed 'A Discourse on Government in Relation to Militias'; and also, 'Two Discourses Concerning the Affairs of Scotland.' His tracts and some of his speeches appeared in one volume, entitled: 'The Political Works of Andrew Fletcher, Esq.' (1737). Consult Omond, 'Fletcher of Saltoun' (1897).

Fletcher, Benjamin, English colonial governor. He was appointed by William and Mary in 1692, after serving during the war in the Low Countries, as well as in Ireland. When William Penn was for a time deprived of his proprietary rights he acted as governor in Pennsylvania (1693–4). He was at last forced to resign from his post in New York, and many charges were made against him. Consult: Wilson, 'Memorial History of the City of New York' (1892).

Fletcher, Giles, English poet: b. Watford, Hertfordshire, about 1549; d. London March 1611. He was ambassador to Russia in 1588, but his description of that country, 'Of the Russe Common Wealth,' appearing in 1591, was suppressed. It was reprinted for the Hakluyt Society 1856. He also wrote 'Licia: Poems of Love' (1593).

Fletcher, Giles, English poet: b. about 1588; d. 1623. He was a son of Giles Fletcher the elder, and wrote the poem, 'Christ's Victory' (1610). A new edition appeared in 1824.

Fletcher, James Cooley, American clergyman and author: b. Indianapolis, Ind., 1823. Between 1851 and 1865 he traveled widely as a missionary in Brazil, and was at one time secretary to the United States legation at Rio de Janeiro. In 1869–73 he was consul at Oporto, Portugal, later was a missionary in Naples, Italy, and from 1877 was resident at Indianapolis. His 'Brazil and the Brazilians,' early editions of which contain the name of D. P. Kidder as associate author, was long the authoritative English work on the subject.

Fletcher, John. See BEAUMONT, FRANCIS, AND FLETCHER, JOHN.

Fletcher, Joseph Smith, English journalist and novelist: b. Halifax, Yorkshire, 1863. He has written extensively for newspapers under the pseudonym "A SON OF THE SOIL," as well as novels and collections of short stories which have been very popular, and several of which have been widely read in the United States. His published books include: 'Anima Christi' (1884); 'When Charles the First was King' (1892); 'Poems' (1892); 'The Quarry Farm' (1893); 'The Wonderful Wapentake' (1894); 'Where Highways Cross' (1895); 'Mistress Spitfire' (1896); 'Ballads of Revolt' (1896); 'Life in Arcadia' (1896); 'At the Gate of the Fold' (1896); 'God's Failures' (1897); 'The Making of Matthias' (1897); 'The Builders' (1897); 'The Paths of the Prudent' (1899); 'From the Broad Acres' (1899); 'Morrison's Machine' (1900); 'The Harvesters' (1900); 'A Picturesque History of Yorkshire' (1899–1900); 'The Three Days' Terror'; 'The Golden Spur' (1901); 'Bonds of Steel'; 'The Investigators' (1902); 'In the Days of Drake'; 'At the Blue Bell Inn.'

Fletcher, Julia Constance (pseudonym "GEORGE FLEMING"), American novelist; b. Rio Janeiro, Brazil, 1858. She is a daughter of James Cooley Fletcher (q.v.). She has resided for years in Italy and in London. Her novels are: 'Kismet' (1877); 'Mirage' (1878); 'The Head of the Medusa' (1880); 'Andromeda' (1885); 'The Truth about Clement Ker' (1889); 'For Plain Women Only' (1895); and 'Little Stories about Women' (1897). She has also written the plays: 'Mrs. Lessingham' (1894); 'A Man and His Wife' (1897); 'The Canary' (1899); 'The Fantasticks' (1900).

Fletcher, Lazarus, English mineralogist: b. Salford, England, 3 March 1854. He was educated at Balliol College, Oxford, and has been keeper of minerals in the British Museum from 1880. He has published: 'Introduction to the Study of Meteorites' (1881); 'Introduction to the Study of Minerals' (1884); 'The Optical Indicatrix' (1892); 'Introduction to the Study of Rocks' (1895).

Fletcher, Phineas, English poet: b. Cranbrook, Kent, April 1582; d. about 1650. He was a son of Giles Fletcher the elder and a cousin of John Fletcher (q.v.). He was the author of 'Sicilides,' a pastoral drama (1614); 'The Purple Island and Piscatory Eclogues' (1633). 'The Purple Island' is an allegorical description of man, founded upon an allegory in the ninth canto of the second book of the 'Faerie Queene.' It is composed in the Spenserian manner, and is not without passages of strong fancy and beauty of description. In the first five cantos, however, the reader loses the poet in

the anatomist — a character but little adapted to the handling of poetry. When, however, he steps from the physical to the intellectual man, he not only attracts, but secures attention by a profusion of images, many of which are distinguished by much boldness of conception and brilliancy of coloring. The 'Piscatory Eclogues' have considerable sweetness of versification, and much descriptive elegance. Milton was indebted to both Phineas and his brother Giles, different passages of the 'Paradise Lost' and 'Paradise Regained.'

Fletcher, Robert, American surgeon: b. Bristol, England, 1823. He was graduated at the Royal College of Surgeons 1841; came to the United States, and was surgeon of an Ohio regiment during the Civil War. He afterward became principal assistant librarian of the surgeon-general's office at Washington, D. C., and professor of medical jurisprudence in the Columbian University. He has published: 'Paul Broca and the French School of Anthropology' (1882); 'Human Proportion in Art and Anthropometry' (1883); 'The New School of Criminal Anthropology' (1891); 'Scopelism' (1897).

Fletcher, Robert Howe, American soldier and author: b. Cincinnati, Ohio, 21 July 1850. He entered the United States Naval Academy at 17, and at graduation was transferred to the army where he served on the Indian frontier and in California till 1886. Since 1898 he has been curator of the Mark Hopkins Institute of Art at San Francisco. He has published: 'A Blind Bargain'; 'The Johnstown Stage'; 'Marjorie and Her Papa.'

Fletcher, William Isaac, American librarian: b. Burlington, Vt., 28 April 1844. He has been librarian of Amherst College from 1883 and is the author of 'Public Libraries in America' (1895); and was joint editor of 'Poole's Index to Periodical Literature.' He has also edited continuations of the latter (1882–1900); the 'A. L. A. Index to General Literature' (1893); and the 'Co-operative Index to Periodicals' (1883–91).

Fleur-de-lis, flėr-dė-lē, an heraldic emblem probably derived from the iris-plant. Some of the great families of France (most of whom are now extinct) bore the emblem on their shields from the very commencement of the practice of blazoning, and a large number of families in Germany, Sweden, Switzerland, and other parts of Europe have borne the fleurs-de-lis on their coats of arms from the 12th century. The great popularity of this emblem in France dates from the 13th century. The royal coat of arms of France consisted of three golden lilies on a blue ground, with the device, '*Lilia neque nent neque laborant.*' The shield of France was anciently, in heraldic language, *semé de fleurs-de-lis*, that is, bore this emblem scattered over the shield. It is commonly believed that it was Charles V. (1364–80) who reduced the number to three; but this is disproved by the fact that two seals have been preserved, the one belonging to Philip the Fair (1285–1314), the other belonging to Philip of Valois (1328–50), both of which bear three fleurs-de-lis; and the town library of Rouen contains a collection of charts relating to the celebrated abbey of Savigny, to one of which, bearing the date 1212, a seal is attached, which is still in a state of perfect preservation, representing three fleurs-de-lis exactly similar to those used on the shield of France. Hence it appears that the use of this emblem in a triple form is much more ancient than is usually thought. See HERALDRY.

Fleurus, flė-rüs, a town in Belgium, province of Hainaut, seven miles northeast of Charleroi. It has manufactures of coarse woolens and flax, with some tanneries and salt-works, and a trade in agricultural produce. In the vicinity, in August 1622, the Spaniards under Gonzales defeated the army commanded by Ernst von Mansfeld; 1 July 1690, the French under Marshal Luxembourg defeated the Germans under Prince Waldeck; and 26 June 1794, the French republican forces under Marshal Jourdan defeated the Austrian army. The battle of Ligny, also, is sometimes known as the battle of Fleurus, Ligny being only about two miles from Fleurus. Pop. (1901) 6,264.

Fleury, André, Hercule de, äṅ-drā ãr-cül dė flė-rē, a cardinal and prime minister of France under Louis XV.: b. Lodève, Languedoc, France, in 1653; d. 29 Jan. 1743. Coming to court, he won general favor by his pleasing person and fine understanding; became bishop of Fréjus; and, through the interest of Madame Maintenon, was appointed instructor to Louis XV. In 1726 he was made cardinal, placed at the head of the ministry, and from his 73d to his 90th year he administered the affairs of his country with great success.

Fleury, Claude, clōd, French Church historian: b. Paris, France, 6 Dec. 1640; d. there 14 July 1723. His learning and unaffected simplicity made him a notable figure at the court of Louis XIV., and later at that of Louis XV., whose confessor he became. An 'Ecclesiastical History' (1691–1720) forms his claim to enduring renown; the work coming down to 1414, at which point a later writer has attempted, though not sympathetically, to round out the master's performance. 'A History of French Law' (1674) and a 'Historical Catechism' (1679) are less important achievements.

Fleury, Maurice de, mō-rēs dė, French physician: b. Bordeaux 1860. He studied under his father at Bordeaux, and practised in the hospitals there and at Paris. His specialties are nervous complaints and the physical and intellectual training of children, so as to produce a sound mind in a sound body. He has published many valuable contributions to the subjects of his special study. Such are: 'Contribution à l'étude de l'hysterie senile' (1890); 'Traitement rationnel de la neurasthénie' (1894); 'Pathogénie de l'épuisement nerveux' (1806); 'Introduction à la médecine de l'esprit' (1897); 'L'âme du criminel' (1899); and 'Le corps et l'âme de l'enfant' (1899).

Fleury-Husson, Jules. See CHAMPFLEURY.

Flexibility, in physics, the property which all bodies possess to a greater or less degree, and which is evinced in their disposition to yield or change their form in a direction at right angles to their length, through their own weight or by means of any pressure or strain applied to them. Pieces of the same material differ from each other in the degree of flexibility they exhibit in proportion to their length and thickness. See PHYSICS.

Flexner, Simon, American path[illegible]: b. [illegible] M. D. in 1889. He then became a post-graduate student at [illegible]ently pursued his pathological studies at the Uni[illegible] and has [illegible] year last named. He [illegible] Chemical [illegible] and pathologist at [illegible] Hospital and Philadelphia Hospital [illegible] 1903. His ability was further recog[illegible] of the R[illegible] of Research in New York, [illegible] study of the [illegible] Among his publications are: '[illegible] Albumin Intoxication'; '[illegible]'; 'The Bacillus Pyogenes [illegible]'; '[illegible] of Dysentery'; '[illegible] Infections'; 'Experimental Pancreatitis'; 'The Nature of Snake Venoms,' and many other papers and monographs relating to [illegible]al and pathological subjects.

Flexure, in mechanics, is a species of strain in which a solid body is distorted so that certain of its original planes become converted into cylindrical or conical surfaces. The term is [illegible]nly used in connection with beams, where it signifies the elastic yield of the beam under the influence of its load. When a beam is supported at both ends and loaded in the middle, it sags in such a manner that its originally [illegible] longitudinal fibres become curved into approximately circular arcs. The radius of [illegible] very large, of course, in practical [illegible], where the beams are composed of [illegible]. In a beam that is supported and [illegible] above, the upper fibres of the beam are in compression, and the lower ones in [illegible]. The compressive strains in the upper parts, and the tensile strains in the lower parts, decrease toward the middle of the beam, and somewhere about the middle there is a sur[illegible] "neutral surface," or "neutral [illegible], on which there is neither tension nor compression. The flexure of such a beam is measured by the depression of its centre under the [illegible] load; this depression being [illegible]l to the product of the load by the cube of the length of the beam between supports, and inversely proportional to the continued product of the horizontal thickness of the beam, multiplied by the cube of its vertical [illegible] the value of Young's modu[illegible] which the beam is made. (See [illegible]; [illegible] OF MATERIALS.) Consult also, [illegible], '[illegible]ful Rules and Ta[illegible].'

Flick, Lawrence F., American pathologist: b. [illegible], Pa., 10 Aug. 18[illegible]. He [illegible] Benedictine College near [illegible] graduated in medicine at Jefferson Medical College, Philadelphia, in 1879. He [illegible] specialty and early in [illegible] a movement for the prevention of this disease. In June 1888, he read a paper upon the contagiousness of phthisis [illegible] of the State of Pennsylvania, showing that houses which had been occupied by consumptives gave the disease to subsequent occupants, and that the malady was essentially a contact disease. He [illegible]ntly published many monographs upon this topic, and 1890 started a movement for the [illegible]lishment of consumption hospitals which culminated in the founding of the Rush Hospital [illegible] of the chest. In 1892 he founded the Pennsylvania Society for the Prevention of Tuberculosis, of which he was president for some years. In 1895 he helped to found the Free Hospital for Poor Consumptives and was elected its president. In 1903 he was entrusted with the establishment of the Henry Phipps Institute for the Study, Treatment and Prevention of Tuberculosis and was appointed its medical director.

Flick'el, Paul, powl, German artist: b. Berlin 8 April 1852. He studied three years in the Art School at Weimar, and in 1874 went to Düsseldorf and in a year began his career as a landscape painter. He traveled for the sake of studying art in Germany and Austria. In 1877 he continued his wandering in Italy and on the spot painted many pictures, such as 'The View of Naples from Capo di Monte'; 'Garden at Monte Carlo'; 'Fountain of the Villa Borghese,' scenes in which he showed a skilful management of bright sunlight effect, and complete mastery in handling the luxuriant vegetation of the south. His pictures of mountain forest scenery in Austria attracted notice and his 'Beech Forest,' which was based on studies made near Prerau, Moravia, gained for him the "Great Gold Medal" at the Berlin exhibition of 1880.

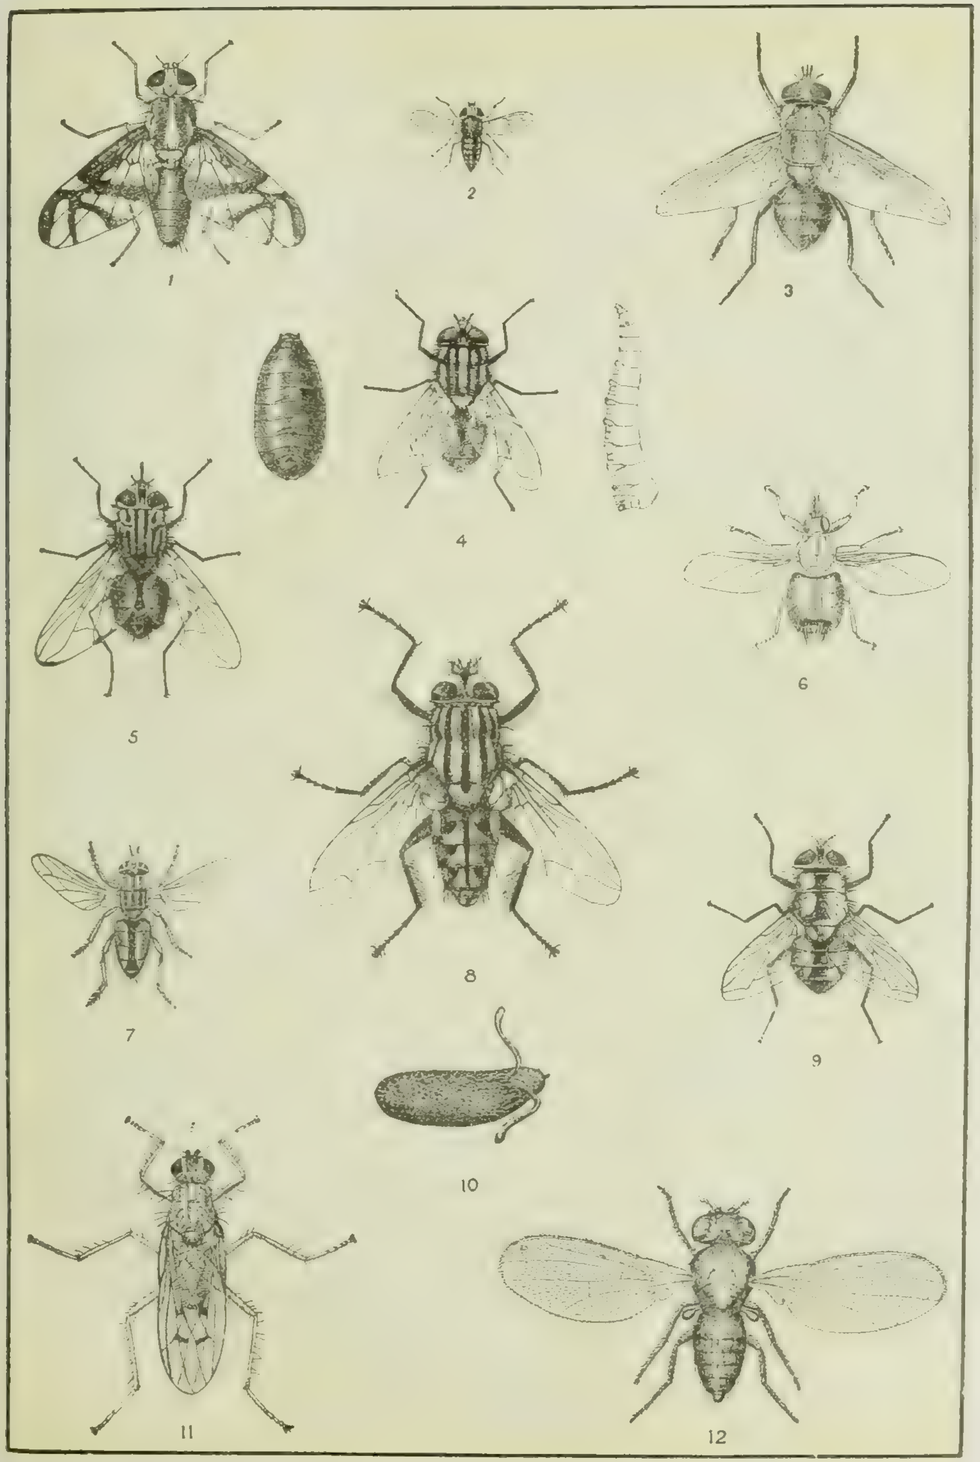
Flicker, one of the many local names of the North American golden-winged woodpecker (*Colaptes auratus*). This name, derived from one of the bird's characteristic calls, is coming into far more general use than formerly. A description of the bird will be found under WOODPECKER.

Flick'inger, Daniel Kumler, American bishop of the denomination of United Brethren: b. Sevenmile, Ohio, 25 May 1824. In 1857-85 he was corresponding secretary of the United Brethren Missionary Society, in 1885 became foreign missionary bishop, and in that capacity made 12 journeys in Africa. His publications, besides a volume of sermons, include: 'Off-Hand Sketches in Africa'; 'Ethiopia'; 'The Church's Marching Orders'; 'Our Missionary Work.'

Fliedner, Theodor, tā'ō-dōr flēd'nĕr, German Lutheran clergyman: b. Eppstein, Nassau, Germany, 21 Jan. 1800; d. Kaiserswerth 4 Oct. 1864. He became pastor in Kaiserswerth 1822. He gradually amassed in this poor parish an endowment fund for a church, school and poorhouse. In 1833 he founded an asylum for released female convicts, and in 1835 an infant school, at Düsseldorf, the earliest in Germany; a similar institution was organized by him at Kaiserswerth, the year following. In the same year he founded the Deaconesses' association, which was his greatest and most notable work. Among his writings, which are principally devotional and educational, may be mentioned 'Das Buch der Martyrer.'

Flies, two-winged insects of the order *Diptera* (q.v.), whose larvæ are legless, soft, and cruciform, and are termed "maggots." The

HOUSE, STABLE, AND GARDEN FLIES.



1. Apple-worm Fly. 2. Orange-belted Gadfly. 3. Horn-fly. 4. Common House-fly, with maggot and puparium. 5. Stable-fly. 6. Forest-fly or Bird-tick. 7. Meat-fly. 8. American Flesh-fly. 9. Green-bottle Flesh-fly. 10. Egg of Pomace-fly. 11. Dung-fly. 12. Pomace-fly.

group is world-wide in its distribution, and probably quite as numerous as either the beetles, or the group of wasps, bees, ants, etc. It is now known to contain about 40,000 species, most of which are incalculably numerous in individuals; so that "swarms" of flies is a proverbial expression. Entomologists believe that 8 or 10 times 40,000 species really exist. This vast abundance is due to the plenitude of their food, and to their fecundity; and it is accompanied by a very high state of organization, so that certain families of flies are held by some students to stand at the head of the insect tribe in specialization of structure. Intellectually, however, they are far behind the *Hymenoptera;* and to this fact, to the small size and unattractive appearance of most specimens (although great brilliance of color is to be found among some families), and to the comparatively uniform and uninteresting nature of their metamorphoses, are to be charged the relatively small amount of study that has been given to the group. The life-history of the ordinary flies is detailed below; but many peculiarities exist in other families of the order. "With some," says Howard, "no eggs are laid, and living larvæ issue from the body of the female. Such flies then become practically viviparous or 'larviparous.' With others, although these are few in number, the development within the body of the female goes even farther, and when the insect emerges from the body of its mother it is already in the pupal condition. Such forms are called 'pupiparous.' . . . Many species — comprising, in fact, whole families — are aquatic or subaquatic in their early stages, and some possess the faculty of living under what appear to be most disadvantageous conditions." Some of the flies of the family *Ephydridæ* (whose eggs or larvæ are eaten by American Indians,— see AHUATLE; KOO-CHAH-BEE) live in the strongly alkaline lakes of the Far West where little else can exist.

Flies are mainly day-flies, and fond of sunshine, but some appear only at night or in the dusk; a section of the tribe does not fly at all, being wingless and parasitic. They live in the most diverse manner; some attack large animals and suck their blood; some prey on smaller insects; some suck honey, and in search of it take part in the cross-fertilization of flowers (see FLOWERS AND INSECTS); and many find their food in decaying animal and vegetable matter. A large number of dipterous larvæ eat refuse or carrion,— whence arise serious evils to mankind,— others feed inside growing vegetables; and some maggots prey, or are parasitic upon, other animals.

A type of the group is found in the house-fly (*Musca domestica*), which represents the great family *Muscidæ*, in which most of the familiar flies about houses and stables are included, and its life-history represents that of its kind generally. Its eggs are laid preferably on horse-manure, but also on human or other excrement, decaying vegetables, etc., and hatch in six or eight hours, producing white maggots. These mature in four or five days, when their skins harden and turn brown, forming a puparium, or case, within which the true pupa forms, and five days later gives birth to a perfected fly. Thus a total life cycle requires in midsummer only about 10 days, and a dozen generations may thus be born in warm climates within a single season. As each fly deposits on the average 120 eggs, and as the maggots of 1,200 house-flies may be sustained by a pound of manure, the possible rapidity of their multiplication is apparent. Most flies live but a few weeks, and toward the end of the season they die with great rapidity, becoming infested with reddish mites, which suck their juices, or with fatal fungous diseases (see FUNGI). In warm houses a few may survive a winter, but as a rule all adult flies die in the fall, and the species survives and recovers in the spring from the eggs or pupa left over winter in the manure-heap or other feeding-place. It is plain that attempts to mitigate the annoyance and danger resulting from many flies may best be directed toward the destruction of their eggs and young. That such destruction is desirable and the duty of society is plain when one considers the vast amount of injury these insects may do. Many sorts attack vegetables and fruit, for example the hessian-fly, which is perhaps the most destructive insect in the United States, the apple-fly, the gall-flies, fruit-midges, potato-scab gnat, and others. Others harm domestic animals, as the bot-flies, sheep-ticks, horn-flies, tsetse, and all the horse-flies, bee-killing robber-flies and bee-flies, black-flies, mosquitoes, and many more. This catalogue of harmfulness (to which can be opposed only the beneficial work done by the tachina-flies which cause the death, by parasitism, of other kinds of injurious insects) becomes of small importance, however, beside the enormous evil flies do in spreading virulent diseases from man to man and place to place. Were this not so it might be true, as formerly alleged, that their services as scavengers, as parasites, and in the cross-fertilization of plants, balanced the damage caused by some, and left something to their credit.

Flies as Carriers of Disease.— Consideration of the habits of house-flies and their relatives will show how prone they are to feed upon excrementitious matter, and to be attracted to any decaying or purulent substance. When this is the product of wounds, sores or diseased bodies it is likely to contain the germs of disease; and these may be sucked into the blood or cling to the body of the insect. If, then, the fly alights upon a human being or a susceptible animal, and punctures the skin with its sucking proboscis (for ordinary flies do not "bite," properly speaking), it is likely to leave in the puncture some of the germs it has fed upon, and so infect the person with the disease to which they give rise. Wounds may thus be inoculated with "blood-poison"; and certain diseases, grouped as "myiasis" may arise from taking into the stomach, in eating spoiled vegetables, minute flies (*Anthomyia*) breeding in them. Even vegetable diseases may be so transmitted, as is the case with the "scab" of potatoes, which, according to Hopkins, is spread from plant to plant by the visits of a fungus-gnat (*Epidapus scabiei*).

That this theoretical transmission of disease actually occurred has been demonstrated since the latter part of the 19th century by observation and experiment. It was first ascertained of certain mosquitoes, whose responsibility for much if not all of the malaria from which men suffer was shown. This may be found more fully treated under Mosquitoes (q.v.), where the agency of these small ubiquitous flies in spread-

ing other diseases is also shown. Dr. Joseph Leidy attributed the spread of gangrene in the hospitals at Washington during the Civil War to the flies; a few years later it was shown that gad-flies which had settled upon the body of cattle affected with anthrax would communicate the disease to healthy kine. In 1888 an Italian investigator showed that flies fed upon a bacillus culture would drop virulent bacilli in their ordure, capable of infecting new cultures; further experiments in India showed that flies fed with a culture of the bacilli of bubonic plague and of Asiatic cholera survived and conveyed the plague to man. An English physician asserted that typhoid fever was spread by insects; and this was abundantly proved during the prevalence of that disease in the military camps during the Spanish-American war of 1898. Flies which have access to the excreta of patients and afterward alight upon food, so infect the food that whoever eats it is in danger of taking ill with the fever. Howard demonstrated that the common house-fly was the principal agent in this transmission. Subsequent investigations showed that the danger of the propagation by flies (and other household insects) was equally great in diphtheria and yellow fever. In another series of cases, as among mosquitoes, the fly acts as intermediary host for disease germs which develop in its blood to the point where they are virulent when introduced into the circulation of man or beast. Such is the case with the African tsetse fly (q.v.), which transmits a greatly dreaded cattle-disease. The purulent ophthalmia, known as "pink-eye," and particularly prevalent in the South, is facilitated by minute gnats of the genus *Hippelates*.

Dr. L. O. Howard, of the United States Department of Agriculture, has given special attention to this matter, and has found that no less than 77 species of flies frequent human excrement and are therefore liable to obtain and carry disease germs. As the innumerable insects themselves are beyond reach, the measures for protection must be preventive. Dr. Howard says that in order to avoid epidemics of typhoid fever it is necessary to abolish the box privy, prevalent in rural and village districts, and substitute earth-closets, where water-closets cannot be installed; to place stable manure in receptacles and treat it with chloride of lime to destroy the maggots, throwing a shovelful over each day's addition. Pantries, dining-rooms and kitchens should be carefully screened to keep out flies; and especial pains taken in summer to keep flies out of sick-rooms. Detailed instructions and the reasons for them are given by Howard in his pamphlet, 'How Insects Affect Health in Rural Districts,' issued as Farmers' Bulletin 155, by the United States Department of Agriculture.

Classification.— The classification of the *Diptera* has proved difficult. An early division was based on the structure of the antennæ: *Nemocera* — those having the antennæ thread-like and with 6 to 30 joints, and *Brachycera*, those with the antenna three-jointed and bristle-like. A later and more widely accepted subdivision was based upon the way the pupa escapes on emergence of the fly: in the *Orthorapha*, the pupæ escape from the larval skin through a T-shaped orifice; in the *Cyclorapha* the pupæ escape through a circular opening at the anterior end. American entomologists, following the special investigations of D. W. Coquillet, now usually divide the order into two sub-orders based upon the character of the mouth-parts, and characterized as follows:

Sub-order Proboscidea.— Antennæ conspicuous, inserted at upper end of the face, sometimes many-jointed, proboscis usually furnished with terminal lips, body rather soft and brittle, legs approximated, wings usually present and frequently furnished with a discal cell; adults oviparous or larviparous, never in all their stages living externally on mammals, birds, or honey-bees.

In this group are placed, in order, the following important families: *Tipulidæ* (crane-flies), *Culicidæ* (mosquitoes), *Cecidomyiidæ* (gall-gnats), *Mycetophilidæ* (fungus-gnats), *Simuliidæ* (black-flies), *Leptidæ* (snipe-flies), *Stratiomyiidæ* (soldier-flies), *Tabanidæ* (horse-flies), *Bombyliidæ* (bee-flies), *Asilidæ* (robber-flies), *Syrphidæ* (syrphus-flies), *Œstridæ* (bot-flies), *Tachinidæ* (tachina-flies), *Sarcophagidæ* (flesh-flies), *Muscidæ* (house-flies), *Anthomyiidæ* (fruit-flies), *Trypetidæ* (fruit-flies), *Ephydridæ* (edible salt-water flies), and *Oscinidæ* (grass-stem flies); besides various less important ones. Each is more particularly described elsewhere in this work.

Sub-order Eproboscidea.— Antennæ usually inconspicuous, commonly inserted near the middle of the sides of the face, and composed of from one to three joints, the apex furnished with a style or bearing several long bristly hairs, proboscis never furnished with terminal lips, body integument tough and leathery, legs on one side of the body usually widely separated from those on the other side, wings, when present, never furnished with a discal cell; adults pupiparous, living externally upon mammals, birds or honey-bees.

This second sub-order comprises only two families, the parasitic bird-ticks (*Hippoboscidæ*) and the bat-ticks (*Nycteribidiidæ*), which owe their vernacular names to their resemblance to true ticks in appearance and habits.

Bibliography.— L. O. Howard's 'Insect Book' (New York 1901) contains the latest and most fully illustrated general account of the flies, and also a large list of books on the subject, especially those relating to systematic description. S. W. Williston has an excellent illustrated account in 'The Standard Natural History,' Vol. II. His 'Manual of American Diptera' (New Haven 1896); Comstock's 'Manual for the Study of Insects' (Ithaca, N. Y., 1895); Packard's 'Half Hours with Insects' and 'Text-Book of Entomology'; and Miall's 'Natural History of Aquatic Insects' (1895), may be consulted with profit.

Flight. Flight, strictly speaking, is progress through the air in any desired direction by an agent or object heavier than the air, as opposed to the floating of an object lighter than the air, such as a balloon. Animals accomplish flight mainly by means of wings, which may be special organs as in the insects, or modified fore legs, as in the case of bats and birds. The wings of insects are always thin membranes supported by a stiffer framework. In bats they consist of extensible membranes stretched over the immensely elongated fingers and joined also to the sides of the body and the hind legs. The wings of birds are composed of long stiffened

REPRESENTATIVE FLIES.

feathers attached to the rudimentary fingers and to the bones of the forearm; the individual feathers overlapping one another so as to form a continuous more or less arched surface. The tail feathers constitute another sail area which plays an important part in flight, while in many bats a continuation of the flight-membrane between the hind legs has much the same function.

Besides these special organs the structure of aërial creatures is modified in many other respects with a view to facilitating flight. Thus the hollow bones of birds are lighter than the solid bones of terrestrial animals and relieve birds of much unnecessary weight; while the general shape of the bird's body and the smooth rounded contour of its feather covering are calculated to give the least possible resistance to the air during flight. Birds are also provided with large distensible air sacs under the skin, the function of which has been a matter of much dispute, but which, as suggested by von Leudenfeld, may aid in shifting the centre of gravity of the body, a matter of the utmost importance to the bird in holding to its course or in turning in flight. The centre of gravity, we may note, is also kept well below the plane of the wings by the distribution of the heavy parts of the body on the pectoral side. So that as the bird flies the heavy breast muscles, which constitute the bulk of its weight, are well down while the wings are attached to the back of the thorax. Thus the body becomes essentially a weight hung directly below an outstretched sail area.

So much for the general structure of flying creatures. Turning now to the principles of flight we have as the main agencies (1) the muscular propulsion on the part of the bird; (2) the support offered to the «sail area» by the air; (3) the force of the wind both in raising and in propelling the bird. Mechanical and physical problems are involved in the study of flight which it will be impossible to consider here, but one or two principles may be mentioned which are of fundamental importance, and the application of which may be seen in all forms of flight. We know that the resistance (that is, support) of the air to a flat surface is greatly increased when the surface is traveling rapidly through the air in its own plane, and it follows that when a bird is once on the wing the buoyancy of the air relative to it is greatly heightened: and having gained a certain momentum it will be possible for the bird to sail some distance without loss of altitude. Again when a flat surface is sailing diagonally through the air the maximum pressure (that is, support) of the air is not under the centre of the surface, but under the forward edge. It is on this principle that we find a tendency to force up the anterior edge of the wings of a sailing bird and in order to counteract it the bird is compelled to shift the centre of gravity of its body farther forward. To do this it may draw the wings back, spread the tail or perhaps extend the head and neck. On the same principle to turn the direction of flight it is merely necessary to flex or raise one wing or one side of the tail. Flight proper may be of two sorts, (1) by flapping the wings, and (2) by soaring. The former is the most familiar and is practised by all birds, while the latter is possible only for birds of large expanse of wing, such as vultures, eagles, gulls, etc.

In taking flight it is very important for the bird to «get a start,» as we say; that is, to acquire some relative velocity, and to accomplish this we often see birds which are about to fly run along the ground for a few steps or flap along the surface of the water, while starting head toward the wind with wings properly spread accomplishes the same result. Rising into still air by flapping is very laborious work and some heavy-bodied birds, as the loons, for instance, are utterly unable to take flight when confined within a small area.

When once in the air and fairly started in flight the wing action is far less laborious than at the start, and the upward stroke is often relative to the body only and not necessarily a muscular effort. When this stroke is active, the individual feathers, as instantaneous photographs show us, are more or less separated to reduce the resistance of the air on the recovery. Most birds mingle flapping and straight sailing in various ways, and when once on the wing flight is mainly a matter of presenting their sail area to the air currents in such a way as to gain the greatest benefit from them.

Soaring is flight in circles with set wings and without any visible muscular action on the part of the bird. In spite of this the bird is able to mount higher and higher in the air, gaining impetus enough on the flight with the wind to carry it above its initial altitude when returning on the other half of the circle against the wind. Many theories have been advanced to explain the «soaring bird,» some of them purely fantastic, but the true solution of the problem seems still to be lacking. Suffice it to say that this method of flight is possible only in the presence of currents of air, and that the unequal velocity of air at different altitudes doubtless has much to do with it.

Aëronauts naturally look to birds for suggestions in artificial flight, and the great superiority which they exhibit over the best flying machine so far constructed may be seen in Prof. Langly's comparison of his aërodrome which has repeatedly flown from a half to three quarters of a mile, with a condor. The machine with a weight of 30 pounds and a supporting area of 54 square feet is driven by an engine of one and a half horsepower, while the bird weighing 17 pounds has a sail area of only 9.85 square feet and a propelling power of but .043 horsepower. Birds vary very much in wing power according to their method of flight; the humming-bird and pigeon being abundantly supplied with wing muscles to maintain their rapid strokes, while the frigate-bird, a notorious «sailer,» is remarkably weak in muscular development. The speed of flying birds also varies greatly. The best flyers of which we have definite record are the carrier pigeons, which travel from 30 to 50 miles an hour, while an albatross, caught and tagged by sailors, was recaptured, according to Lucas, 12 days later, 3,150 miles distant.

Our familiar small birds do not travel at anything like such a rate, but their endurance is very great, as we can realize in view of their migrations, which often reach from the northern United States to equatorial South America, while the small waders travel from one end

of the hemisphere to the other. See MIGRATION.

Flying [illegible] occur among mammals, reptiles and birds. The extinct pterodactyls were [illegible] experts on the wing, and some of them constituted the largest flying animals of which we have any record. Of mammals the bats are the only true fliers, the flying squirrels and lemurs having merely parachute-like expansions of skin on the sides of the body which when the legs are stretched out enable them to sail obliquely downward from the tree tops to the lower branches.

In the flying-fish (q.v.) there is an enormous development of the pectoral fins which simulate wings. Their flight, however, consists only of a short sail through the air on an impetus gained as they leap from the waves with the fins rigidly extended.

Consult: E. J. Marey, 'Vol des Oiseaux' (Paris 1890); Prof. Chas. S. Roy, article 'Flight,' in 'Newton's Dictionary of Birds' (1896); Prof. S. P. Langley, 'The Greatest Flying Creature,' Smithsonian Report 1901.

Flightless Birds. Certain birds are quite unable to fly, or fly very poorly, or use their wings only as paddles or balancers, or in extreme cases have lost not only the use of wings, but the wings themselves have disappeared. Examples of this degeneration will be found treated of in the articles upon APTERYX; DODO; GARE-FOWL; MOA; OSTRICH; PENGUIN; RATITÆ; SOLITAIRE.

Flinch, a card game said to have had its origin in Kalamazoo, Mich., and to have been invented by a man named Flinch. The game is played with a pack of 150 cards, numbered consecutively from 1 to 15, there being 10 cards of each numeral. All are of the same color; there are no hearts, diamonds, clubs or spades, and the court cards, are, of course, also missing. The cards are shuffled, and 10 cards are dealt to each player for his flinch pile, then 5 more to each to play with. Each player must place his flinch stack face up, with only the top card exposed. The other five cards are kept in hand, spread out like a fan to see the numbers, for flinch has not as yet the dignity of indexed-edged cards. The object of the game is to get rid of the flinch pile, and whoever first succeeds wins the game. To this end the flinch pile must be played from whenever possible. When this is not done, the opponent will call "flinch," and the player will have to draw a card from the opponent's flinch pile and place it on the bottom of his own. In case two or more of the opponents call "flinch" at the same time, the negligent player must draw a card from the pack. The game may be played by any number from two to eight. After shuffling, the entire pack is usually stacked up criss-cross into handfuls of five, to facilitate drawing new hands.

Flinck, Govaert, Dutch painter: b. Cleves 25 Jan. 1615; d. Amsterdam 2 Feb. 1660. At Amsterdam, where he took up his permanent residence, he became a pupil of Rembrandt, whose manner and technique he so closely imitated that he comes nearer to the master than any other of his pupils, with the exception of Eeckhout. He was much sought after as a portrait painter, and has also left many religious pictures and a few genres, such as 'The Watchtower,' which is equally Rembrandtesque in subject, conception and treatment.

Flind'ers, Matthew, English navigator: b. Donington, Lincolnshire, England, 10 March 1774; d. London 19 July 1814. He did much toward mapping out the coastline of Australia. In his first voyage of discovery he started in 1795 from Port Jackson, and skirting the southeast coast reached Van Diemen's Land. In a subsequent voyage of discovery, on which he was despatched by the British government with but poor equipment, he sailed along the south coast to Cape Leeuwin, and the bay which now bears his name. He next explored the east coast of Australia, from Port Stephens to Cape Palmentone; threaded the formidable Barrier Reefs, and coasted the Gulf of Carpentaria. Then turning back he made for Europe, by way of Sydney. He was shipwrecked on this voyage and detained by the French in Isle de France for seven years. From the effects of this imprisonment he never recovered. On his arrival home he published 'A History of Terra Australis.' The coast of South Australia was long called after him Flinders Land. His name is still attached to the southernmost county in Eyre Peninsula, and to Flinders Island, off that coast; to the Flinders Range in South Australia, rising near the head of Spencer Gulf, and running north (highest peaks, 3,100 feet); also to a town in Victoria, 61 miles southeast of Melbourne. See Life by Thynne (1896).

Flinders-Petrie, William M. See PETRIE, WILLIAM MATTHEW FLINDERS.

Flindersia (named after Captain Matthew Flinders), a genus of trees of the order *Meliaceæ*, allied to the mahogany, to which, however, it is generally inferior. The trees of this genus are tall, with a correspondingly great diameter, and furnish large quantities of valuable timber. *F. australis*, the Queensland ash, is used in Australia for staves, etc.; *F. oxleyana* is a hardwood tree yielding excellent material for cabinet-work, and also furnishing a yellow dye. The wood of *F. greavesii* is used in house-building, for which it is well adapted by its durability.

Flint, Austin, American physician: b. Petersham, Mass., 30 Oct. 1812; d. New York 13 March 1886. He was graduated at the medical department of Harvard College in 1833. After practising in Northampton, Mass., Boston, and Buffalo, where he established the Buffalo 'Medical Journal' in 1846, he was one of the founders, and for six years a professor, of the Buffalo Medical College. He was a professor in Louisville University 1852-6; professor of pathology in the Long Island College Hospital in 1861-8; president of the New York Academy of Medicine in 1872-5, and of the American Medical Association in 1884. He was the author of numerous text-books, clinical reports and medical papers.

Flint, Austin, American physician, son of the preceding: b. Northampton, Mass., 28 March 1836. He was graduated from the Jefferson Medical College, Philadelphia, 1857, and removing to New York in 1861 became professor of physiology in Bellevue Hospital Medical College, and surgeon general in 1874. He has published 'Text-book of Human Physiology'; 'Physiology of Man'; 'The Source of Muscular

Power'; 'Chemical Examinations of Urine in Disease'; etc.

Flint, Grover (originally **Flint Grover**), American writer: b. New York 27 June 1867. He was graduated at Harvard in 1888 and from 1892-4 served in the United States army as cavalryman. In 1896 he went to Cuba and served with a Cuban insurgent army, and returning to the United States, some months later, married a daughter of John Fiske (q.v.). He served in Cuba in the Spanish-American war and subsequently went to the Philippines as a lieutenant of volunteers. He has published 'Marching With Gomez, With Historical Introduction by John Fiske' (1898).

Flint, Timothy, American author: b. North Reading, Mass., 11 July 1780; d. Salem, Mass., 16 Aug. 1840. He was a Congregational minister during 1812-4; subsequently he devoted himself to editorial work, descriptive writing, and fiction. In these departments his most important work is included in: 'The Geography and History of the Mississippi Valley'; 'Indian Wars in the West'; and 'Francis Berrian'; 'George Mason;' and 'The Shoshone Valley.'

Flint, Weston, American librarian: b. Pike, N. Y., 4 July 1835; d. Washington, D. C., 6 April 1906. He was graduated at Union College in 1860, and at the law department of Columbia University in 1877. He was United States consul to China 1871-4; librarian of the Scientific Library, United States Patent Office, in 1877-87; and was appointed librarian and secretary of the board of trustees of the Public Library in Washington in 1898. His publications include: 'Catalogue of the Library of the United States Patent Office' (1878); 'Catalogue of Additions to the Library of the United States Patent Office, 1878-82'; and 'Statistics of Libraries in the United States, Canada, and Washington' (1893).

Flint, Mich., a city and county-seat of Genesee County, on the Flint River and on the Chicago and Grand T. and the Flint and P. M. R.R.'s; 64 miles northwest of Detroit. Flint has a court-house, the State Institution for the Deaf and Dumb, a private retreat for the insane, a high school, waterworks, gas and electric lights, public library, a national bank, and several daily, weekly, and monthly periodicals. It has a large number of saw-mills, carriage and wagon factories, flour- and woolen-mills, bicycle-works, brewery, etc., and an assessed property valuation of about $13,000,000. Pop. (1901) 13,103.

Flint, or **Flintshire,** North Wales, a maritime county having on the north the Irish Sea and on the east the river Dee and Cheshire, with the county of Denbigh on the west. Its area is 256 square miles, and it is the smallest county in Wales. The low and sandy coast becomes fertile along the estuary of the Dee. A range of hills running parallel to the Dee rises in the highest part to 825 feet. The Carboniferous rocks underlie Flintshire, and the chief minerals are coal, iron, copper, lead, zinc, and limestone. Mining is the principal industry, and there are some manufactures of cotton, pottery, chemicals, etc. The chief towns are Flint, St. Asaph, Mold, Holywell, and Hawarden. Pop. (1901) 81,490.

Flint, Wales, a market town and seaport, in Flintshire, 13 miles southwest of Liverpool. It has a handsome parish church in the Gothic style, erected in 1848. Near the town, on the shore of the estuary, stands the ancient castle of Flint, an object of some historical interest. It was completed by Edward I., and was the prison of Richard II. It has remained in ruins since 1667. Flint is on the Chester and H. R.R. Pop. (1901) 4,624.

Flint, a massive variety of quartz, somewhat resembling chalcedony, but more opaque, and commonly of a gray or smoky-brown color, darker in the interior than on the surface. It occurs abundantly in the United States and in various other parts of the world. In England and France it occurs chiefly in the chalk formations, and a microscopic examination of it often shows the remains of diatoms and other minute organisms, from whose silicious skeletons the silica of the flint was doubtless largely derived. In other cases the flint was probably formed by the replacement of lime by silica held in solution by the ground water. The coloring matter of flint is chiefly carbonaceous matter, with some iron sesquioxide. Flint was used for many ages in the manufacture of stone implements, a use for which it is well adapted by its hardness, and also from the fact that it breaks with a conchoidal fracture, leaving sharp cutting edges. Previous to the invention of matches, flints were greatly used for the production of fire, the flint being struck repeatedly against a piece of steel, from which it detached small particles that were rendered red-hot by the friction. These were caused to fall into a mass of very dry and highly inflammable matter, known as "tinder," which took fire from them as dry grass beside a railroad takes fire from the sparks of passing locomotives. Before the invention of the percussion cap, flints were also used on musket locks, for igniting the powder.

Flint Glass. See Glass.

Flint Implements, tools, weapons, etc., made of silicious or flinty stones; a term particularly denoting implements used by man before the use of metals. See Stone Age.

Flint Mill, (1) In pottery, a mill in which burnt flints, having been previously stamped to reduce them below a certain size, are ground to powder for mixing with clay to form slip for porcelain. The flint-mill is a strong circular pan 10 or 12 feet in diameter, having a bottom of quartz or feldspar blocks, and a runner or runners of hard silicious stone, called chert, lime in any form being inadmissible, as it forms a flux for the other material which would vitrify in the seggars or become blistered by the escape of carbonic acid. (2) In mining, a mode formerly adopted for lighting mines, in which flints studded on the surface of a wheel were made to strike against a steel, the blows producing a quick succession of sparks, which lighted the miner at his work.

Flint River, one of the largest rivers in Georgia, rising near Atlanta and flowing 300 miles to the Gulf. It drains an area of 8,000 square miles.

Flintlock, the old-fashioned lock for firearms, in which the cock held a piece of flint, and came glancing down upon the steel cap of the pan which contained the priming. See Firearms; Musket.

Floating Battery, a vessel strengthened so as to be shot-proof, or as nearly so as possible, and intended for operating in comparatively smooth water, for defending harbors or attacking fortifications. The most notable attempt to make use of floating batteries against maritime fortresses, till the time of the Crimean war, was during the siege of Gibraltar in 1782, when batteries of this description, invented by the Chevalier d'Arçon, were employed at first with considerable effect. On this occasion, however, they turned out in the end a complete failure, being destroyed by the red-hot shot directed against them from the fort. After this failure no more attention was paid to them until Napoleon III suggested the use of floating batteries, protected by iron plates, in attacking the Russian fortresses in the Black Sea and the Baltic. The suggestion was actually carried out, and the floating batteries then constructed proved very effective in 1855, during the operations against Sveaborg and Kinburn, as well as on subsequent occasions.

Floating Bridge. See BRIDGE.

Floating Docks. See DOCKS.

Floating Fern. See *Filicales* (4), under FERNS AND FERN ALLIES.

Floating Gardens. See FLOATING ISLANDS.

Floating Houses, abodes so constructed as to be movable at will upon the surface of a river or other water. Floating houses form whole streets in Bangkok, being anchored in rows and capable of being moved from one position to another. From the depth of water, large vessels of from 200 to 300 tons burden can sail up to this picturesque town and pass alongside the houses of the inhabitants. These floating houses are made of bamboo stems, wicker-work, and palms, with a veranda in front; and they are built on large rafts. See BANGKOK.

Floating Islands, islands formed either by the aggregation of driftwood in rivers and the deposition thereon of soil and vegetable matter, or by the detachment of portions of a river-bank or lake-shore. Tall trees are sometimes seen standing erect on such islands as they are carried down by the river current. Floating islands are sometimes seen 50 or 100 miles distant from the mouth of the large rivers of America, Asia and Africa. Portions of the alluvial soil from river-deltas, held together by the roots of mangroves and other trees, are sometimes detached by hurricanes or typhoons and then swept out to sea; such islands have been met with in the Philippines, in the seas of the East Indies, and in the Pacific. A floating island is mentioned by Herodotus as existing in Egypt. Others were known to Roman writers. Those on Lake Vadimona were, according to the younger Pliny, capable of supporting sheep. Loch Lomond in Scotland long possessed a floating island, which has now, however, disappeared or become attached to one of the stationary islands of the loch. In Ireland large masses of peat float about some of the bogs. In England, in Lake Derwentwater, there is an instance of an island which appears and disappears from time to time in the same spot. Perhaps the most satisfactory of the many theories which have been proposed to account for this phenomenon is that which attributes its rising from the bottom of the lake, where it ordinarily rests, to the permeation of its mass by marsh-gas during hot weather, the upward motion being assisted by the growth of buoyant water-plants on its surface. Between 1696 and 1829, similar islands were observed at irregular intervals, generally, however, after great droughts and violent storms, in Lake Rålang in the Swedish province of Småland. Oceanic floating islands sometimes perform important service in the transportation of vegetable seeds from place to place, also in the distribution of animal species, by carrying insects, land mollusca, and small mammalia, more rarely reptiles. Darwin met with islands floating on Lake Tagua-Cagua in Chile which passed from side to side of the lake and carried cattle and horses as passengers. In Northern India, and on the borders of Tibet, and Persia, floating gardens are often erected by the natives, for the purpose of raising melons, cucumbers, and other similar vegetables and plants, which require a very aqueous soil for their cultivation. These gardens, however, are of a very fragile nature, and rarely exceed a foot in depth of soil, their prime structure being composed of wicker-work, interlaced with reeds and wattles, and covered with matting, over which the earth is placed. In the Vale of Cashmere the lakes contain floating gardens devoted to the same purpose, but these are in reality portions of the marshy ground made to float artificially by cutting through the roots of the reeds and other plants about two feet below the surface. The Chinese, too, devote considerable attention to this style of horticulture, but more by way of ornamentation. Floating gardens, or *chinampas*, also existed in Mexico before the Spanish conquest. Clavigero describes them as formed of wicker-work, the stems of water-plants, and mud, the largest sometimes having on them a tree or a hut. Both flowers and vegetables were grown on them.

Floats. (1) In angling, the quill or cork from which the bait line is suspended, and whose motion indicates the bite of a fish. (2) An inflated bag or pillow to sustain a person in the water. (3) The small piece of ivory on the surface of the mercury in the basin of a barometer. (4) The hollow, metallic ball of a self-acting faucet, which floats on the water in the cistern or boiler. (5) A raft, or collection of timber fastened together for conveyance down a river. (6) In hydraulic engineering, one of the boards or paddles attached to the radial arms of a paddle wheel or water wheel. (7) In machinery, a single-cut file, or one in which the teeth are parallel and unbroken by a second row of crossing teeth. The usual horizontal obliquity of the teeth relatively to the central line of files is 55°, but single-cut files are much less inclined, and the teeth of floats are sometimes square across the face of the file. (8) In plastering, a plasterer's trowel used in spreading or floating the plaster on to a wall or other surface. The long-float is of such a length as to require two men to use it. The hand-float is that in ordinary use. The quirk-float is used in finishing moldings. An angle-float is shaped to fit the angle formed by the walls of a room. (9) In masonry, a polishing-block used in marble working; a runner. (10) In shoe making, the serrated plate used by shoemakers for rasping off the ends of the pegs inside the boot or shoe. (11) In tempering, a contrivance for affording a copious stream of water to the heated

steel surface of an object of large bulk, such as an anvil or die in the process of tempering. The rapid production of steam prevents the constant contact of cold water when the object is merely dipped, as a body of steam intervenes. The dashing stream of water constantly exposes a new body of water to the hot surface, and makes the hardening more complete. (12) Theatrical: A stage name for the footlights, derived from the use of a row of oil-pans, with floating wicks, along the stage-front, previous to the invention of gas.

Float-stone, a variety of opal, or hydrated silica, occurring in concretionary masses of such a porous texture that they float on water. They are of a gray or white color, break with uneven fracture, and sometimes have a hard nucleus of a flinty appearance.

Flodden, flod'n, a village in Northumberland, England, about five miles southeast of Coldstream, near which was fought the celebrated battle in which James IV. of Scotland was defeated by the Earl of Surrey (9 Sept. 1513). See SCOTLAND.

Floe-rat. See SEAL.

Flogging, the infliction of stripes or blows with a whip, lash, or scourge, especially as a judicial punishment. In Britain it long existed as a punishment in the army and navy; but it was totally abolished in the former in 1881, and in the latter it is practically extinct. It was made a punishment for certain violent crimes, such as garrotting, in 1863; and for juvenile offenders in 1847 and 1850. In these cases, however, the number of stripes is limited by law, 50 being the maximum in some instances, 25 in others, and so on. A judge in sentencing a prisoner to flogging must specify the instrument and the number of stripes. In the case of juveniles under 14 years of age the instrument must be a birch rod, and the number of stripes must not exceed 12. The punishment of the knout in Russia and of the bastinado in the East are severe forms of this punishment. In the United States, flogging was discontinued in the navy and on merchant vessels in 1850. In the army, it was abolished 1861. As a means of prison discipline, it has been used till very recently, and its disuse is a subject of debate. For the subject of its use as a legal punishment for certain offenses, see FLAGELLATION; WHIPPING-POST.

Flood, flud, **Henry,** Irish orator and politician: b. near Kilkenny 1732; d. Farmky, county Kilkenny, Ireland, 2 Dec. 1791. He was educated at Trinity College, Dublin, and Christ Church, Oxford, entered the Irish parliament in 1759, and soon became the most prominent and eloquent member of the popular opposition. He was privy councilor for Great Britain as well as for Ireland in 1775, and vice-treasurer for Ireland 1775-81. In 1783 he had a personal dispute in the house with Grattan, when a remarkable display of the power of invective was made on both sides. He afterward became a member of the British Parliament for Winchester and Seaford. His speeches were published in 1787. See Lecky: 'Leaders of Public Opinion in Ireland' (1872).

Flood, Theodore L., American Methodist clergyman: b. Williamsburg, Pa., 20 Feb. 1842. He served in the Federal army in the Civil War, entered the Methodist ministry, and after an active pastorate of 15 years became connected with the Chautauqua movement. He edited the Chautauqua Assembly 'Herald,' which began its monthly issue at Meadville, Pa., in 1877, and became 'The Chautauquan' in 1880. He retired from its editorship and ownership in 1899. He has been active in various denominational and commercial enterprises and was an unsuccessful Republican candidate for Congress in 1892.

Flood Plain, the plain formed by a river in broadening its valley. The first work done by a river is to cut a trench-like valley, this having been cut so deeply that the slope of the river-bed toward the sea so slackens the current of the river that it cannot carry its load of detritus, this detritus is partly dropped. Then the upbuilding of the river channel causes the river current to swing from side to side. In this way first one side, then the other of the valley is attacked by the river. In time of flood the plain of waste thus accumulated may be entirely covered by the swollen river. The flood plain of the Mississippi west of Tennessee is 50 miles wide. See RIVER; VALLEY.

Floods and Inundations are caused by excessive rains, giving rise to an overflow of the rivers; by the bursting of the banks of rivers, lakes, and reservoirs; by the sudden melting of ice and snow; and by irruptions of the sea, produced by high tides, wind-storms driving the sea-water inland, earthquakes, volcanic outbreaks, and the bursting of sea banks. The felling of forest trees throughout extensive tracts of mountainous country also tends to make the rivers which have their origin there swell rapidly after a heavy rainfall; good and complete drainage of land has the same tendency. (For the Noachian flood, see DELUGE.) The subjoined list embraces some of the most disastrous floods and inundations of which we have record.

684 A.D. Japan; 780 sq. m. of Isle of Shikoku covered by sea.
968. Persian Gulf; many cities destroyed and new islands formed by irruption of sea.
1014. Many English seaports destroyed by sea.
1098 or 1100. East of Kent inundated; Goodwin Sands formed.
1100 or 1108. Flanders inundated.
1161 or 1165. Sicily; irruption of sea; thousands drowned.
1170. Holland and Friesland; great flood.
1173. Holland; Zuyder Zee much enlarged.
1219. Nordland, Norway; lake burst; 36,000 people perished.
1228. Friesland; invasion of sea; 100,000 people drowned.
1277. Friesland; the Dollart formed.
1286–7. Holland on both sides of Zuyder Zee inundated in consequence of a storm.
1396. Holland; islands of Texel, Vlieland, and Wieringen separated from mainland, and Marsdiep, the channel between Texel and North Holland, formed.
1421 or 1446. Holland; 72 villages inundated, of which 20 permanently, about 100,000 persons drowned, Biebosch formed east of Dordrecht, and this town separated from mainland.
1521. Holland; 100,000 lives lost by an inundation.
1570. Holland; storm drove in the sea, destroying numerous villages and 20,000 people in Friesland.
1617. Catalonia, Spain; 15,000 perished in floods.
1629. Mexico (city) inundated.
1642. China, at Kaifong; 300,000 drowned.
1646. Holland and Friesland inundated; loss of life, 110,000.
1726. Floods and inundations all over Europe.
1745. Peru; Callao destroyed by irruption of sea caused by earthquakes.
1767. England; irruption of sea on east coast.

[illegible] submerged, and [illegible]
1787–8. India, in Northwestern Provinces and Punjab; [illegible]
[illegible]
[illegible]
1813. [illegible] in Po [illegible]
[illegible]
[illegible] submerged [illegible]
[illegible]
[illegible] banks, [illegible]
[illegible] Belgium to Swit- [illegible]
[illegible] floods did damage to extent [illegible],000.
[illegible] and Iquique nearly destroyed by earthquake wave[illegible]
[illegible] River valley (Mass.) inundated [illegible] a dam; 144 drowned. [illegible] floods in western Pennsylvania, [illegible]
1875. Disastrous floods throughout central Eur[illegible], in [illegible], India, and West Indies.
1876. China floods in northern provinces; in Bengal [illegible] persons perished from inundation of a tidal wave.
1883. Java and Sumatra; parts submerged by volcanic wave. (See Krak[illegible])
1887. China; the Hoang-ho in Ho-nan; millions of lives lost.
1880. Johnstown, Pa.; reservoir burst; 2,209 lives lost.
[illegible] lives lost.
[illegible]; great destruction of property.
[illegible] 27,000 lives lost
[illegible],000 lives lost and 3,000 buildings [illegible]
1903. Kansas City, Mo., and Mississippi River towns; [illegible] of dollars in property destroyed; few lives lost.
1903. Heppner, Oregon; cloudburst; 300 lives lost.

Floor. (1) In building, the surface on which a person walks in a room or house. It may be of masonry, bricks, tiles, concrete, earth, boards. The term usually refers to boards laid close together and nailed to timbers which are termed joists. (2) In geology and archæology, the part of a cavern corresponding in situation to the floor of a house. Here frequently there is new cave earth, covered, and therefore hermetically sealed for the purpose of the investigator, by stalagmite, which has been formed by droppings from the stalactites hanging from the roof. (3) As a nautical term, the bottom part of the hold on each side of the keelson; the flat portion of a vessel's hold. (4) In hydraulic engineering, the inner piece of the two which together form the bucket of an overshot water wheel. (5) In mining, the bottom of a coal seam, the underlay on which the coal, lead, or [illegible] rests. (6) To take the floor: To rise to address a public meeting; also to stand up to dance (Irish).

Floor-cloth, or Oil-cloth. The basis of floor-cloth is a [illegible] canvas, woven of flax, with a slight admixture of hemp. Owing to its great width, 6 to 8 yards, it has to be woven in special looms. It is made in lengths of from [illegible] yards. A length of [illegible] feet is stretched in a frame, brushed with glue-size, and rubbed with pumice-stones. It then receives two or three [illegible] coats of paint on each side. [illegible] commonly made of linseed oil and ochre, and is laid on with a trowel. Each coat on the front is smoothed with pumice-stone. When this operation is completed the cloth is transferred to the printing-room, where the pattern is printed by blocks, as in calico printing. There is a block for each color.

Floquet, Charles Thomas, sharl tō-mä [illegible], French statesman: b. St. Jean de Luz [illegible] Oct. 1828; d. Paris 18 Jan. 1896. He began life as a lawyer in Paris, where he defended the Republican journalists. On the fall of the empire he was appointed one of the deputy mayors of Paris, but was forced to resign on account of his complaisance toward the Red Republicans. Later he was elected to the Paris municipal council and in 1876 became one of the deputies for Paris. He sat in the Chamber till 1882, when he was appointed Prefect of the Seine; re-entered the Chamber in 1882 and was elected its president in 1885, but resigned in April 1888, to become prime minister. In 1889 he was again elected president of the Chamber. He aspired to the presidency of the republic, for which office he was the Radical candidate in 1887; but his career was cut short by the Panama Canal scandal, and he lost his seat in the elections of 1893.

Floquet, Pierre Amable, pē-ār ä-mäbl, French historian: b. Rouen, France, 9 July 1797; d. Formentin 6 Aug. 1881. He made Normandy's annals and personages the objects of his painstaking study in 'Norman Anecdotes'; 'History of the Parliament of Normandy' (1840-3); and 'Studies in the Life of Bossuet' (1855), the last two of which were crowned by the Academy.

Flo'ra, the Roman goddess of flowers and spring, whose worship was established at Rome in the earliest times. She is represented as a beautiful female, with a wreath of flowers on her head or in her left hand; in her right hand she generally holds a cornucopia. Her temple at Rome was situated near the Circus Maximus, and her festival, the Floralia, was celebrated from 28 April to 1 May. The later Romans identified Flora with the Greek goddess Chloris. In botany Flora signifies the plants of a region collectively, as Fauna signifies the animals. In astronomy an asteroid discovered by Hind, 18 Oct. 1847.

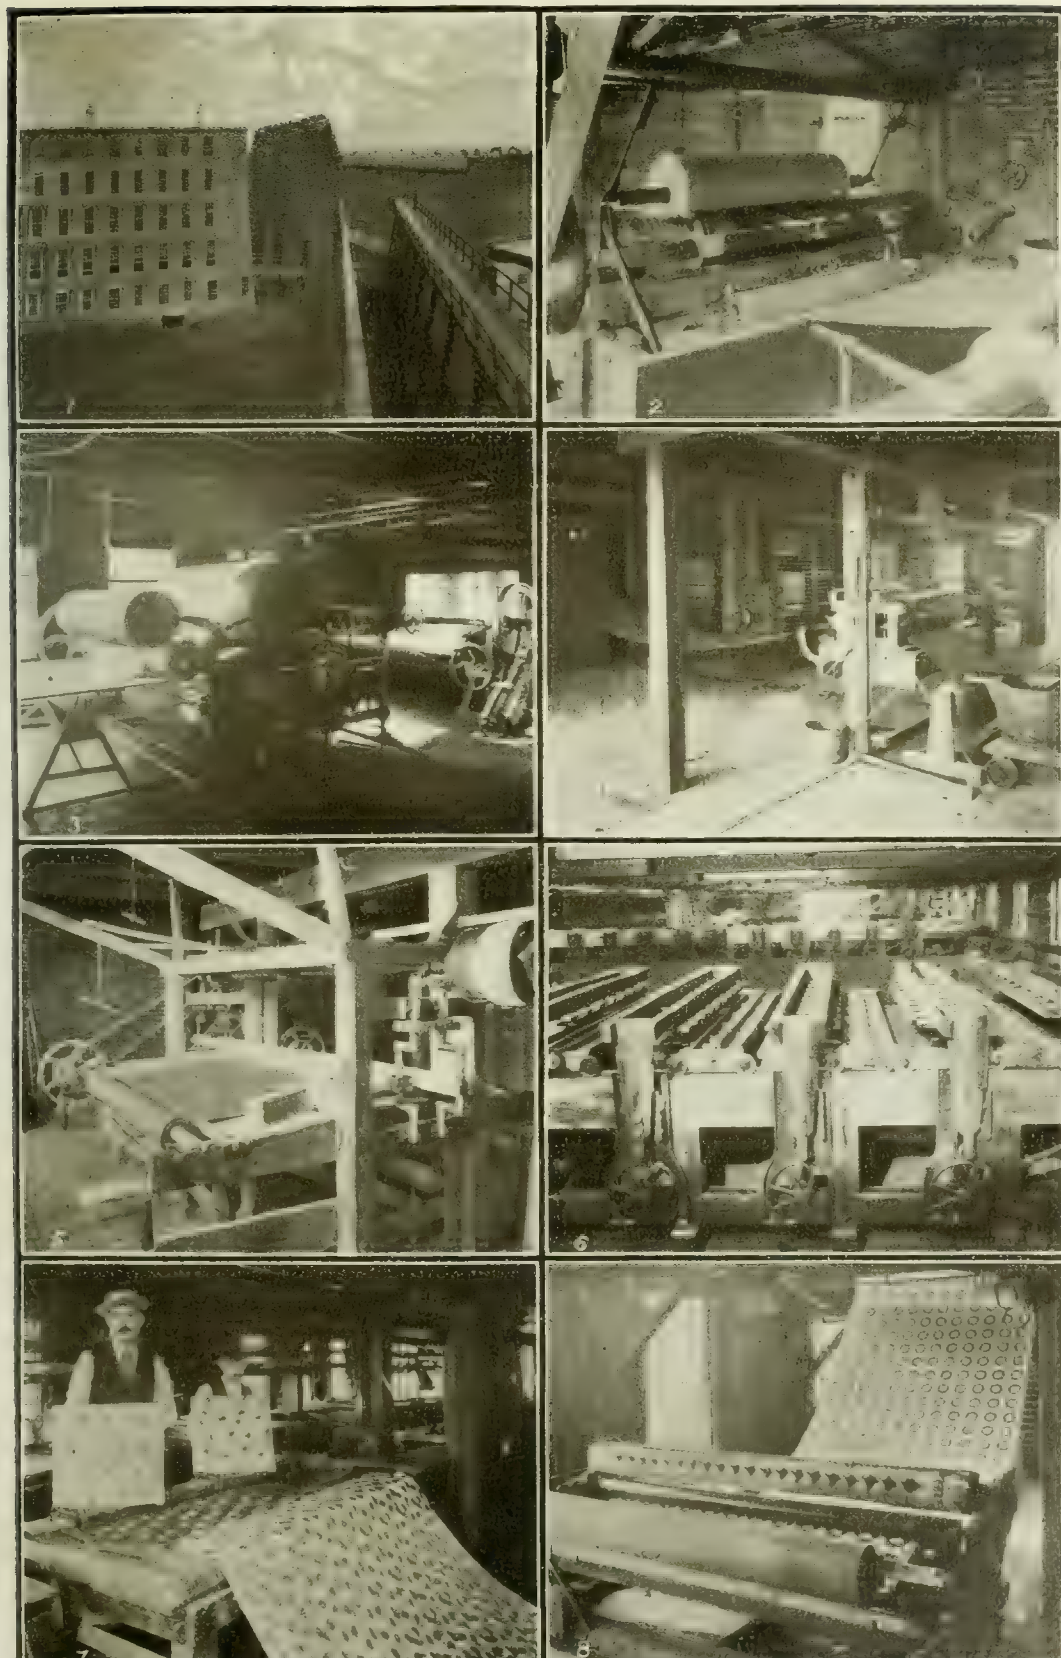
Flore'al, flō-rā-äl ("month of flowers"), the eighth month in the calendar of the first French republic (1794). It began 20 April and ended 20 May. See CALENDAR.

Flor'ence, William Jermyn (stage name of BERNARD CONLIN), American comedian: b. Albany, N. Y., 1831; d. Philadelphia, Pa., 1891. He began his career as an actor at Brougham's Lyceum, N. Y., in 1850, and soon became a great favorite with the public, especially in such characters as 'Bob Brierly'; 'Sir Lucius O'Trigger,' which latter he played to Joseph Jefferson's 'Bob Acres' with great success in a series of joint performances during the last two years of his life. He was the author of several Yankee and Irish plays.

Florence of Worcester, English chronicler: d. 1118. He was a monk of Worcester, wrote 'Chronicon and Chronicis,' a compilation from Marianus, an Irish monastic chronicler, which is of the highest authority in early British and Irish history.

Florence, Ala., a city and county-seat of Lauderdale County, on the Tennessee river, and on the Memphis and C., the Louisville, and the

MANUFACTURE OF OIL-CLOTH.



1. Fire Wall and Railroads
2. Sizing Machine.
3. Calender End of the Sizing Machine.
4. Painting Machine and Drying Racks.
5. Rubbing Machine.
6. Printing Machine Running Nine Colors.
7. Hand Printing a Mosaic Pattern.
8. Varnishing the Printed Oil-Cloth.

Nashville R.R.'s. Here are the Florence Synodical Female College, the State Normal College, Mars Hill Academy, Florence Institute, Paxton high school, a Congregational school, several churches, and a number of weekly newspapers. The city has manufactories of iron, cotton, wagons, ice, flour, stoves, etc., and an assessed property valuation of over $2,000,000. Pop. (1900) 6,478.

Florence (in Italian, *Firenze*), a province of Italy; area, about 2,262 English square miles. The surface is beautifully diversified by mountains, valleys, and plains. The climate is generally mild and healthy, and the soil very fertile, producing wheat, maize, beans, and all kinds of leguminous crops. The vine, olive, orange, citron, and fig thrive well in the low grounds; while the mountainous districts afford excellent pasture, admirably adapted for the rearing of sheep. The minerals include mines of copper, lead, and mercury; and quarries of marble, alabaster, and fine building stone. Pop. (1901) 939,054.

Florence (Italian, *Firenze*), a famous walled city of central Italy; on both sides of the Arno, 187 miles northwest of Rome. It stands in a richly wooded, well-cultivated, and beautiful valley, encircled by the Apennines. Its shape is nearly a square, the sides of which almost correspond with the cardinal points; the Arno intersects it from southeast to northwest, three of the quarters into which it is divided being situated on the right, and the fourth on the left bank of the river. The communication between the opposite sides of the river is maintained by means of seven bridges. Florence contains a great number of magnificent edifices and squares, generally adorned with statues, columns, or fountains; there are no fewer than 170 churches, 89 convents, 2 royal, and many other palaces, 12 hospitals, and 8 theatres great and small. Each angle of a street presents an architectural view fit to be drawn for a scene in a theatre. Many of the houses are palaces, fitted up with great magnificence, and some of them contain valuable galleries of pictures. The streets are mostly wide and straight; and they are admirably paved with angular blocks of sandstone.

The Piazza Reale is the largest square; it has a fine marble fountain, and an equestrian statue in bronze of Duke Cosmo I., by John of Bologna. The Piazza del Mercato Vecchio, in the centre of the city, has a marble column from which Florence radiates for one mile on each side. The Arno is decidedly superior to the Tiber at Rome. The bridge Santa Trinita, built of marble in 1559 by Ammanate, is designed in a style of elegance and simplicity unrivaled by the most successful efforts of modern artists. The bridges, and quays by which the river is bordered, afford fine views of the river, Florence being in this respect much superior to the "Eternal City." The duomo, or cathedral, a vast edifice, coated with marble, about 500 feet in length, and 384 feet in height to the top of the cross, stands in a spacious square. The church of Santa Croce, called the Pantheon of Florence, is interesting from its containing the remains and tombs of four of the greatest men of modern Italy, or indeed of modern times — Michelangelo, Galileo, Machiavelli, and Alfieri. Among the palaces are the Palazzo Vecchio, or Old Palace, inhabited by the Medici when citizens of Florence, which was begun in 1298, and finished in 1550. It is in a massive, severe, and gloomy style, with a tower 268 feet high, and is now occupied by the principal public offices. Adjoining it is the Piazza del Palazzo Vecchio, a square containing a fine collection of statues, and a noble arcade, the Loggia di Lanzi, under the porticoes of which are magnificent groups of sculpture. The Palazzo Pitti, erected in 1440, the ordinary residence of the king of Italy, is a vast and heavy structure; it is furnished in the most costly manner, and is enriched with a great number of the choicest works of art and vertú and an excellent library. Attached to this palace are the Boboli Gardens, laid out by Cosmo I. in 1550, in the classical style. Connected with these gardens is the botanical garden, a museum of natural history, the Fontana anatomical collection in wax, etc. Another fine palace, the Riccardi (built in 1440), has a noble gallery with a ceiling painted by Luca Giordano, and a library of 40,000 volumes, open to the public. But the crowning glory of Florence is its Grand Gallery, occupying the upper floor of the Ufizi, a building erected after a design of Vasari, by Cosmo I., consisting of two parallel corridors or galleries, each 448 feet in length, and 72 feet apart, united at one end by a third corridor. This contains some masterpieces of statuary, as the world-renowned 'Venus de Medici,' 'The Knife-Grinder,' the 'Fawn,' 'Niobe and Her Children,' etc. The collection of pictures comprises superb examples of all the best schools, and is said to surpass even that of the Vatican. A splendid apartment, known as the Tribuna, contains the rarest treasures of the collection, and is in itself a wonder of art, with its cupola inlaid with mother-of-pearl, and its rich marble pavement. Besides the Riccardi and Laurentian libraries, the Magliabecchi Library, containing a rare, extensive, and valuable collection of books, is also open to the public.

The literary and educational institutions of Florence are both numerous and important. At the head of these is the famous Academia della Crusca. The charitable institutions are numerous, extensive and well conducted. The common people of Florence are well clothed and have a comfortable appearance; and there are, as compared with most other Italian towns, few beggars, priests, and monks. The citizens are friendly, cheerful, and hospitable. The encouragement given under the government, to artistic and scientific studies, has conferred advantages on Florence unknown in most other parts of Italy. All sorts of foreign publications are met with here; and the facilities it affords for gratifying a taste for the fine arts, the beauty and security of the city and environs, and its salubrity and cheapness, make it, on the whole, a more desirable residence even than Rome. Manufactures silks, straw hats, articles of vertú, as intaglios, etc., jewelry, porcelain, perfumery, etc. Florence has produced more celebrated men than any other place in Italy, or, perhaps, of Europe; among others may be specified Dante, Petrarch, Boccaccio, Villani, Cosmo and Lorenzo de Medici; Galileo, Michelangelo, Leonardo da Vinci, Benvenuto Cellini, Alberti, Lapo Brunelleschi, Giotto, Andrea del Sarto, Machiavelli; Popes Leo X. and XI., and Clement VII., VIII., and XI.

Florence owes its origin to a colony of Roman soldiers sent thither by Octavianus after the victory of Philippi, to whom he allotted part of the territory of the colony of Fiesole, established about 40 years before by Sulla. Little more is known of it under the empire, and hardly any remains exist of that period, except some relics of an amphitheatre and a few inscriptions. Christianity was established here in the third century, and early in the fourth a Bishop of Florence attended a council at Rome. In the beginning of the 12th century the city had risen into importance through the industry and enterprise of its inhabitants, who had now commercial establishments in the Levant, France, and other parts, and had become money-changers, money-lenders, jewelers, and goldsmiths. In the latter end of the 14th century the wealthy family of the Albizzi became chief rulers in Florence. These again were overthrown in 1434 by Cosmo de Medici, a popular citizen and princely merchant, who assumed the first place in the state. On the fall of the republic in the 16th century a member of a lateral branch of the Medici, the line of Cosmo having become extinct, was placed by Charles V. as Duke of Florence. The ducal dynasty of Medici continued to rule till the year 1737, when, becoming extinct, they were succeeded by Francis of Lorraine, afterward emperor of Germany. From this period the history of Florence merges into that of Tuscany, until its amalgamation with the kingdom of Italy. From 1865 till 1871 it held the dignity of capital of the kingdom, the seat of government being transferred to it from Turin. It then received a considerable increase of population, and consequently a number of broad new streets have been constructed on the site of the old fortifications, and of late years its precincts have been extended in every direction. Pop. (1901) 205,589.

Florence, S. C., a city and county-seat of Florence County, on the Atlantic C. L. R.R. It has a bank and several newspapers. Pop. (1900) 4,047.

Florentine Experiment, in physics, an experiment made in 1661 by some academicians at Florence to test whether or not water was compressible. They enclosed it in a globe of thin gold, afterward hermetically sealed. In compressing the globe the water, instead of yielding, forced its way through the pores of the gold, and stood in drops on its outer surface. See PHYSICS.

Florentine Fresco, a kind of painting, first practised at Florence during the flourishing period of Italian art, for decorating walls. Like common fresco, the lime is used wet, but in this mode it can be moistened, and kept damp and fit for painting upon. See FLORENCE; ITALY.

Florentine Lake, in painting, a pigment prepared from cochineal. It is now obsolete, the greater durability in oil-painting of the lake prepared from madder having entirely superseded those prepared from cochineal.

Florentine Mosaic, the term applied to the art of inlaying tables and other plane surfaces with *pietra dura* and *pietra commesse*, carried on principally at Florence. See ART; FLORENCE; ITALY.

Florentine School, an Italian school of painting during the 14th and 15th centuries remarkable for greatness; for attitudes seemingly in motion; for a certain dark severity; for an expression of strength by which grace is perhaps excluded; and for a character of design approaching to the gigantic. The Tuscan artists, satisfied with commanding the admiration, seem to have considered the art of pleasing as beneath their notice. This school has an indisputable title to the veneration of all the lovers of the arts, as the first in Italy which cultivated them. See ART.

Flores, Juan José, hoo-ăn' hō-sā' flō'rāz, Venezuelan soldier and statesman: b. Porto Cabello, Venezuela, 1801; d. Guayaquil, Ecuador, 1 Oct. 1864. He distinguished himself as Bolivar's lieutenant in the war that secured the independence of South America. In 1823 he was governor of Pasto, and head of the army in Ecuador. His victory at Tarqui (1828) ended the war with Peru and he was made president of the republic of Ecuador (1831–5). He filled the same office in 1839 and from 1843 to 1845, when he resigned in consequence of a revolution stirred up by the liberals. He was defeated by Mosqueza in the war with Columbia at the battle of Cuaspuda, in 1863.

Flores, Venancio, vā-nän'thi-ō, South American soldier and statesman: d. Montevideo, Uruguay, 19 Feb. 1868. In 1853 he took part in an insurrection against Giro, the president of Uruguay and was elected president of the republic in January 1854. The two parties in the government were the Colored (Liberals), and the Whites (Conservatives), and the former being the stronger had elected Flores. A division in this party made it possible for a former president, Oribe, to land with troops, and Flores laid down his office, and in 1858 took refuge in Buenos Ayres. He returned later and with the help of Brazil stormed the city of La Florida in 1864 and in 1865 made a triumphant entry into Montevideo, and assumed the title of provisional governor of the republic. On 4 May 1865, he concluded a treaty of alliance with Brazil and the Argentine republic in the war against Paraguay. He won over the party of the Whites by his clemency, regained the presidency in 1866, but was assassinated on his way to the city hall, or capital of Montevideo.

Flores, flō'res. (1) *Endé* or *Mandfirei Floris*, a large island (Dutch) of the Indian Archipelago, forms one of the chain of islands which extend east from Java; length, about 200 miles; breadth, about 50 miles. It has a mountainous surface, with several volcanic peaks, one of which, Lobetobie, is 7,200 feet high. Little is known of the interior. Sandal-wood, once abundant, has become scarce. Endé, near the middle of the south coast, is said to be the principal port, and to have safe anchorage for any number of ships. The passage between the east end of the island and those of Solor and Adenara is called Flores Strait; and the part of the Pacific north of the Flores chain and south of Celebes is called the Flores Sea. (2) The most western island of the Azores, about 30 miles long by 9 miles broad, with a hilly surface, containing an extinct crater now converted into a lake. The chief products are wheat, pulse, and poultry, and great numbers of small cattle are reared. (3) An island of the North Pacific, off the west coast of British America, opposite to Vancouver's Island; lat. 49° 20′ north; lon. 125°

45′ west; length, northwest to southeast, 15 miles; breadth, from 2 miles to 6 miles. (4) A small island off the coast of Uruguay. (5) A river in Brazil in the province of Piauhy.

Florez, Henrique, en-rē'keth flō'reth, Spanish historian: b. Valladolid, Spain, 14 Feb. 1701; d. Madrid 20 Aug. 1773. He was an Augustinian ordinary who taught theology and history by presenting dogmas and annals from the standpoint of their human interest. 'Sacred Spain' (1747–73), and 'Memorials of Catholic Queens' are his most important works.

Florian, Jean Pierre Claris de, zhōn pē-ār clä-rē dē flō-ryän, French poet: b. near Anduza, Gard, France, 6 March 1755; d. Sceaux, France, 13 Sept. 1794. He made his début with some pleasing farces (1779), and added greatly to his fame with the two pastoral stories, 'Galatea' (1783), and 'Estelle' (1787); sentimental romances in the dominant taste of that time. He also wrote: 'Medleys of Poetry and Literature'; and 'Florian's Youth,' in which he recounts the story of his boyhood. In 1788 he became a member of the French Academy. While there, engaged in finishing his poem, 'Ephraim,' he was arrested by the orders of the Committee of Public Safety, but the fall of Robespierre saved him from the guillotine.

Floriculture in America.— Growing flowers as a business was unknown in America previous to about 1825; and, indeed as late as 50 years ago it was impossible to buy cut flowers in some of our leading cities. Owing to the increase of population of the eastern cities, and consequent increase of wealth and luxury, a demand for flowers began to be felt in the second quarter of the last century; and thus began the development of commercial floriculture in this country. This branch of horticulture first became prominent in the vicinity of Philadelphia and Boston. In the early days more wealth was centered in these cities, and the people there paid more attention to luxuries in home surroundings. New York was less prominent in the development of this industry. From 1830 to 1840 floriculture made considerable progress, owing to improved methods in the construction and management of greenhouses, as well as to the increased demand for flowers. The application of hot-water heat to greenhouses gave an impetus to the work, making it possible to grow better plants than had been done when heated air conducted through brick flues was the only means of keeping out the frost. Since the Civil War the development of the industry has been rapid and varied, as to extent and methods, and as to the kinds of flowers cultivated. Up to about 1885 the cultivation of plants was the leading feature of floricultural work; but since that time the rapid increase of wealth and luxury in the large cities has developed a tremendous demand for cut flowers, thus making this branch of the business the all-important one for the florist. This increased demand for cut flowers has led to specialization in floriculture and has produced the best work of the florist. Older flowers, such as the once popular camellia, have been dropped, and the rose, carnation, violet and chrysanthemum have been substituted. In this way floriculture, as we find it to-day, has been gradually evolved. There are two distinct departments of the word, viz., the growing of plants, and the cultivation of cut flowers. The plants grown mostly are various kinds of palms, ferns, rubber plants and dracænas; also ornamental an bedding stock for out-door purposes. There has been specialization in both of these main branches of floriculture. For instance, certain growers devote all their energies to palms; others concentrate on ferns; others raise bedding-plants exclusively. In flower-growing there has been even greater specialization; and it would now be difficult to find an important establishment where more than one of the leading flowers is grown. While one florist will grow roses exclusively, another will devote all his time and ingenuity to the improvement of the carnation, a third will grow nothing but violets, and a fourth will concentrate on chrysanthemums. These four flowers are the most important cut flowers, their commercial importance being in the order named. The most recent statistics on floriculture in the United States are to be found in the United States Census of 1900. At that time there were 8,799 floricultural establishments, representing an investment (land, equipment, etc.), of $52,462,-419, and selling flowers and plants to the amount of $18,759,464 annually. About two-thirds of this amount was realized from cut flowers, the rose bringing in $6,000,000, the carnation $4,000,000, the violet $750,000, the chrysanthemum only $500,000, owing to the shortness of the season. The annual expenditure for labor was $4,155,179, or 22.6 per cent. of the total receipts. Since the figures given above are something less than the wholesale price, and the profit of the retailer is about 100 per cent., it is clear that the public spends annually some $30,000,000 on flowers.

There are few adequate treatments of floriculture. As among the best may be mentioned: Henderson, 'Practical Floriculture'; Hunt, 'How to Grow Cut Flowers'; Taft, 'Greenhouse Management.' Consult also Bailey's 'Garden-Craft' series, and his 'Cyclopedia of American Horticulture.' See Botany; Breeding Plant; Horticulture; Flower; Flower and Insects; Garden; Inflorescence; Greenhouse; Cross-Fertilization; Fertilization, Etc.

Florida (Sp. flowery, a name given to the country by Ponce de Leon because he discovered it on Easter Day, Sp. *Pascua florida* or *de flores*, flowery Easter; or, according to some authorities, on account of the exuberance of flowers which he saw), the southeasternmost State of the Union, sometimes called "the Everglade State," and also "the Peninsular State." It is situated between lat. 24° 30′ and 31° N. and lon. 79° 48′ and 87° 38′ W. Alabama and Georgia bound it on the north, the Atlantic Ocean on the east. On the South, Florida Strait, which connects the Gulf of Mexico with the Atlantic, separates the peninsula from Cuba, and the Bahamas. West of the peninsula and south of the western extension of the State is the Gulf

of Mexico. The extreme western boundary is the Perdido River in Alabama.

Florida is mainly a peninsula of irregularly rectangular form. The northern part is continental, and extends about 400 miles from east to west. From north to south the peninsular extension is about 375 miles in length, and nearly 100 miles in width, the total length of the State north and south being about 450 miles. From Biscayne Bay, near its southeastern extremity, stretches a series of islets or keys, the only one of importance being Key West, situated at the lower end of the chain.

The physical features of the State are decidedly dissimilar to those of the other Southern States. The geological upheaval resulting in its formation left neither table-land nor mountain from which to view ocean and gulf, the most elevated portion of the State barely reaching the dignity of a hill-country. Its area is 58,680 square miles, 4,440 being lakes, lagoons, and rivers. Its coast-line, excluding islands, is 1,145 miles, 470 miles of it being in the Atlantic Ocean. Capital, Tallahassee.

Surface, Soil and Drainage.— The northwestern part, continuing the Alabama uplands, is a hilly rolling country sinking to a flat strip of coast. The east is part of the Atlantic coastal plain. The peninsula is a surface of sand and marsh, lying in the north on a basis of Upper Eocene or Vicksburg limestone; in the south on one of coral whose southern extremity is the bounding wall of the Gulf Stream, silted up at the end into the "keys." These have spread by deposits and vegetable growth into habitable islands, and in the course of ages will be joined to the peninsula, which itself is yet but land in the making. Almost everywhere the water lies close below the surface, which is dotted with springs, some of which are charged with carbonates and sulphuretted hydrogen; many fresh and of immense size, and of crystal clearness. One of the most famous is near St. Augustine, two miles out at sea, and boils so violently that the waves break against it as against a sunken reef. Another large one is in St. George's Sound, opposite Lanark. The wonderful Silver Spring, at the head of navigation on the Ocklawaha River, near Ocala, Marion County, has an estimated outflow of 300,000,000 gallons daily. The Blue, in the same county, the Wekiva in Orange County, and the Wakulla near Tallahassee, are also famous.

As the soil is a mere surface deposit with no volcanic upheaval, the State has no real hills; but the centre has a watershed in the shape of a ridge from 100 to 300 feet high, with a summit level 200 miles north of the strait, from which low sand-terraces decline each way to the sea, with countless lakes and swamps at their bases. Many of the lakes are aggregates of the great springs before mentioned. The largest is Okeechobee in the south, 1,200 square miles in area and [illegible] feet above the sea-level, its waters sinking into the Everglades; a bordering rim of sand about [illegible] miles wide divides it from the Atlantic. Others are Monroe, George, Kissimmee, Crescent, Dexter, Apopka, Harris, Orange, and Eustis. Most of them are shallow and usually connected by fresh-water streams. On the higher levels the terraces are covered with a magnificent growth of large pine-trees; on the lower levels are prairies and marshes timbered with cypress-trees, and in which are "hummocks," which are dry elevations, covered with a great variety of hardwood, and cabbage-palms. The basins of the draining streams are mostly marshy jungles of cane-brake and vines and semi-tropical trees. In the southernmost portion are the remarkable Everglades, forming a district 160 by 60 miles in extent, and containing 3,600 square miles, both land and water; and overflowed marsh hidden by tall grass, and thickly dotted with dry "hummocks" ranging in size from those just large enough to stand on, up to those covering a square mile or more, and covered by a jungle of vines and shrubs, pine, and palmetto. The eastern part is a maze of these islands and small shallow bayous. The islands were once really such in the ocean, the water around them having silted up and been overgrown with vegetation. The Everglades are separated from the Gulf by extensive cypress swamps; the forests extend down the west coast, narrowing out around the cape, and stretch up along the Atlantic coast. The latter, except in the extreme north, is almost harborless, a line of narrow sand-spits with interior lagoons, the type of the whole southern coast; but the gulf side, otherwise formed in the same fashion, is pierced with many deep bays and harbors — Pensacola, Santa Rosa, St. Andrew's, St. George's, Appalachee, Tampa, Hillsboro, Charlotte Harbor, Oyster, Ponce de Leon, Cedar Keys, etc.

The great river of Florida is the St. John's, rising in Cypress Swamps, just north of the Everglades, and flowing north parallel with the ocean, threaded on a series of lakes; 150 miles from its mouth becoming a mile wide, and in its lower course six or seven, a miniature Amazon in size and character and draining a similar country. Pleasure-steamers navigate it 250 miles, and the tributary swamp-rivers several hundred more. Its total course is 350. The Kissimmee, flowing into Lake Okeechobee from Kissimmee Lake, is also a favorite of tourists and sportsmen. The leading streams of the west are the Suwanee; the great Appalachicola from Georgia, 90 miles long under that name, with a course of nearly 600 through the Chattahoochee; the Choctawhatchee (180 miles), and Escambia (250 with the Conecuh) from Alabama, the latter navigable to the Conecuh.

Climate.— The climate of Florida is not subject to prolonged and severe winters with great ranges in temperatures. The annual precipitation is from 58 to 60 inches, ranging from 6 to 8 inches in the fall and winter — the dry season — to 18 to 20 inches during the summer. The normal sunshine is about 60 per cent. The normal mean temperature for January ranges from 60° to 70° F., that for July being 80° and above. The hottest months are June, July, and August, the heat being tempered by frequent showers. Already famed as the Riviera of America, offering hope to the invalid and pleasure and comfort to the robust, Florida occupies a unique place among the States of the Union. The large immigration of a rich and cultured class has had a great influence on the social, political, and business development of the State.

Flora and Fauna.— These are naturally affiliated to those of the West Indies and South America. The forests are estimated at 25,000,000 acres, two thirds the area of the State; largely consisting of live-oak, hickory, long-leaved pine, pitch-pine, and cypress. Prof. A. H. Curtis, a

distinguished botanist, says that Florida has a greater variety of trees than any other State in the Union. Florida has many trees peculiar to itself, or almost so, in the United States — the wild orange, cocoanut, and Indian almond, mahogany, satinwood, and manchineel, cachibou and kino-gum, etc. The tropical fruit acclimated there is noted below. The alligator, green turtle, and sponge, indicate the tropic nature of the State.

Fish and Fisheries.— Florida's enormous coast-line in the mid-continental seas gives its fisheries the greatest extent and value of any State south of Virginia; they employ seven or eight thousand men. Foremost is that of the red snapper, utilizing some 200 vessels besides hundreds of boats, the headquarters being Pensacola; the catch is over $2,000,000 a year, mostly packed in ice and sent North. Shad, mullet, and green turtle are also caught in large quantities. The sponge fishery is peculiar to Florida, and centres in Key West; it has produced as much as $250,000 a year. Alligators are caught for their skins.

Agriculture and Forest Products.— The rich phosphatic soil mingled with decaying vegetation, the large rainfall, and warm climate render Florida enormously fertile, and dictate its representative crops. It of course raises corn and other cereals for its own use — in 1902 it produced 5,180,000 bushels of corn from 600,000 acres of land — and at last report had over 500,000 neat and 80,000 dairy cattle; but its chief export crops are semi-tropical. Sugarcane, Sea Island cotton, and rice; 160,000 bushels a year of the last named; sweet potatoes, over 2,000,000 bushels a year; Irish potatoes, 200,000 bushels; peanuts, over 1,000,000 bushels; cassava, nearly 10,000,000 pounds; tobacco, 1,600,000 pounds in 1902; with some 7,000,000 watermelons and 3,500,000 muskmelons a year, besides general market-gardening products for the North, are the typical field crops of the State. Several thousand acres are devoted to watermelons for the seed alone, for which there is an extensive northern market. The orchard crops are rich in tropical products — lemons (2,357 boxes in the census year), limes (22,714 boxes), grape-fruit (2,306 boxes), guavas (1,645,000 fruit), Japanese plums (75,110 fruit), olives, figs (66,680 pounds), cocoanuts (136,600 nuts), etc.; but the two leading crops are oranges and pineapples. The former has been subject to immense vicissitudes. Early in the nineties it was the one speculation of central Florida, and the product rose to 5,000,000 boxes in one year; then the terrible cold wave of 1894–5 froze millions of young trees to the roots, often splitting them in two. The older trees, where well handled, generally survived, but another cold wave in 1899 — giving native Floridans the unprecedented sight of several inches of snow — destroyed a large part of those also: the two disasters killed three fourths of all the orange trees in the State. The crop sank to 125,000 boxes or so, and most of the growers abandoned the business, thinking a permanent change of climate had set in; but it is now known that these frosts occurred now and then in earlier times as well, and growers are recovering courage, though the industry is shifting toward the southwest coast. The crop for 1902 was about 750,000 boxes, over treble that for the census year. The next greatest orchard crop — though peaches and pears are considerably grown — is the pineapple, raised mainly in the southeastern counties. Florida in the census year produced nearly 3,000,000 of the fruit, against 440 from California and none from any other State.

In 1902 the Florida East Coast & Drainage Sugar Company was formed to drain the Everglades, which will reclaim some millions of acres of valuable agricultural land.

The forest products are usually ranked under manufactures. The lumber and timber product of Florida in 1899–1900, with the tar, turpentine, and ship stores, amounted to $17,572,999, or nearly as much as all the rest of the State's manufactures together. The turpentine and rosin — 236,778 barrels of the former, 772,537 of the latter — were valued at $6,469,605, and the industry employed 15,073 hands, or toward half the industrial workers of the State. The industry has grown from almost nothing within the decade, there being in 1890 only 484 hands and $191,859 product.

Minerals.— Florida has no metals, and its mineral industries are of rock and earths. The chief is the mining of phosphate rock for fertilizers (q.v.), in which it rivals any other district of the world. It is in various forms — hard and soft rock, land and river pebble, and vertebrate remains. The hard rock — much the most valuable, containing 80 per cent phosphate of lime — is found in a belt skirting the Gulf from Tallahassee nearly to Tampa. It was discovered in 1888, and since then the product has risen to some 750,000 tons a year of all kinds — 500,000 being hard rock, nearly all exported to Europe, principally Germany. The river pebble is only worked on the Peace and Alafia rivers, by dredges and pumps. Most of the fuller's earth used in the United States is also from Florida. At Ellenton, on the Manatee River, 60,000 tons has been produced in a year, and at Quincy 30,000 tons. Some $40,000 a year of kaolin also goes out.

Manufactures.— The greatest industry of Florida, aside from the forest products, is the tobacco and cigar manufacture, of which the heart is Tampa and Key West; it was developed by the immigration of Cuban cigar-makers, and still uses mainly Havana leaf. Some 300,000,000 cigars a year are turned out, and the total value of tobacco products manufactured in the census year was $10,891,286; the industry employed 6,461 wage-earners. The fertilizer industry from phosphate rock amounts to over $500,000 a year, against less than $100,000 in 1890, and nothing two years before. Wooden boxes and barrels, cedar for lead-pencils, sugarcane syrup, cotton-seed oil, and meal are also to some extent exported, though the consumption is largely at home. Jacksonville has two establishments for canning pineapples, guavas, etc.

Commerce and Transportation.— Florida's position makes it the natural outlet for exports to the West Indies; but till late years unimproved harbors and inferior railroad equipment have checked its commerce. Within the past 15 years, however, Congress has expended over $6,000,000 on its river and harbor improvements (appropriating nearly $3,000,000 more in 1902); and its railroad lines have more than trebled in mileage, and increased in even greater ratio in quality of service. The mainland harbors on its immense peninsular coast-line, with its noble

island port Key West, do an export trade of toward $20,000,000 a year, with some $2,000,000 of imports. About 3,000 vessels a year, of over 2,500,000 gross tons, clear from Florida ports. The chief exports are timber and lumber (over $7,500,000 a year), naval stores, fruits, corn, cotton, tobacco and cigars, phosphate rock and fertilizer, fish, and horses, mules, and cattle to Cuba. The largest exporting places are Pensacola, Tampa, Jacksonville, and Key West. There are important steamer lines running from Jacksonville to Charleston, New York and Boston; from Tampa to Havana and Porto Rico (great sums having been recently expended on its terminal facilities); from Key West to Havana, Galveston, New Orleans, and New York; and from Miami to Nassau and Cuba; also coasting lines from Fernandina, Apalachicola, Carrabelle, and Punta Gorda. There is much tourist and business navigation on its fine rivers and bays. The railroad mileage is now some 3,500, of which 2,800 is main track; there are several through express trains to and from the North daily, and three great trunk lines traverse the peninsula — the Atlantic Coast Line, Seaboard Air Line, and Florida East Coast.

Banks.— On 1 Jan. 1902 there were 25 incorporated banks in the State, with assets of $6,149,852.82; and capital, surplus, and undivided profits of $1,169,645.70. Five of these were savings banks or had savings departments, with assets of $2,632,928.31.

Finance.— The assessed valuation of the State is slightly over $100,000,000; and there is no floating debt, but a surplus of $228,074.19 in the treasury on 1 Jan. 1903. The bonded debt is $350,000 in 7's of 1871, and $925,000 in 6's of 1873. The State tax is five mills. The county taxes produce over $1,250,000 a year, the school districts over $70,000.

Education.— At the end of 1902 there were about 2,400 public schools, and 2,799 teachers, 1,782 of them female. The average monthly salary was $44.49 for white males and $35.44 for white females. Total paid for salaries, $569,733.33; total expenditure on schools, $775,000, or about $1.35 per capita; about half the average for the Union, and one of the lowest averages among the States. The average attendance for the year was 55 days for white children, 41 for colored. The illiterates above 10 number over one fifth of the population. This is misleading, however, unless classed by color: the illiterate whites numbered 19,184 out of 297,812, or 6.4 per cent, while the illiterate colored numbered 65,101 out of 230,730, or over 35 per cent. The educational status is gradually improving. There are some 30 high schools in the State. The Constitution provides for two normal schools, a white and a colored; the former is at De Funiak Springs, the latter at Tallahassee. There are also three private normal schools. For colored secondary education there are three institutions at Jacksonville and one at Live Oak. For whites there are, besides the State Agricultural College at Lake City, seminaries for East Florida at Gainesville, West Florida at Tallahassee, South Florida at Bartow. There are also several private and denominational colleges, including the John B. Stetson University at Deland, affiliated with the University of Chicago, and Rollins College at Winter Park.

Charitable and Penal Institutions.— There is a State hospital for the insane at Tallahassee accommodating about 1,000 patients, and treating some 300 new ones a year; a school for the blind and for deaf-mutes at St. Augustine; and a State reform school. The State penitentiary at the end of 1902 had 1,033 inmates; 449 received during the year, of whom 413 were colored. The State farms out its convicts for mining phosphate, etc.

Religious Denominations.— The strongest in the State are the African Methodist Episcopal, the Methodist Episcopal South, the Regular Baptist South, the Regular Baptist Colored, Roman Catholic, Methodist Episcopal, Protestant Episcopal, Presbyterian, Disciples, and Congregational.

State Government.—The Constitution is of November 1886, and made sweeping changes from the former one in the direction of democracy. The State and county officers had formerly been mostly appointed by the governor, and the Supreme Court justices were appointed for life; under the present Constitution all are elected, except circuit judges, and the judges' terms are six years. The governor is elected for four years, and cannot be re-elected for an immediately succeeding term. His salary is $3,500. His veto may be overridden by a two thirds vote of the members present in both Houses. In case of vacancy, the succession devolves on the president of the Senate and the speaker of the House successively. The legislature consists of 32 senators and 68 representatives, and meets biennially, with sessions limited to 60 days except at their own expense. There is a railroad commission to enforce reasonable rates of freight and passenger carriage. The divorce law requires two years' residence. Counties have local option at the request of one fourth of the registered voters. There are 1,258 militia. The State has two representatives in Congress. It is overwhelmingly Democratic in politics; in the legislature of 1903 there are 67 Democratic representatives and one Republican.

Population.— 1830, 34,730; 1840, 54,477; 1850, 87,445; 1860, 140,424; 1870, 187,748; 1880, 269,493; 1890, 391,422; 1900, 528,542. The foreign-born numbered 23,832, mostly West Indians. The colored population was 230,730, or a little over two fifths. The present population, based on estimates of the census officials, is about 575,000.

The State has 45 counties, which, with their capitals, are as follows:

Alachua, Gainesville.
Baker, MacClenny.
Bradford, Starke.
Brevard, Titusville.
Calhoun, Blountstown.
Citrus, Inverness.
Clay, Greencove Springs.
Columbia, Lake City.
Dade, Miami.
De Soto, Arcadia.
Duval, Jacksonville.
Escambia, Pensacola.
Franklin, Apalachicola.
Gadsden, Quincy.
Hamilton, Jasper.
Hernando, Brooksville.
Hillsboro, Tampa.
Holmes, Westville.
Jackson, Marianna.
Jefferson, Monticello.
Lafayette, Mayo.
Lake, Tavares.
Lee, Myers.
Leon, Tallahassee.
Levy, Bronson.
Liberty, Bristol.
Madison, Madison.
Manatee, Braidentown.
Marion, Ocala.
Monroe, Key West.
Nassau, Fernandina.
Orange, Orlando.
Osceola, Kissimmee.
Pasco, Dade City.
Polk, Bartow.
Putnam, Palatka.
St. John, St. Augustine.
Santa Rosa, Milton.
Sumter, Sumterville.
Suwanee, Live Oak.
Taylor, Perry.
Volusia, Deland.
Wakulla, Crawfordville.
Walton, DeFuniak Springs.
Washington, Vernon.

The chief cities are Jacksonville, on the St. John's, with a population of 28,429, in 1900, in-

creased to about 40,000 in 1903; Pensacola, in the extreme west, 17,747; Key West, 17,114; Tampa, on the west coast, 15,839. No other place has as much as 5,000 people; and only two over 4,000 — St. Augustine, on the east coast, 4,272, and Lake City, between Jacksonville and Tallahassee, 4,013. Between 3,000 and 4,000 are Gainesville, Ocala, Palatka, Fernandina, and Apalachicola. Tallahassee, the capital, has 2,981.

History.— The earliest attempted colonization of the North American mainland was in Florida, and the first white settlement was St. Augustine. Juan Ponce de Leon discovered the coast a little north of St. Augustine 27 March 1512; was made governor, and authorized to colonize the "Island of Florida," as it was then supposed to be, in 1513; and sought there for the "Fountain of Youth." Thenceforward it was the highway of Spanish explorers. Vasquez de Ayllon raided it for slaves 1520–6, Pánfilo de Narvaez began his fatal expedition westward in 1528 from Pensacola Bay; Hernando de Soto his in 1539 from Tampa Bay; Tristan de Luna in 1559 explored northward from Pensacola Bay. Coligny designing to found a Huguenot colony and refuge in the New World, René de Laudonnière in 1564 built Fort Caroline on the St. John's; in 1565 Pedro Menendez de Aviléz captured the fort, massacred the French there and in two detachments outside, "not as Frenchmen but as heretics," and built St. Augustine; in 1567 Dominique de Gourgues in turn exterminated the Spaniards at the settlement that had replaced Fort Caroline, "not as Spaniards but as assassins." St. Augustine was overlooked; but in 1586 Sir Francis Drake destroyed it. All through the 17th and early 18th centuries the Spaniards in Florida harassed, or set on the Indians to harass, the English colonies, from St. Augustine as headquarters, especially after Georgia was settled; and St. Augustine was repeatedly attacked by colonial expeditions. The Spaniards did but little toward settling the country, however. In 1763 East and West Florida — the latter west of the Apalachicola, and including parts of modern Alabama and Mississippi — were ceded to Great Britain, and in the next 20 years more than 25,000 whites had settled there. In 1783 it was retroceded to Spain, and most of the English settlers withdrew. In 1795 West Florida was sold to France. After the Louisiana Purchase of 1803 the United States claimed up to the Perdido as part of "Louisiana"; the claim was not then pressed, for fear of war; but in 1810, the Spanish monarchy being overthrown and the king a prisoner, the United States took possession of all but Mobile, which was occupied in 1813 during the War of 1812. Meantime and afterward, the Southern States found East Florida an intolerable thorn in their flesh. The so-called Spanish "government" there was mere anarchy, partly from there being no stable home government to control it; Indian bands raided Georgia and escaped over the border, British and Spanish traders intrigued with them, and it was an Alsatia for fugitive slaves which drove the slaveholders wild. Congress authorized Madison to take "temporary possession" in 1811, but nothing was done; in 1818 Jackson invaded it to punish Spanish assistance to the Seminole raids and withholding fugitive slaves, captured St. Mark's and Pensacola, and hanged Arbuthnot and Ambrister, two British adventurers making their account by furnishing supplies and possibly other help to the Indians. The district being both profitless and untenable to Spain, she ceded it to the United States by treaty of 22 Feb. 1819, in exchange for government assumption of $5,000,000 claims of American citizens against Spain. The latter only ratified it in 1821 (see ANNEXATION). In March 1822 it was admitted as a Territory. The two sections, East and West Florida, both from geographical and political reasons, had no sympathy with each other, and repeatedly petitioned Congress for separation, without avail. Especially West Florida, as late as 1869, voted for annexation to Alabama, which offered the State $1,000,000 for it; but no further steps were taken. On 11 Jan. 1839 a convention framed a constitution for the State of Florida; but it was not admitted to the Union till 3 March 1845, paired with Iowa, as a slave State with a free State. The Constitution, forbidding emancipation of slaves by the legislature, roused a violent debate in Congress over admission. From 1835 to 1842 raged the bloody Seminole war (q.v.), ending in the deportation of the tribe to Indian Territory in 1843. On 10 Jan. 1861 an ordinance of secession was passed, 62 to 7; and on 4 Feb. the Florida delegates took their seats in the Confederate Congress. The government posts nearly all fell into Confederate hands; but Fort Pickens, off Pensacola, was retained, and formed a nucleus for recapture. After 1863, however, the Union forces were employed in other quarters; and by the battle of Olustee, 20 Feb. 1864, the State was lost to the Union till the close of the War restored it. On 13 July 1865 a provisional government was formed; on 25 October a State convention met, and on the 28th annulled the ordinance of secession. A new constitution was adopted without slavery, and a legislature organized in 1866; but on 2 March 1867 it was brought under the Reconstruction Act, and became a part of the Third Military District. A constitution of 25 Feb. 1868 chose officers to hold till January 1873, and by act of 25 June 1868 Florida reorganized as a State. Reconstruction conditions here were as anarchic and deplorable as elsewhere (see ELECTORAL COMMISSION; RECONSTRUCTION); but in the last 20 years the enormous investments of Northern capital in industries and railroads, the national expenditures on harbors, etc., have made it a strong and thriving State. Consult: Norton, 'Handbook of Florida' (1892); Fairbanks, 'History of Florida' (1871); Barbour, 'Florida' (1884).

CHAS. H. SMITH.
Secretary Board of Trade, Jacksonville.

Florida Agricultural College, an important educational institution at Lake City, Florida, established in 1884. It is under the direct control of a State board appointed by the governor. There are 200 students of both sexes.

Florida Blanca, José Moñino, hō-sā' mōn-yē'nō flō-rē'thä blän'kä, COUNT OF, Spanish statesman: b. Hellin, Murcia, 21 Oct. 1728; d. Seville 20 Nov. 1808. He was Spanish ambassador at Rome during the pontificate of Clement XIV., and particularly distinguished himself by his activity in the abolition of the order of the Jesuits, and in the election of Pius VI. In 1777 he became minister of foreign affairs, and at once

acquired almost unlimited authority in Spain. He introduced post-coaches, and caused the post-roads to be made practicable; directed his attention to the most important subjects of general police, particularly in the capital; embellished Madrid, and was on every occasion the active friend of the arts and sciences. His attack upon Algiers in 1777, and the siege of Gibraltar in 1782–3, were unsuccessful; but the result of his co-operation with the English colonies of North America in securing their independence was more favorable to Spain. After the accession of Charles IV., his enemies succeeded, in 1792, in effecting his disgrace. He was imprisoned in the citadel of Pampeluna, but was soon restored to liberty and banished to his estates. He appeared once more upon the political stage in 1808, when he was president of the extraordinary Cortes.

Florida Cape. See CAPE FLORIDA.

Florida, Gulf of. See FLORIDA STRAITS.

Florida Jay. See JAY.

Florida Keys, or **Reefs,** in Florida, a chain of small islands, keys or reefs, and sandbanks, extending southwest from Cape Florida, about 220 miles. They are very considerable in number, but only a few are of any importance. Among these may be mentioned Cayo Largo, Indian Key, Long Island, Old and New Matacombs, Cayo de Boca, and Key West, on which the city of Key West is built.

Florida Straits, or **New Bahama Channel.** The gulf waters separating Florida from Cuba and the Bahamas, and traversed by the Gulf Stream. The total length is 300 miles, with a width of from 50 to 150 miles.

Florida, Treaty of. In American history, a treaty signed between Spain and the United States, 22 Feb. 1819, by which Spain conceded the Floridas to the United States. Until the final ratification of the treaty Congress had passed a law empowering the President to appoint a governor, and Gen. Andrew Jackson assumed command of the Florida region. Gen. Jackson issued a proclamation at Pensacola requiring obedience to United States authority. See FLORIDA; UNITED STATES — ARBITRATION IN THE.

Florin, the name of a coin first struck in Florence in the 13th century. The silver florins of Holland are worth about 40 cents. The British and Austrian florins are each worth 50 cents. The English florin was first coined in 1849. See NUMISMATICS.

Florio, Caryl. See ROBJOHN, W. J.

Florio, John, English lexicographer and translator: b. London of Italian parents about 1553; d. 1625. He taught French and Italian in Oxford University, and was appointed by James I. teacher of languages to the queen and Prince Henry. His chief works are his great Italian and English dictionary, 'A World of Words' (1598, improved edition 1611), and his translation of 'Montaigne' (1603).

Floris, flō'ris, **Frans** (originally **de Vriendt**), Flemish painter: b. Antwerp 1517; d. there 1 Oct. 1570. He was called by his contemporaries the Raphael of Flanders. He went to Italy, where his taste, particularly in design, was improved by the study of the masterpieces of Michelangelo; but he never equaled the grace and purity of form which distinguished the Florentine and Roman masters. His style was grand; but his coloring and his figures are reproached with dryness and stiffness. Most of his works, and in particular his triumphal arches, made on the occasion of the entry of Charles V. and Philip II. into Antwerp, and his 'Twelve Labors of Hercules,' have often been engraved by skilful artists. His paintings are to be met with in Flanders, Holland, Spain, Paris, Vienna, and Dresden.

Flor'izel, in Shakespeare's 'Winter's Tale'; the Prince of Bohemia, hero of the drama, and the lover of Perdita.

Flo'rus, Roman historian, of the 2d century A.D., probably a native of Spain or Gaul. He is variously styled in the manuscripts; in some L. Annæus Florus, in others L. Julius Florus, in others L. Annæus Seneca, and in one simply L. Annæus. He wrote an abridgment (epitome) of Roman history in four books, from the foundation of the city to the first time of closing the Temple of Janus, in the reign of Augustus. His style is florid, and not sufficiently simple for history. The best edition is that of Duker (Leyden 1744); later ones are by Titze (1819) and Seebode (1821).

Floss Silk, the portions of raveled silk broken off in reeling the silk from the cocoons, carded and spun into a soft coarse yarn, and used for common fabrics. See SILK.

Flotow, Friedrich (frēd'riH flō'tō) **von,** German musical composer, b. Teutendorf, Mecklenburg-Schwerin, 27 April 1812; d. Wiesbaden 24 Jan. 1803. His earlier operas (which include one called 'Rob Roy') did not find favor among the Parisian opera-house directors, so he had to content himself with performances in the private theatres of the aristocracy. This brought him gradually into notice, however, and his 'Naufrage de la Méduse' was publicly produced in 1839. 'Alessandro Stradello' was first performed at Hamburg in 1844, and his most successful opera, 'Martha,' was originally given at Vienna in 1847. His subsequent works, such as 'Indra' (1852), 'Rübezahl' (1854), 'Albin' (1856), 'L'Ombre' (1869), achieved but small success.

Flotsam, Jetsam, and **Ligan,** in law, flotsam, or floatsam, is derelict or shipwrecked goods floating on the sea; jetsam, goods thrown overboard which sink and remain under water; and ligan, goods sunk with a wreck or attached to a buoy, as a mark of ownership. When found such goods may be returned to the owner if he appear; if not, in England, they are the property of the crown. See DERELICT; SALVAGE.

Flounder, any of several of the more common and useful flat fishes (q.v.) of northern waters. The commonest American species are the "summer" and "winter" flounders. The latter (*Pseudopleuronectes americanus*) is dark rusty brown, more or less spotted, about 15 inches long when large, and weighs one to two pounds. It is caught in the colder months from Chesapeake Bay to Labrador, and is excellent eating. The "summer" flounder (*Paralichthys dentatus*) becomes twice as large, is light olive brown, studded, when adult, with numerous small white spots, and is excellent eating. The "four-spotted" flounder (*P. oblongus*), and the

Gulf species (*P. albiguttus*), are closely related. On the Pacific coast several good species are known; and the British coast has a valuable species in *Pleuronectes flesus*, closely resembling the plaice (q.v.).

Flour and Meal Insects. Various forms of small whitish caterpillars and darker-colored "worms" are commonly found in flour and meal and manufactured cereal products of different kinds. The most prominent of these is the Mediterranean flour moth (*Ephestia kuehniella*), which has been termed a veritable scourge in flouring-mills. It was practically unknown as a pest until 1877, and in North America is still limited to portions of California, Minnesota, New York, and Pennsylvania, where flour-milling is an important industry. The moth has a wing-expanse of a little less than an inch, and is of a pale lead-gray color. The caterpillars are whitish, with long but inconspicuous hairs, and make the trouble while searching for a proper place for transforming to the pupa stage. Wherever it crawls it drags after it a large quantity of silk, with the result that flour becomes felted together and lumpy and the mill machinery gets clogged, requiring frequent and expensive stoppages. The entire life cycle of this insect may be accomplished in 38 days, hence in well-heated mills or other buildings inhabited by the insects from four to six generations may be produced. When a mill is found infested the entire building must usually be fumigated. Sometimes a whole district becomes overrun, and in this case great care must be observed that the insect does not spread from one mill to another. Various remedies are used for eradicating the pest, including the free use of bisulphid of carbon and hydrocyanic-acid gas, the use of "steam-sweepers" and "elevator brushes."

The Indian-meal moth (*Plodia interpunctella*) somewhat resembles the preceding, but is smaller; the outer halves of the fore-wings are dark greasy brown with metallic reflections, and the larva usually has a reddish or greenish tinge. It has the same habit of webbing up flour, but is not so great a pest as the Mediterranean flour-moth, possibly because it has a larger range of food material, feeding on nearly all forms of dried vegetable matter, among which are dried fruits and jellies, which have earned it the title of "pantry moth." It is to be found in nearly every store and household, and particularly where dried vegetable foods are neglected for any length of time. The meal snout-moth (*Pyralis farinalis*) is rarer than the preceding, and seldom does injury to flour or meal, although it spoils clover hay.

Two species of beetles (*Tenebrio molitor* and *obscurus*) and their larvæ are popularly known as "meal-worms," both in this country and abroad. The former is a shining brown beetle over half an inch long, and produces a yellow meal-worm: the latter is dull black, and produces a dark brown meal-worm. They are most apt to be troublesome in dark locations, in feed-stores and in stables; but are useful when raised under control, since they are salable as food for mocking-birds, nightingales, and other cage birds.

Flour beetles or "weevils" are little flattened reddish beetles of the same family (*Tenebrionidæ*) as the meal-worms and are great pests in mills and storehouses. The chief source of annoyance from these insects is due to their imparting a highly offensive and persistent odor to the substances which they infest, which include various drugs, snuff, capsicum, ginger, dried peas and beans, baking powder, nuts, and cabinets of dried insects. Several species occur in America. They differ somewhat in structure and in habits, but may be controlled by the use of bisulphid of carbon.

Flourens, Marie Jean Pierre, mä-rē zhŏṅ pē-ār floo-roṅ, French physician and physiologist: b. Maureilhan, department Hérault, 15 April 1794; d. Montgeron, near Paris, 6 Dec. 1867. His first scientific writings, which were distinguished by their perspicuous style and analytical precision, appeared in 1819. In 1828 he was elected a member of the Academy of Sciences, in 1830 was appointed to the chair of comparative anatomy at the Jardin des Plantes, and in 1833 succeeded Dulong as permanent secretary to the Academy of Sciences. In 1840 he was admitted a member of the French Academy. In 1846 he was created by Louis Philippe a peer of France, but he was deprived of this dignity by the revolution of 1848. Flourens combined with profound scientific knowledge great literary talent. His works are very numerous, but the following may be mentioned particularly: 'Recherches expérimentales sur les Propriétés et les Fonctions du Système nerveux' (1824); 'Expériences sur le Système nerveux' (1825); 'Developpement des Os' (1842); 'Anatomie de la Peau' (1843); 'Mémoires d'Anatomie et de Physiologie comparées (1844); 'Buffon' (1844); 'De l'Instinct et de l'Intelligence des Animaux' (1841); 'De la Longévité' (1854); De la Vie et de l'Intelligence' (1858); 'Œuvres de Buffon' (1853–5); 'Des Manuscrits de Buffon' (1859); 'Éloges historiques' (1857). Flourens was the first to demonstrate experimentally that the substance of the animal body undergoes a constant process of renewal.

Flour Milling, American. Flour milling is of two kinds; one the primitive, small industry that supplies a natural local demand; the other a commercial enterprise, which goes into the open markets for its raw material and disposes of its product in the markets of the world. One dates from the early settlement of the country, or as soon as wheat was grown in America; while the other had its beginning about the time of the Revolution, though it assumed no really great importance until after the middle of the last century. While the country has, and probably always will have, a large number of small mills situated in the rural districts, the flour-milling industry proper — considered commercially — is on a larger and more important scale than ever before. In fact, the census of 1900 gives it fourth place among the manufactures of the United States in value of products.

The small mill that supplies a purely local village or rural demand, may properly be termed an "agricultural adjunct." Therefore the history of farming in this country is the history of the grist-mill development. Yet its early growth is of some interest. In 1626, a horse-power mill was built on Manhattan Island, and a windmill in New England, near Watertown, about two years later. Windmills soon became common on the Atlantic coast. The first water-mill in New England was probably built on the Dorchester

side of the Neponset, in 1634. Before the middle of the century, New England was doing an export business, sending wheat and flour to Portugal. In 1649, Virginia had four windmills, five water-mills, and numerous horse-mills, and was also an exporter of wheat and flour. By 1678, New York had a considerable number of mills, and, moreover, had a monopoly on the process of the bolting of flour. The charter was repealed, however, in 1694.

For nearly 100 years following, the development of milling was but the reflection of the growth of the country, with some extension of trade in the West Indies and South America. Still, the process of milling was crude, and the industry, with perhaps a few exceptions, had hardly gone beyond the agricultural or farm-product basis. Not until the mills began to centralize, until "milling centres" began to form, did the industry commence to shape itself on a commercial basis. This period may be said to have commenced shortly after the Revolution. Yet milling then, as compared with to-day, was as the stage coach of 1776 compared with the luxurious express train of the present century. Still, the mills of Delaware, on the Brandywine, were celebrated for their flour. This district had 130 mills within a radius of 40 miles, and Wilmington was an exporter of "superfine" flour.

The next milling centre of importance, and which later became first, was Baltimore. In 1787 the mills of that city made 325 barrels of flour daily, and it was there that the first marked improvements in the process of making flour were adopted. Up to 1785 the different stages of milling were separate and largely done by hand, as they are even to-day in the Hungarian process. But Oliver Evans introduced the elevator and conveyor, and combined the different steps into a continuous system; thus dispensing with much labor, and making a saving in the cost of production. Owing to this improvement and to the slowness of the Delaware millers to adopt it, Baltimore became the more important centre, and the Patapsco River, with its fine water power, became celebrated during the next 50 years. In 1840, the Patapsco, within 30 miles in which the fall is 800 feet, had 60 mills, which ground several hundred thousand barrels of flour a year. A considerable export trade was done with the West Indies.

Still another milling centre was formed at Richmond, Va., at the falls of the James River. The district is now not known as a milling point; the milling business has passed, leaving nothing but a memory of its one-time importance. In 1845, Richmond had the largest mills in the United States, the "Gallego" and the "Haxall." The number of mills there was 21, and their trade besides the local and nearby territory, was with South America. The "Gallego" mills, in 1864, had 31 pairs of buhrs or millstones, with an annual capacity of 190,000 barrels of flour. The "Haxall" mills had a capacity of 160,000 barrels.

From the Atlantic coast the milling centre began its westward march, following the wheat-fields. Rochester, N. Y., in the Genesee valley, was the next centre, and while it retained its importance for many years, it succumbed to newer districts farther to the west. At one time Cincinnati assumed considerable importance as a milling point, but St. Louis was destined to follow Rochester as the centre of a great milling district. While Rochester at the present writing has lost its importance, St. Louis has retained its mills, but has been outclassed by the younger city of Minneapolis. Milwaukee has also developed a slightly greater milling capacity than St. Louis. Thus the milling centre has finally fixed itself, apparently for all time, at Minneapolis. For many years, however, Rochester was recognized as the first milling city of the country, having as early as 1835, no less than 21 mills, with 95 run of stones. The flour from these mills was sold throughout the Atlantic coast States. In 1865, the flour output of Rochester was 800,000 barrels.

With the development of the great central wheat States, mills were built wherever there was increased population. In 1840, Ohio, Kentucky, Indiana, Illinois, and Michigan had a total of 1,200 mills, producing about 30 per cent of all the flour made in the country, yet very few of them belonged to the commercial class, such as those of the centres. The scattered country mills supplied the farming communities and the small towns, while the few larger mills and those of the centres supplied the large markets and the districts where wheat was not raised.

St. Louis began as a milling point in 1840, with two small mills. The city, due to its location, was then the principal point in the West. By 1860, the St. Louis mills were making 800,000 barrels of flour a year. In 1870 the output was over 1,000,000 barrels, and in 1880 over 2,000,000. St. Louis led all other centres until 1881, when Minneapolis began its rapid development. Among the other important milling centres are Toledo, Buffalo, Detroit, Indianapolis, Chicago, Kansas City, and Milwaukee, already mentioned.

A small, crude mill was built at the Falls of St. Anthony, now Minneapolis, by a detachment of soldiers in 1823, but the first merchant-mill was erected in 1854. The first flour was shipped to the east from Minneapolis in 1859. In 1865, the city had six mills, with a total daily capacity of 800 barrels. It was not until 1878 that the total annual output reached 1,000,000 barrels, and the direct export shipments were about 100,000 barrels.

In tracing the movement of the milling centre, it may be of interest to investigate the causes that brought a large number of milling interests together. The importance of the first milling district, the Brandywine, in Delaware, was evidently principally due to convenient wheat supplies. The Patapsco district owed its importance to fine water power, local wheat supplies, and water transportation, while Richmond would probably never have gained any prominence but for its water power, though its transportation facilities, down the James, enabled it to build up an export trade. The fine water power of the Genesee River, at Rochester, was a natural inducement for the miller to build there, while the rich agricultural valley gave an abundant supply of raw material. Then, too, the opening of the Erie Canal gave Rochester unexcelled transportation facilities to other markets. Until other conditions entered into the situation to affect it, Rochester was particularly favored. St. Louis had no water power, but it had river transportation both for wheat and flour, and it was for years the principal distributing point for a vast

territory. Milwaukee was an early wheat market and was the lake outlet for the Northwest before Chicago became a shipping point of importance. It was thus early that mills began to be built at Milwaukee, and its milling importance may be ascribed to its favored position on the lake.

The greatness of Minneapolis as a milling centre is partly due to the water power from the Mississippi River and partly to the position of the city, which is the gateway between the wheat fields and the markets, but it is also largely due to the quality of the wheat of Minnesota and the Dakotas, the greatest spring-wheat territory in the world. Lastly, the pre-eminence of Minneapolis as a milling centre is due to the early business men of genius, who grasped the situation and made the name "Minneapolis" known the world over. Given all the other advantages,— geographical position, water-power, and even the annual production of some 200,000,000 bushels of superb hard spring wheat, — yet without the business genius and enterprise that dominated the early Minneapolis millers, the city might never have been known as the greatest flour-milling centre in the world.

The latest figures at hand show the following flour output at milling centres in the United States for 1902:

	Barrels.
Atlanta	315,000
Buffalo	1,415,300
Chicago	1,300,000
Detroit	567,000
Duluth	1,804,400
Kansas City	1,298,300
La Crosse	435,100
Minneapolis	16,329,800
Milwaukee	1,755,000
New York	1,760,700
Nashville	1,000,000
Philadelphia	301,500
Rochester	402,400
Richmond	218,200
St. Louis	1,625,900
Toledo	1,600,000

The present time may be called a commercial era in the flour-milling industry. The period from 1870 to 1900 might fittingly be termed the mechanical era, for during that time greater changes and improvements were made in the process than in all the 200 years preceding it. During the mechanical period, there was also the export era, when the building of new mills and the increasing output of old ones, together with the increase in wheat raising of the country, caused an over-production of flour, if domestic markets alone were depended upon. In fact, the increased output was to keep pace with the growing export trade. After reviewing the natural development of the milling industry, which up to 1870 was identical with the growth of the country, these three divisions,— the mechanical, the export, and the commercial,— seem most important.

No better review of the mechanical period, up to 1895, can be given that that written by the late Charles A. Pillsbury, of Minneapolis, who did more than any other one man to make the city in which he lived, and the wheat of the Northwest, known in every great market of the world.

In 1895, Mr. Pillsbury wrote:

Down to 1870, the milling process in the United States was that invented by. Oliver Evans, with some minor and gradual improvements. From 1787 the nether and upper millstones, the former stationary and the latter balanced to rotate upon it, ground the flour of America. The stones were set close together, to produce as much flour as possible at one grinding. This produced friction and heat, and often brought about chemical changes which injured the color, taste, and quality of the flour. In the early milling history of Minneapolis, when enterprising manufacturers rushed the speed of the stones to secure a large product, the flour came out dark, and so hot the hand could not be held in it.

Minneapolis spring-wheat flour then stood low in the scale, and was sometimes branded, at the request of buyers, " St. Louis flour from winter wheat." The hard spring-wheat, rich in gluten which made it tough, rendered difficult the separation of flour from bran, and thereby yielded a dark-hued flour which brought a low price in the market. The soft and starchy winter-wheat, on the other hand, yielded readily to the old low-grinding process; the bran was more easily separated, and the flour was lighter in color and less damaged by hard-grinding. The color and quality of spring-wheat flour were somewhat improved in the best mills by a reduction in pressure and speed and by scientific stone dressing; but the main difficulty remained. The difficulty in grinding spring-wheat by the old process was with the middlings, or that part of the kernel between the bran covering and the starchy central body. The middlings, although known to be rich in the gluten which gives wheat-flour its chief value with the baker and pastry-cook, were associated with the bran; and the richer the wheat in gluten, as in case of hard spring-wheat, the more difficult was the process of separation, because the gluten was the cause of the toughness.

The first experiments were made with a view to the purifying of middlings. In 1868, E. N. La Croix, a French millwright, came to Faribault, Minn., and experimented in making a middlings purifier, like one he had seen in France. In 1870 he removed to Minneapolis and continued his experiments. At length a machine was made, and a sample shipment of flour was sent to New York. Word came back by wire that the new flour was selling at 50 cents a barrel higher than other brands. The La Croix machine was crude and in some respects unsatisfactory, and George T. Smith produced a superior machine, different in many points, but retaining the same principle, and obtained a patent.

As a result of the new middlings purification process the mills using it added 50 cents a barrel to their profits in the first year, $1 the second year, and from $2 to $4 per barrel the third and fourth years. Thereupon George H. Christian, representing the Washburn mills, a number of head millers from other mills, and myself, representing the Pillsbury mills, went to Europe and made a thorough study of the Hungarian "high-milling" or gradual-reduction roller and middlings process. As a result some of the Minneapolis mills adopted the Hungarian process bodily, middlings purifier and all, and in a few years were compelled to throw away some of the complex machinery with which they were loaded. The Pillsbury mills, however, adopted only what seemed to be the best features of the Hungarian process, such as the rolls, made modifications all along the line, and retained the American middlings purifier invented by Mr. Smith. We found that the Hungarian system needed simplification to increase its efficiency, to save labor, and especially to avoid dangerous accumulation of mill-dust.

The new and improved high-milling system of Minneapolis and Minnesota thus established made the hard spring-wheat of the Northwest the best flour material on the globe, immediately added 10 to 15 cents per bushel to its market value, and gave Minneapolis flour the first place among the cooks and bakers of the world. By the new process chilled iron and porcelain rolls gradually came into use in place of the old millstones. The grain, in place of being ground in a single pair of millstones, was run through six or seven sets of rolls, being sifted and graded after each breaking by the rolls. The old process aimed to get as much flour as possible at one grinding; the new seeks to get as little flour as possible at the first two or three breakings. The old millstones were set so close together that the weight of the upper stone rested almost wholly upon the grain. The first rolls in the new process are set so far apart that the kernel is simply split for the liberation of the germ and crease. The old process sought to avoid middlings as far as possible, because they entailed loss of flour. The new process seeks to produce as much middlings as possible, because out of the middlings comes the high-grade patent flour. In the handlings of the middlings the new process exhibits the highest art. The gluten, which gives flour its strength or rising power, is saved and made available to the baker, and made a prominent source of profit both to the farmer who raises the wheat, the miller who grinds the flour, the baker who makes the bread, and finally to the consumer, in whom it is transformed into brain and muscle.

With the introduction of the new milling process came the big mills which have made Minneapolis famous, and the development of the spring-wheat industry which has made the Northwest known around the globe. In 1884 there were 23 mills equipped with the new process machinery and possessed of a daily capacity of 30,000 barrels.

The number of mills in Minneapolis has not increased since 1884, although the capacity has been largely increased. In 1884 the output was 5,317,600 barrels of flour, while in 1902 it was 16,329,800 barrels. This increase, without even the enlargement of any of the mill buildings, was due to improved and condensed machines. There are seven milling companies in Minneapolis, having 22 mills with a maximum daily capacity of 75,000 barrels of flour. The capacity of the individual mills is from 600 barrels daily to 15,000 barrels. The Pillsbury "A" mill, having the latter capacity, is the largest mill in the world. Four of the seven companies are small ones, having but one mill each. The mills of the three large companies have a maximum daily capacity of approximately 31,000, 27,500, and 18,000 barrels respectively. The greatest actual weekly flour production was 443,800 barrels, for the week ending 11 Oct. 1902.

Since the discovery of patent flour and the introduction of the rolls, particularly during the last 15 years, the energy and inventive genius of the mill furnishers have been directed toward economy of manufacture, to get the best out of the wheat at the least possible expense. As late as 1900, improvements were made that aided in economy of manufacture, but at this time the limit seems to have been reached in the percentage of high-grade flour that can be produced from the wheat. However, in view of what has been done, one dare not say that still further improvement cannot be made. In this connection a word should be said for patent flour. Much has been written denouncing it as unwholesome and inferior to whole wheat flours; and it has been said that it is over-refined; that the best part of the wheat is eliminated to produce a white flour. All this is without foundation. Chemical analysis and extensive digestive experiments by the United States Agricultural Department prove that white flour bread is not only more easily and completely digested than whole wheat or graham flour bread, but that it contains a greater percentage of the properties that go to nourish the human system. Patent flour is made from the middlings, or that part of the wheat lying between the bran and the starchy central portion of the berry, and it is rich in a high quality of gluten. There is probably no other manufactured article in the world that is sold as cheaply, compared with the cost of the raw material, as is patent flour.

Like the development of milling in this country, the export flour business was not placed upon a high commercial basis until the Minneapolis millers, in the early eighties, began a systematic campaign. From that time until 1900, the export trade increased steadily. Since then some adverse factors, which will be touched upon further on, have arisen. The early mills of the Atlantic coast, as already mentioned, were the first to export flour, probably to meet an actual demand because these mills were the most convenient to buy from, rather than to supply a trade that had been built up by the mills. The early export business doubtless came of itself — a natural demand. The uncertain export flour trade of the first part of the last century reached its climax in the forties, and then, when competition of European mills was felt, dropped off markedly, about the year 1850. During the next 25 years large amounts of wheat were exported annually, while the percentage of the flour production that was sent out of the country was small. The flour trade with the United Kingdom which is now an important part of the export flour business of this country, fell almost entirely away by 1865. This, perhaps, was because the American millers could not hold their own on even terms against the foreign millers, who were then becoming more aggressive and progressive than ever before. The building up of the export flour trade, beginning with about 1875, would make an interesting chapter of commercial history, for this time it was built on a foundation that no fair competition could shake.

The following table, which gives the flour output and the direct export shipments of the Minneapolis mills by years for the last 25 years, will furnish some idea of the development of the export business of the country:

Year	Output Barrels	Export Barrels
1902	16,329,800	3,362,300
1901	15,921,900	3,897,900
1900	15,082,700	4,702,500
1899	14,291,800	4,009,100
1898	14,232,600	4,052,600
1897	13,635,200	3,942,600
1896	12,874,900	3,707,300
1895	10,581,600	3,080,900
1894	9,400,500	2,370,700
1893	9,377,600	2,877,300
1892	9,750,700	3,337,200
1891	7,877,900	3,038,100
1890	6,988,800	2,107,100
1889	6,088,900	1,953,800
1888	7,056,700	2,197,500
1887	6,574,900	2,650,000
1886	6,168,000	2,288,500
1885	5,221,200	1,834,500
1884	5,317,700	1,805,900
1883	4,046,200	1,343,100
1882	3,175,900	1,201,600
1881	3,143,000	1,181,300
1880	2,051,800	799,400
1879	1,551,800	442,600
1878	940,800	107,200

A falling off of the exports will be noticed for 1901, which was true also of the general export business of the country. It was not due to the competition of other countries, but to a discrimination in freight rates, inland and ocean, whereby wheat could be exported cheaper, relatively, than flour.

The table which follows gives in condensed form a clear impression of the importance of the flour industry. Only the merchant-mills are considered. Over 5,000 small grist-mills have been omitted, as they properly belong to an agricultural review rather than to a sketch of milling.

A classification of the merchant-mills of the country for 1900 giving the States having a yearly product of $1,000,000 or over, results as shown in the following table — the second column shows the rank of the States.

The census report of 1900 says of flour milling:

"In order to form a correct idea of the magnitude of the milling industry in any given locality, it will be sufficient to compare with the number of establishments, the capital invested and the number of wage-earners employed. For in-

State or Territory	Rank	No. of mills	Raw Material—Wheat: Bushels	Raw Material—Wheat: Cost	Product—Flour: Barrels	Product—Flour: Value	Average daily product	Average value per barrel	Average bus. wheat per barrel	Average cost per bushel
Minnesota	1	324	102,921,426	$66,641,825	22,705,165	$72,381,659	234	$3.19	4.5	$0.65

Total		8,987	481,658,179	$312,632,026	100,823,820	$342,119,777	37	$3.39	4.8	$0.65

stance, in the State of Minnesota, there were 512 milling establishments (including small grist-mills not included in the foregoing table) representing a capital of $24,125,781, and employed 4,086 wage-earners. The average capital invested for each establishment was $47,121, and the average number of wage-earners for each establishment was eight. Compare with this some other locality having approximately the same number of establishments, for instance, Arkansas: the total number of establishments in Arkansas was 410, representing a capital of $1,183,052, the number of wage-earners was 443, the average capital for each establishment was $2,885, and the average number of wage-earners for each establishment was one. Again, in the case of South Carolina, the total number of establishments was 556, the capital invested was $652,553, the number of wage-earners was 281, the average amount of capital invested in each establishment was $1,174, and the average number of wage-earners was only about equal to one for every two establishments in operation."

The following table shows the number of flour-mills having an annual production of 1,000 or more barrels, in States having a cereal mill product of $1,000,000 and over in which wheat flour is the chief product. (Many small mills grind rye and corn principally, and a little wheat):

One of the more recent features of the flour trade has been the considerable business by Minneapolis mills with Australia, the direct result of the crop failure there in 1902. Minneapolis mills also send flour to South Africa, and have

made trial shipments to China, and there is a possibility of a trade being developed in the Far East. Pacific coast mills have introduced their flour in China and Japan, but as yet those countries are not bread-eaters. The northern transcontinental railroads, which will soon connect with an Asiatic steamship line owned by one of the roads, promises to revolutionize some of the native customs. And if China can be induced to become a bread-eater, the export flour business via the Pacific will increase very rapidly.

Commercially, the flour-milling industry has made as great progress as it has mechanically. As the skill of the mill furnisher and the operative miller has separated the best parts of the wheat into a refined and delicate product, yet retained the most wholesome and nourishing properties, as compared with the dark and coarse flour of an earlier milling age, so the work of the merchant miller of to-day differs from that of the miller of the early part of the last century.

Milling is now more a commercial and less a mechanical proposition than ever before. Mechanical perfection has nearly been reached; and it is easier to keep a machine running smoothly than to invent and perfect the machine. Perhaps the greatest commercial problem is that of competition, not only of individual millers, but of nations. It is first a competition for the raw material, and then for the flour trade. Almost every country desires to be a manufacturing nation to some extent, whether a wheat-growing country or not, therefore encouragement is given to home industries. Then, too, Europe buys large quantities of American wheat when the price is low, and later this enters into competition with American flour in foreign markets. Therefore, the flour trade is on a world-wide basis, and the large miller, more than ever before, has great commercial, rather than mechanical, problems to solve. Never, however, will he feel they have all been solved, until the United States exports the surplus of its wheat crop as the manufactured article of flour, rather than a large part of it as raw material.

HENRY L. LITTLE,
Mgr. Pillsbury-Washburn Flour Mills Co., Ltd.

Flour, Wheat, a finely ground meal used for food. Ordinary white or bread flour, of which there are a number of grades, is composed of the interior portion of the wheat kernel subjected to processes of pulverization and purification. In the preparation of white flour either a portion or all of the bran, germ, and other offal parts are removed. When the entire wheat kernel is ground into a meal, it is called graham flour. When a portion of the bran is removed but the germ and fine bran are retained, the product is called purified graham or entire wheat flour.

The history of wheat milling shows that many and gradual changes have taken place since the early times when wheat was pulverized between stones to the present time when it is reduced by steel rolls. Wheat has variously been reduced to flour by means of stone crushers, saddle stones, and stone mortars. The ancient Greeks, Romans, Chaldæans, and Egyptians used saddle stones for grinding wheat into flour, the wheat being placed in a concave stone and rubbed with a convex stone rocked backward and forward. Saddle stones are still in use among the native Africans, and are known to have been used from earliest times. They are also found among the remains of the prehistoric Swiss lake-dwellers and mention is made of them in the earliest literature. Their use appears to have been common among all primitive races and they are in use to-day by many barbarous and half-civilized nations. Near the beginning of the Christian era, querns or crude crushers in which the parts were fitted mechanically came into use. The upper stone or pestle revolved upon the lower concave stone. The quern was the forerunner of the millstone. Querns are still in use in some Asiatic and European countries. The millstone came into use about the 14th century and was the result of gradual evolution from the stones shaped by nature and operated by hand to specially hewn and dressed millstones propelled by various forms of motive power. In ancient times, flour was prepared in each household, the grinding being done by women, slaves, and menials. During the Middle Ages when the feudal system was at its height, crude flour-mills or querns formed a part of the outfit of each castle or estate. In some countries, the right to operate these mills was vested in the clergy, and in early English history frequent mention is made of contests between the people and the landlords and clergy relative to their right to operate these mills or querns.

Until the beginning of the 17th century wheat milling was simply a crude agricultural industry, the earlier mills being operated by slaves, then by oxen. Later water wheels and windmills were used as motive power. About 1820, a flour-mill was first operated by steam. At the present time, some mills are operated by electric power.

About 1870 the present roller process of flour production was introduced from Hungary into America. The process consists of the gradual reduction or pulverization of the floury portions of the wheat kernel between corrugated and smooth steel rolls and of the purification of the product by means of aspirators, sieves, and bolting cloths. During the process of milling, the granular middlings undergo gradual reduction and are passed from break to break. At each break or grinding, the fine flour is removed by bolting, the middlings are separated and passed to other rolls and the tailings are subjected to further reduction. Before passing to the rolls, the wheat is screened to remove loose dirt and weed seeds, and occasionally washed to remove adhering dirt and debris; then dried or tempered with steam, as may be necessary in order to more easily effect reduction. The first break simply flattens the kernels after splitting them in halves along the longitudinal groove. The germ is pinched off by the rolls and is readily separated. The flour passes automatically from one break or set of rolls to another. Each break is regulated so as to pulverize a little finer than the preceding one. Each stream is purified by passing through reels and by subjection to aspirators which remove the fine dust and dirt by suction. Finally the various streams are blended so as to form different grades of flour. In large mills, the cleaned wheat is usually elevated to the top of the mill, and then passed on to the rolls, and the various

streams blended in such a way that the final flour product is obtained after being separated into 40 or more separate streams.

The introduction of the roller process of miling has made it possible to use varieties of wheat from which high-grade flour could not be made by the old stone process. By the roller process of reduction, the granular middlings which were formerly excluded from the flour and sold as a distinct product for animal feeding are now reduced and added to the patent grades of flour. About 75 per cent of the cleaned wheat is returned as merchantable flour, 72 per cent being straight grade or ordinary white flour. In ordinary milling, the grades are as follows: (1) first patent; (2) second patent; (3) straight, sometimes called standard patent; (4) first clear; (5) second clear; (6) red dog. First patent flour is the highest grade manufactured. Its gluten has greater power of expansion and absorbs more water than that from any other grade. First patent flour produces the whitest and largest sized loaf of bread. Second patent flour is similar to first patent, but the bread is slightly darker in color and the gluten does not possess quite so high a power of expansion. First clear grade flour is obtained after the removal of the first and second patent grades. This flour is slightly darker in color and produces a smaller sized loaf than the patent grades. Second clear or low grade is the name given to a small amount of flour obtained after the removal of the first clear. About 12 per cent of the cleaned wheat is recovered as first clear flour and about .5 per cent as second clear or low grade. When the wheat is milled so that the first and second patents and the first clear are all obtained as one flour, the product is called straight grade. This is the flour that is most extensively used for bread-making purposes. Straight flour is the sum of the first and second patents and the first clear. The lowest grade of flour manufactured is called red dog; it is dark in color and possesses but little power of expansion. It is secured largely from those portions of the wheat kernel adjacent to the germ and aleurone layers. Red dog flour is not generally used for human food, but is employed in the arts, as for foundry purposes, for the feeding of animals and occasionally in the preparation of some cereal breakfast food. It has a high per cent of protein or nitrogenous material, but is not valuable for bread-making purposes because the gliadin and glutenin (see Bread and Bread Making) are not present in the right proportions to form a balanced gluten. By blending the different standard grades of flour, various commercial grades sold under different trade names are secured. The composition and properties of different kinds of flour result from the kind of wheat used in preparation (see Wheat) and the method of milling employed. The percentage amounts of bran, shorts, and standard grades of flour obtained by the roller process vary with different kinds of wheat. Some wheats yield more flour than do others. The average yields are approximately as follows:

	Per cent of cleaned wheat recovered
1. First patent	56.0
2. Second patent	60.8
3.* Straight or standard patent	72.6
4. First clear or first bakers	11.8
5. Second clear or low-grade	0.5
6. Red dog	1.9
7. Shorts middlings	11.6
8. Bran	13.4

*Straight grade flour is composed of first and second patents and first clear grade.

By the roller process of milling, the germ is excluded because of its poor bread-making properties and its fermentable nature. The wheat offals of which shorts and bran form the main portion are by-products used for the feeding of animals. About 25 per cent of the cleaned wheat finds its way into the offals. Bran is the episperm or outer covering of the wheat kernel. As human food, it is indigestible and does not contain any appreciable amount of available nutrients. As an animal food, however, it has a high value. Shorts consist mainly of the fine bran mixed with some of the floury portions of the wheat kernel. When the wheat screenings, consisting of weed seeds and other refuse are ground and mixed with the shorts, the product is known as shorts feed. When the germ is mixed with the shorts, the term shorts middlings is used. By some processes of milling, the germ is obtained separately. From 5 to 7 per cent of the weight of the cleaned wheat is recovered as germ.

Wheat flour is composed of starch, gluten proteids, water, fat, ash, or mineral matter, and small amounts of other compounds, as sugars, cellulose, organic acids, amids, etc. The proximate composition of the different kinds of flour when milled from the same lot of hard wheat is given in the following table:

	Water, Per Cent	Protein (N x 5.7) Per Cent	Fat Per Cent	Carbohydrates Per Cent	Ash Per Cent	Phosphoric Acid Per Cent	Acidity Per Cent	Heat of Combustion per Gram. Determined. Calories
Wheat	8.50	12.65	2.36	74.69	1.80	0.75	0.18	4.140
First patent flour	10.55	11.08	1.15	76.85	.37	.15	.08	4.032
Second patent flour	10.49	11.14	1.20	76.75	.42	.17	.08	4.006
Straight flour	10.54	11.99	1.61	75.36	.50	.20	.09	4.050
First clear grade	10.13	13.74	2.20	73.13	.80	.34	.12	4.097
Second clear grade	10.08	15.03	3.77	69.37	1.75	.56	.27	4.267
Red dog flour	9.17	18.98	7.00	61.37	3.48	....	.59	4.485
Shorts, middlings	8.73	14.87	6.37	65.47	4.56	....	.14	4.414
Bran	9.99	14.02	4.39	65.54	6.06	2.20	.23	4.198

From the table, it will be observed that there is a gradual increase in the amount of ash, proteids, and fat from the first patent flour to the red dog or lowest grade of flour. In fact, the variations in ash content of the different grades of flour are so regular that the percentage of ash can be taken as an index to the grade of flour. The highest grade flours, as first patent, contain least ash because of the more perfect exclusion of the bran and endosperm parts. There is but little difference in chemical composition between the first and second grades of patent flour, second patent, containing more fat, slightly more protein and germ, and less carbohydrates than first patent. In the straight grade or ordinary bread flour, there is only from .6 to .7 per cent less nitrogenous material as

proteids than in the wheat from which it was milled. Second clear and red dog flours contain a large amount of protein, fat, and ash, and judged by their proximate composition only, would appear to have a higher nutritive value than the patents or straight grade flours. But when judged on the basis of digestibility, available nutrients and physical character of the bread, these flours are found to have a much lower value than the patents or straight grade flours. For nutritive values, see article on BREAD AND BREAD MAKING. During the process of milling, the flour particles pass through bolting cloths containing from 12,000 to 16,000 meshes per square inch, which results in even and fine granulation of the flour particles. The character of the flour particles as angular or spherical depends largely upon the character of the wheat, as hard or soft, and to a less extent upon the method of milling. The flour granules from hard wheat are angular and have a sharp feeling akin to fine sand, while soft wheat flours produce small spherical particles lacking in gritty feeling.

In the testing of flour, particular attention is given to physical characteristics, as color, purity as indicated by absence of dirt and fine pieces of bran, capacity to absorb water, quality of gluten and character of the bread product. For bread-making purposes, the quality of the flour depends largely upon the amount and quality of the gluten. The gluten is obtained by making a stiff dough of the flour and then washing this dough with an abundance of water, which removes the starch, leaving the gluten in the form of a gum-like mass. Gluten from high-grade flours is firm, elastic, white or of slightly yellowish tinge and possesses good qualities of expansion. Poor gluten is dark in color, sticky and lacking in elasticity. The color of the flour depends largely upon the quality of the wheat and the method of milling employed. Some wheats produce creamy or yellowish flours, others chalk white flours and others dark-colored flours. Dark-colored flours, however, produce bread of inferior quality; creamy and white flours producing the best grades of bread. The granulation of the flour is also taken as an index of its quality, as it reveals to the experienced miller and baker the character of the flour. Comparative baking tests are generally resorted to in order to determine the bread-making value of flours. By these tests, under uniform conditions with the same amount of flour, yeast, water, etc., in each case, differences in the bread-making qualities of the flour are readily revealed. When flour is stored for a long time, it sometimes becomes inferior through fermentation changes. Ordinarily, flour will not deteriorate until after it has been kept for 10 months or more. Some wheats produce flours of better keeping qualities than do others. The soundness of the wheat, as freedom from rust, smut or other blemishes, influences the keeping qualities of flour as well as does also the process of milling, particularly the extent to which the cleaning and purification are perfected.

Wheat flour is not ordinarily adulterated, although at times attempts have been made to add other cereals and mineral adulterants. The national flour law requiring all mixed flours to be branded has prevented extensive adulteration. At one time, corn flour produced by milling corn, was used for adulterating wheat flour. This, however, was only practised for a very short time when corn was cheap and wheat was high in price. The blending of wheat and corn flours has never proven successful and the practice since the passing of the national flour law has been discontinued. Wheat flour appears to be less subject to adulteration than many other articles of food. See ADULTERATION.

Wheat flour is used not only for bread making but for other purposes. Crackers, cakes, pastry and many food articles are made largely of flour. Flour is also used in the arts and industries and in various manufacturing operations. The comparative value of bread made from different kinds of flour, as graham, entire wheat and straight, is discussed in the article BREAD AND BREAD MAKING.

It is estimated that four and a half bushels of wheat, equivalent to about 200 pounds of flour, are consumed annually per capita in the United States. The consumption of flour as food has, during recent years, gradually increased. Some political economists and scientists have feared that at no distant date the consumption of flour would exceed the production of wheat. But improved methods of agriculture and the opening up of large tracts of land suitable for wheat culture, as in northwestern Canada, render this improbable. From earliest times wheat and wheat flour have taken an important part in the dietary of man and there is every reason to believe that it will continue to be one of his staple articles of food. The extent to which it should be used in the dietary depends largely upon the individual and the cost of food. Ordinarily wheat flour is one of the cheapest articles of food, and when it forms a part or even the main portion of a ration, it supplies a large amount of nutrients in a digestible form and at a low cost.

HARRY SNYDER,
Professor of Agricultural Chemistry, University of Minnesota.

Flow'er, Benjamin Orange, American editor and author: b. Albion, Ill., 19 Oct. 1858. He was for some years the publisher and editor of the 'Arena' at Boston. Among his numerous works are: 'Civilization's Inferno; or Studies in the Social Cellar' (1893); 'The New Time' (1894); 'Persons, Places, and Ideas'; 'Gerald Massey: Poet, Prophet, and Mystic' (1895); 'The Century of Sir Thomas More' (1896); 'Lessons Learned from Other Lives.'

Flower, Frank Abial, American historical writer: b. Cottage, N. Y., 11 May 1854. Has written several local histories: 'Old Abe, the Wisconsin War Eagle' (1880); 'The Life of Matthew H. Carpenter' (1883); 'History of the Republican Party' (1884).

Flower, Roswell Pettibone, American financier: b. Jefferson County, N. Y., 7 Aug. 1835; d. Eastport, Long Island, 12 May 1899. He began his business and political career in Watertown, N. Y., where he organized the Jefferson County Democratic Club. His success in politics attracted the attention of Samuel J. Tilden, through whose influence he was appointed chairman of the Democratic State Committee in 1877. Four years later he was elected to Congress, and in 1886 was appointed president of the Subway Commission. He was re-elected to Congress in 1888 and 1890, and in 1891 was elected governor of New York. From the close

of his term till his death he applied himself to the interests of his large banking house and to a systematic course of philanthropy.

Flower, Sir **William Henry,** English zoologist: b. Stratford-on-Avon 30 Nov. 1831; d. London 1 July 1899. After a medical training he served as an assistant-surgeon in the English army during the Crimean war; in 1861 was appointed conservator of the museum of the Royal College of Surgeons; and in 1870 Hunterian professor of comparative anatomy in the same institution. In 1884 he was appointed director of the natural history departments of the British Museum, which two or three years before had been removed to their new quarters at South Kensington. From this post he retired in 1898. In 1889 he was president of the British Association meeting at Newcastle-on-Tyne. He was made a knight commander of the Bath in 1892. Several important treatises came from his pen, including 'Introduction to the Osteology of the Mammalia' (1870, 3d ed. 1885); 'Fashion in Deformity' (1881); 'Introduction to the Study of Mammals, Living and Extinct' (1891); 'The Horse: a Study in Natural History' (1892); and 'Essays on Museums and other Subjects connected with Natural History' (1898).

Flower, that part of the spermatophytous (phanerogamous) plant which consists of the organs of reproduction, frequently, but not necessarily, accompanied by protecting envelopes. In common usage, the word "flower" is applied to those related structures only in which one or both sets of floral envelopes are present and rather conspicuous.

Parts: Their Position and Functions.— The end of the flower stalk upon which the parts of the flower are grouped is known as the torus or receptacle. In a complete flower the floral envelopes are double, composed of two whorls or circles, alternating with each other; the outer series consisting commonly of green or greenish leaves named sepals, and together forming the calyx; and the inner series, of leaf-like parts, usually of a delicate texture, and of some other color than green, named petals, and together constituting the corolla. The term perianth is sometimes applied to the floral envelopes taken together, but it is generally restricted to those flowers in which only one of the series is present, at least in appearance, as in the lily, and in the common marsh-marigold; or in other instances where the limits of the calyx and the corolla are not easily distinguished. The organs of reproduction are the stamens, or fertilizing organs, forming a whorl within the floral envelopes and known collectively as the andrœcium; and the pistils at the centre of the flower, containing the ovules or undeveloped seeds, and known as the gynœcium. The essential part of the stamen is the anther or pollen sac, having usually two cells attached by a connectile to one another and to the stalk, called a filament, at the summit of which they are placed. The insertion or place of attachment of the stamens varies. In the lily, the buttercup, and the marsh-mallow the stamens are seen to arise directly under the gynœcium, and are accordingly described as hypogynous; in the strawberry and cherry they arise in a higher circle and upon the calyx and are termed perigynous; while in the iris, the rose, and blueberry they are inserted upon the top of the ovary, and are said to be epigynous. (Plate I., Figs. 3, 4, 5.) In the absence of the filament the anther may be sessile on the receptacle, calyx, petals, or ovary, or be adherent to the style (as in *orchis*). The essential parts of the pistil are the ovary and the stigma. The former is the rudimentary seed vessel. The latter, which is intended to receive the pollen upon its viscid surface, is connected with the ovary by a stalk known as the style, or is sessile upon it, as in the poppy. The pistil may be formed of a single carpel or of a number of carpels united by their lower parts to form a compound pistil. The number of carpels represented in such a pistil may be determined by the number of styles; by the number of free stigmas (though a single carpel is sometimes accompanied by a two-lobed stigma); by the seams, lobes, or angles of the ovary; by the cells, by the character of the placenta, or ovule-bearing portion of the carpel. The ovules, or rudimentary seeds, are borne upon the inner or ventral suture formed by the united edges of the carpellary leaf constituting the seed-vessel. In a "compound" pistil the single carpels may be closed, as in a "single" pistil, and joined at their sides and ventral sutures; or they may be open and joined by their edges. In the first case there will be in the compound ovary, as many cells as there are carpels, and the placentæ will meet at the axis. In the second there will be but one cell and the placentæ will be parietal. There are, however, many intermediate conditions, as in the poppy where the inflected margins of the carpels carry the placentæ to the centre. The apparent anomaly of a free axial placenta in the single cell of a compound ovary is found in the purslanes and in the pinks. The delicate partitions or dissepiments have very early disappeared. The ovules vary in number from one to hundreds. They are sessile or borne on a stalk called the funiculus. In direction they are horizontal, ascending (pointing obliquely upward), erect from the base of the cell, pendulous from near the top of the placenta, or suspended from the summit. The ovule-body is surrounded by an integument of one or two coats, which does not meet at the summit. The minute opening thus left is known as the micropyle. Within the ovule-body is the embryo-sac, which contains the endosperm and one or more germ-cells. The simplest form of pistil is that of the gymnosperms, which consists of open scales bearing two or more ovules on the inner face next the scales.

The chief function of the calyx is protection, an office which it shares with the corolla, especially while the more delicate organs are in the bud. When the corolla is lacking, the calyx frequently assumes some of its characteristics, becoming more conspicuous and of finer color and texture, the marsh-marigold and purple clematis furnishing examples in point. The bright hues or markings of the corolla serve to attract the insects that play such an important part in the pollination of the flower. The andrœcium has for its function the producing and scattering of the fructifying pollen, which falls from the anthers when they open at maturity. The gynœcium is devoted to the development of seed from the ovules.

Evolution of the Flower.—The recognition of the flower as a modification of the stem and leaves, adapted to the purposes of reproduction, gives a key to its morphology, throwing light on

innumerable variations of arrangement and structure and even on such details as scent, color, and the production of nectar. This conception of the flower was of fundamental importance in the transition from the artificial to the natural system. The shortening of the axis aggregates the transformed leaves and a growth is produced in which the arrangement of the true leaves on the stem is still the regulating principle, whether there be an alternating succession or a whorled (cyclic) grouping, the more developed flowers following the latter order, with limited number of parts, generally definite for certain large groups. Flower buds, like leaf buds, are terminal or axillary. The prefloration or æstivation of the sepals and petals, individually considered, is similar to that of leaf buds, being convolute, revolute, or involute. The metamorphosis of the leaf is easily traced in certain flowers. In the peony the transition from leaves to bracts and thence to petals is gradual, as is the change in the sweet-scented shrub (*Calycanthus*) from sepals to petals. In the white water-lily the gradations between the pistil and stamen are finely illustrated. It does not follow that the order of development is from the former to the latter. That the essential organs are of earlier origin than the floral envelopes is indicated by the fact that the latter are wanting in the gymnosperms, which are older and less developed forms than the phanerogams (spermatophytes). In the anther we recognize the infolded leaf-blade, in the filament its petiole, and in the pollen a development from the parenchyma. In the pistil the carpellary leaf may be traced, with its lengthened apex forming the style. The double-flowering cherry offers an interesting example of the reversion of the pistil to the form and color of the true leaf. The interpretation of the ovule as a transformed bud upon the edges of the carpellary leaf is confirmed by the fact that the leaves of *Bryophyllum* and certain other plants produce buds upon their margins or upper surface. Even the stipule of the leaf has its homologue in the floral structure. What is called the outer calyx or epicalyx of the strawberry may be regarded as the united stipules of adjacent sepals. That portion of the stem which becomes the floral axis sometimes undergoes striking modifications in its function as a receptacle. In the wild geranium it is extended into a slender beak, while in the rose-hip it becomes urn-shaped. The fig and the strawberry are succulent receptacles, the one hollow and the other convex. In investigating the morphology of the flower it was formerly the method of botanists to start from an ideal type and to consider as mere modifications of that type all forms that differed from it. A later view admits the probability of various independent lines of development. Those types are the simplest in which the floral structure is nearest to the original arrangement, the parts being more definitely separated. Union of parts indicates as a rule greater complexity of type, though simplicity of structure may in some cases be an indication of degeneration. Simplicity of type is illustrated by the water-lily family (*Naiadaceæ*), and complexity by the orchids (*Orchidaceæ*) and the thistle family (*Compositæ*).

Although the morphology of the flower continues to be of paramount importance in the classification of plants, the application of the principles of evolution to the study of botany has inevitably led to a method differing from that formerly in use. The 24 classes into which Linnæus divided plants were (with the exception of the cryptogams) based on the length, number and other characteristics of the stamens; and the classes were divided into orders chiefly according to the characteristics of the pistil. In the system worked out by the French botanists and known as the "natural" system stress was laid upon the characteristics of the perianth, the presence or absence of a corolla and the union or separation of petals. In a system based on the facts of development the fundamental division into monocotyledons and dicotyledons may still be maintained, though late methods do not recognize the likeness existing between adult forms as sufficient to place them in the same group, classification proceeding rather on the principle that relationship is more convincingly shown by similarity in manner of reproduction and in laws of growth.

Variation in Structure and Arrangement.— Flowers are said to be perfect when they are provided with both kinds of essential organs; complete when calyx and corolla are also present; regular when all the parts of each set are alike in shape and size; and symmetrical when they have an equal number of parts of each kind. In the monocotyledons the parts are in threes; in the dicotyledons mostly in fives or fours. The perianth of the lily, though apparently having six in a set, has really three sepals and three petals, as is plainly shown in the bud. Apparent violation of the law of symmetry may in certain cases be due to adhesion, abortion or non-development of floral plants. In the mustard family, though the calyx and corolla are in fours, the stamens are generally six. The suppression of two stamens would account for lack of symmetry. An instance of non-development is found in the monkshood, where the sepals number five and the petals two, while three very minute rudimentary petals are sometimes discernible. The violet, although symmetrical as to sepals, petals, and stamens, which are in fives, has a simple stigma and three-valved seed-vessel. The flax is a good example of a symmetrical and regular flower. The irregularity of the flower may be shown in any of its parts, but is most striking in the peculiar forms often assumed by the corolla and calyx, most curious instances being seen in the orchids, a family in which the morphology of the andrœcium and gynœcium are also of especial interest.

Certain variations of form may be traced to the visits of insects, as where such a visitant alighting always on the same side of the flower tends by its weight to increase the size of that part or to thicken the tissue, etc. The chief irregularity of some corollas consists in having one or more spurred petals. This deviation from the ordinary petal shape is common and sometimes serves the purpose of providing flowers with nectaries, as in the case of the violet, the toad-flax, and the columbine. In the nasturtium it is the calyx spur that constitutes the nectary. Less noticeable modifications in the petals of other flowers have the same function, as the scales on the petal-claws in the crowfoots and the pits in the petals of lilies and fritillaries. The irregularity illustrated in the blossoms of the pea and the bean is of a very common kind. This butterfly or papilionaceous corolla marks

the family to which these legumes belong. In the case of gamopetalous (sympetalous) corollas it is convenient to speak of the parts of the more primitive or separated type as having coalesced, even if the growth be regarded as undivided from the beginning. The regular five-petaled corolla has its homologue in such a gamopetalous corolla, as that of the campanula (Plate I., Fig. 8), where the five lobes correspond to the separate petals and maintain the numerical scheme of the flower. The labiate or bilabiate (two-lipped) corolla is the characteristic form of the mint family (*Labiatæ*), and of the figworts (*Scrophulariaceæ*), the ringent or gaping corolla of the dead-nettle (Plate I., Fig. 14) and the personate corolla of the snapdragon and toad-flax being variations of the type. Not only is a union of parts frequent in the corolla and the calyx, but it has its counterpart in certain forms of the andrœcium and the gynœcium. The filaments of the lupine arise as a single cylindrical growth and the syngenesious anthers of the *Compositæ* are a pre-eminent characteristic of that large family. The combination of several carpels to form one pistil has already been referred to, complete union being found in the rhododendron among other instances, and the gynœcium takes a great variety of forms according to the degree of distinctness maintained by the separate parts of the contiguous carpels.

Fertilization.— Flowers which are achlamydeous, that is, destitute of floral envelopes, may be unisexual or bisexual (androgynous). The male (staminate) flowers and the female (pistillate) flowers may be found upon the same plant, which is then termed monœcious, the alder, oak, ragweed and begonia being examples; or the staminate flowers of a species may be produced by one plant and the pistillate by another, the plants being then diœcious, as in the willow family (*Salicaceæ*). The neutral flower is one lacking both kinds of essential organs, as is the case with the ray flowers of many *Compositæ*. The showy snow-ball tree and the garden hydrangea are examples of development of such flowers by cultivation, the neutral flowers being found only on the margin of the flower cluster in the wild species. Close fertilization, that is, the fertilization of a flower by its own pollen, is rendered impossible by the unisexual arrangement, but so long as the transfer may be from flower to flower on the same plant the advantages of cross-fertilization strictly so-called (that is, from plant to plant) are not positively insured. Diœcious flowers might be expected to prove better producers of seed, as close fertilization would naturally be looked for in bisexual flowers, and indeed was formerly considered the normal method, but it is doubtful if there is any species of which it could be proved that its flowers are without exception self-fertilized. By the dichotomy of some species of bisexual flowers (that is, by a difference in the time when the essential organs mature) the pollen is set free before the stigma is ready for pollination, the latter being accordingly obliged to rely upon pollen from without. In other cases the structure of flowers is of such a nature that fertilization by their own stamens is guarded against.

Agencies for the transportation of pollen are various. Flowers dependent upon the wind, like those of the date-palm, are known as «anemophilous»; those for which insects are the carriers are «entomophilous.» (See FLOWERS AND INSECTS.) Many plants bear two kinds of blossoms, conspicuous, nectar-producing flowers, which are entomophilous, and inconspicuous, later-blooming blossoms in which close fertilization takes place. Certain species of violets have the two forms, their later flowers never opening nor developing petals, but becoming fertilized in the bud. Contrary to the law which generally controls fertilization, these cleistogamous blossoms are more fruitful than those on the same plant open to cross-fertilization. Whatever be the method of pollination, the pollen-grain when it falls upon the stigma absorbs the moisture of the surface and germinates. It then sends down a tube which passes through the tissues of the style and stigma and on reaching the cavity of the ovary enters the micropyle and penetrates to the embryo sac. Sometimes the latter has grown out to the micropyle, or even through it, to meet the pollen-tube. The chalaza, or point of attachment of the ovule, is in a few instances the place of entrance for the pollen-tube. The transfer of the contents of the pollen-tube to the germ-cell in the embryo sac takes place, thus fertilizing the cell, which begins to grow and divide, developing the embryo plant, at first nourished by the endosperm, or albuminous contents of the sac.

Colors of Flowers.— The colors of flowers have been arranged in two series, the blue and the yellow, in both of which red and white are found, green being produced by a blending of the two. It has been estimated that in an average collection of 1,000 plants about 284 have white flowers, 226 yellow, 220 red, 141 blue, 73 violet, 36 green, 12 orange, 4 brown, and 2 black. White flowers are more generally odoriferous than those of other colors, and their odors are almost always agreeable. Red flowers, though less numerous than yellow ones, are more often fragrant. The tints are due to fluid or viscous matters contained in superficial cells and can be separated in certain cases by solution in water and in others by solution in alcohol and ether. Attempts have been made to refer the coloring matters to one or two principles, which have been described under the names of xanthin, xanthein, anthoxanthin, and cyanin and anthocyan. These bodies, however, are very ill defined and are in all probability mixtures, even supposing that when obtained from different sources they are essentially the same. The chief difficulty is to obtain the coloring matters in sufficient quantity for investigation and then to separate them accurately from each other which, as they are amorphous, uncrystallizable bodies, is not easy to accomplish satisfactorily. Of the coloring matters from flowers one of the most individualized is the yellow body obtained from saffron. See BOTANY; FLOWERS AND INSECTS; FRUIT; GARDEN; INFLORESCENCE; SEED.

Flower Beetles, scarabeid beetles of several genera. One of the most abundant and destructive of these insects is the rose-chafer (q.v.), which annually does great damage to roses and other flowers and fruits. Several species of the genus *Euphoria,* more especially *E. inda,* is frequently found on flowers eating pollen, but it also attacks corn in the milk, and eats into various forms of fruit. Other flower beetles belonging to the genera *Hoplia* and *Trichius* are commonly found on flowers through-

out the country and take some part in the cross-fertilization of useful plants. Numerous other beetles frequent flowers, among which are beautiful species of the genera *Clerus* and *Trichodes* of the *Cleridæ; Leptura* and many related genera of long-horned beetles; and many genera of small families such as the *Mordellidæ*.

Flower-bug, a very minute bug (*Triphleps insidiosus*) also called "insidious flower-bug," and related to the bedbug. It is found on the foliage of various plants, and preys upon other minute insects.

Flower Month, in general any month in any country in which flowers are springing most abundantly; in the United States, June is specially the month of flowers. Specifically, the month Anthesterion, the eighth of the Attic year, corresponding nearly to February; so called because that time was, in that country, the season of flowers.

Flower-peckers, general name for a large family (*Dicæidæ*) of small insectivorous birds allied to the creepers (q.v.) which get their food largely by searching flowering plants and their blossoms, picking up minute insects largely by aid of a curious tongue which is separated at the end into four tubular projections. They inhabit the Indo-China region and thence throughout the archipelagoes to Australia, where the white speckled diamond-birds (*Pardalatus*) and the swallow-dicæum (*Dicæum erythrorhynchum*) are familiar friends of the gardener. They frequent bushes and trees, hopping briskly about the branches, and creeping and clinging like titmouses. Some make extremely beautiful, highly decorated nests, while others are content to deposit their eggs, which in most of the species are white, in holes in trees, or earthen banks, or old birds' nests. Some are plainly dressed, but most of the flower-peckers are gaudily colored, and several sing sweetly.

Flowering Ferns. See *Filicales* (1), under Ferns and Fern Allies.

Flowers, in chemistry, a term formerly applied to a variety of substances procured by sublimation in the form of slightly cohering powder, hence in all old books we find mention made of the flowers of antimony, arsenic, zinc, and bismuth, which are the sublimed oxides of these metals in a more or less pure state. We have also still in use though not generally the terms flowers of sulphur, of benzoin, etc.

Flowers and Insects: Their Relations. In order to appreciate the intimate relations between flowers and insects we should bear in mind the fact that in all probability the earliest plants known were flowerless, and that the earliest known insects never visited flowers. The most primitive reproductive parts of plants were minute structures, simply greenish, and without colors. From the cryptogamous plants somehow arose the flowering plants, and when flowers did appear, they were of regular shape, with the corolla made up of separate petals; then finally appeared the irregular flowers like those of the monkshood, the pea, bean, wistaria, etc. The simpler forms of flowers were those of the grasses. Such plants are fertilized by the wind, but in the higher modern flowering plants the floral organs are fertilized by insects. What attracts insects to flowers, and thus causes them to carry the pollen from the stigmas to the pistil? Is it the nectar or the odor given out by the flower, or the colors of the petals?

Insects Attracted by the Sweets of Flowers. — According to Darwin, Lubbock, and others, the brightly colored petals of flowers are necessary to attract bees, butterflies, moths, beetles, etc. Thus the petals of many flowers are beautifully marked with highly colored hues, which are thought to be "guiding lines," by which the bee was guided to the nectary at the bottom of the flower. But this view has been called in question by a Belgian naturalist, Plateau. To test the matter Darwin and others had removed the petals, or corolla, and watched to see whether insects continued to visit the flower, but this, owing to want of care in removing the petals, had led to contradictory results. Plateau experimented more carefully; he avoided handling the flowers, or doing anything which might influence an insect's sense of smell. He removed the brightly colored corollas from the flowers of lobelia, ipomæa, larkspur, foxglove, etc., and in every case, except that of *Antirrhinus majus*, the mutilated flowers were observed to be freely visited by various kinds of insects (bees, bumblebees, syrphus flies, and an occasional butterfly), no special preference being exhibited for flowers that were left intact. The insects not only sucked honey from the mutilated flowers, but they often circled around them without alighting. In the case of the snapdragon, several bumblebees hovered around the mutilated heads but afterward left them for those with entire flowers, a result explained by the peculiar mode in which bees have to enter the corolla, which would render the absence of that structure perplexing to them. Plateau covered several of the large umbels of Hieracium with rhubarb leaves, when it was found that even when thus masked they were freely visited by insects. The result shows that insects are in reality guided to flowers in the great majority of cases by their sense of smell,

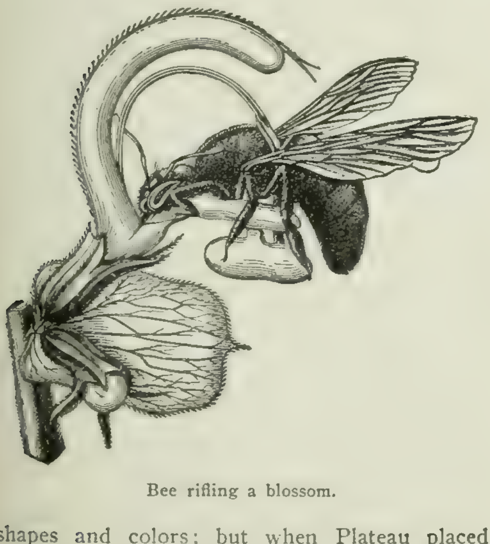
A hawk-moth sucking nectar from a tiger-lily.

the scent of the nectar attracting them. Some insects, as the white cabbage butterfly, are attracted by the white color of the flowers they visit, and yellow butterflies by yellow flowers. Undoubtedly some butterflies and moths have the color-sense, but probably those insects such as beetles, bugs, etc., which are most concerned in fertilizing flowers, are attracted by the odors emanating from the nectary and glands of such flowers.

Of flower-haunting flies (*Diptera*) the color-sense is shown in the case of certain higher types of flies which prefer red and blue flowers, and they oftener visit the more complicated kinds of flowers than do the smaller bees. These flies seem to possess greater importance for the function of pollination than previously supposed. In Africa some kinds of orchids are fertilized by flies.

It thus appears that though the colors of some flowers attract certain insects which have the sense of color, the most efficient insect-aids to fertilization of flowers are those which are attracted mainly if not solely by smelling the nectary or odor of the flower.

Plateau indeed claims that any flower is freely visited by insects if it be nectariferous, no matter how colorless or inconspicuous it may be. There are, on the other hand, flowers which seem to be wholly avoided by insects, many of which are gay and attractive enough in their



Bee rifling a blossom.

shapes and colors; but when Plateau placed nectar at the base of these flowers, visits of insects were at once begun. Meehan states that in the United States a single plant of the common sumac (*Rhus glabra*) was growing in an isolated spot almost hidden by other vegetation, and far away from any flowers visited to any great extent by insects. The flowers of this shrub are small, green, entirely inconspicuous, and so far as human olfactories go, odorless. But he observed an extraordinary number of kinds of insects visiting the flowers. He infers that this remarkable collection of insects, including honey-bees and wasps, could only have been guided by the sense of smell, and he infers that all plants with nectar have odor, though it may not be strong enough to be perceptible to man.

The nectary is a specially modified scent-gland, and the nectar is a specialized form of the sap or juice of the plant. As stated by Henslow, the nectaries probably originated from the visits of insects, and the local irritation set up by these visits gradually led to the origination of the glandular secreting organ called the nectary. When the entire flower degenerates and becomes self-fertilizing, not needing the help of insects, the nectary also disappears. Ant-plants are so-called because they are due to the modifications occasioned by the visits of ants.

Fertilization of Flowers by Insects.— We have seen that insects are strongly attracted to flowers by smelling the sweets secreted by glands or nectaries. How important this nectar is to bees is proved by the fact that the honey they produce is nectar changed to honey in their digestive organs. Many insects subsist on the pollen of plants; such are bees of all kinds which use it in making bee-bread as food for their young; multitudes of wasps, flies, and beetles gather also the pollen of flowers, and eat it, this being their only food, or they store it up as nourishment for their young.

Their visits to flowers result in their carrying the pollen from one flower to another, and thus fertilizing the plant. Hence owing to the visits of honey-making bees, of wasps, of moths, and butterflies, and of pollen-eating flies and beetles, the flowers become indirectly fertilized, and were it not for their visits, such flowers would be sterile, and the species die out.

As early as 1793 Sprengel discovered the main facts and many details as to the relations between flowers and insects. As Wallace states, he noticed the curious adaptation of the structure of many flowers to the particular insects visiting them; he proved that insects cross-fertilize flowers, and that the presence of nectar and pollen ensured the continuance of their visits. Afterward it was shown that cross-fertilization of plants was a benefit to them, while Darwin (saying that "nature abhors perpetual self-fertilization") proved that this was a general occurrence not only among ordinary plants but with orchids. It thus appears that insects have been the cause of, and are the means of maintaining, the present wealth of flowers which enliven the tropical forests, and adorn our northern gardens and fields.

Colors of Flowers and the Visits of Insects.— Although it is generally claimed that sweet odors are, as Wallace says, usually supplementary to the attractions of color, yet this view, as we have seen, will have to be modified. Gaudily colored flowers, like the sunflower, poppies, and peonies, are nearly scentless compared with plants like the mignonette, which are so fragrant. White flowers are fertilized by moths, and very frequently give out their scent only at night, as in the case of the butterfly-orchis. Bright red flowers are very attractive to butterflies, and are sometimes specially adapted to be fertilized by them, as many kinds of pinks, the corn-cockle, etc. Blue flowers are especially attractive to bees and other hymenoptera, as many as 67 species having been observed to visit the common European sheep's bit. Dull yellow or brownish flowers, some of which smell like carrion, attract flies, while the dull purplish flowers of the Scrophularia attract many wasps. (Wallace.)

It is interesting to learn that many change

their colors as soon as fertilized; in this way bees avoid wasting their time in visiting such flowers as have already been fertilized and their nectary exhausted. The common lung-wort is at first red, but afterward turns blue. In southern Brazil grows a species of Lantana whose flowers are yellow the first day, orange the second, and purple the third, while F. Müller observed that many butterflies visited the yellow flowers only, some both the yellow and the orange flowers, but none the purple. Moreover many flowers have been specially adapted to the kinds of insects that most abound where they grow. Thus in the Swiss lowlands the gentians, although with us they flourish in the White Mountain region, are adapted to bees, but those of the high Alps to butterflies only, as this zone is the home of Alpine butterflies. The visits of insects to flowers in fine weather are incessant and hence economy of time is, as Wallace states, very important both to the insects and the flowers, because the fine working days are comparatively few. For example, bees keep to one flower at a time, visiting hundreds of blossoms in succession; they thus acquire quickness in going at once to the nectary, and the change of color in the flower, or incipient withering when fertilized, enables them to avoid those flowers that have already had their honey exhausted.

Perforation of Flowers by Bees.— If one will watch a wistaria when in blossom, he will notice that the bumblebees, in order to get at the nectar without loss of time, perforate the corolla right over the nectary, and thus speedily rifle the flower of its sweets. So well trained is the bee that the hole is always made right opposite or over the nectary. On the other hand the honey-bee, with its shorter and weaker maxilla, cannot make a hole through the walls of the corolla, but partly enters the flower on one side or the other and with more or less trouble laps up the nectar. At the end of the season, provided bumblebees are plenty, nearly every flower on a large vine will be found to have been perforated. Similar flowers, as the clover, touch-me-not, etc., are thus perforated. Lovell states that the maxillæ alone are employed in this act, being moved slowly backward and forward in puncturing the tissue. Thus the stout strong maxillæ of the bumblebee are adapted for this purpose.

Click-beetle and orchid.

Irregular Flowers due to Visits of Insects.— It is now thought by some observers that owing to the strains, pressure, and irritation caused by the visits of insects, flowers like those of the pea, bean, etc., have been formed. Henslow points out that the lower petal or lip of these irregular flowers forms a platform on which the bee rests while engaged in probing the corolla for nectar. In the irregular flowers of the foxglove, petunia, etc., the tube of the corolla has enlarged so as to allow the ingress of an insect which partly crawls into it, hence the tubular corolla having to bear the strain upon it bulges outward, while the lip or anterior petal is not much if at all enlarged. Even if, says Henslow, no more than the head of an insect enter the flower, then the corolla shapes itself to fit it. He explains the formation of the deep tubular corolla of the evening primrose or the honeysuckle by the fact that butterflies, in probing their depths while on the wing, irritate the tube only, which is thus made to become longer and correspondingly to contract in diameter, the result being that there is but little irregularity in the shape of the flower. The immediate mechanical cause of the shape of the wing-petals of many pea-blossom-like flowers is probably due to the weight of the insect in front, the local irritations believed due to the thrust of the insect's head and its probing for nectar, united with the absence of all strains upon the sides. An example of the great thickening of the tissue just where the strain will be most felt is the flower of the lady's slipper and Calceolaria.

Origin or Modification of Insects by Flowers. — We have seen that flowers attract insects by means of their nectar and sweets and also their pollen; that the visits of insects are in favorable days practically incessant, though owing to the weather more or less intermittent; the result seems to be that the forms of insects, especially of their accessory jaws (maxillæ and labium), as well as of their legs, are wonderfully adapted to their habits. It is not improbable that by these simple mechanical causes, that is, the use or exercise of the parts concerned in gathering pollen and nectar, a number of groups of insects (bees, certain flies, and the moths and butterflies, and certain families of beetles) have been brought into existence. We know that in all probability flowers and the insects which visit them, came into existence after the coal period, owing to the reaction of flowers upon these kinds of insects, causing the exercise and modification of the structures actively employed in collecting pollen. Among the flower-visiting flies and beetles the proboscis of the former, and the maxillæ of the latter, are wonderfully adapted for scraping off the pollen from the anthers of flowers.

ALPHEUS S. PACKARD,
Late Professor of Zoology, Brown University.

Flowers, Artificial, flowers made from various materials to imitate natural blossoms. These are not a modern invention. The famous floral wreaths made by the ancient Egyptians were formed from thin plates of horn stained in different colors, sometimes also of leaves of copper, gilt or silvered over. The Romans excelled in the art of imitating flowers in wax and in this branch of the art attained a degree of perfection which has not been approached in modern times. Crassus, renowned for his wealth, gave to the victors in the games he celebrated at Rome crowns of artificial leaves made of gold and silver. In modern times the Italians were the first to acquire celebrity for the skill and taste they displayed in this manufacture, but they are now far surpassed by English and French manufactures, more especially by the latter.

The first artificial flowers made in modern times in civilized countries were manufactured out of many-colored ribbons which were twisted together and attached to small pieces of wire. But these first attempts were decidedly crude. In course of time feathers were substituted for ribbons, a more delicate material, but one to which it was not so easy to give the requisite shades of color. The plumage of the birds of South America is admirably adapted for artificial flowers on account of the brilliancy and permanence of the tints, and the natives of that continent have long practised with success the making of feather flowers. The Zoological Gardens in Regent's Park, London, contain a magnificent collection of artificial flowers made out of the feathers of humming-birds. In South America artificial flowers are also composed of the wing cases and other parts of some brilliant specimens of beetles. In Italy the cocoons of silkworms are frequently used for the purpose, as these take on a brilliant color and have a velvety appearance. Among the other materials used in this manufacture are cambric, muslin, satin, velvet, and other woven fabrics, blown glass, mother of pearl, brass, thin layers of whalebone, etc., beside the various vegetable and mineral coloring matters. Flowers were at one time made of porcelain and were perfumed. Great skill has been attained in the making of glass flowers and a remarkable collection of this kind is owned by Harvard University.

Flowers, Symbolism of, a special significance attached to flowers by means of which they are made to represent various ideas and sentiments. This mode of communicating thought has developed in certain countries into a language of remarkable elaboration. Among the Greeks and Romans the use of flowers was full of significance. Though the well-developed floral speech of the Romans was probably lost to a great extent, the study was revived in Europe during the Middle Ages, being especially appropriate in connection with such a romantic institution as chivalry. The Orientals have developed the language of flowers into a vehicle for communicating sentimental and amatory expressions of all degrees of warmth. Still further complexity is added by the habit of employing flowers the Turkish or Arabic names of which rhyme with the other really significant words. The language of flowers is, of course, arbitrary, and a bouquet which a Persian girl would understand would be unintelligible to an Egyptian inmate of the harem. Yet among European nations certain flowers have a common significance. The rose is widely accepted as the symbol of love and beauty; the forget-me-not of true love; the lily of purity; the violet of modesty; the daisy and white violet of innocence; the rosemary of remembrance; the amaranth of immortality; the asphodel of death and the unseen world; the pansy of thought; the hyacinth of sorrow; the narcissus of self-admiration; the poppy of oblivion. The almond expresses hope; the lily-of-the-valley unconscious sweetness; the wallflower, love faithful in spite of adversity; the primrose, early youth; and the cyclamen, diffidence. So surely as the orange-blossom is associated with marriage does the finding of white heather betoken good-fortune to come, while the future chances of love may be revealed from the daisy and poppy by a simple method of divination. The laurel has long been accepted as the emblem of glory, and the oak of patriotism. In the Grecian games wreaths were placed upon the brows of the victors, but these were of leaves rather than blossoms. Floral garlands were much used at the feasts of the ancients, and in India it is customary to show special honor to a guest by encircling his neck with a wreath of flowers. Historical and national associations cluster about certain flowers. The violet was the flower of Athens. The red and the white roses of Lancaster and York gave name to a great civil war. Particular families and clans have their floral badges and there are national and heraldic emblems drawn from the floral kingdom, such as the rose of England, the thistle of Scotland, the shamrock of Ireland, and the fleur-de-lis (q.v.) of France, the latter being associated for centuries with the royal crown. The pomegranate became a Spanish national emblem having previously been the emblem of Moorish Granada. In Japan, the chrysanthemum is the flower of the nation, and in India the lotus has an especially sacred significance, as it had formerly in Egypt. In the latter country it often figured in architecture. In the decorative art of India it is represented in bronze and in paintings in connection with divinities or exalted sages. The cactus is the national emblem of Mexico. No flower will ever become the national emblem of the United States in the manner in which such floral emblems have become connected with other nations, but an attempt has been made to gain an expression of popular opinion on the subject of a national flower and the golden-rod appears to lead in the contest, as it has done in the case of the Empire State, of which it has been chosen as an emblem. The legislatures of certain States have taken action on the choice of a State flower, Utah selecting the seg lily; Vermont, the red clover; Oregon, a native grape; Nebraska, the golden-rod; Michigan, the apple-blossom; Maine, the pine tassel and cone, and Iowa the wild rose. In England what may be called a party emblem is illustrated in the adoption of the primrose, generally known as Lord Beaconsfield's flower, by the Conservatives. Before the «Hundred Days» in French history, the violet was used by the adherents of Napoleon I. to symbolize the hope of his return from exile.

Floyd, John Buchanan, American statesman: b. Smithfield, Montgomery County, Va., 1 June 1807; d. near Abingdon, Va., 26 Aug. 1863. He was educated at Columbia College, S. C., graduating in 1829. Studied law and settled in southwest Virginia. Was a member of the Virginia legislature several terms, and was governor of the State 1850–3, his term being notable for his advocacy of the policy of public im- of war in the cabinet of President Buchanan, provements. In 1857 he was appointed secretary and remained in it until 29 Dec. 1860, when he resigned because he considered the action of Maj. Anderson in occupying Fort Sumter a breach of faith to South Carolina. He went to Abingdon, Va. On 29 Jan. 1861 the grand jury of the District of Columbia indicted him as privy to a defalcation in the Department of the Interior. He returned to Washington, gave bail and demanded a trial, and the government thereupon, on 7 March 1861, entered a *nolle prosequi.*

After his departure he was also accused of having transferred arms from Northern to

Southern arsenals in order to arm the South for the Civil War. This charge was investigated by a Congressional committee, which, on 18 Feb. 1861, made a report showing it to be groundless, the arms transferred having been condemned arms, removed in order to make room in the Northern arsenals for modern ones.

In the summer of 1861 he was appointed a brigadier-general in the Confederate army, and raised a brigade which served in West Virginia until ordered to join the army of Gen. A. S. Johnston in the West. He was sent to Fort Donelson, arriving there after fighting had begun. When surrender was discussed, he transferred the command to Buckner and extricated his brigade; in consequence of which he was removed from command by Jefferson Davis. The State of Virginia thereupon appointed him a major-general in its service.

Floyd, William, American statesman: b. Brookhaven, Long Island, N. Y., 17 Dec. 1734; d. Weston, Oneida County, N. Y., 4 Aug. 1821. He entered political life as a delegate to the Philadelphia congress of 1774. The next year he was appointed a delegate to the first Continental Congress, and continued by successive reappointments a member of every Continental Congress up to 1782 inclusive. From 1777 to 1788 he also was a State senator under the first Constitution of New York, and in the Presidential elections of 1792, 1800, and 1804 was a Presidential elector.

Flück'iger, Friedrich August, ow'goost frēd'riH, German pharmacognosticist: b. Langenthal, Switzerland, 1828; d. 1894. He was educated at Berlin, Ban, Geneva, and Heidelberg, became president of the Swiss Association of Apothecaries in 1857, and in 1881 was member of a committee appointed to revise the pharmacopœia of the German empire. He wrote, in conjunction with Hamburg, 'Pharmacography: A History of the Principal Drugs of Vegetable Origin met with in Great Britain and British India' (1879), and works in German and French on the nature and history of drugs.

Flue. (1) A passage for the conveyance of the volatile results of combustion from the fireplace to the open air, or into another passage; a smoke duct, a chimney; one of a cluster of smoke ducts in a stack of chimneys. Also a passage in a wall for the conveyance of heat from one part of a building to another. (2) In music, one of the divisions of organ-stops, so called because the sound is produced by the wind passing through a fissure, flue, or windway, and striking against an edge above. (3) In a steam-engine, a pipe for the conveyance of the caloric current through a boiler, to heat the surrounding water. It is usually secured in the sheets of the fire box and smoke box respectively, as in the locomotive.

Fluel'len, a humorous character in Shakespeare's play 'Henry the Fifth.' He is a disputatious little soldier, pugnacious, and as voluble as his Welsh accent permits him to be when attempting to speak English.

Flü'gel, Johann Gottfried, yō'hän gōt'frēd, German lexicographer: b. Barby on the Elbe 22 Nov. 1788; d. Leipsic 24 June 1855. He spent many years in the United States prior to 1820 in business, diplomatic and official occupations, and became professor of English in the University of Leipsic in 1824. He compiled a 'Complete English-German and German-English Dictionary' (1830), besides publishing 'A Series of Commercial Letters' (9th ed. 1874); 'Practical Handbook of English Business Correspondence' (9th ed. 1873); 'Triglot; or Mercantile Dictionary in Three Tongues — German, English, French' (2d ed. 1854); and other useful manuals, all revised, or brought down to contemporary needs, by his son.

Flügel, Otto, German philosopher: b. Lützen 1842. He studied at Schulpforta and Halle, and took up pastoral work; was made editor of the 'Zeitschrift für exacte Philosophie im Sinne des Neueren Philosophischen Realismus,' and in 1894 was one of the founders of 'Zeitschrift für Philosophie und Pädagogik.' He supports Herbartian realism, as opposed to New-Kantian speculations, yet he believes in the necessity of a revelation. Among his works may be mentioned: 'Die Spekulative Theologie der Gegenwart'; 'Das Ich und die sittliche Idee im Leben der Völker' (1892); 'Über die persönliche Unsterblichkeit' (1902).

Flüg'gen, Gis'bert, German painter: b. at Cologne 9 Feb. 1811; d. Munich 3 Sept. 1859. In his youth he learned the manufacture of novelties in his native town, and in 1833 began his art studies at Munich, which he made his permanent home. He is a German counterpart of Hogarth and Wilkie, whom he rivals in masterly grouping and life-like expression, while in the technique of the brush he excels them both.

Fluid, a substance devoid of rigidity, or whose modulus of rigidity (see ELASTICITY) is zero. The word includes both gases and liquids, since these bodies, while resisting compression, offer no sensible resistance to change of form, but yield continuously and without limit to any force which tends to alter their shape while leaving their volume constant. The word "fluid" is also figuratively applied to other things which may be conveniently represented to the mind as fluids, even though it is known that they are not such. We speak, for example, of the "electric fluid," thereby meaning electricity, whose motions and general properties are known to conform to certain differential equations that are strongly suggestive of those governing the motions and properties of true fluids. This figurative use of the word is now avoided by the best writers, because, while it is convenient from certain points of view, it connotes properties that the things that it stands for do not possess. It dates from the time when electricity, magnetism, nervous energy, and certain other obscure manifestations of nature were actually believed to be due to imponderable fluids that were supposed to have a real, objective existence. See CRITICAL POINT; ELASTICITY; GAS; GASES, KINETIC THEORY OF; LIQUID; MATTER; THERMODYNAMICS; etc.

Fluid Lens, in optics, a lens in which a liquid is imprisoned between circular glass disks of the required curvatures. Attempts to obtain achromatism have been made by using metallic solutions and other liquids having a higher dispersive power than flint glass.

Fluke, or Pole Flounder, a fish, one of the smaller deep-water flounders (*Glyptocephalus cynoglossus*), common near both coasts of the North Atlantic, caught by means of beam-trawls in great quantities, and highly prized as food, especially in Great Britain, where it is considered little inferior to the sole. It is the "craig fluke" of Scotland. See FLOUNDER.

Fluke-worm. See DISTOMA; TREMATODEA.

Flume (Latin *flumen*, stream), an artificial channel or conduit used to convey water for power development, hydraulic mining and irrigation. Flumes are commonly built of wood, but may be of steel and are placed above ground, frequently over trestles. See IRRIGATION; LOGGING; MINING.

Flu'or-spar. See FLUORITE.

Fluores'cence, that property of certain bodies in virtue of which they become self-luminous when exposed to light of certain wave-lengths. All bodies reflect a part of the incident light, but fluorescence is more than a mere reflection, as may best be shown by an example. "Canary glass" (glass colored slightly with oxid of uranium) exhibits a beautiful yellowish-green surface color when well illuminated, and for this reason it is much used for the production of ornamental effects. If a ray of sunlight be admitted into a darkened room through a piece of cobalt glass that is so dense that the feeble violet light that it transmits is barely visible, the canary glass shows its yellow-green color brilliantly when placed in its path. This shows that the phenomenon is not simple reflection, and further evidence of the same sort may easily be had. Glass that is tinged brownish-yellow by oxid of gold is almost perfectly transparent to the golden light from the canary glass, but if the violet light from the cobalt glass is caused to traverse the gold-oxid glass before striking the canary glass, the fluorescence is no longer observed. Furthermore, light that has passed through one piece of canary glass is incapable of exciting fluorescence in a second piece. These and other equally remarkable phenomena indicate that a fluorescent substance absorbs a portion of the light that strikes it, modifies it profoundly in some manner, and then radiates it again. Stokes has shown that the modification consists in increasing the wave-length of the incident light; and it is now known that fluorescent light invariably has a greater wave-length than the primary light that excites the fluorescence. This fact has an important bearing upon many of the phenomena of physics. When it had been determined, for example, that the "X-rays" differ from ordinary light merely by having a very different wave-length, the question whether their wave-length is longer or shorter was immediately answered by the fact they can excite brilliant fluorescence. Knowing that the X-rays are either too long or too short to affect the eye, and knowing also that fluorescent light always has a longer wave-length than the light that excites it, it follows at once that the X-rays have a shorter wave-length than ordinary light.

Many substances exhibit fluorescence to a greater or lesser degree. An aqueous infusion of horse-chestnut bark shows it brilliantly, and so also does a solution of sulphate of quinine. Certain of the coal-tar colors (q.v.) are conspicuously fluorescent, fluorescein taking its name from this fact. Kerosene is fluorescent, and sometimes strongly so. Most fluorescent substances cease to emit light almost instantaneously when the incident light is cut off from them. Some, however, such as calcium tungstate and the sulphids of calcium, barium, and strontium, continue to emit their rays for a sensible time, fading gradually away into darkness after the incident light ceases to excite them. Instruments consisting of screens that are coated with some fluorescent material and protected from ordinary light by shields, or by enclosure within a light-tight box, are known as "fluoroscopes," and are used for studying the X-rays (or Röntgen rays), and the shadows cast by them. It is to be observed that fluorescence differs from phosphorescence (q.v.) not only because it is usually of very short duration, but primarily because it is induced by the exciting action of light-rays. Phosphorescence may be due to very different causes. The light emitted by phosphorus, for example, is probably due to the slow oxidation of that substance. That which is observed in the ocean at night, and in connection with various fungi and insects, is due to causes which are more or less obscure; but in any event these various phosphorescent phenomena are quite different from true fluorescence. The name "fluorescence" was coined by Sir George G. Stokes in 1852, from the fact that the mineral fluorite sometimes exhibits the phenomenon. Previous to 1852 fluorescence was known as "epipolic dispersion." Consult: Tait, 'Light'; Preston, 'The Theory of Light.'

Flu'orides. See FLUORINE.

Flu'orine, a gaseous, non-metallic element, possessing properties resembling those of chlorine, and exhibiting powerful chemical affinity. It occurs abundantly in nature, notably in the minerals fluorite and cryolite, from the former of which it takes its name. The elementary character of fluorine was first recognized by Ampère and Davy about 1810; but although many attempts were made to isolate it, none was certainly successful until 1887, when Moissan succeeded in preparing it in the elementary state by electrolyzing a solution of hydrogen potassium fluoride, HF.KF, in perfectly anhydrous hydrofluoric acid, the solution being contained in a platinum vessel whose temperature was maintained at 10° F. below zero, and the electrolysis conducted by means of 20 Bunsen elements connected in series. When thus prepared fluorine is a gas, variously described as colorless, or as of a light greenish-yellow color. Many of the elements take fire when immersed in it, and burn with the formation of the corresponding fluorides. Water is decomposed by it, with the formation of hydrofluoric acid, HF, and the liberation of ozonized oxygen; and in fact fluorine appears to combine with all known elements except oxygen and carbon, and argon, helium, and the other recently discovered inert gases of the atmosphere. Fluorine has the chemical symbol F, is a monad, and has an atomic weight of about 19. Few of the physical properties of the element are yet known, on account of the difficulty of handling it. It corrodes glass rapidly, for example, and for this reason glass vessels cannot be used in experimenting with it.

Fluorine combines with hydrogen directly even in the dark, the compound, HF, that is

formed being known as hydrofluoric acid. Hydrofluoric acid is more conveniently prepared by means of the action of strong sulphuric acid upon the mineral fluorite (calcium fluoride, CaF_2). The reaction is as follows: $H_2SO_4 + CaF_2 = 2HF + CaSO_4$. Hydrofluoric acid is a colorless gas at ordinary temperatures and pressures, fuming strongly in the air. It condenses at 5° F. below zero to a colorless, mobile liquid having a specific gravity of about 0.988, and boiling, at ordinary atmospheric pressure, at 67° F. As thus prepared, liquid hydrofluoric acid contains traces of water; but these may be removed by electrolysis, the liberated fluorine combining with the water as noted above, and the oxygen of the water escaping in the free state. When the water has all been eliminated, electrolysis ceases. The commercial importance of hydrofluoric acid depends upon the fact that this substance attacks glass so freely that it must be prepared and stored in vessels of lead or rubber. It is much used for etching upon glass, the reaction between the glass and the acid being $4HF + SiO_2 = 2H_2O + SiF_4$; the acid attacking the silica of the glass, with the formation of water and a gaseous compound of silicon, known as silicon tetrafluoride. When silicon tetrafluoride is passed into water, it is decomposed according to the equation $3SiF_4 + 4H_2O = 2H_2SiF_6 + H_4SiO_4$; the substance represented by the last term in this equation, silicic acid, separates out as an insoluble precipitate, while the compound H_2SiF_6, known as hydrofluo-silicic acid, remains in solution. Hydrofluo-silicic acid forms salts which are known as silico-fluorides. Potassium silico-fluoride, K_2SiF_6, is one of the few potassium compounds that are insoluble in water.

Liquid anhydrous hydrofluoric acid does not attack glass, but the action is vigorous when traces of water are present. The diluted acid is therefore used in practical etching, the article that is to be treated being immersed in it, after the parts that are not to be attacked have been protected by a coating of wax, or of a special "etching varnish." Hydrofluoric acid in aqueous solution acts very similarly to hydrochloric acid, forming salts which are known as fluorides; hydrogen being liberated when the acid acts upon a metal, and water when upon an oxid.

Fluorite, or **Fluor Spar,** a native fluoride of calcium having the formula CaF_2, crystallizing in the isometric system with cubical habit, and also occurring massive. It has a hardness of 4. and a specific gravity varying from 3.00 to 3.25. It has a vitreous lustre, and is transparent to subtranslucent, varying in color from white through yellow, green, red, blue, and brown. The green and violet-blue varieties are most common, and the red is rare. Certain specimens exhibit a bluish fluorescence (q.v.), and the mineral develops differences of electrical potential under the influence of heat and of light. Fluorite occurs in England, Germany, and many parts of the United States, and the commercial supply comes chiefly from Kentucky, Illinois, Arizona, Tennessee, and New Hampshire. It is a chief source of fluorine and hydrofluoric acid (see FLUORINE), and is also used as a flux for promoting the fusion of certain refractory minerals, deriving its name from this latter circumstance (Latin, *fluor*, a flow). Colorless specimens have been used for the manufacture of lenses, for which they are well adapted on account of their small dispersion.

Fluor'oscope. See FLUORESCENCE.

Flürsheim, Michael, mēн'ä-el flürs'hīm, German social reformer: b. Frankfort-on-Main 24 Jan. 1844. He emigrated to the United States in 1867, and resided there for five years. He then returned to Europe and established an iron foundry in Gaggenau, Baden (1888). Since 1892 he has lived at Castagnola, near Lugano, Switzerland, engaged in disseminating his ideas through his writings. He believes private property is the cause of immense wealth to some and profound poverty to others, and advocates the government possession of land. His works are: 'Auf friedlichem Wege' (1884); 'Deutschland in 100 Jahren' (1894); 'Papst und Sozialreform' (1891); 'Der Einzige Rettungsweg' (1894); 'Rent, Interest, and Wages' (1891).

Flush'ing, Netherlands, a flourishing seaport town in the province of Zeeland, on the south coast of the island of Walcheren, at the mouth of the West Schelde. It has long been a place of importance, but has few buildings or institutions of note. The town-house is a roomy, suitable edifice; the exchange is a simple building, and near it is a statue, erected in 1841, of Admiral van Ruyter, born in Flushing in 1607. The inhabitants are chiefly engaged in commerce, for the encouragement of which much has been done in recent times by the construction of docks, etc. Flushing has suffered several times from fire, water, and war, and in 1809 was bombarded by a British fleet, under Lord Chatham. Pop. (1901) 18,893.

Flushing, N. Y., a former village on Long Island, now a part of the borough of Queens, New York. It was settled in 1645 and was called Vlissingen.

Flute, a musical wind instrument, consisting of a tube furnished with a number of holes in it for the purpose of varying its sounds. The oldest form of the English flute had seven holes which could be stopped by the fingers, but it had no finger-keys. This was in use till about the beginning of the 18th century, when it gave place to the German flute, an instrument which, in its best form, was 27 inches in length, consisted of 4 pieces fitting into one another, and had 6 finger-holes for the normal tones, and from 6 to 12 keys for the semitones, with a compass of nearly 3 octaves, counting from middle C upward, the higher octaves being obtained by overblowing. The improvements made on this instrument, by Böhm, a German, acting in conjunction with Gordon, an Englishman, enable the player to perform music on any key, with all the chromatic intervals. The chief improvement consisted in the application of a system of keys, by which several holes could be stopped at one time, by one movement of the finger. The flutes made by Böhm are now taken as the models by most makers in all countries. In modern flutes the number of keys varies. The materials of which flutes are made are box, ivory, ebony, silver, glass, and a kind of red ebony.

Fluted Scale. See SCALE INSECTS.

Fluting, in architecture, channels or furrows cut perpendicularly in the shafts of columns, particularly Doric, Ionic, and Corinthian.

It seems probable that this kind of ornament had some relation to the original type; perhaps the furrowed trunk might have suggested the idea. It is, however, a beautiful ornament, which is applied with equal happiness to break the otherwise heavy mass of a Doric shaft, or to obviate an inconsistent plainness in the other orders. When the lower parts of the flutes of a column are filled with a convex bead, they are said to be cabled. See ARCHITECTURE.

Fluting Machine, a machine for corrugating or crimping metals. It has a pair of rollers, each one having projections which enter the interdental spaces of the other. By turning the operating screw the bent bar, and with it the upper roller, can be adjusted up or down at will to regulate the distance between the two rollers.

Flux, a substance or mixture added to assist the fusion of minerals. In the large way, limestone, and fluor-spar are used as fluxes. In the smelting of iron great attention has to be paid to the fluxes, because on their character depends to some extent the complete separation of the metal. To accomplish this the flux must be such that it will combine with the earthy matter of the ore, and form a slag, which must neither be too refractory nor fusible. Hence if the ore abound in clay or sulphur, lime, or limestone, and possibly sand, must be added; if in quartz, lime and clay are requisite, otherwise the quartz is slagged by combining with part of the iron, which is thus lost. Frequently ores are so selected that the earthy matters present may flux each other, but this requires skill and experience. The fluxes used in pottery are very various, and are distinguished by different names; but they almost all consist of litharge or red-lead, with sand or boracic acid, sometimes singly, sometimes together. They are, therefore, essentially colorless glasses used as vehicles for infusible colors. See COPPER; IRON; etc.

Fluxion, fluk'shôn, (1) in medicine, an unnatural flow or determination of blood or other humor toward any organ; a catarrh. (2) In mathematics, a method of calculation resulting from the operation of fluents, or flowing numbers. Thus a mathematical line may be considered as produced by the fluxion or flowing of a point; a surface by the fluxion of a line, and a solid by the fluxion of a surface. A mathematical point in motion will really make a line; a revolving radius which is a line will make a circle which is a surface, and its revolution about its diameter will generate a sphere which is a solid. The same principle may be applied to purely numerical calculations, like the formulæ of algebra. This branch of the higher mathematics was invented by Newton in 1665. In 1676 he communicated his method to Oldenburg in a sentence with all the letters disarranged so that his correspondent could not possibly have put them in order. If he had succeeded in doing this the sentence would have been *Data æquatione quotcunque fluentes quantitates involvente fluxiones invenire et vice versa.* ["Given it makes no matter how many equations involving fluent quantities, fluxions are to be discovered, and the reverse is true" (that is, where fluxions occur the fluents are to be found).] Leibnitz received this letter in 1677, and in 1684 explained a discovery which he had made. It was that of the differential calculus, which was essentially the same as that of fluxions. What Newton called fluxions, Leibnitz called differences. An angry controversy subsequently arose between Newton and Leibnitz as to the priority of discovery, the Royal Society of London taking the part of the former, who was then its president, and the scientific men of Germany that of the latter, who was their countryman. Both appear to have made the discovery independently. In the slight differences of method which exist, the advantage lay with Leibnitz, and while the term fluxions is now scarcely ever used, that of differential calculus is in common use. The first elementary treatise on fluxions published in England was by John Harris in 1702. A description of the process by Newton himself followed in 1704, in his 'Quadrature of Curves.' See CALCULATION; MATHEMATICS.

Fly, an insect. See DIPTERA; FLIES; and the names of various groups and species of flies.

Fly-blister, a collection of blood-serum between the layers of the skin, caused by the application of some preparation of the Spanish fly. It is used to extract fluid from underlying tissues, and to cause desired changes in local circulation. Absorption from applications sometimes takes place, giving rise to the irritation and inflammation of the kidneys, bladder and genital organs which characterize the drug when taken internally.

Fly-casting, the art of throwing an artificial fly in angling. (For the various methods employed see ANGLING.) Aside from its use in actual fishing the art is employed by some in competitive contests, and "national tournaments" are held annually in both Great Britain and the United States, sustained by a federation of clubs devoted to the sport, in which the championship and prizes are competed for.

Fly River, a considerable stream in New Guinea (British) which has its source in the Victor Emanuel Mountains and empties into the Gulf of Papua. Its length is 150 miles. There is a delta at the mouth of Fly River in which lies the island of Kiwai.

Fly Sheet, a paper broadside or bill. Certain publications of this sort advocating changes in the English Wesleyan Methodist constitution and practice were published in 1847–8. Those who were suspected of having them issued were expelled in 1849, and taking the name of Methodist Reformers laid the foundation of a new denomination, which has, however, since been amalgamated with others, the designation of the collective body being the United Free Church Methodists.

Fly, Spanish. See BLISTER BEETLE.

Fly-up-the-Creek, a local name for the little green heron (*Ardea virescens*), a common bird throughout eastern North America. See HERON.

Flycatcher, popularly and broadly used, birds which catch insects in the air. More restrictedly, in ornithology, birds of the Old World insectivorous family *Muscicapidæ*, allied to the thrushes; but this is a group very difficult to limit or define. All these are small, active

birds, with great activity in flight and skill in seizing their agile prey; and all have broad flattened beaks, at the base of which is a growth of long stiff rictal bristles. The feet are usually weak and the wings long and pointed. Four or five species are common summer visitors to Europe, including the familiar and typical spotted flycatcher (*Muscicapa grisola*) and the pied or blackcap (*M. atricapilla*). In all the hotter latitudes of the Old World the species are very numerous, and ornate, many being crested, or having, in the case of the males at least, very long tail-feathers, which are handled most gracefully. Such are the paradise flycatchers (genus *Tersiphone*) of India and eastward, the Japanese species of which is so commonly represented on painted or embroidered screens. The "fantail" (q.v.) is another species remarkable in its flight. Most of these flycatchers are birds of the woods, and are usually solitary and silent, feeding on little except insects, which are habitually caught upon the wing with an audible snap of the bill. Some of the smaller ones are sometimes called "fly-snappers" (q.v.). They nest in various situations, and many make highly beautiful receptacles for their variously decorated eggs.

None of the muscicapids is to be found in the New World, but America has a large family of flycatchers (the *Tyrannidæ*) just as suitably so-called as are the others, so far as habits are concerned; nor are they far removed in structure. This family contains some 400 species, mainly tropical, and chiefly of an olive-green, or black-and-gray complexion, often with ornamental touches of scarlet on the head or wings. The bill is rather stronger as a rule than in the Old World flycatchers, and often decidedly hooked, like that of vireos or shrikes. The wings are usually short, and the tail varies greatly, sometimes being beautifully prolonged, as in the scissor-tailed flycatcher of the western United States. The genus *Alectrurus* presents still more striking examples of very long and beautifully modified tail plumes. Good examples of this group are the king-birds, pipiris, pewees, vermilion flycatcher, and scissor-tail, elsewhere described. An excellent general account of these families will be found in Evans' 'Birds' (1900).

Ernest Ingersoll.

Flying Bridge. See Bridge; Movable Bridges.

Flying Buttress, a contrivance by means of which the thrust of a vault or arch is carried across an open space to a buttress (q.v.). Nearly every instance of the use of the flying buttress is in connection with Gothic architecture, and some of the earliest forms are very curious and illustrate well the growth of the style. The "high vault" over the nave or choir should have a buttress on each side to resist its thrust, but to build one there would be to obstruct the aisle on either side, which it was important to leave open and free as a part of the great interior of the church. The buttress, therefore, was built outside of the aisle, where it took up the thrust of the aisle vault and was made much larger than necessary for that purpose so as to receive also the thrust of the high vault, which was transmitted to it by means of a sloping bar of stone carried on a separate arch or half-arch. This bar and half-arch taken together form the flying buttress. In large churches the flying buttress is sometimes double or two-fold, leaping over two aisles, or an aisle and a row of chapels; and again it is sometimes repeated in height, one flying buttress coming above another — these being sometimes an addition where a slight yielding was visible.

Flying Dragon, a flying lizard (q.v.) of the Oriental genus *Draco*.

Flying Dutchman, a phantom ship said to be seen in stormy weather off the Cape of Good Hope, and thought to forebode ill luck. One form of the legend has it that the ship is doomed never to enter a port on account of a murder committed on board; another, that the captain, a Dutchman, swore a profane oath that he would weather the Cape though he should beat there till the last day. He was taken at his word, and there he still beats, but never suceeds in rounding the point. He sometimes hails vessels and requests them to take letters home from him. The legend is supposed to have originated in the sight of some ship reflected from the clouds. It has been made the groundwork of one or two novels and of Wagner's opera 'Der Fliegende Holländer.'

Flying-fish, a fish able to leave the water when alarmed or pursued, and sustain itself for several seconds in the air. In tropical seas the flying-fish rise from the water in flocks, or, more properly, shoals, of many thousands at a time, when disturbed by the passing of a ship, or pursued by such foes as the bluefish and albicore. They spring from the crest of a wave, and, darting forward, plunge into another to wet the membrane of the fins, and in this manner continue their flights for several hundred yards, often pursued by marine birds in the element to which they are driven for protection against the tyrants of their own. The sole motive power is the propulsion obtained by the work of the tail in giving the rushing leap from the water; but the great pectorals act to some extent as parachutes. In all the species belonging to the genus *Exocœtus* (which is typical of the family *Exocœtidæ*, allied to the sauries), the pectoral fins are very much developed, and the superior lobe of the caudal fin shorter; the head and body are invested with large soft scales, and the body has a ridge or carina extending longitudinally along each flank, which gives it somewhat of an angular appearance. Head, when viewed from the front, triangular; eyes very large; air-bladder very large. Flying-fish are inhabitants of every temperate sea, though abounding in the vicinity of the equator. In length they rarely exceed 13 inches, and are commonly found about 8. The flesh is pleasant. Several species are described by naturalists, some of which have very long fleshy filaments depending from the lower jaw, the use of which is not known. The *Exocœtus volitans*, or common flying-fish of the Atlantic, is also known in Pacific waters; and the coast of California is visited by a large species, 18 inches long (*E. californicus*) called *volador* by the Spanish fishermen. About 65 species are contained in this and other genera, among which is *Fodiator*, with at least one common flying-fish (*F. acus*), distinguished by sharpness of its snout. Another sort of flying-fish is the gurnard or sea-robin (qq.v.).

FLYCATCHERS.

1. Spotted Flycatcher. 2. Pied Flycatcher. 3. White-collared and Red-breasted Flycatchers.
4. Kingbird. 5. Bienteveo

Flying-fox, or **Fox-bat,** one of the great fruit-bats (q.v.) of the Oriental region; specifically the kalong (*Pteropus edulis*), which is regarded as good food by the people of Java and neighboring islands. It is the largest of known bats, measuring five feet in expanse of wings, has rusty red fur, woolly upon the neck, and a long pointed fox-like muzzle, short, triangular ears, and large eyes. These bats belong to a very large widespread genus, and have the general characteristics and habits of the fruit-bats (q.v.).

Flying Frog, a Malayan tree-dwelling frog of the genus *Rhacophorus*, which has large webbed feet with adhesive disks. Some 20 species are known in various parts of the tropics, one of which was believed by Wallace to sail down from trees in a long slanting flight; but there is no direct evidence of it as to any species. A full account of the varied habits of the genus will be found in Gadow's 'Amphibia and Reptiles' (1901).

Flying Gecko. See FLYING-LIZARD.

Flying Gurnard, or **Robin.** See FLYING-FISH.

Flying-lemur. See COLUGO.

Flying Lizards. Various lizards are provided with something more or less elaborate in the way of a parachute assisting them in springing from branch to branch, and perhaps in frightening off would-be enemies. Thus a Malayan gecko (*Ptychozoon homalocephalon*), about eight inches long, with membranous expansions along the sides of the neck, body, tail and limbs, which are supposed to enable it to make long, sliding leaps; but its habits are very little known. The term applies especially, however, to the East Indian "flying-dragons" or showy lizards of the genus *Draco*, which have loose folds of skin distensible by the erection of several movable ribs, and spread as a parachute. There are various species, harmless, pretty and tamable.

Flying Machine, a device for enabling man to navigate the air. The feat of flying has been often attempted; even among the ancients it was tried, and we are informed, succeeded to some slight extent. Friar Bacon affirms in his writings that this feat is not only possible, but he also informs us that he himself knew how to construct a machine in which a man, in a sitting position, might be able to transport himself through the air like one of the feathered tribe. The secret of Friar Bacon consisted of a very simple mechanical contrivance: It was a pair of globes made of hollow copper, exhausted of air, on which a chair could be supported, by which means a man could float in the atmosphere above the earth, and could buoy himself along. Another friar asserts the truth of this invention, or, at least, of one similar. Father Francisco Lana declares that a round vessel of plate-brass, 14 feet in diameter, weighing 3 ounces per square foot, will only weigh 1,848 ounces; whereas a quantity of common air of the same bulk will weigh 2,155 2-3 ounces; consequently he deduces the fact that the globe will not only be sustained in the air, but that it will be capable of supporting a weight of 373 2-3 ounces; and also that a globe of the same weight, but greater in capacity, would support a man. This, however, is a fallacy; for, from the fact of nature abhorring a vacuum, the globe would be crushed in by the superior force of the atmosphere. At many periods this subject has been taken up by philosophers, particularly in the reign of Charles II. For modern inventions under this heading see AËRIAL LOCOMOTION; AERODROME; AEROPLANE; BALLOONS; LANGLEY, S. P.; SANTOS-DUMONT.

Flying Mouse. See PHALANGER.

Flying Phalanger. See PHALANGER.

Flying-squid, a squid of the genus *Ommastrephes*, having two large lateral fins, which enable it to leap so high out of the water that sometimes these mollusks fall on ships' decks. See SQUID.

Flying Squirrel, a small squirrel with soft, dense fur; the skin on the sides capable of being drawn out by extending the legs, so as to form a "parachute," like that of the bat. There are various species native to America, Europe, and Asia, all falling within two genera, *Pteromys*, and *Sciuropterus*. In the latter genus are the European and American flying squirrels. The American species (*S. volucella*) is found from Maine to Florida and westward to the plains. It is entirely nocturnal in habits, and so closely resembles, in color, the bark of the dead trees wherein it makes its home that it is well-nigh invisible. Hence, less is known of it than of other squirrels. Yet when caught it proves to be a gentle, soft-eyed little creature easily tamed. All flying squirrels live in the woods, and gnaw into decayed tree-trunks, where such are obtainable, to make their nests. They feed on nuts, leaf-buds; and, sometimes, on birds' eggs, and even on small birds. Their sailing flight may extend as far as 60 feet, and they cover this distance with a rapid, graceful motion. Wherever found, flying squirrels seem to be fairly numerous, except in Alaska, where one species is found, but is very rare.

Flynt, Josiah. See WILLARD, JOSIAH FLYNT.

Flysnapper, a remarkable bird (*Phænopepla nitens*) of the southwestern United States, which belongs to the wax-wing family (*Ampelidæ*), but has the shy yet active movements of a flycatcher with a habit of jerking its tail. The male is shining bluish-black, with white wing-quills and vent, and a noble crest; his mate is gray, brown and white. It catches insects on the wing, by leaping from its perch and snapping at them noisily; but also eats mistletoe berries, etc. It makes a shallow nest in a low tree and lays eggs with dark dots about the small end. The term "flysnapper" is also given to some of the smaller flycatchers (q.v.).

Fly-wheel, a wheel employed in machinery, which by means of its great momentum renders equable and regular the motion which is generated by an irregular or intermittent force, or meets with an irregular or intermittent resistance. In order to effect this object its rim is made heavy, its circumference proportionately long, and it is hung on the revolving shaft of the machine it controls. Thus by its inertia it opposes any sudden acceleration of speed, and by its accumulated momentum it prevents sudden diminution of speed; acting in the latter case as a store of power to continue the movement when the motor temporarily flags, or in passing dead centres when the motor is inoperative.

Fo, the name given by the Chinese to Buddha. Originally, the name Buddha was expressed in the Chinese language with sufficient exactness by the term *Fô-thau,* pronounced *Fôudah;* but, as is usual in China with proper names, the last syllable was subsequently dropped. See BUDDHISM.

Foa, Eugénie, ė-jā-nē fōä, French author: b. Bordeaux 1708; d. 1853. Her maiden name was Fradis, and she was of Spanish-Jewish descent. Separated from her husband she supported herself by her pen, often writing under the name "MARIA FITZCLARENCE." Her tales for young children are delightfully clever. Notable among her works are: 'Les Mémoires d'un Polichinelle' (1839); 'Le Petit Robinson de Paris' (1840); and 'Le Vieux Paris' (1840).

Focus, a word introduced into science by Kepler in 1604. It literally means a hearth, round which all the members of a family gather, and takes the acquired meaning of the centre, into which certain activities are gathered. In optics it denotes the point at which divergent rays of light are brought to meet again, and from which they appear to proceed. The principal focus of a lens is the focus of rays falling upon the lens in a line parallel to its axis. The conjugate foci of a mirror or lens are two points so situated that the rays emitted from a light, or a luminous object, at either point, are reflected or refracted to the other. In photography the word is familiarly used of the image reflected on the screen of ground glass, which is said to be in focus when it is fixed at a true focal point, and so as to procure a focal or undistorted effect. It is also used of the lens, with regard to its distance from the screen of ground glass. The lens is in focus when it transmits to the screen an image without blurring or aberration. See LENS; LIGHT; MIRROR; OPTICS.

The term is employed in geometry in the description of the ellipse, which has two foci, of which it can be proved that the sum of the distances of any point of an ellipse from its foci is constant, and the difference of the distances of any point of a hyperbole from its foci is constant.

Fodder (A. S. *fódor,* cog. with Ger. *futter*), the food collected by man for the use of the domestic herbivorous quadrupeds. In English the term is commonly restricted to dried herbage, as hay and straw; but in other languages it is more comprehensive, and includes all the food of cattle, except what they gather for themselves in the field. The principal part of the food of the domestic herbivora is furnished by grasses, most of which are eaten by them when fresh and green. Besides the supplies which they receive of the surplus of corn cultivated for human food, they are also, to a considerable extent, dependent on the straw or dried herbage of the corn-plants for their winter provender; and that of many other grasses, cultivated on this account alone, is converted into hay for their use. Hay, being cut and rapidly dried while the plant is still full of sap, contains more nutritious matter than the ripened straw of the cereals. In the United States the best grasses are timothy, red top or Rhode Island bent, white top, orchard grass, and June grass or Kentucky blue grass. In California the best fodder grass is the alfalfa, of which three or even four crops a year are obtained.

Next to the grasses are ranked the *Leguminosæ,* affording food for cattle in their seeds — as beans, peas, lentils, lupines, etc. — and in their herbage, on account of which many of them are cultivated, as clover, lucerne, vetch, tares, sainfoin, etc. When consumed green, the produce of these crops is usually termed forage or green forage. (See SILAGE.) Some of them enter also largely into the composition of hay, being cut and dried with the grasses along with which they have been sown. Some of the *Cruciferæ* are cultivated to a considerable extent as forage-plants, cattle being fed on their green herbage, although they are not suitable for drying as fodder. Among these are kale and cabbage, rape, etc. In some parts of the world cattle are not unfrequently fed on the leaves of trees, as in the Himalayas, where the leaves of different species of Aralia, Grewia, elm, and oak are chiefly employed for this purpose, and are collected, dried, and stacked for winter fodder. In seasons of drought in India cattle are kept alive on the green leaves and pods of acacia and *Inga dulcis.* See ALFALFA; CLOVER; GRASSES; HAY; PASTURE; etc.

Fodder, Green. See SILAGE.

Fodientia, the aard-varks (q.v.); also EDENTATA.

Fœniculum. See FENNEL.

Foehn (fėn) **Wind,** a warm wind that blows from the Alps in some of the northern valleys of Switzerland. At one time the *fœhn* was supposed to be an air-current that had been warmed by passing over the Desert of Sahara. Now it is known that the *fœhn* is warm because it is a south wind which, robbed of its moisture by expansion and cooling in passing over the Alps is warmed by compression in descending through the increase of atmospheric pressure with decreased altitude. It corresponds to the Chinook wind of Montana, Washington, and British Columbia. See CHINOOK WIND.

Fœtus, fē'tus, **Development of,** the growth of the unborn child from the fourth month until its birth. The convolutions of the brain, distinguishable organs of sex, ossification, and muscular movement advance in the fifth month, during which nails and hair appear. During the sixth month the pubic bones ossify, eyelids and eyelashes form, fat develops under the skin. In the seventh month, the fat increases, the eyelids are open. During the eighth month the nails are fully developed, and the fœtus attains a weight of from 5 to 9 pounds. See also EMBRYO.

Fog, a very thick mist; small hollow vesicles of water suspended in the air, but so low as to be but a short distance from the earth in place of rising high above it and becoming so illuminated by the sun as to constitute clouds of varied hue. Fogs often arise when the air above warm, moist soil is colder than the soil itself. The hot vapors from the ground are then condensed by coming in contact with the colder air above, as the warm steam of a kettle is by the comparatively cold air of a room. But no fog arises till the cold air has absorbed vapor enough to bring it to the point of saturation. Fogs often hang over rivers. Their cause is the condensation by contact with the cold water, of the vapor in a hot and moist air current passing over

the river. The "pea-soup" fogs of London life are produced by the carbon of the smoky atmosphere coloring the fog vesicles; a fog which is brown in London's business district is generally white a few miles off, and wanting altogether at the further extremities of the city. On hills and mountains of any size it is easy to rise above a fog, and see it like an ocean beneath one's feet.

Fog-signals, signals given by means of sound or light to warn vessels of danger during fogs. Various kinds of fog-signals are used, among which may be mentioned bells, drums, gongs, guns, compressed-air whistles, steam-whistles, and fog trumpets or horns, and latterly powerful electric flashlights. Gongs are not very powerful as signals, often failing to be heard at more than the distance of a quarter of a mile. Bells may be heard during fogs at a distance of from 1 to 3 miles. Guns have been heard as far as 10 miles, with a light breeze blowing across the sound. One of the most powerful signals is the siren fog-horn, the sound of which is produced by means of a disk perforated by radial slits made to rotate in front of a fixed disk exactly similar, while a long iron trumpet forms part of the apparatus. The disk is made to revolve rapidly, and when the slits are opposite each other openings are formed through which electricity, steam, or compressed air is forced. This causes a sound of very great power, which the trumpet collects and compresses, and which under favorable circumstances is heard from 20 to 30 miles out at sea. Fog-signals are also used on railways during foggy weather. They consist of cases filled with detonating powder, which are laid on the rails and exploded by the engine when it comes up to them. Bell-buoys, common to the coasts of the United States, are operated by the current, by the ebbing and flowing tide, by the swaying of the waves, by the wind, and by clockwork impelled by weight or spring. As to construction, they are adapted for anchorage on spits, sand-bars, or shoals. The use of electricity in fog-signals is well illustrated at Sandy Hook, N. J., where a powerful searchlight flashes every few moments in varying directions. In clear weather this flashlight can be observed a distance of 50 miles at sea. There are in the United States under government control nearly 10,000 fog-signals of all kinds, 3,000 of which are lighted. Eleven buoys are operated by electric light. Germany erected in 1903 a fast flashing light on the island of Helgoland in the North Sea. The system or principle employed is said to be entirely new. Not only that, but it was said to present absolutely insurmountable difficulties. The revolving light on Helgoland is not only the largest in the world, it is the most unique, for Germans claim that it never had a model.

They built upon the superiority of the German reflector, with its exactly parabolic ground-glass mirror or speculum, and the marvelous success of the Helgoland fast-flashing light has justified German effort, skill, and courage. In these lines, for a long time, France was in the lead. It looks as if she would have to guard her laurels. The reflector invented by Schuckert, with its parabolic mirror, is easily earning a place by the side of the world's very best work. It took a long time to get a hearing for the glass parabolic mirror in the lighthouse world. The bright fires — *feux éclairs* — of the system, based upon a combination of Fresnel lenses and totally reflecting ring prisms, which were built by the French with marvelous skill and accuracy, blocked the way to the new lights. About the middle of the nineties German experts were sent to France by the German imperial government for the express purpose of studying flashlights. The experts stayed long enough to find out all that was best in the French system, aided thereto by the kindness of the scientific men of the republic. Before their return they were convinced that by means of two or more reflectors, erected upon a reflector with Schuckert's glass parabolic mirror, results equal to those of France could be produced.

Experiments were made in Nuremberg. They went far beyond what the most sanguine had believed possible. The revolving reflector of the German apparatus was fully equal to the Frenchman's revolving light. As soon as the experts had demonstrated their point, work was begun on a light reflector or projector equal to the largest ever used. It was to represent 30,000,000 candlepower and to last no longer than one tenth of a second. The flashes must follow each other every five seconds. When the weather is favorable the beams go far beyond the central fires of light rays. On the first night that the new light was used, its peculiar, flashing beams were seen by people standing on the mole at Busum, a distance of 65 kilometres, or a trifle over 40 miles. The watchers in the lighthouse at Amrum, about the same distance, were able in unfavorable weather to see the same beams as they rapidly appeared and disappeared. It was noted that the otherwise bluish-white light of the electric arc appeared red. See BUOY; ELECTRIC LIGHTING; FOG; LIGHTHOUSE; MEGAPHONE; SIREN; TOPOPHONE.

Fogarassy, János, yän'ōsh fō'-gä-rŏsh-ĭ, Hungarian lawyer and philologist: b. Käsmark, in Austria-Hungary, 1801; d. 11 June 1878. He studied at Sáros-Pátak, and was graduated in law, became an advocate, and was appointed to an office in the government bureau of finance. His principal claims upon the memory of posterity are his legal works written in the Hungarian tongue. He also published a 'Hungarian Dictionary' (1836), and began, at the suggestion of the Hungarian Academy, a complete dictionary of the language in collaboration with G. Ezuczor, after whose death he finished the work single-handed. It was published in 1861, and for this achievement he was awarded a gold medal by the Academy.

Fogazzaro, Antonio, än-tō'nē-ō fō-gä-tsä'-rō, Italian poet: b. Vicenza, Italy, 1842. He first came into notice with 'Miranda,' a story in verse (1874), and added greatly to his reputation as a poet with 'Valsonda,' a volume of lyrics (1876). He was author of several novels which were received with marked favor, among them: 'Master Chicco's Fiasco' (1885); 'Daniel Cortis' (1887); 'The Poet's Mystery' (1888).

Fogelberg, Bengt Erland, bengt ĕr'länt fō'-gĕl-bĕrg, Swedish sculptor: b. Grotenburg 8 Aug. 1786; d. Trieste 22 Dec. 1854. He began his art studies in the Academy at Stockholm and in 1820 went to Rome, where he soon made a name. He was among the first to invest the mythologic figures of the North with the graces of the Grecian antique, and the influence

of Thorwaldsen is plainly seen in his 'Odin and Thor' in the museum at Stockholm. He also vied with Thorwaldsen in such purely classic subjects as: 'The Dying Argus'; 'Venus'; 'Cupid and Psyche.' He executed two statues of Gustavus Adolphus, and, in collaboration with Byström, the series of colossal statues of the Swedish kings at Stockholm.

Foggia, fōd'jä, or **Capitanata,** cäp-ē-tän-ä'tä, Italy, a province on the Adriatic, between the provinces of Campobasso and Bari. It possesses rich pastures. Among its special products are wines, saffron, and fruits. The principal town is Foggia. Area, 2,688 square miles. Pop. (1901) 425,450.

Foggia, a city of southern Italy, capital of the province of the same name, in the centre of the great Apulian plain, 46 miles east by south of Campo Basso. It is well built, most of the houses being reconstructed since an earthquake which happened in 1732. It has large storehouses for keeping corn, and is the place where the flocks that feed on the great plain of Apulia are registered. Pop. (1901) 53,151.

Foglar, Ludwig, lood'-vĭg fō'glär, Austrian poet; b. Vienna 24 Dec. 1819; d. Kammer 15 Aug. 1889. Among his poems, mostly lyric, are: 'Cypresses' (1842); 'Sunbeams and Shadows' (1846); 'Clara von Vissegrad,' an epic (1847); 'Freedom's Breviary' (1848); 'Joyful and Sorrowful' (1867); 'Saint Velocipede' (1869), a satire (under the pseudonym "Lebrecht Flott").

Fo'go, Fuego, fwā'go, or **St. Philip,** (1) One of the Cape Verde islands, in the Atlantic Ocean, and the highest of the group, being 9,760 feet above sea-level, and presenting the appearance of one single mountain, though, on the sides, there are deep valleys; area, 170 square miles. Pop. estimated at 16,000. It has no rivers, and a scarcity of fresh water prevails, yet it is one of the most fertile islands of the archipelago, producing excellent maize and fruits. The chief town is Nossa Senhora da Luz. (2) Fogo, a port of entry and capital of Fogo Island, Newfoundland, at the southwest entrance to Notre Dame Bay, 122 miles northwest of St. John's, N. B. Pop. (1901) 1,118.

Fohi, fō'hē, the first Chinese emperor and legislator. He is said to have founded this kingdom 2,207 B.C. Nothing certain is known of his reign; but there are attributed to him the institution of marriage, the invention of fishing, hunting, music, and writing. He acknowledged and worshipped a supreme deity. He is supposed to be the Noah of the Bible.

Föhr, fėr, Germany, an island of Schleswig, in the North Sea; area 31 square miles. The town of Wyk is a fishing centre. The population numbers 4,200, mostly Frisians.

Foil. (1) A leaf or thin sheet of metal placed beneath transparent jewels to heighten their color and improve their brilliancy; also applied to those sheets of tin amalgam placed behind mirrors to make them reflect perfect images. They are made of copper, tin, and silvered copper, and are much used in imitations of precious stones. Colored foils are made by coating the white with any varnish of the required tint. The sheet lead which is used for the lining of tea-chests is a species of foil, and the Chinese purchase about 4,000 tons of lead annually from England for this purpose. (2) In architecture a small arc in the tracery of a window or panel. (3) In fencing. See Fencing.

Foix, Gaston, gas-täṅ fwä, Count de, and Viscount de Béarn, French military officer: b. 1331; d. 1391. Acquired the surname of Phœbus. He spent his life in war and the chase. His first service in arms was against the English in 1345. During the revolt known as la Jacquerie he contributed to the rescue of the Dauphin at Meaux. He wrote a book on the pleasures of the chase, of which several editions were published.

Foix, Gaston de, French soldier: b. 1489; d. Ravenna, Italy, 11 April 1512. He had the command of the army of Italy, and on account of the daring exploits was denominated the "Thunderbolt of Italy." After performing prodigies of valor he was killed at the battle of Ravenna.

Fokien. See Fu-Kien.

Fokshani, fŏk-shä'nē, town in Rumania, population 23,800. Extensive vineyards are in the neighborhood and much wine is produced here. The town is well-known historically. It was destroyed by the Russians in 1789 and by the Turks in 1822.

Fold, in geology, a term used to denote an inclined position into which various disturbances may have moved rocks previously horizontal. Even very brittle rock may be thus folded, rather than broken, under a severe, steady pressure. Three kinds of fold are generally distinguished: (1) monocline, in which the rocks are inclined in one direction only; (2) anticline, in which they are bent up in the manner of an arch; and (3) syncline, in which the arch is bent downward instead of up. Folds are rarely symmetrical. See Dip; Fault.

Folding Machines. The folding of printed sheets for books or newspapers was performed by hand up to 1856, when Cyrus Chambers, Jr., of Philadelphia, invented a practical folding machine, which was manufactured by him and his brother Edwin, who within a few years produced a considerable line of folders of various sizes and capacities. The folding machine of C. S. Forsaith, of Manchester, N. H., designed for folding newspapers only, came out some years later. A good many Stonemetz folders were sold between 1880 and 1890. The leading folders on the American market to-day are the Dexter, the Chambers, and the Brown. The vital principle on which nearly all paper folders are based is the descent of a dull blade on the paper sheet at the point where the fold is to be made, the blade thrusting the paper between rotating rollers, which draw it in folded. The making of a second fold is accomplished in the same way, the paper being passed along by traveling tapes from one stage to another, up to three or four folds. The earlier machines were not positive in their register, that is, the fold was apt to vary slightly in position, but the modern machines are very accurate, and large 64-page sheets are commonly folded on the machines with entire satisfaction. The heavy coated paper introduced about 1890 to 1895 developed a tendency to buckle or crease slightly on the last fold of a large sheet, and the most recent folding machines have introduced devices to overcome this difficulty. The most conspic-

uous improvement of recent years has been the drop-roll, which has added materially to the speed of the machines. This was introduced by Dexter, and enabled the sheet to be fed sideways — that is, the shortest way. Registering by means of points, that slip into holes or slits in the sheet, is another feature of modern machines. The equipping of machines with pasters was accomplished early in the history of the folding machine, and this feature has been brought to a high degree of perfection. The paste is held in fountains and laid on the paper in strips as it passes by.

Folders are now made in so many styles that the mere enumeration of them requires considerable space. They may be either drop-roll or point-feed; there are quadruple 16s and double 32 folders, some of which insert one sheet within another; there are marginal folders for books and pamphlets and for jobbing work; also large single and combination periodical folders, rapid circular folders, plain circular folders, jobbing circular folders, and various so-called newspaper folders. Then there are special newspaper and periodical folders, combinded folding and wire-stitching machines, combined folding and feeding machines, and combined feeding, folding and wire-stitching machines.

The Dexter combined folding and wire-stitching machine was introduced in 1897, and it is continuous and strictly automatic. It takes the sheets from the platforms of the feeders, and folds, gathers, collates, covers, and wire-stitches, delivering completed copies without intermediate handling.

There are various other combinations and arrangements for special work, which, together with those above named, have greatly reduced the cost of binding books, pamphlets, and periodicals.

On fast web newspaper printing presses there is used a rotary type of folder, that was brought out by the Hoes, and controlled by them for many years, being probably their most valuable patent in connection with these presses. Three folding blades were mounted on a single cylinder, catching the paper three times in a single revolution, thus securing immense speed. The device is not accurate enough for book folders, but it made possible the enormous speeds obtained by the so-called lightning newspaper presses.

The job folding machines for doing odd work of varying sizes, have come into extensive use within a few years. They are small and comparatively simple machines capable of operating at high speed. See AMERICAN NEWSPAPERS.

Földvar, fėld'vär (ancient SUSSUINUM), a walled town of Hungary, on the slope and summit of a hill, on the right bank of the Danube, 49 miles south of Budapest. Pop. (1900) 12,364.

Folengo, Teofilo, tā-ō'fē-lō fō-len'gō (pseudonym «MERLINO COCCAJO»), Italian poet: b. near Mantua, Italy, 8 Nov. 1491; d. near Bassano, Italy, 9 Dec. 1554. He was the first to win fame as a writer of macaronic verses. His 'Macaronic Work of Merlino Coccajo, Mantuan Poet' (1517–25) comprises the comico-heroic poems, 'Baldus' and 'Moscæa' (War of the Midges). His satire is mostly against monachism. He writes in cynic humor, but under his burlesque lies a vein of serious purpose. Under the pseudonym «LIMERNO PITOCCO» he wrote in Italian the epic satire 'Orlandino' (1526), in ridicule of the story of 'Roland'; then, partly in macaronic, partly in pure Italian, partly in pure Latin, 'The Chaos of Three by One' (1527), in which he darkly recounts the events of his own life.

Foley, John Henry, Irish sculptor: b. Dublin 24 May 1818; d. Hampstead, England, 27 Aug. 1874. His 'Ino and Bacchus' (1840) attracted much notice, and was followed by a succession of admirable classical and ideal works, including: 'A Youth at a Stream'; 'Caractacus'; and several excellent subjects from Shakespeare. The most noteworthy feature of his work, however, was his careful and artistic execution of his statues and busts, which incuded the Hampden and Selden figures in St. Stephen's Hall, Westminster; Goldsmith, Burke, and O'Connell, in Dublin; and the equestrian statues of Lord Hardinge and Sir James Outram, for India, which rank among the finest equestrian sculptures of modern times. The statue of the Prince Consort for the Albert Memorial is also Foley's work, and one of his latest works was a bronze statue of Stonewall Jackson for the State of South Carolina.

Folger, fōl'jėr, **Charles James,** American jurist: b. Nantucket, Mass., 16 April 1818; d. Geneva, N. Y., 4 Sept. 1884. He was graduated at Hobart College in 1836; and admitted to the bar in Albany, N. Y., in 1839. He became judge of the court of common pleas of Ontario County in 1843; was a member of the State senate in 1861–9; elected associate judge of the State court of appeals in 1871; succeeded to the chief justiceship of that court in 1880; and was secretary of the United States treasury in 1881–4. In November 1882 he was the Republican candidate for governor of New York, but was defeated.

Folger, Peter, American colonist and author: b. England 1617; d. Nantucket 1690. He emigrated from Norwich, Norfolk, to America and settled at Martha's Vineyard in 1635. He was grandfather of Benjamin Franklin, his daughter Abia having married Josiah Franklin and borne the illustrious statesman and philosopher among her 17 children. He was clerk of the courts in 1673 and possessed a literary sprightliness which descended to his grandson, as may be seen from a perusal of his 'A Looking-glass of the Times, or the Former Spirit of New England Revived in this Generation' (1875).

Folgore, fōl'gō-rā, Italian poet. He flourished at the end of the 13th century, but the dates of his birth and death and the incidents of his life are unknown. He wrote a number of sonnets, all of which have been translated into English by Dante Rossetti and J. A. Symonds. Their poetic merit is far from contemptible, and they are particularly interesting from the vivid light which they throw on Italian society. Their prevailing tone is one of refined epicureanism, and their style is mainly remarkable for affluence of imagery. «Every line,» says Mr. Symonds, «presents a picture, and each picture has the charm of a miniature fancifully drawn and brightly colored on a missal marge.' See Rossetti, 'Dante and His Circle' (1874); and Navone, 'Le Rime di Folgore' (1880).

Folia'tion, a term restricted by Darwin, and subsequently by geologists, to the arrangement of the constituent portions of a rock in alternating and more or less parallel layers or folia of different mineralogical nature. It differs from cleavage (q.v.), which is applied to certain superinduced divisional planes that render a rock fissile; and from lamination, in which the planes of separation in a rock are the result of deposition in successive layers. If foliation postdate the formation of the rock, the structure is practically the same as that known as schistose. The folia are conspicuously lenticular, thickening and thinning out, and reappearing after an interval on the same or a different plane. These alternately lenticular folia are usually more or less closely welded or felted into each other, so that they are not readily separable; and they frequently present the appearance of being puckered or crumpled. The crystalline texture and the foliated character of the schists distinguish them at once from any ordinary bedded "fragmental rock." See SCHIST; SCHISTOSE.

Folio, (1) in printing: *a*. The running number of the pages of a book. The even folios are on the left-hand pages, the odd upon the right. The folios of prefatory matter are frequently in lower-case Roman numerals. *b*. A sheet of paper once folded. *c*. A book of the largest size, whose sheets are folded but once, four pages to the sheet; hence it is used generally for any large volume or work. (2) In bookkeeping, a page or opening in an account book. (3) In law, a certain number of words in legal documents. The number varies in the States; thus in some of them, as in England, in law documents, conveyances, deeds, etc., the folio is 72 words; in chancery and parliamentary proceedings 90 words. In New York and other States 100 words constitute a folio.

Fo'lium of Descartes, dā-kart, in mathematics, a curve such that the simultaneous increments of two lines drawn from the generating point of the curve to two fixed points, have always to each other a constant ratio. If the ratio is equal to -1, the oval becomes an ellipse; if it is equal to $+1$, it is an hyperbole.

Folk, Joseph Wingate, American lawyer and political leader: b. Brownsville, Tenn., 28 Oct. 1869. He was graduated at Vanderbilt University, studied law, and was admitted to the bar in 1890. Later he removed to Missouri, where he became prominent in his profession and in political life. As district attorney at Saint Louis, he was active in exposing political corruption and punishing the offenders. Owing to his efforts nearly 20 officers of corporations and city officials were convicted of bribe giving and taking; and afterwards similar corrupt practices in the State legislature were exposed. His fearlessness in attacking a long established evil and his success in accomplishing results won for him the confidence and admiration of the people of the State, and in 1904 he was nominated for governor by the Democratic Party in spite of the opposition of the party machine. He was elected governor of Missouri by a good majority, though the State went Republican in the national election at the same time.

Folk-lore, the science which embraces all that relates to ancient observances and customs, to the notions, beliefs, traditions, superstitions, and prejudices of the common people. Gomme's divisions are: (1) Traditional narratives: (a) folk-tales, (b) hero tales, (c) ballads and songs, (d) place legends; (2) traditional customs: (a) local customs, (b) festival customs, (c) ceremonial customs, (d) games; (3) superstitions and beliefs: (a) witchcraft, (b) astrology, (c) superstitious practices and fancies; (4) folk-speech: (a) popular sayings, (b) popular nomenclature, (c) proverbs, (d) jingle rhymes, riddles, etc.

Folk-lore had been observed and noted by countless writers of early days, but it was not till after the beginning of the 19th century that its value for the elucidation of the social history of mankind had become apparent to thinkers, and its systematic study been seriously begun. Meantime the reawakening to natural poetry, and to the beauty of free emotional expression in literature, which lay at the foundation of what it is usual to call romanticism, had already commenced even in the 18th century, and the publication of Percy's 'Reliques of Ancient English Poetry' (1765) had given a powerful impulse to Scott and others in England, to Herder, and to Arnim and Brentano in Germany, who found a rich wealth of traditional poetry, the poetic value of which they fortunately had the eyes to see. But the study of folk-songs really began with Scott's 'Minstrelsy of the Scottish Border' (1802–3). It was perhaps an advantage rather than a disadvantage that the first worker in this new field was but the folk-lorist unawares and mere great poet and romancer of genius that he was; for our folk-poetry would never have enriched and permanently influenced all later English literature but for its own intrinsic and genuine poetic quality, any more than our detached folk-lore facts would ever have risen above the dignity of the whimsical pastime of an idle hour but for their inherent though unsuspected faculty for throwing light backward on the history of human civilization. All, or nearly all, the facts of comparative mythology are to be found in folk-belief in solution; a great many facts of folk-belief are to be found in comparative mythology crystallized. The facts are essentially the same in both cases, but the one study deals with them at one, the other at another stage.

First in importance of the collections of material is still the earliest, the 'Children and House Tales' (1812–14) of the brothers Grimm (q.v.). Grimm's 'German Mythology' (1835) is still unequaled in the range of its erudition and in the systematic thoroughness with which the mythology and superstitions of the ancient Teutons are traced back to the dawn of direct evidence and downward in decay and diminution to the popular tales, traditions, and phrases in which they still unconsciously survive. These two works of Grimm created a school, whose abundant labors later folk-lorists have entered into, while they have enlarged the horizon of the science, because the stamp of soundness and sufficiency so far as it goes is impressed in all the work of Grimm and his successors, of whom, in Germany, the most eminent were Kuhn, Mannhardt, J. W. Wolf, and W. Schwartz. To the English-speaking world Max Müller's essays

revealed a new world of undreamt-of affinities, and the combined charm of their literary grace, wide learning, and rare powers of exposition converted every reader to a theory which, as has been seen, is only now being displaced by another with a sounder basis of real philosophy and facts. Since then the study of folk-lore has become fashionable, indeed almost an article of patriotism, and societies have been formed in most countries to further its study. Of these the most important is still the Folk-lore Society of England, established in 1878, with its official organ, the 'Folk-lore Journal.' The American Folk-lore Society was instituted at Cambridge, Mass., early in 1888: (1) For the collection of the fast-vanishing remains of folk-lore in America, namely: (a) Relics of old English folk-lore (ballads, tales, superstitions, dialect, etc.); (b) lore of negroes in the Southern States of the Union; (c) lore of the Indian tribes of North America (myths, tales, etc.); (d) lore of French Canada, Mexico, etc. (2) For the study of the general subject, and publication of the results of special studies in this department. Already its journal has amply justified its existence by a series of articles of striking originality and value.

Folk-lore, though it takes cognizance of many apparently trivial matters, is of great importance in the science of comparative mythology, and helps to throw much light on the relationships between races, and on the origin and development of religious beliefs and ceremonies. It is, therefore, of great assistance to the ethnologist, the sociologist, and the historian, as well as to the student of comparative mythology and of the science of religion. It has attracted much attention in recent times. See ASTROLOGY; FABLES; FAIRY TALES; LEGENDS; MYTHOLOGY; SUPERSTITION; WITCHCRAFT.

Bibliography. — Aubrey, 'Miscellanies' (1696); Browne, 'Pseudodoxia Epidemica' (1646); Brand, 'Popular Antiquities'; Chambers, 'Book of Days'; Hone, 'Everyday Book'; Hone, 'Year Book'; Lang, 'Custom and Myth'; 'English Folk-lore Journal'; 'American Folk-lore Journal.'

Folk-music. The music of a nation is generally based on folk-music, or the folk-tunes that are handed down from generation to generation along with folk-lore. Hungarian folk-music has provided material not only for native composers but for the Germans. Haydn, Liszt, and Schubert utilized the melodies of the Magyars and the Gypsies. Brahms and others did the same thing in Russia. Beethoven went to Scotland and Ireland for melodies and Puccini traveled as far as Japan for one of his operas. Of all European countries Germany and Ireland have probably the greatest variety of folk-songs. (See FOLK-LORE; MUSIC.) Consult: Engel, 'Study of National Music' (1886); Tinck, 'Songs and Song Writers' (1900); Parry, 'Evolution of the Art of Music' (1896).

Folk-psychology, an ethnological study of the psychology of races and people, differing from folk-lore, which studies survivals. Among modern students of this science are Baldwin, Wundt, Lombroso, Lazarus, Steinthal and Felix Adler. Folk-psychology considers the habitat and food conditions of a people, its somatology, sex, technology, æsthetics, jurisprudence and pathology. Nearly all the books written upon this subject have been published only in German. See ETHNOLOGY.

Folk-right, the native laws and customs in Early English history as distinguished from the rules and observances introduced by William the Conquerer and his followers. See ENGLAND.

Folkestone, or **Folkstone,** fōk'stōn, a fortified seaport town of England, in Kent County, 62 miles southeast of London, and 7 west of Dover. It possesses a spacious harbor and fine pier whence the tidal steamers sail twice a day to Boulogne on the French coast. It was the birthplace of William Harvey (b. 1578), the discoverer of the circulation of the blood. Pop. (1901) 30,694.

Folk'land, or **Folcland,** fok'land, the land of the people, that portion of Anglo-Saxon England which was retained on behalf of the community. It might be occupied in common or possessed in severalty, but could not become allodial estate or absolute private property except with the consent of the Witan or highest council in the land. From time to time large grants were made both to individuals and to communities; and land thus cut off from folcland was called bocland or "book-land." Ultimately the king practically acquired the disposal of it, and the remnant of folkland became crown lands.

Folkmar, Daniel, American anthropologist: b. Roxbury, Wis., 28 Oct. 1861. He was graduated at the Western College of Iowa in 1884 and continued his studies at Paris and Berlin. He subsequently taught in several western institutions of learning (1895–1900) and was professor of anthropology in the Université Nouvelle of Brussels 1898–1901. Among his many writings are: 'L'Anthropologie Scientifique' (1899); and 'Leçons d'Anthropologie Philosophique' (1900).

Folkmoot, fōk'moot', or **Folcmote,** in Anglo-Saxon England, an assembly of the people to consult respecting public affairs.

Folks, fōks, **Homer,** American sociologist: b. Hanover, Mich., 18 Feb. 1867. He was graduated from Albion College (Mich.), in 1889, from Harvard in 1890, was superintendent of the Pennsylvania Children's Aid Society 1890–3, and in 1893 became secretary of the New York State Charities Aid Association. In 1900 he assisted the United States military government of Cuba in reorganizing the public charities of the island. He has written a 'History of the Care of Destitute, Neglected and Delinquent Children in the United States during the 19th Century.'

Fol'len, August, ow'goost, later **Adolf Ludwig,** German poet: b. Giessen, Germany, 21 Jan. 1794; d. Bern, Switzerland, 26 Dec. 1855. He became extremely popular as the author of 'Sons of Fatherland,' a patriotic hymn; 'Malegys and Vivian' (1829), a romance of chivalry; and numerous translations and poetic appeals to the instinct for liberty. He was a brother of Charles T. C. Follen (q.v.).

Follen, Charles Theodore Christian, American professor and Unitarian clergyman: b. Romrod, Hesse-Darmstadt, 4 Sept. 1786; d. 13 Jan. 1840, in the burning of the steamer Lexington, on Long Island Sound. He was educated at

Giessen, and became professor of Latin and history at Coire, Switzerland. His liberalism in politics and theology caused him to be driven from that town, and he was afterward forced to leave Basel, where he lectured on law and metaphysics, for the same reason. He finally took refuge in the United States and for five years (1830–5) was successful as professor of German at Harvard. He then took charge of the First Unitarian Church of New York, a position which he retained for a year (1836–7). He removed to East Lexington, Mass., in 1839.

Follen, Eliza Lee Cabot, American author: b. Boston, Mass., 15 Aug. 1787; d. Brookline, Mass., 26 Jan. 1860. She was married to Charles T. C. Follen (q.v.) in 1828. She published: 'Poems' (1839); 'Twilight Stories' (1858); 'Home Dramas' (1859), etc.

Folly Island, a small island off the coast of South Carolina, in Charleston harbor. It is separated from the mainland by Folly Island channel. It was the scene of several engagements during the Civil War.

Folsom, Charles, American scholar: b. Exeter, N. H., 1794; d. 1872. He was graduated from Harvard in 1813, was in the navy as chaplain and midshipmen's instructor in mathematics, was tutor at Harvard in 1821–3, and librarian in 1823–6. In 1824 he was associated with William Cullen Bryant in the editorship of the 'United States Literary Gazette.' As a member of the printing firm of Folsom, Wells & Thurston he long prepared for the press the classical works used at Harvard. Publications: An edition of Cicero's selected orations (1811), and an edition of selections from Livy (1829).

Folsom, Charles Follen, American physician: b. Haverhill, Mass., 3 April 1842. He was graduated from Harvard in 1862, was in the Southern States in connection with the Freedmen's Bureau from 1862 to 1865, and after study in the Harvard Medical School practised medicine in Boston from 1870. In 1877–82 he was lecturer in hygiene at Harvard, and in 1879–88 lecturer in and assistant professor of mental diseases. Among his writings is a volume on 'Mental Diseases.'

Folsom, George, American antiquary: b. Kennebunk, Maine, 23 May 1802; d. Rome, Italy, 27 March 1869. He was graduated 1822, studied law, and removing to New York in 1837 became librarian of the New York Historical Society. He was a member of the New York State senate 1844–8, and was appointed *charge d'affaires* at the court of the Netherlands 1850–4, and was for some years president of the American Ethnological Society. Among his publications are: 'History of Saco and Biddeford, Maine' (1830); edition of the 'Collections of the New York Historical Society' (1841), translation of 'Despatches of Hernando Cortes'; 'Political Condition of Mexico' (1843); 'Documents Relating to the Early History of Maine' (1858).

Folsom, Joseph L., American soldier: b. Meredith, N. H., 19 May 1817; d. San José, Cal., 19 July 1855. He was educated at West Point, and served four years in Florida against the Indians (1840–4), and in California in the Mexican war. He communicated officially to the government the discovery of gold in that State; and Folsom City on the American River, near the earliest found gold deposits, is named after him, as one who became identified with the development of the State and especially of San Francisco, where he was a large property owner.

Folsom, Nathaniel, American soldier and statesman: b. Exeter, N. H., 1726; d. there 26 May 1790. He was in command of a company at Fort Edward 1755, and of a regiment later, being brigadier-general of the New Hampshire Contingent in the siege of Boston, and was elected to the Continental Congress 1774–5 and 1777–80.

Foltz, Philipp von, fē'lēp fōn fōlts, German painter: b. Bingen 11 May 1805; d. Munich 5 Aug. 1877. At Munich he was a pupil of Cornelius, whom he assisted in the decoration of the Glyptothek and the arcades in the Hofgarten. He was later a professor in the Academy, and in 1865–70 director of the Centr l Gallery. His historical paintings are minute and faithful in detail and skilfully designed in their pictorial arrangement, but they fail of proper effect from stilted drawing and dryness of color. The Cologne Museum possesses his 'Minstrel's Curse' (after Uhland's ballad); the Maximilianeum, Munich, his 'Humiliation of the Emperor Frederick I. before Duke Henry the Lion,' and 'Pericles attacked by Cleon and his Followers.'

Fol'well, William Watts, American educator: b. Romulus, Seneca County, N. Y., 14 Feb. 1833. He was graduated at Hobart College, later becoming assistant professor of mathematics there; was appointed professor of mathematics at Kenyon College, Ohio, 1869, becoming president of the University of Minnesota the same year, later, professor of political economy there. Author of 'Public Instruction in Minnesota' (1875); 'Lectures on Political Economy.'

Fond du Lac, fŏn'do-lăk, a city and county-seat of Fond du Lac County, Wis., on Winnebago Lake, at the mouth of Fond du Lac River, and on the Chicago, M. & St. P., the Chicago & N. W., and the Wisconsin C. R.R.'s; about 60 miles northwest of Milwaukee. Fond du Lac was first settled in 1836 by Germans; became a village 1 March 1847, and a city in April 1852.

Industries, etc.— Fond du Lac has important manufactures and is noted for its dairy and agricultural products. The chief industries, besides agriculture, are lumber, grain, flour, leather, paper, machinery, refrigerators, sash and doors, shoes, wagons, furniture, shirts, etc. The city has four banks, with a combined capital of $500,000, and an annual business of $15,000,000.

Buildings, Churches, etc.— The principal buildings are the Carnegie Public Library, Elks' Club House, Saint Mary's Springs Sanitarium, Saint Agnes' Hospital, and Henry Boyle Roman Catholic Home for the Aged. The city has also an excellent public school system (10 buildings), a parochial school and a cathedral school.

Government.— The city is governed by a mayor, elected annually, and a council of 32 members elected biennially, half each year. Pop. (1900) 15,110; (1903 est.) 16,037.

E. M. Jenison,
Editor 'Daily Commonwealth.'

Fon'da, N. Y., a town and county-seat in Montgomery County, on the New York C. & H. R. R.R. It is a thriving centre of a large agri-

cultural district, has one bank and several newspapers. Pop. (1900) 1,190.

Fondi, fōn'dē, the ancient FUNDI, a town of Italy, Naples, in the province Terra di Lavoro, near a lake to which it gives name. It is a bishop's see, and contains a cathedral. The Lake of Fondi (ancient *Lacus Fundanus* or *Amyclanus*) lies between the road and the sea; it sends forth noxious exhalations. Pop. (1901) 9,930.

Fonseca, Antonio Manuel da, än-tō'nē-o mä-noo-äl' dä fōṅ-sā'kä, Portuguese artist: b. Lisbon 1796; d. 1893. He studied in the Academy at Lisbon, became a professor there, was in 1839 appointed court-painter and in 1862 was elected corresponding member of the Academy of Fine Arts at Paris. Several of his pictures, which are chiefly of a historical character, were exhibited in the Paris Exposition of 1855.

Fonseca, Juan Rodriguez, hoo-än' rō-drē'geṫh fōn-sā'kä, Spanish ecclesiastic and statesman: b. Toro, near Seville, 1451; d. Burgos 4 Nov. 1524. He passed through many grades of preferment from the archidiaconate of Seville, to the archbishopric of Burgos, where he became *limosiuero* or private chaplain to the king and queen. In 1493 Ferdinand and Isabella appointed him to superintend the preparations for the second voyage of Columbus and practically to administer the affairs of the New World. He became first president of the Council of the Indies (q.v.), organized in 1511. His conduct in the discharge of this office has been stigmatized by modern historians, and he has been charged with shortsightedness, if not with malignity in his treatment of Columbus, Cortes and Las Casas.

Fonseca, Manuel Deodoro da, mä-noo-äl' dā-ō'dō'-ro dä fōṅ-sā'kä, Brazilian soldier and politician: b. province of Alagoas 5 Aug. 1827; d. Rio de Janeiro 23 Aug. 1892. He was educated as a soldier and graduated with the rank of sub-lieutenant of artillery in 1849. He saw active service in the Paraguayan war (1868–70), and attained the rank of major-general. In 1887, although a conservative and personally attached to the Emperor Dom Pedro II., he and others felt bound to protest against the acts of the government. They were punished for insubordination, revolted, and proclaimed a republic, which was recognized by the United States and later by the powers of Europe. Dom Pedro was banished and Fonseca was elected president of the government 24 Feb. 1891. In November of the same year he was accused of arbitrary acts and compelled to resign. He was succeeded by the vice-president, Peisoto.

Fonseca Lima e Silva, Manuel da, mä-noo-äl' dä fōṅ-sā'kä lē'mä ā sēl'vä, Brazilian soldier: b. Rio Janeiro 1793; d. 1862. He entered the Portuguese army in Brazil, and was apointed lieutenant-colonel in the struggle which subsequently took place for the independence of the country. Under the new régime the Emperor Pedro I. chose him as lord chamberlain. When Pedro abdicated (1831) Fonseca sided with the Liberals and rose to high rank in the government, being minister of war (1831), minister of the interior (1836), and in 1851 he was apointed general and commander-in-chief of the army.

Fonse'ca, fōn-sā'kä, or **Conchagüa,** cōn-chä'gwa, a bay on the Pacific coast of Central America, the proposed terminus of a projected interoceanic railway through Honduras. It is one of the largest bays in the South Pacific and affords one of the finest harbors in the world.

Font. (1) In church architecture, the vessel which contains the water for baptism. It is frequently sculptured in stone or marble, with richly decorative designs. The form of font with which we are now familiar seems to have been introduced in mediæval churches. In the early Latin Church, from the time of Constantine, baptism was administered in baptisteries, which were buildings separate from but adjoining the church. (See BAPTISTERY.) (2) An assortment of any particular kind or size of type used in printing, each font containing a proportionate number of letters, figures, spaces and punctuation marks. See TYPE.

Fontaine, Pierre François Léonard, pēār fräṅ-swä lā-o-nar fôṅ-tān, French architect and author: b. Pontoise, France, 20 Sept. 1762; d. Paris 10 Oct. 1853. He took the second grand prize of Rome 1785, going to Italy in 1786, and there connecting himself with Percier (q.v.), who, as director of the decorations of the Opera, Paris, called him to his aid, a partnership then being formed which lasted till 1814, when Percier retired. They constructed a beautiful stairway in the Louvre; the Arc du Triomph du Carrousel; the arcades of the Rue de Rivoli as far as the Rue de l'Echelle. He retained the favor of Louis XVIII. and Louis Philippe, constructing the Galerie d'Orleans at the Palais-Royal, the Chapelle Expiatoire, the Chapelle Ferdinand, repairs of the Louvre and the Tuileries, and the hospital at Pontoise. He wrote: 'L'Histoire du Palais-Royal'; and, in collaboration with Percier, 'Palais, maisons et autres edifices de Rome moderne' (1802); 'Choix des plus celebres maisons de plaisance de Rome et ses environs' (1809–13); 'Descriptions de cerémonies et de fêtes' (1807–10); 'Recueil des decorations intérieures' (1812–17); 'Residences des souverains' (1833).

Fontainebleau, fôṅ-tān-blō, a town of France, in the department of Seine-et-Marne, and in the midst of the forest of same name, about 2 miles from the left bank of the Seine, and 37 miles east of Paris. It is well built, partly of stone and partly of brick, with spacious and regular streets; is the seat of a court of first resort, and several public offices; contains fine barracks, a communal college, school of design, public library of 28,000 volumes, public baths, and several hospitals; and has manufactures of calico, porcelain, and stoneware; quarries of sandstone, extensively used in paving the streets of Paris and the roads of the surrounding districts; and a trade in wine, fruit, preserves, cattle, etc. Pop. (1901) 14,160. The castle or palace of Fontainebleau, from which the town derives its chief importance, is one of the most magnificent in France. Many of its sovereigns have made it their favorite residence, and vied with each other in lavishing upon it all the embellishments that art could furnish, without any limitation as to expense. Henri IV., Louis XIV., Napoleon I., Louis Philippe, and Napoleon III. all expended large sums upon it. It is now a summer residence of the president of the republic.

Fontainebleau, School of, a group of artists assembled at Fontainebleau in France by Francis I., where they were employed in decorating the palace. There were two branches, Flemish and Italian; the influence of the latter, led by Rosso dei Rossi (1495–1541), eventually dominated French art (q.v.). See FRANCE: *Painting and Sculpture.*

Fontana, Carlo, kar'lō fōn-tä'nä, Italian architect: b. Brusciato, Italy, 1634; d. Rome 1714. He was a pupil of Bernini. While still very young he executed important commissions, including the Grimazzi and Bolognetti palaces, the monument of Queen Christina of Sweden in St. Peter's, and the fountains of St. Peter, and Santa Maria in Trastavere. He also built the cathedral at Fulda. Among his published works are: 'Il Tempio Vaticano e sua origine, con gli edifici piu cospicui antichi e moderni' (1694); 'Ultissimo Trattato delle acque correnti' (1697); 'L'Anfiteatro Flavio' (1725).

Fontana, Domenico, dō-men-ē'kō, Italian architect: b. Mili, Italy, 1543; d. Naples 1607. Cardinal Montalto (afterward Pope Sixtus V.) engaged him to construct a chapel in the Church of Sta. Maria-Maggiore, and a palace in the garden of the same church. But the pecuniary resources of the cardinal failed and the undertaking would have been interrupted had not Fontana himself supplied the means for continuing the work. Sixtus V. wished to remove the great obelisk now in front of St. Peter's Church, which was then nearly buried under the rubbish, to the middle of the square. Fontana happily executed this gigantic operation in 1586. Among other buildings erected by Fontana by the command of Sixtus V., the library of the Vatican and the aqueduct (*acqua felice*), deserve particular mention. Having been accused of converting to his private use the money received for public purposes, he was deprived of his office by the Pope, but immediately received the offer of the post of architect and chief engineer of the king of the Two Sicilies, and in 1592 went to Naples. He there constructed several canals to prevent inundations, a new road along the bay, and the royal palace in the capital.

Fontana, Felice, fā-lē'chā, Italian physiologist: b. Pomarolo, in the Italian Tyrol, 1730; d. 1805. He was appointed professor of natural philosophy in the University of Pisa, and while retaining this position he formed the museum at Florence which contains an immense number of anatomical preparations in colored wax, which exhibit all parts of the human body in the minutest detail, and in all imaginable positions. They are executed with the greatest skill, and were made by different artists under the direction of Fontana. Fontana wrote several works on scientific subjects, some of which have been translated into German and French. He also made discoveries relative to the application of carbonic acid, and different sorts of gas. He was buried in the Church of Santa Croce by the side of Galileo and Viviani.

Fontane, Marius, mä-rios fôn-tän, French writer and administrator: b. Marseilles 4 Sept. 1838. He met Ferdinand de Lesseps in the Orient and became his secretary, shortly afterward being appointed chief of exploitation and secretary-general of the Suez Canal Company and later administrator and member of the Committee of Direction of the Panama Canal Company. He was implicated with the other officers in the downfall of that company, was condemned in 1893 to two years' imprisonment, but this verdict was set aside on appeal, and after another trial he was acquitted. Among his works are: 'Les Marchands de Femmes' (1863); 'Confidences de la vingtieme annee' (1863); 'Selim l'egorgeure' (1865); 'Zara la rebelle' (1866); 'La Guerre d'Amerique' (1866); 'Le Canal maritime de Suez' (1869); 'Essais de poesie vidique' (1876); 'L'Histoire universelle' (Vol. I. 1881, Vol. X. 1899).

Fontane, Theodor, tā'ō-dōr fōn-tä'nĕ, German author: b. Neuruppin, Prussia, 30 Dec. 1819; d. Berlin 21 Sept. 1898. Among his writings are three volumes on England, one 'A Summer in London' (1854); 'The Sleswick-Holstein War of 1864' (1866); 'The War with France' (1876); and other war histories. His first volume of lyrics, 'Men and Heroes,' was published in 1850; his collected 'Ballads' in 1892. He wrote stories of North German life, as 'Count Petöfy'; 'Under the Pear-Tree' (1885); 'Mrs. Jenny Treibel' (1892).

Fontanes, Louis, loo-ē fôn-tän, MARQUIS DE, French writer: b. Niort, Poitou, 6 March 1757; d. Paris 17 March 1821. He went in 1777 to Paris, where he acquired a reputation by his poems: 'Le Cri de mon Cœur' (1778); 'Le Verger' (1788); 'L'Essai sur l'Astronomie' (1789); and 'L'Epitre sur l'Edit en Faveur des Non-Catholiques' (1789). He also wrote a metrical translation of Pope's 'Essay on Man' (1783). In 1802 he was made a member, and in 1804 president, of the legislative body. His admiration of Napoleon was great; and his oratorical talents were often employed in eulogizing the emperor's acts. In 1810 he entered the senate, and, passing on the fall of Napoleon into the service of the Bourbons, was raised to the peerage by Louis XVIII. His writings, prose and poetic, which are regarded as models of elegance and correctness, were edited by Sainte-Beuve in 2 volumes in 1837, with a critical and biographical memoir.

Fontarabia. See FUENTERRABIA.

Fontenelle, Bernard le Bovier de, bär när lė bō-vyā dė fônt-nel, French poet and miscellaneous writer: b. Rouen 11 Feb. 1657; d. Paris 9 Jan. 1757. Although he lived to the age of nearly 100 years, and retained, till his death a remarkable degree of activity, he came into the world so weak that it was not thought possible that he could survive. In 1674 he went to Paris, and soon became known by his poetical effusions and learned works. Before the age of 20 he had assisted in the composition of the operas of 'Psyche' and 'Bellerophon,' which appeared under the name of his uncle, Thomas Corneille (q.v.). In 1683 appeared his 'Dialogues of the Dead,' which were favorably received, although his continual straining after wit and novelty deprives them of the charm of natural ease. His 'Entretiens sur la Pluralité des Mondes' (1686) was the first book in which astronomical subjects were discussed with taste and wit.

Fontenoy, fônt-nwä, **Battle of,** one of the most famous battles in the war of the Austrian succession. It was fought at a small village of the same name, in western Belgium. Here 11

May 1745, the French under Marshal Saxe defeated the Allies under the Duke of Cumberland, with very heavy loss on both sides.

Fontevrault, fôṅt-vrō, a commune of France, in the department of Maine-et-Loire, with 3,581 inhabitants, situated in the middle of a forest occupying a valley in which flows a perennial fountain, 10 miles southeast of Saumur. This valley is celebrated as the site of the rich Benedictine abbey founded by Robert d'Arbrissel in 1099.

Fontevrault, Order of, a branch of the Benedictine order of monks; so named from the place in France where the first monastery of the sect was erected. The order was started in the 12th century by Robert of Abrissel, who brought monks and nuns under one roof, and placed them under the government of a female, because Jesus placed John in subjection to the Virgin Mary, saying: «Woman, behold thy son» (John xix. 26). The founder of the monastery was suspected of immorality, a charge which his followers strenuously denied. In 1106 the order received the sanction of Pope Pascal II.; in 1113 it was exempted from episcopal jurisdiction. In 1177 some monks connected with it came over to England by invitation of Henry II. It was remodeled in 1507 by the Abbess Renée of Bourbon.

Fonvielle, Wilfried de, wēl-frēd dė fôṅ-vyēl, French scientific writer: b. Paris 21 July 1824. He aimed to popularize scientific truths by his writings, of which the best known are: 'Fossil Man' (1865); 'Balloons in the Siege of Paris' (1871); 'The Physics of Miracles' (1872); 'The Conquest of the North Pole' (1877); 'The Wonders of the Invisible World' (5th ed. 1880); 'Thunders and Lightnings' (4th ed. 1885); 'History of the Moon' (1885); 'Hypnotizers' (1887); 'The South Pole' (1888); 'Famous Vessels' (1890); besides one or two minor historical works.

Fonviz'in, Denis Ivanovich, Russian author: b. Moscow, Russia, 14 April 1745; d. St. Petersburg 12 Dec. 1792. His fame as the Molière of his country arises from two comedies: 'The Brigadier' (1766), and 'The Minor' (or 'Mother's Favorite Son') (1782). He wrote also a burlesque, 'Court Grammar,' and mock correspondence of a facetious sort.

Foochow, foo-chow', or **Fu-Chau,** town in China, capital of the province of Fu-Kien, in a plain surrounded by an amphitheatre of hills, on the left bank of the Min, 125 miles northeast of Amoy. It consists of the town proper, surrounded by walls, and of extensive suburbs, which, stretching along both sides of the river, communicate by a stone bridge. The walls, 30 feet high and 12 feet wide at top, are overgrown with grass, and the gates, seven in number, are overlooked by high towers. The streets are extremely dirty, and the lines of shops, crowded with goods or with workmen in the act of making them, make the whole place look like one vast series of market-stalls. The principal edifices are the Ching-hwang Miau, and several other temples. Foochow is one of the five ports thrown open by the Treaty of 1843. The trade is very extensive, but the navigation of the river from the sea to the harbor is difficult. Principal exports — timber, bamboo, fruits, tobacco, potash, paper, and especially for the foreign trade — tea. In 1900 the exports amounted to $3,889,490. The imports in 1900 were of the total value of $4,088,560. Pop. (1900) 650,000.

Food, any substance which, taken into the body, is capable of sustaining or nourishing, or which assists in sustaining or nourishing the living being. Foods may be classed under three heads, gaseous, liquid, and solid, the first two consisting of the air we breathe — the oxygen of which is so essential to life — and the water we drink. Milk, tea, coffee, cocoa, etc., are popularly called liquid foods, but each of these is simply water in which various solid substances are dissolved, or held in suspension. The solid foods are of three kinds — namely: nitrogenous, non-nitrogenous, and mineral. Nitrogen compounds, or flesh formers, are essentially composed of carbon, hydrogen, oxygen, and nitrogen. They possess the only ingredients capable of building up and repairing the nitrogenous tissues of the body, but they also furnish a limited supply of heat, especially when heat-giving compounds are deficient in the body. Nitrogenous compounds are found both in the animal and vegetable kingdoms under the forms of albumen, fibrin, casein, gelatine, and chondrin. Non-nitrogenous compounds, or heat givers, sometimes called carbonaceous compounds, are composed of carbon, hydrogen, and oxygen. They serve to keep up the heat of the body, and so produce energy or force; but they contribute also to the repair and growth of the body. The chief heat givers are starch, sugar, and fat. None of these substances will of itself sustain life. The mineral foods are the salts of soda and potash, the phosphates of lime and magnesia, iron, etc. Common salt is the only mineral substance purposely added to food, the other mineral substances being found in nearly all parts of plants and animals used as food. Milk is a natural model food, as it furnishes all the nourishment required, and in due proportion. Oatmeal may also be called a model food, as it contains one part flesh formers and 5½ parts of heat givers. In fine wheaten flour the proportion is as one to eight, a part of the flesh-forming body having been removed in its preparation. The adulteration of any article of food reduces one or both of its essential constituents. The National Pure Food Law, which went into effect in the United States 1 Aug. 1900, was aimed against adulteration (q.v.). For a more extended description and classification of foods see the article NUTRITION.

Food of Plants. See PLANT FOODS.

Food-poisoning, a form of poisoning from food, which in times past was thought to be extremely common, but at the present time is known to occur but rarely. One of the most important features in food-poisoning is individual idiosyncrasy. It is well known that certain foods, such as strawberries and tomatoes, affect susceptible people uncomfortably, but instances of this are rare, and are often of mental origin. Epidemics of food-poisoning have occurred, as when, for instance, a baker has used a yellow coloring matter in his cake to obviate the necessity of using eggs, which coloring matter was largely made up of lead.

Food-poisoning may be classified under three main types: (1) Poisoning by means of

metals; (2) poisoning by means of animal parasites; (3) poisoning by means of plant parasites, bacteria and fungi and allied organisms. The metals which have been known to cause poisoning in food are particularly arsenic, lead, copper, antimony, tin, and zinc. During 1900 there was a widespread epidemic from poison by arsenic, in Manchester, England, and neighboring cities, from the drinking of beer. On investigation it was found that the arsenical poisoning, which in some cases proved fatal, was due to the glucose used in the manufacture of the beer. This glucose had been prepared by a sulphuric acid which had in turn been made from iron pyrites containing large amounts of arsenic. It entered into the glucose, and thus became an ingredient of the beer. This epidemic was extremely severe, thousands of cases of arsenical poisoning having been observed. Lead-poisoning very frequently follows the use of water which has been conveyed through new lead pipes. It may also result from the use of leaden coloring matters used in bread, biscuit, cake, etc. Zinc and copper poisoning have resulted from the use of canned vegetables, copper frequently being used to impart a good color to the vegetable.

Food-poisoning resulting from animal parasites or from animal poisons are of extreme interest. Trichinosis from the flesh of hogs, which has been imported in pork and pork sausages, while rare in this country, is common among those people who habitually eat their sausages without thorough cooking. A form of poison results from the eating of mussels which have developed the ptomaine mytilotoxine, and similar forms of poisoning from decomposition products in meat have been observed. A special form of meat-poisoning, botulism (q.v.), is extremely common in certain countries. It seems to be due to the development of the *Bacillus botulinus*. This form of poisoning has been observed in those who have eaten ham. The symptoms are late in onset; from 24 to 36 hours after eating gastric pains with frequent vomiting occur; and constipation is at first obstinate. Practically all the cases of botulism have shown eye-symptoms. There is disturbance of vision, the eyes become fogged, the lids droop, people see double, and there is dilatation of the pupils, while burning thirst and constriction of the throat are frequent signs. Extreme muscular weakness with perhaps loss of ability to speak, or of power to empty the bladder, may develop.

Other forms of food-poisoning have been described resulting from eating sausages and other meats which were diseased at the time of killing, or which have become tainted afterward, and a number of poisonous bacteria have been isolated. *Bacillus enteritidis, Bacillus morbificans, Bacillus breslaviensis, Bacillus Friedebergensis*, have been some of the forms that have been obtained in poisonous meat. Fish-poisons are not unknown, and in Russia and Switzerland and the West Indies a number of cases have been described as resulting from fish-poisoning. A peculiar type of poisoning from milk, ice-cream, cream-puffs, frozen custards, and cheeses is known. This poison seems to be due to the presence of a toxic substance which has been named by Vaughan of Ann Arbor, Mich., as tyrotoxicon.

As to poisoning from vegetable foods, the most important general poisons are those due to eating the poisonous mushrooms, and the grains affected by ergot and allied species. Thus ergotism as found in Russia, Spain, Italy, and its close ally pellagra are types of this form of food-poisoning. A well-known disease in eastern Japan and neighboring parts of Asia, termed beriberi (q.v.), is thought to be due to poisonous rice. See FUNGI; MUSHROOM; PTOMAINES; TOXICOLOGY.

Food Preservation is the method adopted for the preservation of organic substances used as food, either animal or vegetable, and may be considered under the following heads: (1) Preservation by cold; (2) Preservation by drying; (3) Preservation by salting; (4) Preservation by smoking; (5) Preservation by sterilization by heat and the exclusion of air; (6) Preservation by chemical or antiseptic substances.

1. *Cold.*— The application of cold for the preservation of meat and vegetables may now be conducted under modern methods of applying this agent, at temperatures varying from 0° F. (—18° C.) to 40° F. or more. In the large cold storage plants now established in many cities, in which ammonia is chiefly used for the production of variable degrees of cold, it is customary to provide several large chambers for the preservation of food in which different temperatures are required, fruit being kept at temperatures a little above the freezing point, and meats, fowl and especially fish at considerably lower temperatures.

In densely settled countries like England, where the land is insufficient to produce the necessary amount of meat for the food supply of the people, frozen meat from other countries forms a very large part of the food supply. If the meat is frozen before *rigor mortis* (rigidity following death) supervenes the meat keeps well, but if it is frozen later it rapidly decomposes after thawing. Freezing arrests putrefaction and has a tendency to conceal the odor of decomposition. Hence the bad condition of frozen fish may not be detected until the heat necessary for cooking is applied. Meat which has been frozen, is often unusually tender, on account of the loosening of the intermuscular tissue by freezing; bacteria can more readily penetrate into the interior of the thawed meat, and bring about rapid decomposition. Such meat and fish, especially when thawed too suddenly, lack the flavor of fresh meat. Bacteria in general and especially those which are concerned in the production of putrefaction, seem to be endowed with extraordinary powers of resistance to the action of cold. Colemann and Mickendrick kept flesh six hours in hermetically sealed boxes at temperatures from —6° to —130° C., but in every instance the flesh after being kept at a slightly warm temperature began to decompose in from 10 to 12 hours, though protected from subsequent infection. But cold, though it may not destroy micro-organisms, prevents their development, or at least does so in the case of putrefactive bacteria. There are, however, certain bacteria which are capable of developing in frozen meat, and especially in that which is kept at about 0° C. Lafar attributes to this cause, the unpleasant flavor sometimes acquired by meat which has been kept in a refrigerator for several days. This is confirmed by Popp, who says that the walls of such ice chambers when moist, swarm with bacteria, which in his opinion produce the

objectionable flavor often developed in stored meat.

The Detection of Frozen Meat.— Maljean describes a method of detecting frozen meat by microscopic examination of the blood of the meat. A drop of the blood is expressed from the meat upon a glass slide, covered with a thin glass, and examined as soon as possible to avoid solidification. The juice of fresh meat shows numerous red corpuscles of normal color and shape floating in a nearly colorless serum. But the corpuscles of frozen meat are more or less distorted in form and are completely decolorized, while the surrounding fluid is relatively dark in color. On placing a fragment of frozen meat in a test tube, containing some water, the liquid becomes colored more rapidly and intensely than when fresh meat is used.

2. *Drying.*— This is one of the oldest and best known of the various processes of preservation, and applies equally to animal and to vegetable products. By this means, beef and fish of many kinds, grapes, figs, apples, peaches, currants, and many other kinds of fruit are annually preserved by drying, and are thus rendered more suitable for transportation to distant markets, in consequence of great reduction in weight, as well as preservation from decay. The more rapidly the drying process is conducted the better. Drying is conducted in the open air by the aid of the sun's heat, or by artificial means. The curing of fish by drying constitutes an important industry in most northern maritime countries, the principal edible fish employed for this purpose being cod and herring, of which large numbers are dried in the fishing ports of the Atlantic coast north of Cape Cod, and in the British Islands and on the coast of Norway and Sweden. Fish are prepared for drying by the removal of the entrails, slitting them lengthwise, and then drying them in the open air.

3. *Salting.*—Salting is one of the oldest and best-known methods of preserving meat and fish. The most common method of preserving meat, especially pork, is by placing the meat in casks in layers, with salt between each layer. The salt withdraws water from the meat, and the brine thus formed penetrates the fibres of the meat. In Eckart's Munich quick-salting process, the meat is impregnated under pressure with a 25 per cent solution of common salt for 24 hours and then smoked. It is claimed that by this process the loss consists, mainly, of only water and a little phosphoric acid, that the meat has a better flavor, and that trichinæ are completely destroyed. As one of the results of salting meat is the removal of its natural color, it is quite customary to add a small quantity of saltpetre to counteract this effect. According to Lehmann, a small percentage only should be used on account of its harmful effect. Five grams of this salt have caused severe illness and eight grams have been known to cause death. The effect of the continued use of meat containing saltpetre, upon the human system, has not been determined by observation or by experiment.

Influence of Salting Upon Bacteria.— Forster's experiments show that the streptococci of erysipelas and many other well-known bacteria can live for weeks and even months in salted meat. The bacilli of tuberculosis retain their virulence for more than two months, and while the bacteria of anthrax perish in less than a day, their spores retain their vitality for a much longer period.

Effect of Salting Upon Flesh.— Salted meat is harder and more difficult of digestion than fresh meat. Voit shows by analysis that the nutritive value of meat is only slightly diminished after 14 days' salting. He found the percentage loss to be for water 10.4, organic matter 2.1, albumen 1.1, extractives 13.5, phosphoric acid 8.5. The amount of salt taken up by 1,000 grams of fresh meat was 43 grams. Polenske, on the contrary (Jahresbericht Nahr. u. Genussmittel 1891, p. 40), found that the meat, after being salted for three weeks lost 7.7 per cent of its nitrogenous constituents, and 34.7 per cent of its phosphoric acid, and after three months and six months the loss was still greater. He therefore concluded that the meat was greatly altered in its nutritive character, and that it could not be used continuously without injurious effects. Salted pork constituted a very important part of the food ration of the Union army in the Civil War, and when accompanied with an abundant supply of fresh vegetables, it was considered a wholesome article of food. Absence of the latter, however, was often the cause of serious illness. Strohmer gives the following analysis of fresh and salted herring:

	Fresh herring	Salt herring
Water	80.7	46.2
Nitrogenous substances	10.1	18.9
Fat	7.1	16.9
Ash	2.1	16.4
Salt	....	14.0

Caviare.— This is the salted roe of the sturgeon and other fish. It is prepared by washing the roe with salt water, leaving it in the brine for some time, pressing it, again treating it with salt water, passing it through a hair sieve, and finally packing it in salt. The most highly prized is the Astrakhan caviare, which is prepared at the mouth of the Volga. The following analyses of caviare are compiled from the works of Gobley and of König:

		Caviare	Pressed caviare
Water		43.89	30.89
Nitrogenous substances		30.79	40.33
Fat		15.66	18.90
N-free substances		1.67	....
Ash		8.09	9.88
The dry substance	N-substances	54.89	58.36
	Fat	24.02	27.35
	Nitrogen	8.78	9.36

4. *Smoking.*— The preservative qualities imparted to meat or fish by smoking are due partly to the drying action of heat, and partly to the antiseptic action of some of the substances of which smoke is composed, namely, creosote, formaldehyde, and pyroligneous acid. The smoke coagulates the albumen of the meat, and forms a protecting envelope. The best woods for the production of such smoke for preserving are beech, birch, and poplar, the conifers being unsuitable in consequence of the resin which they contain. There is no loss of nutriment, and Strohmer found that smoked meat is as digestible as fresh meat. Smoking may be con-

ducted in two ways: (1) by slowly smoking the meat for 24 hours at 25° C., or in the case of sausages and fish at 70° C., and then for a short time at 100° C.; (2) the meat may be placed directly in the hot smoke. Products prepared by the slow process have been found to contain more micro-organisms than those made more rapidly. The smoking should be continuous and not intermittent.

Action on Bacteria.— Serafini and Ungaro found that smoke acts energetically on pure cultures of bacteria, those of anthrax being killed in 2½ hours, and anthrax spores in 18 hours. Bacilli in the interior of the meat were not killed. Forster found the bacilli of tuberculosis still virulent in the interior of meat after it had been salted and smoked.

The following analyses of smoked and salted meats and fish are from the works of Strohmer and König:

	Water	Nitrogenous substances	Fat	Ash	Common Salt
Ham	59.73	25.08	8.11	7.08	....
Smoked beef...	47.68	27.10	15.35	10.59	....
Smoked herring	64.49	21.12	8.51	1.24	....
American bacon	9.15	9.72	75.75	5.38	....
Mackerel	44.45	19.17	22.43	13.82	11.42
Salmon	51.46	24.19	11.86	12.04	10.87

During the process of salting and smoking the coloring matter of meat is changed, as shown by the spectroscope. Smoked ham and other meats have an alkaline reaction.

5. *Preservation by Exclusion of Air After Sterilization by Heat.*— In early times food was preserved to a limited extent by heating in earthen vessels, and sealing hermetically by such crude processes as were available. At the present day such methods have given place to preservation, either in tin cans or boxes or in glass. In the former instance food may be preserved for long periods, by means of soldering, and in the latter by means of tight-fitting joints and rubber rings. The latter method is not so much used in trade, but is largely employed for domestic purposes. The prudent housewife also makes use of surface layers of paraffine and waxed paper for the temporary exclusion of air. Tin cans are stronger, and more tight, and more economical. Almost every kind of perishable food is now preserved in this manner.

In the United States the preservation of meats, poultry, fish, vegetables, and fruits in this manner has become an important industry and branch of commerce, both domestic and international. The canning of meats is conducted to a great extent in those cities where great slaughtering establishments are located. The canning of vegetables and fruits is carried on at places located among the great fruit-producing regions, while the fish canneries are mostly upon the rivers and in the seacoast towns of the northeast and northwest States and Provinces where the fish are taken from the water. The cans filled with their contents are either heated in steam retorts or immersed in boiling water. A small hole is left in the cover, and while still hot, the hole is closed with a bit of solder. In a few days the cans are tested by tapping them with a wooden mallet or hammer. If the cap sinks slowly, the can has been properly sealed, but if it is elastic, and springs back, it is rejected as a "swell-head." In the preservation of corned beef, the cans are pierced to allow the water and fat to escape, and are then soldered and placed in boiling water again for several hours.

Canned roast beef is largely used as a part of the army and navy ration, especially during the time of war, and upon the frontier. The method of preparation is thus described by Munson: "The beef is first placed in water and maintained at a temperature of 95° C. until well cooked. It is then removed, trimmed and placed in cans, a little gelatine being added to bind the meat together. The cans are then sealed and either submerged in boiling brine, or placed in superheated steam at 125° C. The steam in the can escapes through a puncture made in the top of the can which is immediately afterward closed with solder. The meat being sealed while hot, any portion of enclosed space is a partial vacuum; consequently a good can of meat will usually present a concave appearance on the outside, from atmospheric pressure.

When a can is bulged it is bad — unless frozen — and should be rejected. Freezing causes a bulging of the ends of the cans without injury to their contents. The ends, after the contents are thawed, return to their former shape, unless this process has been several times repeated.

The process of canning involves the making and soldering of two punctured holes in the top of each can. The presence of three such holes is evidence that the can had been imperfectly treated, and that it was reheated, the gas allowed to escape and the hole punctured for this purpose again sealed. The contents of such reheated cans are more likely to be of inferior quality than those of properly prepared cans. On this account the packers are careful to make the third puncture as inconspicuous as possible, and often to conceal it entirely by making it on the side of the can near the top and pasting the label over it. This may usually be detected by running the finger around the rim of the can.

Sometimes newly packed cans are so much swollen that reheating is not sufficient. In such cases the cans are opened, the contents sorted and the sound parts repacked in cans as before. The quality of such articles can only be determined by opening the cans and examining their contents, which present an overcooked appearance. First-class canned goods have the name of the manufacturer and often that of the wholesale house through which they are sold upon the labels, while doubtful goods have a fictitious factory name and no dealer's name.

Canned peas are subject to great variations in quality. Dried peas are bought in large quantities, soaked, heated and canned. Such articles can usually be recognized by their appearance and taste on opening the cans. To such an extent is this done as to have led to legislation in some States requiring all such cans to be legibly marked "soaked."

French canned peas and beans are often colored with sulphate of copper, which improves their appearance, but not their taste. The sale of such articles is forbidden in some countries.

The Composition of Canned Meats.— König found the following results in samples of canned meats and salmon. From 48 to 65 per cent of water, from 15 to 33.8 per cent of nitrogenous

substances, from 0.2 to 21.6 per cent of fat, and from 2.3 to 21 per cent of ash. Of the water-free substances, there were from 43 to 78 per cent of nitrogenous substances, and from 0.3 to 43 of fat. The albuminous substances were generally less than those of fresh meat, the actual figures varying in different kinds of meat, from 87.06 to 93.94 per cent as much as that of fresh meat. The preservation of food by hermetic sealing in cans has, within the last half century grown to be an important factor in the commercial and industrial development of the United States. Before 1795 drying and the use of salt and sugar were the only methods used to any considerable extent in the preservation of food. Nicholas Appert, a Frenchman, stimulated by the offer of a reward for a mode of preserving food for use at sea in the navy, submitted to his government a treatise upon the hermetic sealing of all kinds of food. His principle, as set forth in this work, was practically the same as that which is now in use, the exclusion of air, and the application of heat for the purpose of sterilization. France first purchased his process and the industry soon spread to England and Ireland.

One of the first persons who introduced the industry into the United States was Ezra Daggett, who arrived in New York between 1815 and 1818. In 1819 he was engaged in the manufacture of hermetically sealed goods, chiefly salmon, oysters, and lobsters. William Underwood arrived at New Orleans from London in 1817, having learned the trade of pickling and preserving with the house of Mackey & Company. Not liking the climate of the South he walked from New Orleans to Boston, where he and Charles Mitchell introduced the same industry, applying it to pickles, sauces, jams, and fruit. Glass jars were at first used, but on account of their expense and fragile nature, they were soon largely supplanted by tin cans, which were introduced in 1825 by Thomas Kensett. The making of tin cans for this purpose became an important industry, various improvements being made from time to time in the processes of manufacture.

During the Civil War large quantities of canned meats, tomatoes and other vegetables and fruits were furnished both to the army and to the navy, and during the Spanish war the use of preserved meats treated with chemical antiseptics at one time threatened to become a lively campaign issue.

According to the census of 1900 there were in that year 2,195 establishments for the canning and preserving of fruits and vegetables, fish and oysters in the United States, having an aggregate capital of $48,497,978. The value of their products was $82,592,196. The number of wage-earners averaged 52,581, and $12,910,399 were paid for wages. Of the total capital, $27,743,067 was devoted to the canning of fruits and vegetables, $19,514,215 to fish, and $1,240,696 to oysters. The exports of canned or preserved fish, fruits, and vegetables in 1900 exceeded the imports by about $2,500,000.

The capital devoted to the canning of fruits and vegetables had increased from $2,335,925, in 1870, to $27,743,067 in 1900, and the number of establishments from 97 to 1,808.

The number of establishments in the New England States in 1900 was 80, in the Middle States 945, in the Southern States 204, Central 380, Western 28, Pacific 171. The largest numbers in single States were in New York 511, Maryland 271, California 136, Michigan 98, Virginia 88, New Jersey 73, Ohio 70, Illinois 61, Indiana 60, Maine 59, and Delaware 51. The value of the products was, in California $13,081,829, in Maryland $11,996,245, in New York $8,975,321 and in Illinois $3,730,030. The principal preserved fruits and vegetables in value were tomatoes $13,926,749 (641,219,993 pounds), corn $8,230,975, peas $4,679,426, beans $2,124,208, peaches $4,414,277, pears $2,233,166, apples $1,160,728, apricots $1,591,567, dried apples $1,913,142, dried prunes $970,927, and raisins $720,268.

The drying of fruit is confined chiefly to California and New York, these States reporting 87.2 per cent of the total number of pounds. Maryland leads in oyster canning and is among the first in the canning of tomatoes, corn, peaches, peas, lima beans, pears and pineapples. Maine is the leading State in sardine canning, and New York leads in canning corn, apples and pears.

Fish Canning and Preserving.— The number of establishments devoted to fish canning and preserving in the United States in 1900 was 348, having increased from 110 in 1890. Of the total number in 1900, 117 were in Maine, 61 in Massachusetts, 36 in Alaska, 36 in Washington, 24 in Oregon, and 19 in California. The value of products in 1900 was $22,253,749, of which Maine produced $4,779,733, Washington $4,831,038, Alaska $3,821,136 (or more than half the amount paid Russia for this territory), and Oregon $1,788,809.

By far the greatest capital employed in any single city in fish preservation was in Gloucester ($1,479,647), and secondly in Seattle, Wash., $336,620.

The canning of fish was introduced at Eastport, Maine, in 1843, lobsters and mackerel being preserved in this manner. Establishments for salmon canning were started on the Columbia River in 1866, and at Klawak, Old Sitka and Cook Inlet in Alaska in 1878 and 1882. The labor in these salmon canneries is chiefly performed by Chinese. The sardine canning of Maine is next in importance to the salmon canning of the Pacific coast. Sardine is a general term applied to various small fishes, the best known being the young of the pilchard (French) and the young of the sea-herring (coast of Maine). The fish are first fried in oil, and then placed in a can with oil. Olive oil or peanut oil are chiefly used in France for this purpose, and cotton-seed oil in Maine.

The number of establishments engaged in oyster canning in the United States in 1900 was 39, of which 16 were in Maryland, 6 in Florida, and 4 in Mississippi; $1,240,696 in capital was devoted to this industry, and the products were valued at $3,670,134, of which two thirds were produced in Maryland. In canning oysters in large quantities, steam is employed, the oysters being put into a steam-tight box and submitted to the action of steam for 15 minutes, by which process they are more readily opened and made ready for canning.

The extent and importance of the food canning industry of the United States may be estimated by the fact that 400,000 persons are employed in the work of canning, manufacture of cans, packing boxes, etc. It would require 60,000

freight cars to transport a year's product; 750,000,000 cans, 2,000,000 boxes of tin plate for the cans, and 30,000,000 wooden packing boxes.

6. *Preservation by Chemical Substances.*—For many years it has been the custom to employ salt, sugar, alcohol, and saltpetre for the purpose of preserving meat and fish, and some of these substances for the preservation of fruits and vegetables, and no objection has been made to this practice; but in more recent times, and since preserved food has come into more general use, the practice of using other substances has also largely increased. The question whether the use of such articles for this purpose may be injurious to the health of the consumer does not appear to have been yet satisfactorily settled. The experiments of Tunnicliffe and Rosenheim would appear to show that food mixed with boric acid and borax, taken separately and together in such quantities as are ordinarily employed, may be eaten with impunity, but earlier observers have arrived at contrary conclusions. On account, therefore, of the possibility of the use of such chemicals in the preservation of food by persons wholly unacquainted with their physiological properties, legislation appears to be tending in the direction either of prohibition of the use of chemical preservatives or of regulating their use by making their presence known to the consumer. Many substances have been experimented upon with reference to their preservative quality, among which are sulphur dioxide, sulphites and bisulphites, boric acid and its compounds, fluorides, chlorides, alum, lime, sodium carbonate, formaldehyde, benzoic and salicylic acid and their compounds. At the present time boric acid, salicylic acid, and formaldehyde appear to be most frequently used.

Boric acid is most often used for the preservation of meats, certain kinds of fruits and catsup, and upon hams and fish. The latter are found to keep longer if the boric acid is rubbed over the outside. Two grams per kilo is sufficient for fish. According to le Féré boric acid is eliminated slowly from the system, having been detected in the urine 40 to 50 days after it had been taken. It does not appear to interfere seriously with digestion so far as could be concluded from experiments. Cases of flesh poisoning have been reported from Switzerland, where meat had been preserved with borates, which had not acted sufficiently as preservatives, but had only masked incipient putrefaction.

Sulphur and its compounds have been used to some extent for the preservation of food, but not so much at present as formerly. These compounds and especially sulphur dioxide have a powerful germicide action. Authorities differ as to their physiological action. Polli found that 8 to 12 grams of sulphite were not injurious to adults. Ostertag, Bernatzik, and Braun found that one gram of magnesium sulphite caused disorders of the stomach in women. Fischer found that 50 per cent of the preserved meat products sold in Breslau in 1895 contained sulphites, the quantity of sulphur dioxide varying from .34 to .01 per cent. According to Riche, sulphurous acid and its salts, especially calcium bisulphite, have a considerable action on meat, altering its normal condition. This action causes changes in the soluble proteid substances. An addition of 1 per cent of a sulphite to meat is not perceptible to taste or to smell. On cooking the meat the sulphite is only partially decomposed and expelled. Fischer states that meat containing more than 0.1 per cent of sulphur dioxide should be regarded as injurious to health.

Salicylic acid is one of the constituents of many of the modern meat preservatives. Bersch placed a portion of the flesh of a recently slaughtered animal in a concentrated aqueous solution of salicylic acid, and found that after four days the exterior of the meat was perfectly sound, but the interior showed signs of putrefaction, and contained many micro-organisms. He therefore concluded that the preservation of fresh raw meat by salicylic acid was not practicable. In such meat compounds as sausages and potted meat, where the salicylic acid is uniformly distributed through the mass, its germicidal properties would obviously exert a more decided action. On account of its decided taste it cannot be used so freely in meat preparations as in other kinds of food in which the taste of the preservative is concealed. Here again authorities differ as to the action of this preservative on the human economy, when used in connection with food substances. The Paris Academy has forbidden even the least addition of salicylates to food, on account of their liability to injure the kidneys or digestive organs, when any weakness of these organs exists.

Formaldehyde.— In recent years formaldehyde has been introduced as a preservative in consequence of its powerful antiseptic action. A proprietary preservative known as "Carnolin" consists of a 1.5 per cent solution of formaldehyde slightly acidified. It exerts a decided antiseptic action on milk in very small amounts. The effect of salicylic acid upon the system, when employed in the small proportions required for food preservation has not yet been well determined, but its power of forming insoluble compounds with proteid substances, and its hardening power upon animal tissues, would seem to render meat treated with it much less digestible than otherwise. Mahery and Goldsmith found that formaldehyde in the proportion of 0.2 gram limited the artificial peptic digestion of blood fibrin. Ludwig states that formalin is not applicable to the preservation of meat products. Ehrlich tried the effect of an 8 per cent. solution of formaldehyde on various food substances. He found that horseflesh was completely preserved by it, but that the odor developed was such that the meat could not be eaten. Beef thus treated did not develop this odor, but was only fit to be eaten for a short time after addition of the preservative, on account of the chemical changes which it produced. According to Bloxam formaldehyde causes fish to become so hard as to be unsalable even if the solution contains only one part in 5,000.

British Investigation Relative to the Use of Preservatives.— A committee was appointed in 1899 to report to Parliament upon the "Use of preservatives and coloring matters in food," the object of the investigation being to ascertain:

1. Whether the use of such materials, or any of them, for the preservation and coloring of food, in certain quantities, is injurious to health, and if so, in what proportions does their use become injurious?

2. To what extent and in what amounts are they used at the present time?

This committee held many hearings and examined 78 witnesses, among whom were the principal experts in England, physicians, health officers, chemists, grocers, dairymen, and representatives of different food interests.

The committee reported that the preservatives found in use other than alcohol, oils, vinegar, salt and sugar, were boric acid and other boron preservatives, sulphurous acid and sulphites, fluorides, salicylic acid, benzoic acid, and formalin or formaldehyde. A list of 4,251 articles of food examined at the government laboratory for preservatives was presented, of which 1,659, or 39 per cent, were found to contain preservatives. These consisted of 35 different kinds of food and beverages. The articles in which the greatest ratio of preservatives was found were lime and lemon juice, 88.5 per cent, ham 82.7 per cent, cream 77.9 per cent, margarine 74.4, pork-pies 70.8, cordials 70.8, bacon 70.5, sausages 66.4, fruit syrup 65.2, butter 57.1.

Of the 1,659 samples treated with preservatives, 1,249 contained boron compounds, 320 salicylic acid, 20 formalin and 143 sulphites.

The committee were of the opinion that preservatives should not be used in milk, since the milk producer might be liable by such use to protect himself against the immediate results of scrupulous cleanliness. Under the influence of preservatives milk may be exposed without sensible injury to conditions which would otherwise render it unsalable. It may remain sweet to the taste and smell, and yet may contain disease germs of various kinds, whereof the activity may be suspended for a time by the action of the preservative, but may be resumed before the milk is digested.

The following were the general conclusions of the committee, so far as preservatives are concerned:

a. That the use of formaldehyde or formalin or preparations thereof, in food and drink be absolutely prohibited, and that salicylic acid be not used in a greater proportion than one grain per pint of liquid food, and one grain per pound of solid food; its presence in all cases to be declared.

b. That the use of any preservative or coloring matter whatever in milk offered for sale in the United Kingdom be constituted an offense under the food and drug acts.

c. That the only preservative which it shall be lawful to use in cream be boric acid or mixtures of boric acid and borax, and in amount not exceeding 0.25 per cent expressed as boric acid, the amount of such preservative to be notified by a label upon the vessel.

d. That the only preservative permitted to be used in butter and margarine, be boric acid, or mixtures of boric acid and borax, to be used in proportions not exceeding 0.5 per cent expressed as boric acid.

e. That in the case of all dietetic preparations, intended for the use of invalids or infants, chemical preservatives of all kinds be prohibited.

The following statement appears in the 33d annual report of the State Board of Health of Massachusetts (1901). Out of 7,323 samples of milk examined with special reference to the presence of preservatives, 184, or 2.5 per cent, contained formaldehyde; 42, or .6 per cent, contained boric acid, and 7 contained carbonates. These samples were all obtained in the summer months.

Legislation Relative to the Use of Preservatives.— At present Austria has no law upon this subject. In Belgium the use of preservatives in milk is forbidden. In Denmark a law of 1897 prohibits the use of all preservatives except salt in butter and margarine. The use of several specified preservatives in wine is also forbidden. In France the sale of food containing either salicylic acid or formalin is prohibited. In Germany, by a law of 1879, spoiled goods sold in a state concealing their real condition make the vendor liable to a penalty. The addition of alum, boric acid and salicylic acid to wine is also forbidden. The following conclusions have been reached by the Imperial Health Board of Germany regarding the use of sulphurous acid in mince meat:

1. From fresh butcher meat without chemical preservatives, but with due observance of cleanliness, mince meat can be produced, which, if kept at a low temperature, will retain its natural color for more than 12 hours.

2. The addition of preservatives which contain sulphurous acids and similar salts can improve the natural color of the meat, but not the meat itself. By their means mince meat can appear to be of better quality than it really is.

3. The frequent consumption of mince meat which is treated with sulphurous acid salts may be injurious, particularly to people of delicate health.

The Imperial Health Board is also carrying on a series of experiments relative to boric acid and its compounds.

There is no law in Norway prohibiting the use of preservatives in food, unless they can be shown to be injurious to health. In Switzerland each canton acts for itself and there is no general law upon the subject.

Legislation in the United States.— At present there is no law of the general government upon the subject. In the report of the secretary of agriculture in 1899 were the following suggestions:

"It is not regarded as a wise thing to absolutely prohibit the use of preservatives in food. Since, however, all chemicals which have the property of preserving food have also a tendency to interfere with the process of digestion, it is held to be imperative that no food should be offered for sale which contains a preservative without having this fact plainly stated upon the label of the package. Not only should the label state that the food product contains a preservative, but it should also give the name of the preservative, and the quantity employed. In this way the intending purchaser is fully informed in regard to the character of the product which he buys. While it has been established that a healthy stomach can from time to time receive with impunity food containing small quantities of preservatives, it is by no means certain that the continued practice of ingesting preservatives in foods would not produce serious injury. On the other hand, it is also quite certain that weak or diseased stomachs may suffer temporary or permanent injury from minute quantities of preservatives. See Adulteration.

In the different States of the Union there is very little uniformity in the legislation relative

to the use of preservatives in food, many States having no laws whatever upon the subject.

In Minnesota by a law of 1899 the sale of milk, cream or food products of any nature whatever "to which has been added any preparation in powdered or liquid form, known as preservatives, except salt in butter" is forbidden. In Nebraska the sale of cider containing preservatives is forbidden. In New York the use of certain preservatives in wine is forbidden. In North Carolina the name of any preservative "must be made clearly known by conspicuous labeling, or made known to the purchaser when the article is not capable of being labeled." In Ohio the use of salicylic acid or any other antiseptic in wine is forbidden. In Oregon the use of preservatives in butter is forbidden. In Pennsylvania refrigeration is the only allowable mode of preservation for fresh meats. Canned meats, pickled and salted meats and meat extracts must contain no other preservatives than salt, sugar, spices, vinegar, smoke, or saltpetre. In South Dakota no preservatives are allowed in jellies or meats. In Utah they are forbidden in milk. In Washington certain drinks as well as cream and milk must not contain salicylic, benzoic, or boric acid. In Wisconsin, the use of any preservative is forbidden in milk, cream and catsup. See ADULTERATION; FISH AS FOOD; FOOD; MEAT; MILK; REFRIGERATION, etc.

Foods for the Sick. See SICK, FOODS FOR.

Fool. See JESTER.

Fool of Quality, The, a curious novel by Henry Brooke, published originally in five volumes (1760–77). It was considered of such spiritual value by John Wesley, the founder of Methodism, that he prepared a special edition of it for the use of his followers. Toward the close of the book its mysticism becomes exceedingly exalted and visionary, suggesting the author's acquaintance with the teachings of the German mystic, Jacob Boehme. The work as a whole is hardly capable of holding a modern reader's interest. It had, however, no mean place in the popular fiction of the 18th century.

Fool's Cicely. See DOG PARSLEY.

Fool's Errand, A, a story by Albion W. Tourgee, published in 1879. It is the first of a series dealing mainly with events connected with the Civil War. "The Fool" is Comfort Servosse, a Union colonel, who removes from Michigan to a southern plantation after peace is declared. The story of his reception there and the difficulties encountered, arising out of old prejudices upon the one hand and his own training and convictions upon the other, is told with much detail and strong local coloring.

Fools, Feast of. Festivals, under this name were regularly celebrated, from the 5th to the 16th century, in several countries of Europe, by the clergy and laity, with the most absurd ceremonies, and form one of the strangest phenomena in the history of mankind. Among the heathen festivals which the Christians could not easily abolish, were the Saturnalia, which, in the confusion of all distinctions of ranks, and in extravagance of merriment, exceeded the gayest carnivals. The feast of fools, among Christians, was an imitation of the Saturnalia, and, like this, was celebrated in December. The chief celebration fell upon the day of the Innocents, or upon New Year's Day; but the feast continued from Christmas to the last Sunday of Epiphany. At first only the boys of the choir and young sacristans played the principal part in them; but afterward all the inferior servants of the Church, and even laymen, engaged in them, while the bishop, or the highest clergyman of the place, with the canons, formed the audience. The young people, who played the chief parts, chose from among their own number a bishop or archbishop of fools, or of unreason, as he was called, and consecrated him, with many ridiculous ceremonies, in the chief church of the place. This officer then took the usual seat of the bishop, and caused high mass to be said, unless he preferred to read it himself, and to give his blessing to the people, which was done with the most ridiculous ceremonies. During this time the rest of the performers, dressed in different kinds of masks and disguises, engaged in indecent songs and dances, and practised all possible follies in the church. Except from their association with the Saturnalia nothing is known of the origin of these extravagancies, which appear to have been very ancient. The most celebrated, and probably one of the most ancient of these festivals, was held in the city of Sens, in France. By an ordinance in 1245, intended to abolish it, it is alluded to as a very ancient celebration. So general was the custom of these celebrations in France, that it is said there were few towns at the end of the 17th or even as late as the middle of the 18th century, in which associations did not exist. Similar antics seem to have been played in other countries, as Germany, England, and Scotland, but it is to be hoped that the height of profanity reached in some of the extant liturgies and rubrics was not commonly attained in these fooleries. The *fête des fous* at Sens was suppressed in 1547. These fêtes were frequently prohibited, but until the Reformation period, when they were considered dangerous by the ecclesiastical authorities, they were commonly tolerated. To account for these celebrations, so opposed to all our ideas of religion, decency, and common sense, we must transfer ourselves to times when men combined, with childish simplicity, the most ridiculous with the noblest subjects, and often with less injury than we should suppose to the latter. Similarly, grotesque or indecent figures are to be seen among the sculptures of old Gothic churches, and may not unfrequently be detected in the work of the large

initial letters of the breviaries and religious books of this period.

Fool's Parsley. See Dog Parsley.

Foot, Solomon, American statesman: b. Cornwall, Vt., 19 Nov. 1802; d. 1866. He was graduated at Middlebury College in 1826 and in 1831 was admitted to the bar, and settled in Rutland. For several terms he represented the town of Rutland in the Vermont legislature, and in 1842 and again in 1844 was elected a representative in Congress. From 1851 till his death he sat in the United States Senate where he made many important speeches, and bore a conspicuous part in the Lecompton debate of 1858.

Foot. In the human foot the bony structure is made up of three divisions, the tarsus, metatarsus, and phalanges. Seven bones form the tarsus; the os calcis or heel-bone, the largest and strongest of all, carries the principal part of the body's weight. On its posterior surface the large muscles of the calf find their attachment through the tendon Achillis. Half in front of the os calcis and superimposed upon it is the next largest bone, the astragalus. This bone bears directly the weight of the body through the large leg-bone, the tibia, resting on the upper surface. On the outer side in front of these two bones is the cuboid, and on the inner side the scaphoid or navicular bone. In front of the scaphoid there are the three small cuneiform bones, internal, middle, and external. These three bones with the cuboid form articulations with the next row or division. The metatarsus is formed of five so-called long bones; that is, each bone has a shaft and articulating extremities. To each of these is joined one of the next division or phalanges. These are also long bones, the great toe made up of two bones, and the others of three each. Strong ligaments bind these bones to one another in such a way as to form and maintain an arch from before backward, and somewhat from side to side, the points of contact with the ground being only with the os calcis behind and the metatarsus and phalanges in front — the so-called ball of the foot. By this arrangement shock is transmitted through an arch or spring, pads at these two points also further eliminating jars. The sole of the foot is also covered with small muscles, which move the toes, and tendons that flex the toes and extend the foot on the ankle. Across the dorsum or instep pass the flattened tendons that flex the foot and extend the toes. The chief artery to the sole comes down on the inner side of the heel, passing across to the outer side, then arching across to the inner side again, giving off branches to the toes. On the dorsum the main artery comes to the surface at the instep and forms an arch of supply to the toes. The nerves on both surfaces closely follow the arteries.

Among the lower animals, monkeys have feet that approach nearest to those of the human. The separation of the great toe, in a way corresponding to the thumb, and the absence of the arch are the points of difference. In many of the animals, as in the cat tribe, there is a greater or less tendency toward a rudimentary inner toe, and an increase of the function of the ball of the foot, with a lessening of the importance of the heel. In the cattle and equines the toes are fewer, and the nails or claws become converted into hoofs. The horse walks on the end of his single digit.

In measure of length, the name foot is derived from the length of the human foot, containing 12 linear inches. Square foot is a square whose side is one foot, and is therefore equal to 144 square inches. Cubic foot is a cube whose side is 1 foot, and the cube contains 1,728 cubic inches. The foot is a common measure in various countries, but its dimensions often vary somewhat. In poetry, a measure consisting of a variety of syllables, two, three, or four, in combinations of long and short, or accented and unaccented syllables. The number of possible varieties of feet is reckoned at 28. See Rhythm.

Foot and Mouth Disease. See Murrain.

Foot-pound, the unit of work or of energy that is commonly used in engineering calculations in England and the United States. It is defined as the quantity of work expended in raising a weight of one pound through a vertical distance of one foot. As the attraction of the earth for a pound of matter varies somewhat in different latitudes and at different heights above the sea, the foot-pound is subject to corresponding variations as we pass from one locality to another. To give the unit greater definiteness it has been proposed to define it as the quantity of work done in raising one pound of matter through a vertical distance of one foot, at the level of the sea in latitude 45°. This definition differs from the ordinary one, it will be observed, solely by specifying the locality at which the experiment is supposed to be performed. See Units.

Foot-rot, a disease in the feet of sheep, the more common form of which is an inordinate growth of hoof, which at the toe, or round the margin, becomes turned down, cracked, or torn, thus affording lodgment for sand and dirt. In the second form of the disease the foot becomes hot, tender, and swollen, with ulcerations between the toes, followed by the sprouting of proud flesh. The inflammation is due to suppression of the secretion of the gland between the toes, usually the result of standing too much in wet ground. The best remedy is to pare away the diseased and ragged parts of the hoof, thoroughly applying a lotion made by dissolving one pound of blue vitriol in a quart of water, and keeping the animal always in a dry place.

Foot-wall. In mining language, the foot-wall of a vein is the rock boundary of its lower side, the side on which a miner would stand in breaking down the ore. The term is also used in speaking of a fault or rock dislocation, the foot-wall of a fault being formed by the edges of the rock strata that underlie the plane of displacement. See Fault; Mining; Ore Deposit.

Foota-Jallon. See Futa-Jallon.

Football in America, as in England, is of different varieties, but by far the most prominent is the game played in the colleges. This type is the outgrowth of the English Rugby and still possesses points of similarity to the game from which it was derived. Association football is played in and around some of the mill towns where the foreign population predominates, and previous to 1870 a mongrel kind of football made up of a combination of Association and Rugby had some vogue, and was the original form of the sport in America.

The type, however, known as American football suggests now only one variety and that is the one mentioned above as prevailing in colleges and universities. This sport draws to each of its chief annual contests from 25,000 to 40,000 spectators. During its season, which consists of October and November, it temporarily eclipses all other athletics in interest. For this reason it is the money maker in college athletics, in a great number of universities the receipts from the football contests practically supporting the other athletic branches throughout the year.

This sport, developed as it now stands, was originally introduced into American colleges by Harvard, whose team, having visited Canada and played under the Canadian rules, became enamored of the style of the English Rugby, and, although in 1875, as a matter of consideration for her ancient rival, Yale, Harvard agreed to compromise between what was then known as American football and English Rugby, in the next year, 1876, both teams adopted the Rugby Union rules as they stood at that day. Unfortunately for the peace of mind of the legislators, but probably fortunately in another way, in that the final result was the development of still another distinct type of football, there were no traditions in America regarding the English Rugby code and what was forbidden by letter was accepted as barred, whereas anything that was not thus distinctly prohibited the American player thought was perfectly legitimate. Contentions arose over the interpretation of the rules and these discussions led to conventions, and, in the settlement of the problems arising, the rules rapidly multiplied, until in a few years there were more than twice the original number. While this was happening, some of the old English rules apparently became dead letters and were, therefore, dropped. When captains and players attended any of these conventions it was only human that they should contend for possible advantages for their own teams rather than for the improvement of the game as a sport and this led to the appointment of an advisory committee of graduates. In their hands was placed the matter of rules to this extent, that yearly they met and recommended changes which were then submitted to an intercollegiate association for discussion and usually for approval. This lasted as long as there was an intercollegiate association or league of colleges indulging in football. This league finally dissolved and for the season following there were two codes of rules in existence adopted by two different sets of universities. This was wholly unsatisfactory and led to the intervention of the University Athletic Club of New York. This club selected football enthusiasts and asked from them a recommendation as to a code of rules. These gentlemen met and framed such a code, which was then adopted by the various colleges throughout the country. This method of procedure lasted for several years, even after the dissolution of the University Athletic Club, and it is from this body that the football rules still emanate.

This describes the entire legislative machinery, and shows how carefully the game has been watched over and gives some idea of the reasons for its steady and consistent growth in popularity.

As for a brief description of the game and the way in which it is played, the following gives the main points:

The game is played on a field rectangular in shape, 160 feet wide and 330 feet long. The outline of this field is made by heavy white lines marked, as are the lines in a tennis court, with lime. This field is also traversed by transverse lines five yards apart marked for the convenience of the referee in judging the distance gained or lost by either side. In addition to these transverse lines under the rules of 1903 the middle section of the field, that is the space from one 25-yard line to the other, is marked by longitudinal lines also five yards apart in order to assist the referee once more in measuring distance rapidly with his eye. This latter marking was rendered necessary by a rule providing that within that section of the field the quarter-back may run with the ball provided he goes a certain distance out, that is, toward the side line, from the man who puts the ball in play in the centre. The lines which mark the ends of the field are called goal lines, and in the middle of each is a goal made by erecting two posts 18 feet, 6 inches apart with a cross bar 10 feet from the ground. The ball is a prolate spheroid in shape consisting of a rubber bladder encased in a leather cover.

The game is played by 11 men on a side, these 11 men being called a team. For the purpose of general distinction, although different formations are possible, the seven men who play in the forward line, that is on a line with the ball when it is put in play, are called the rushers, the men behind them the backs. The distinguishing terms for the men in the line are of interest. First there is the centre rusher, or centre, or snap-back, which term designates the man who stands in the middle of the line and usually puts the ball in play in a scrimmage. The men on his right and left are called guards, the men next beyond them toward the ends are called tackles and the two men on the ends of the line are called the ends. The man close behind the centre rusher is called the quarter-back. The two men some feet behind him are called the half-backs and the fourth man behind the line is called the full-back. In executing various plays the men take up different positions on the field, but they are usually distinguished by their positions as above, which they assume when the play is between the two 25-yard lines, and the ball is on the ground for a scrimmage.

The game is started by placing the ball in the middle of the field and a man of the side in possession must then kick it at least 10 yards into the territory of the opponents, his own men being behind him when he kicks the ball and the opponents standing at least 10 yards back from the middle line of the field. The choice of goals and the possession of the ball having been determined by the toss of a coin, the side winning has the privilege of thus either kicking off or selecting either goal. When the ball is once kicked off any man who is on side, that is, between the ball and his own goal, may secure it and run with it and when he is thus running may be tackled by his opponents and brought to a stop. If he is thus tackled and stopped he calls "down" and the ball is placed on that spot for a scrimmage. When the ball is thus down the two teams line up opposite each other, the side with the ball en-

deavoring to protect its men so that one of the backs may be able to secure the ball and make a run with it, while members of the opposing side are endeavoring to break through and stop this. The men of the side which has the ball in its possession may not use their hands or arms to obstruct their opponents, but may do this with the body only. The players of the side not in possession of the ball on the other hand are privileged to use their hands and arms to break through the ranks of their opponents. The man who has the ball in his possession, that is running with it, may use his hands and arms to ward off the opponents, but the rest of his side may not. The play thus continues by a succession of downs and runs interspersed with kicks, for a side may kick the ball instead of running with it if they so desire.

In order to prevent a side holding the ball indefinitely without making progress there is a rule providing that in 3 attempts the side must advance the ball 10 yards or take it back 20 or surrender it to the opponents. For this reason it is quite customary after two attempts, if the desired ground has not been gained, for the side in possession to kick the ball, thus transferring it to the possession of their opponents as far into the opponent's territory as possible. When the ball goes across the side line it is out of bounds and if it has gone out of bounds through being kicked, it belongs to the opponents, but if a man carries it out of bounds, in his possession, his own side has the right to it. The ball is brought back to the spot where it crossed the line and is put in play either by bounding it into the field of play, or, far more usually, by the holder walking in a certain distance and putting it on the ground for a scrimmage as already described.

The game thus proceeds until the ball approaches one or the other goal line and here begins the question of generalship for scoring. If the ball be kicked by a drop kick over the cross bar of the opponent's goal it counts the side thus kicking it five points. If the ball be carried by the player of that side across his opponent's goal line or secured by him after it has been kicked across it scores a touch-down, which counts four points and also entitles the side making it to a try at goal. This is performed either by kicking the ball out to a player who catches it and makes a mark with his heel, the ball then being kicked from any point behind that mark, or being brought directly out by a player of the side which has touched it down and held on the ground for another of his side to kick. In either event if the touch-down be converted into a goal by the kicking of the ball over the cross bar it adds an additional point for this scoring.

There is one other possible means of scoring and that is when a side is pressed by the opponents, and, instead of the opponents securing the ball, the defenders of the side secure it and either kick, pass, or carry it across their own goal-line and touch it back behind their own goal it entitles them to carry the ball out 25 yards for a kick. The opponents stand on the 25-yard line while this kick is made. This safety, however, as it is called, counts two points against the side making it.

The game is divided into 2 halves of 35 minutes each with a 10-minute intermission, and the side which has scored the greater number of points at the end of the full period of play wins the game.

American football, while it started from the English Rugby Union rules has developed in many directions so that the game would not now be recognizable to an Englishman. The one thing that he would see that possibly reminded him of Rugby would be that occasionally a man runs in the open field with the ball. But the various formations and the tactics adopted would puzzle him exceedingly. Like the Rugby Union, however, there is some kicking in it, but far less than in the English Association. In the English scrimmage the two lines of forwards push until the ball pops out somewhere, whereas in the American scrimmage the man in the centre who has possession of the ball snaps it out with his hand whenever he is ready to do so to the quarter-back who stands directly behind him and this man passes it to the half-back or full-back or anyone else so long as he does not pass it ahead. This enables the Americans to carry out their very elaborate system of plays because the ball can be absolutely directed at any time to any spot. So perfect has this development become that the quarter-back gives signals for the plays by means of which signals the entire team knows exactly what man is to receive the ball and where he is to run with it when he has received it. Thus the others may assist him very materially in making his gain. Some idea of the variety of plays can be gathered from the fact that teams can without difficulty execute no less than 40 or 50 plays, each distinct from the other. It is not difficult to imagine that with this highly developed form of attack a most thorough and well-studied plan of defense is equally necessary. It is also not difficult to understand that this development on both sides has brought about specialization in the work of various players so that almost every position on the field has a distinct line of duties which its incumbent must be able to perform with skill and accuracy. The signals are quite elaborate codes, devised for easy memorizing, but at the same time sufficiently intricate and bewildering as to render the liability of discovery by the opponents very small.

In the American game the quarter-back usually gives these signals, although the captain sometimes prefers to give them himself.

The history of the game in America as in England and elsewhere has been one of discussion and opposition, the latter coming from those who believe that the sport is too strenuous. Kingly edicts were issued in the old days in England and in the United States State legislatures have been asked at various times to forbid the pastime. Yet it has lived on. In America the game has had already three great epochs as it were. The first in the eighties when the «block game» was legislated out of existence, then in the early nineties when «momentum mass» plays were excised and finally in 1903 when «formation plays» were restricted.

Before the Rules Committee met in that year it sent out a request to those directly interested in the sport of football and to those connected with the boards of control of athletics in various colleges and schools that they offer suggestions concerning the future development of the game and opinions concerning modifications of the

style of play and the revision of the rules. Many letters were received by the Rules Committee, including a communication in response to this request signed by a large number of the head masters of schools. A widespread public sentiment was advanced in favor of such a change in the rules as might bring about more "open play," and it was further felt by the committee and their advisers that the rules should be so modified and the powers of the officials so increased as to eliminate to the greatest possible extent unsportsmanlike tactics, and with these ends in view the committee decided upon the incorporation of two important changes. The first of these was the adoption of such a formation in mid-field between the 25-yard lines as might lead to the development of that open style of play desired by so many. Since, however, it was impossible to predict the character of the play that might result under any specific modifications of the rules, the committee thought it desirable to retain the old style of play within each of the 25-yard lines so that football experts and the public should have opportunity to see the old and the new styles of play side by side, and to thus obtain practical demonstration of the effects of these changes to serve as a guide in further action. The second general change was the incorporation of rules that in some cases greatly increased the penalty for unfair tactics, and in others did away with all excuses for indulgence in certain rough plays, at the same time providing for less offensive armament, as for instance, in the case of the head-gear. To make sure that the wishes of the committee were carried out in this matter, the duties of the linesman were enlarged and he was made practically an assistant to the umpire and given absolute power to deal with certain classes of fouls. The American game thus has for its conduct three officials, the referee whose duties are principally related to the progress of the ball, the umpire who has charge as it were of the conduct of the players, the linesman who acts as a second umpire, at the same time assisting the referee in the matter of measurements.

Walter Camp,
Yale University.

Foote, fůt, **Andrew Hull**, American naval officer: b. New Haven, Conn., 12 Sept. 1806; d. 26 June 1863. He entered the navy as a midshipman in 1822, and in 1849–52 he was engaged in the suppression of the slave trade on the coast of Africa. In command of the China station in 1856, when the Chinese and English were at war, he exerted himself to protect American property, and was fired upon by the Celestials. His demand for an apology was refused and he stormed and captured four Chinese forts. In 1861 he commanded the expedition against Forts Henry and Donelson on the Tennessee and Cumberland rivers, and directed the attack on Island Number 10. In 1862 he was promoted rear-admiral. He wrote 'Africa and the American Flag' (1854). Consult Hoppin, 'Life of Rear Admiral Andrew Hull' (1874).

Foote, Arthur, American composer: b. Salem, Mass., 5 March 1853. He was graduated at Harvard 1874, became a teacher of the piano and organist of the First Church in Boston, and has devoted much time to composition, in which field he has been very successful, having published a cantata 'Hiawatha,' a trio in C major for piano, violin, and 'cello; suites for the orchestra; an overture, 'In the Mountains'; songs, and pianoforte pieces.

Foote, Henry Stuart, American statesman: b. Fauquier County, Va., 20 Sept. 1800; d. Nashville, Tenn., 20 May 1880. He was admitted to the bar in 1822; removed to Mississippi in 1826 and entered politics. In 1847 he was elected to the United States Senate, and in 1852 was elected governor of the State. He was a strong opponent of secession at the convention held at Knoxville, Tenn., in 1859, but when secession was an assured fact, he accepted an election to the Confederate Congress, where he was active in his opposition to most of President Davis' measures.

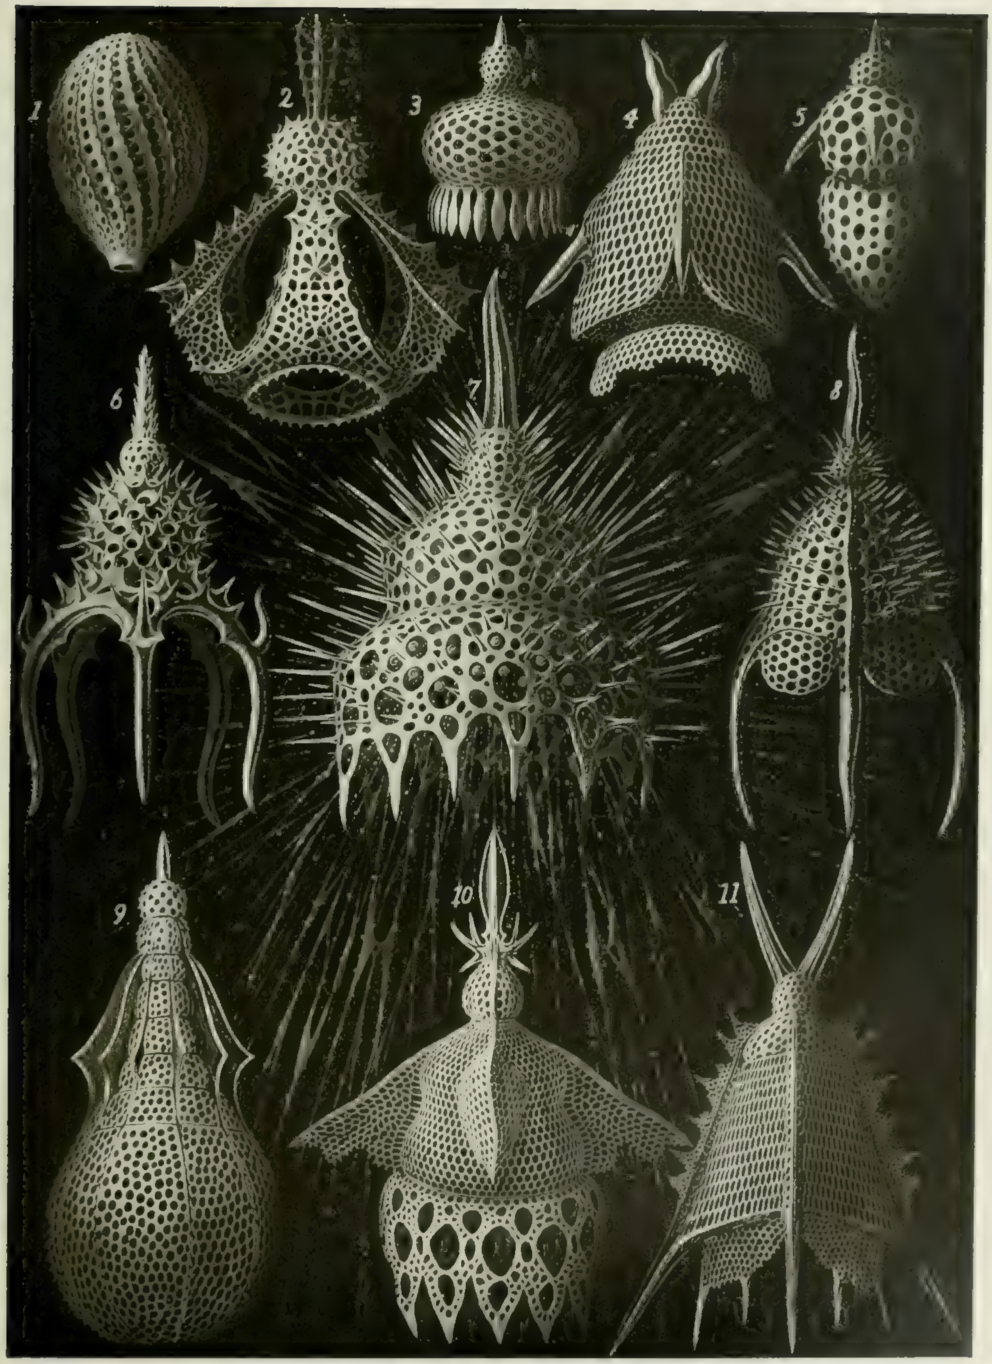
Foote, Lucius Harwood, American diplomatist: b. Winfield, N. Y., 10 April 1826. He was educated at Knox College and at the Western Reserve University; went to California in 1853; and was admitted to the bar in 1856. He became adjutant-general of California in 1861, and was consul to Valparaiso, Chile, 1878–81. Appointed minister to Korea in 1882, he distinguished himself in the protection of Japanese and other foreigners in the nationalist revolt in Seoul in 1883, and received the thanks of the emperor of Japan, the Chinese government, and the emperor of Korea for his services. He resigned in 1884 and returned to California, where in 1890 he was made treasurer of the San Francisco Academy of Sciences.

Foote, Mary (Hallock), American novelist: b. Milton, N. Y., 19 Nov. 1847. In 1876 she was married to Arthur D. Foote, a mining engineer. She has published: 'The Led Horse Claim' (1883); 'John Bodewin's Testimony' (1886); 'The Last Assembly Ball' (1889); 'In Exile and Other Stories' (1894); 'The Chosen Valley'; 'Cœur d'Alène' (1894); 'The Cup of Trembling and Other Stories' (1895); 'The Little Fig Tree Stories' (1900); 'The Prodigal' (1900); etc.

Foote, Samuel, English actor and playwright: b. Truro, England, 27 Jan. 1720; d. Dover, England, 21 Oct. 1777. From Oxford he turned his attention to the stage; tried tragic parts and failed; then began to give entertainments of a sort now familiar but then new, impersonating real and imaginary people and acting little farces by himself. He wrote many farces, the most notable being: 'The Minor' (1760), a skit at the Methodists; 'The Liar'; 'The Mayor of Garratt.' His repartees are famous, and have been collected into a volume.

Foote, Samuel Augustus, American statesman: b. Cheshire, Conn., 8 Nov. 1780; d. there 15 Sept. 1846. He was graduated at Yale College in 1797; served in the legislature for many years; was member of Congress in 1819–21 and 1823–5; served one term in the United States Senate, was governor of Connecticut, and one of the presidential electors on the Clay and Frelinghuysen ticket in 1844. It was he who in 1829 introduced the bill "on the public lands" that occasioned the famous debate between Hayne and Webster.

Footmen, a collector's name for the small gray and yellowish moths of the family *Lithosiidæ*, which have simple antennæ, rather narrow fore wings, beneath which the broad hind wings are folded when at rest.



RHIZOPODS.

[1] Cyrtophormis spirall. [2] Clathrocanium reginae. [3] Anthocyrtium campanula. [4] Pterocorys rhinoceros. [5] Lithornitbium falco. [6] Alacorys Bismarckii. [7] Calocyclas monumentum. [8] Pterocanium trilobum. [9] Stichophaena Ritteriana. [10] Dictyocodon Annasethe. [11] Artopilium elegans.

Foraging Ants, the large, powerful ants of the tropical American genus *Eciton,* which from time to time march in hosts across the country, with the precision of an army under the control of officers. These marching columns are composed almost wholly of workers, apparently directed by a larger, lighter-colored kind; and they search every inch of ground, rubbish-heap or thicket, searching for what they can eat and driving every living thing out of their way in terror. Several species exist, differing in various respects. One, for example, devotes its forays entirely to finding and robbing the homes of a smaller and very different ant (*Hypoclinea*), whose larvæ and pupæ it carries off, but lets the adults go free. Ordinarily no insect that can be caught is spared. These ants have no settled abode, but make nests in hollow stumps, or underground, and change them each season or oftener. Their colonies exhibit a high degree of organization, and contain five separate castes, instead of the three of ordinary ants. See ANTS, and the works referred to thereunder; and especially Belt, 'Naturalist in Nicaragua' (1888).

Foraker, Joseph Benson, American politician: b. near Rainsboro, Highland County, Ohio, 5 July 1846. He enlisted in the 89th Ohio infantry in 1862, participated in the battles of Missionary Ridge, Kenesaw Mountain, and Lookout Mountain and in Sherman's "march to the sea," served on the staff of Gen. Slocum, and was mustered out in 1865 with the rank of first lieutenant and brevet captain. Subsequent to the War he studied for two years at the Ohio Wesleyan University, in 1869 was graduated from Cornell University, and in the same year was admitted to the bar at Cincinnati and there began the practice of law. In 1879 he was elected judge of the superior court of Cincinnati, from which post he resigned in 1882. He was Republican candidate for the governorship of Ohio in 1883, but was defeated by Hoadly, Democrat; was elected in 1885 and re-elected in 1887; and was again defeated in 1889, this time by Campbell. In 1896 he was elected United States senator to succeed Calvin S. Brice, and in 1902 re-elected. He was chairman of the Ohio Republican State conventions of 1886, 1890, 1896, and 1900; a delegate-at-large from Ohio to the national Republican conventions of 1884, 1888, 1892, 1896, and 1900, being chairman of the Ohio delegation in 1884 and 1888; and presented to the conventions of 1896 and 1900 the name of William McKinley for nomination to the Presidency. He attained the largest law practice in southern Ohio, and became well known in that State as a corporation attorney and a vigorous orator on political questions. His election to the Senate at once made him the Republican leader of Ohio. In the Senate he took a prominent part in the discussions connected with the Spanish-American war, of which he was a conspicuous advocate. His name has been mentioned for the Presidential nomination.

Foraminif'era, an order of animals in the phylum *Protozoa* and the class *Rhizopoda.* The body is contained within a calcareous test or shell, which is many chambered. It may be cylindrical or spiral, or it may tend to the pyramidal form. The outer surface presents a punctate or dotted appearance, produced by the presence of very numerous small apertures, or "foramina." The chambers in some are perfectly distinct from others, though so aggregated as to form a compound shell; in others they are connected with a funnel-like tube. The texture of the shell in one group is porcelain-like, in another glassy. The inside of the shell has an extensile and contractile sarcode (protoplasm) of a reddish or yellow color, which streams through the openings and thinly covers the outside. Foraminifers are always of small size, and often microscopic. With the exception of *Gromia* and one or two related genera which occur both in fresh and salt water, they are exclusively marine and many dwell only in the abysses. Sometimes their shells constitute sea-sand. In the Atlantic, at a depth of 3,000 fathoms, there is an ooze composed almost entirely of *Globigerinæ,* which belong to this order. See GLOBOGERINA.

The exceedingly antique *Eozoon* (q.v.) of the Laurentian rocks, if organic, as is generally believed, was apparently a foraminifer. Forms more unequivocal, some of them very like recent species, occur in the Silurian, the Carboniferous, and other strata. They are found through all the Secondary Period, chalk (q.v.) being almost entirely composed of their cases. They increase in number and importance in the Tertiary. The flat, coin-shaped nummulites of the Middle Eocene form the principal bulk of great series of limestone rocks that furnish excellent building-stone. The type of the order has remained wonderfully constant from the earliest times till now.

Foran, Joseph Kearney, Canadian author: b. Aylmer, P. Q., 1857. Among his poems the best known are a 'Lament for Longfellow' and 'Indian Translations.' He is the author of two novels, 'Tom Ellis, a Story of the Northwest Rebellion,' and 'Simon, the Abenakis.' 'The Spirit of the Age' (1894); 'Poems and Canadian Lyrics' (1895).

Forbes, fôrbz, **Archibald,** English journalist and war correspondent: b. Morayshire 1838; d. London 30 March 1900. From 1859 till 1864 he served in the Royal Dragoons, but, abandoning the army for journalism, joined the staff of the *Daily News,* as war correspondent. In this capacity he accompanied the German army through the war of 1870–1, and a little later, in Paris, was present at the downfall of the Commune. He was in India during the 1874 famine, and shortly afterward the Carlist and other troubles kept him for a time in Spain. He accompanied the Prince of Wales on his Indian tour in 1875–6, and on returning described as an eye-witness the Servian war of 1876. In the following year he was with the Russians in their campaign against the Turks, being present at the battle of Plevna, and in 1878 he went to Cyprus. He was under fire during the Afghanistan campaign of 1878–9, next visited Mandalay, and then went to Zululand. He afterward devoted himself mainly to lecturing at home and in America and Australia. His chief publications are: 'My Experiences in the Franco-German War' (1872); 'Glimpses through the Cannon Smoke' (1880); 'Chinese Gordon' (1884); 'Souvenirs of Some Continents' (1885); 'William I. of Germany' (1888); 'Barracks, Bivouacs, and Battles' (1891); 'Havelock' (1891); 'Afghan Wars' (1892); 'Colin Campbell, Lord Clyde' (1895); 'Camps,

Quarters, and Casual Places' (1896); 'Memories and Studies of War and Peace' (1896); 'The Black Watch' (1896); 'Life of Napoleon III.' (1898).

Forbes, David, English geologist: b. Douglas, Isle of Man, 6 Sept. 1828; d. London 5 Dec. 1876. As a civil engineer he traveled all over the world, studying rock formations and fossils, and writing: 'On the Relations of the Silurian and Metamorphic Rocks of the South of Norway' (1855); 'On the Geology of Bolivia and Southern Peru' (1861); and kindred treatises.

Forbes, Duncan, Scottish jurist: b. near Inverness, Scotland, 10 Nov. 1685; d. 10 Dec. 1747. He studied at Paris, Utrecht, and Edinburgh, and rose, in 1737, to the rank of president of the Court of Session. It was mainly owing to his exertions that the rebellion of 1745 was prevented from spreading more widely among the clans; but so ungratefully was he treated by the government, that he was never able to obtain repayment of the various sums he had expended to uphold it. He was the author of: 'Thoughts on Religion'; the 'Culloden Papers'; etc.

Forbes, Edward, English naturalist: b. Douglas, Isle of Man, 12 Feb. 1815; d. Wardie, near Edinburgh, 18 Nov. 1854. He was a brother of David Forbes (q.v.). He became professor of botany in King's College, London, in 1843, and curator of the Geological Society; in 1851 professor of natural history in the School of Mines; and in 1853 he was elected to the chair of natural history in the University of Edinburgh. He did much to advance and systematize special departments of natural history, both by his own labors and by the stimulus which he imparted to his associates and pupils. His classification of the British star-fishes opened a new era in that branch of zoology; and his discovery that air-breathing mollusks lived at the period of the Purbeck beds rectified many erroneous hypotheses. Of his separate works, papers, and monographs upward of 200 were published; among them: 'Star-fishes' (1841); 'The Radiata and Mollusca of the Ægean' (1843); 'Travels in Lycia' (1846); 'Naked-eyed Medusæ' (1847); 'British Mollusca' (1853); 'Literary Papers by E. Forbes' (1855).

Forbes, Edwin, American landscape and genre painter: b. New York 1839; d. Flatbush, L. I., 1895. He was a pupil of A. F. Tait, and became special artist for 'Frank Leslie's Magazine' during the Civil War. The drawings which he made during that time are now in the war office at Washington, and are of historic value.

Forbes, Evelina Louisa Michell, English novelist: b. Tettenhall. She was married to Hon. Walter Forbes in 1888. Her published books include: 'Fingers and Fortune' (1886); 'Her Last Run' (1888); 'Blight' (1897); 'A Gentleman' (1900); 'Dumb' (1901); 'Unofficial' (1902).

Forbes, Harriette Merrifield, American writer: b. Worcester, Mass., 22 Oct. 1856. She was married to W. T. Forbes 5 Feb. 1884. She has published: 'The Hundredth Town' (1889); 'The Diary of Rev. Ebenezer Parkman' (1899).

Forbes, James David, Scottish physicist: b. Colinton, near Edinburgh, 20 April 1809; d. Clifton, England, 31 Dec. 1868. He was admitted to the Scottish bar in 1830; in 1833 was appointed to the chair of natural philosophy in the University of Edinburgh, and in 1860 became principal of the United Colleges of St. Salvador and St. Leonard, in the University of St. Andrews. His fame rests chiefly on his study of glaciers. His chief publications on this subject are: 'Travels through the Alps of Savoy' (1843); 'Norway and its Glaciers' (1853); 'Tour of Mont Blanc and Monte Rosa' (1855); and 'Occasional Papers on the Theory of Glaciers' (1859). Forbes' theory was that glacier ice moves in its channel like a viscous fluid, the middle moving faster than the sides, and the upper portions faster than the lower.

Forbes, John Colin, Canadian artist: b. Toronto, Canada, 23 Jan. 1846. He studied at the Royal Academy, London, England, and on the continent, and returning to Canada he became a successful landscape and portrait painter. Among his works are: 'Foundering of the Hibernia'; 'The Mount of the Holy Cross'; 'The Glacier of the Selkirk'; 'The Lily'; and portraits of Gladstone, Sir John A. Macdonald, the Marquis of Dufferin, Lady Helen Blackwood, and Sir Charles Tupper.

Forbes, John Franklin, American educator: b. Middlesex, N. Y., 13 June 1853. He was graduated at the University of Rochester in 1878; and in 1885 was made president of the John B. Stetson University in Deland, Fla.

Forbes, John Murray, American clergyman: b. 5 May 1807; d. 1885. He was graduated at Columbia College 1827, and at the General Theological Seminary of the Protestant Episcopal Church 1830. He was ordained to the ministry in the year last named, and became rector of St. Luke's Church, New York, 1834. He adopted the Roman Catholic faith in 1849, and was appointed pastor of St. Ann's Church in New York shortly afterward. Returning to his earlier faith in 1859, he was restored to the ministry 1862 and was dean of the General Theological Seminary of the Protestant Episcopal Church 1869–72.

Forbes, John Murray, American merchant: b. Bordeaux, France, 23 Feb. 1813; d. 12 Oct. 1898. He entered a Boston counting room at 15 and in 1834 became a partner in the firm of Russell & Company, china merchants in Boston. He built many clipper ships for the California trade, and was later prominent in railway managements. Naushon, the largest of the Elizabeth Islands, Mass., was owned by him and constituted his summer home where many notables were entertained by him. See Hughes, 'Letters and Recollections of John Murray Forbes' (1899).

Forbes, Stanhope Alexander, English artist: b. Dublin, Ireland, 18 Nov. 1857. He was educated at Dulwich College and studied art at the Royal Academy Schools, and under Bonnat in Paris. Among his pictures exhibited at the Royal Academy are: 'The Fish Sale'; 'The Health of the Bride'; 'By Order of the Court'; 'The Salvation Army'; 'Forging the Anchor.'

Forbes-Robertson, John, English art critic: b. 30 Jan. 1822; d. London 25 Feb. 1903. He was educated at the University of Aberdeen.

went to London at 21, and after visiting various art centres devoted himself to literature and criticism. He has published: 'The Great Painters of Christendom'; and lives of Gustave Dore, Rosa Bonheur, etc.

Forbes-Robertson, Johnston, English actor: b. London 16 Jan. 1853. He is the son of John Forbes-Robertson (q.v.) and has been prominent on the English stage since he was 21.

Force, Manning Ferguson, American soldier and author: b. Washington, D. C., 1824; d. 1899. He was the son of Peter Force (q.v.). He was graduated at Harvard College 1845 and at the Harvard Law School, entering the army in the Civil War as major of the Twentieth Ohio Volunteers, and attaining the rank of brevet major-general of volunteers. He was judge of the court of common pleas of Hamilton County, Ohio, 1867–77, and judge of the superior court of Cincinnati 1877–8. He published: 'From Fort Henry to Corinth' (1881); 'Marching Across Carolina' (1883); 'Personal Recollections of the Vicksburg Campaign' (1885); etc.

Force, Peter, American historian: b. near Little Falls, N. J., 26 Nov. 1790; d. Washington, D. C., 23 Jan. 1868. His life work, entitled 'American Archives,' a valuable collection of 22,000 books and 40,000 pamphlets, was bought by the government (1867) and placed in the library of Congress. He published also: 'Grinnell Land: Remarks on the English Maps of Arctic Discoveries in 1850–1'.(1852); and 'Notes on Lord Mahon's History of the American Declaration of Independence' (1855).

Force, the immediate agency by which the motion of a body is increased or diminished, or changed in direction, or by which such changes are opposed. A force is measured, in theoretical mechanics, by the increase of velocity that it can produce upon a body of unit mass, when it acts upon that body for one second. Suppose, for example, that a uniform force of magnitude F acts for T seconds upon a body of mass M, thereby increasing (or diminishing) its velocity by V units. Then the magnitude of the force is defined by the equation $F = \frac{MV}{T}$. If M is expressed in grams, and V is expressed in centimetres per second, then F, as calculated by means of this equation, is expressed in dynes. If M is expressed in pounds, and V in feet per second, then F, as calculated from this equation, is expressed in "poundals"; the word "poundal" (for which we are indebted to Prof. James Thomson) denoting the force which will increase (or diminish) the velocity of one pound of matter by one foot per second, when it acts upon it for one second. It is known by experiment that when a body falls freely under the influence of gravity, its velocity, at the end of one second, is about 32.2 feet per second. Let the body in question have a mass of M pounds, and let F be the attraction of the earth upon one pound of matter, as expressed in "poundals." Then the total force, F, that is acting upon the body is $F = Mf$; and hence the foregoing equation gives us, for this case (remembering that $T = 1$), $Mf = 32.2M$, or $f = 32.2$; and hence it follows that the attraction of the earth upon one pound of matter is 32.2 poundals in a region where gravity, when acting freely upon a body for one second, increases its velocity by 32.2 feet per second. If we follow the usual custom and represent the accelerative effect of gravity at any place by the letter g (instead of by the particular value 32.2), we may make the following general statement, which may also be taken as the definition of the poundal: In a region in which gravity increases the velocity of a falling body by g feet per second, per second, the earth attracts one pound of matter with a force of g poundals.

A force is said to be "central," when it acts always toward a definite centre, which may be either fixed or in motion. The gravitative forces with which the heavenly bodies act upon one another are of this character, and are often popularly called "centripetal" (that is, "centre-seeking") forces for this reason. When a body is caused to move in a curved path, it exerts a force which acts along the radius of curvature of the path, and in a direction away from the centre of curvature. Forces of this nature are called "centrifugal" (or "centre-fleeing"), and familiar examples are afforded by the pressure of swiftly moving water against the curved vanes of a turbine water-wheel, and by the tension produced in a string when a stone that is attached to the string is whirled rapidly about in a circle. The nature of centrifugal force has been the subject of more or less controversy, some authorities maintaining that it should not be classed as a true force, since it does not produce any acceleration in the direction in which it acts; — that is, a particle on the rim of a swiftly revolving wheel does not fly off radially when it is liberated, but merely continues its motion with unaltered speed, in the direction in which it was moving at the instant of its liberation; — or tangentially to the wheel. The subject is too technical for discussion in this place, but it may be pointed out that such a particle is actually subject to a radial acceleration, if its motion is considered *relatively to the wheel.*

Forces are said to be "conservative" when the principle of the conservation of energy holds true for the systems in which they occur (see ENERGY). All of the forces of nature are believed to be fundamentally conservative, although this has not yet been rigorously proved for the forces that prevail within animals and plants.

A "field of force" is any region in which a given force has a sensible magnitude. A conductor charged with electricity, for example, exerts an attractive (or repulsive) force upon all bodies that are exterior to it, and, from the point of view of theoretical physics, this force still exists at an infinite distance from the charged body, though at such a distance it becomes infinitesimal in intensity. From a practical standpoint, however, the "field of force" due to the charged body can be considered to be limited by an indefinite but finite boundary, whose distance from the body depends upon the intensity of the charge, and also upon the order of minuteness of the forces that can be regarded as negligible, so far as any effect upon the problem that happens to be under consideration is concerned. Within a closed conductor there is no field of electric force, so long as the charges upon the conductor itself, and in the region external to it, are in equilibrium. This fact may be demonstrated mathematically,

and it was also abundantly proved, experimentally, by Faraday. (See ELASTICITY; ELECTRICITY; ETHER; GRAVITATION; MECHANICS; etc.) Consult, also, Mach, 'Principles of Mechanics'; Pearson, 'The Grammar of Science'; Ziwet, 'Elementary Treatise on Theoretical Mechanics.'

Force Bill, a popular name in the United States for four different congressional bills, used at the time of their passage; all aimed at the South, and intended to suppress by national force direct or indirect nullification (q.v.) of national laws. (1) The bill of 2 March 1833 to enforce the tariff law; drawn out by Calhoun's nullification ordinance passed by the South Carolina legislature (See COMPROMISE OF 1833); also called the "Bloody Bill." It was not put in action, because South Carolina first suspended and then repealed the Nullification Ordinance. (2) The bill of 31 May 1870 to put down the forcible resistance which the Southern leaders were preparing to offer to the reconstruction governments. It punished by fine and imprisonment, or both, and gave the Federal courts exclusive cognizance of any interference with the registration, voting, etc., of any one, or going on his premises to intimidate him, or personating him in voting or violating State or Federal election laws, or violating the Civil Rights Bill of 1866. (3) The bill of 20 April 1871 to suppress the Kuklux Klan (q.v.). It gave the Federal courts cognizance of suits against any one depriving another of any constitutional rights; punished as conspiracy any combination to delay the execution of any Federal laws, or deter any one from voting, holding office, or acting as Federal juror or witness; (this clause was held unconstitutional by the Supreme Court); authorized the President to employ the national forces to suppress disorders intended to deprive any class of their constitutional rights, in case the State authorities were unable or unwilling; suspended the habeas corpus "during the continuance of such rebellion" — this provision to remain in force only till the end of the next regular session; authorized the judges to exclude from the juries persons they suspected to be in complicity with the proscribed acts; authorized civil action for damages against all persons who neglected to give warning of such a conspiracy or intended injuries, if they had good reason to suspect them; and confirmed former civil-rights legislation. An attempt was made to extend the fourth suspension of the habeas corpus to May 1872, and the Senate did so, but the House refused. (See RECONSTRUCTION.) (4) The Lodge Election Bill, 2 July 1890, "to amend and supplement the election laws of the United States, and to provide for a more efficient enforcement of such laws." It passed the House, but was tabled in the Senate by a free-coinage fusion of Democrats and Republicans who wished to pass to currency legislation.

Force of Gravity. The determination of the force of gravity from point to point over the earth's surface is a matter of importance. The force of gravity is not the same all over the surface of the earth. It is least at the equator, and it gradually increases as we recede toward the poles. Thus a given mass, if tested by means of a spring-balance of sufficient delicacy, would appear to weigh least at the equator, and would seem to get heavier and heavier as the latitude increases. This is due to two causes: (1) owing to the rotation of the earth on its axis every particle of matter tends to fly off from the surface by centrifugal force. The apparent force of gravity at any place is therefore the force of gravity at that place diminished by the centrifugal force. The centrifugal force at the equator is greater than that in high latitudes, because of the greater radius of the circle described at that place. The second cause is the oblate form of the earth. The earth is not a true sphere, but is flattened at the poles. Hence the distance of any attracted point at the equator from the centre of the mass is greater than that of points situated at or near to the poles; the attraction is, therefore, less at the equator than in high latitudes. Experiments to determine the force of gravity from point to point are made by determining the length of a pendulum, that beats seconds at each place. This being known, the force of gravity is easily calculated. See PENDULUM.

The following table gives the lengths of the seconds pendulum at different places, as determined by various experimenters, and also the force of gravity as deduced from their observations:

THE VALUE OF THE ACCELERATING FORCE OF GRAVITY AT DIFFERENT PLACES.

Observer	Place	Latitude	Length of seconds pendulum in inches.	Acceleration of gravity in feet per second.
Sabine	Spitzbergen	N. 79° 50′	39.21469	32.2528

Forcing, in gardening, is a term used to designate a process in which artificial heat is applied so that flowers, fruits, or other products of plants are obtained at a date or season other than that at which they may be had in the ordinary course of culture. Thus, for example, kinds of grapes which by the simple influence of the heat of the sun in a vinery do not ripen till September or October are induced by forcing to ripen in March or later, according to the period the process is commenced; and strawberries, which ripen from June to September, in the forcing-house yield their fruit from February onward. Conducted, as the system is, during the short days of the year, the chief obstacle the gardener has to contend with is diminished light. This in the case of forcing fruits taxes his skill to the utmost, because abundant light is essential both to the proper fertilizing of the flowers and to the perfecting of the fruit. Some vegetables and salads and many flowers are, however, more successfully forced in the dark than in light. Rhubarb, seakale, mushrooms, lily of the valley, lilac, are all forced in greater or less darkness in order the better to develop their individual perfections. See ELECTRIC VEGETABLE GARDENING; HORTICULTURE.

Ford, Edward Onslow, English sculptor: b. London 1852; d. 1901. He studied in Antwerp and Munich, and was made a Royal Academician of London in 1859. His artistic faculty was displayed in felicitous portraiture, and he executed striking statues of many eminent contemporaries, including Gladstone and "Chinese" Gordon. The Marlowe Memorial at Canterbury and the Shelley Memorial at University College, Oxford, are also from his chisel. A monument to his memory was unveiled in Grove End Road, Saint John's Wood, London, 13 July 1903.

Ford, Henry Jones, American editor: b. Baltimore, Md., 25 Aug. 1851. He was graduated from the Baltimore City College in 1868, was connected with the *American* and *Sun* of Baltimore and the *Sun* of New York, and in 1901 became editorial manager of the Pittsburg *Commercial Gazette* and *Chronicle-Telegraph.* He published 'The Rise and Growth of American Politics' (1898).

Ford, James B., American plate-glass manufacturer: b. Kentucky about 1812. He established plate-glass manufactories at New Albany, Ind., and elsewhere, and after a somewhat checkered career became at 78 nearly penniless. He then succeeded in interesting capitalists in his plans and established two immense factories, at Tarentum and Creighton, Pa., and founded Ford City, Pa., building a third large factory there. In 1899 he retired from business with a fortune of $10,000,000. He is said to have been the first person in the United States to discover that natural gas could be used as fuel for manufacturing establishments.

Ford, James Lauren, American journalist: b. St. Louis, Mo., 25 July 1854. He has written several volumes of short stories and essays, among which are: 'Hypnotic Tales' (1891): 'The Literary Shop' (1894); 'Bohemia Invaded'; 'Dolly Dillenback.' He is also the author of two books for young readers: 'Dr. Dodd's School' (1892); and 'The Third Alarm' (1893).

Ford, John, English dramatist: b. Devonshire 1586; d. after 1639. He printed his first tragedy of the 'Lover's Melancholy' in 1629. This, however, was not his first play, as a comedy of his, entitled 'A Bad Beginning has a Good End,' was acted in 1613. His genius is seen at its highest in the tragedy, ''Tis Pity Shee's a Whore' (1633), though the subject is repulsive. He wrote, or assisted to write, at least 11 dramas. Most of these were exclusively his own composition; but some of them were written in conjunction with Decker and others. Other plays by him are: 'The Broken Heart' (1633); 'Love's Sacrifice' (1633); 'Perkin Warbeck' (1634); 'The Fancies Chaste and Noble' (1638); and 'The Ladies' Trial' (1638). His genius was most inclined to tragedy, but he was too fond of an accumulation of tragic incidents. Besides the works already mentioned, he wrote an able little manual, entitled 'A Line of Life, pointing out the Immortalitie of a Vertuous Name' (1620). In 1827 Gifford issued an edition of Ford's works, which was revised and reissued by Dyce in 1869. There is also an edition of Ford and Massinger by Hartley Coleridge. 'The Broken Heart,' edited with notes by C. Scollard, appeared in 1894.

Ford, John Donaldson, American engineer: b. Maryland. He entered the United States navy as third assistant engineer in 1862 and during the Civil War took part in several important engagements. Later, after having served on many expeditions, he was detached and ordered to Baltimore for the purpose of organizing the Baltimore Manual Training School. In 1890 he was made a chief engineer in the navy; was assigned to duty on the Brooklyn in 1896; and in 1898 joined the Asiatic fleet and took part in the destruction of the Spanish fleet and batteries at Cavite.

Ford, John Thomson, American theatrical manager: b. Baltimore, Md., 1829; d. 1894. He was manager of the Holliday Street Theatre, in Baltimore, of which city he was acting mayor for two years. Among the three theatres he built at Washington, D. C., was the well-known Ford's Theatre (q.v.), the scene of the assassination of President Lincoln. He was arrested as an accomplice of Booth, but as there was absolutely no ground for the accusation he was discharged. In 1871 he built Ford's Grand Opera House at Baltimore.

Ford, Paul Leicester, American author: b. Brooklyn, N. Y., 23 March 1865; d. New York 8 May 1902. Besides numerous pamphlets relating to American historiography his works include: 'The Honorable Peter Stirling' (1894), a novel of New York society; 'The True George Washington' (1896); 'Bibliotheca Hamiltonia'; 'Franklin Bibliography'; and an edition of the works of Thomas Jefferson (1897), with notes, biographical introduction, etc.; 'The Story of an Untold Love'; 'Tattle Tales of Cupid'; 'Short Stories'; 'Janice Meredith' (1899); 'Wanted — a Matchmaker'; etc.

Ford, Sallie Rochester, American story-writer: b. Rochester Springs, Boyle County, Ky.,

1828. She was married to S. H. Ford (q.v.) in 1855, and with him edited the 'Christian Repository' and the 'Home Circle' for many years. Among her published works are: 'Grace Truman' (1857); 'Mary Bunyan' (1859); 'Morgan and His Men' (1864), and 'Ernest Quest' (1887); 'The Inebriates'; etc.

Ford, Washington Chauncey, American statistician: b. Brooklyn, N. Y., 16 Feb. 1858. He is a brother of P. L. Ford (q.v.). He was chief of the bureau of statistics, Department of State, 1885–9, and of the bureau of statistics in the Treasury Department in 1893–8; was connected with the Boston Public Library 1897–1902, and was chosen lecturer on statistics in the University of Chicago in 1901. He published: 'American Citizen's Manual'; 'The Standard Silver Dollar' (1884); 'George Washington' (1899).

Fordham, fôr'dam, a part of New York in the borough of Bronx. Prior to 1874 it was a village in Westchester County, N. Y. Fordham was made a manor in 1671. St. John's College is located here. The poet E. A. Poe lived in Fordham for a number of years and wrote 'The Bells' and other pieces here.

Ford's Theatre, a Washington theatre in which President Lincoln was shot by the assassin, Booth, 14 April 1865. The United States government purchased the building in 1866, and it was at first used as the Army Medical Museum, but after 1887, as the Pension and Records Bureau of the War Department. It gradually fell into ruin, however, and suddenly collapsed with the loss of several lives, 9 June 1893.

Fordun, John of, known as the father of Scottish history: b. probably at Fordoun, Kincardineshire, about 1310; d. about 1386. He wrote the first five books of his 'Chronica Gentis Scotorum,' bringing the history down to the middle of the 12th century, and also a part of the sixth volume, which was completed by Walter Bower, abbot of the monastery of Inchcohn. He enlarged the first five books and added 11 new ones, bringing the history down to 1437. Several editions have been printed, the best probably being that of W. F. Skene (Edinburgh 1871–2).

Forearm. See ARM.

Forecasting the Weather. See METEOROLOGY.

Foreclosure is the right of a mortgagee, or of any one having interest in a mortgage, in the event of the conditions of the mortgage being violated, to compel the mortgagor to redeem the pledge or forfeit his right of redemption. This is done by filing a bill for foreclosure. The court may, on application of the mortgagee, mortgagor, or any incumbrancer of the mortgage, grant, under certain conditions, a sale of the subject instead of foreclosing the mortgage, the money raised by the sale being applied to the payment of the mortgage, any surplus being claimed by subsequent mortgages, or in the event of no other claim, being paid to the mortgagor.

Forefathers' Day, the day celebrated as the anniversary of the landing of the Pilgrims; first commemorated in 1769. Owing to a mistake in the change of Old Style (11 December) to New it was made 22 instead of 21 December.

Foreign Coins and Their American Equivalent. As the monetary value of national coins is subject to frequent change, it is impossible to prepare a statement which would correctly specify the value of any particular coin at any future time. As such changes are correspondingly slight, however, the following list of the coins of all nations will always be comparatively correct, the values in the moneys of account of the United States having been corrected to 1 April 1905 by the director of the mint, United States Treasury Department:

Argentine Republic.— Gold coins: argentine ($4.824) and half argentine; silver coins: peso ($0.965) and its divisions.

Austria-Hungary.—By a law passed 2 April 1892 the monetary system of Austria-Hungary was reformed on a gold basis, with the crown ($0.203) as a unit. The coins issued under the old system are still in circulation, however. They are, gold: eight florins ($3.858), 4 florins, ducat ($2.287), and 4 ducats; silver: florin ($0.5052) and 2 florins. The coins under the new system are, gold: twenty crowns ($4.052), 10 crowns, and 1 ducat ($2.287); silver: one crown ($0.203); nickel: twenty hellers ($0.0405) and 10 hellers; bronze: two hellers, or one kreutzer ($0.0040), and one heller.

Belgium.— Belgium being a member of the Latin Union, its monetary unit is the franc ($0.193), and its coins the gold 10 and 20 franc pieces and the silver 5 francs.

Bolivia.— The boliviano ($0.439) is the monetary unit of Bolivia. Its coins, all silver, are the boliviano, the 50, 20, 10, and 5 centavo ($0.0211) pieces.

Brazil.— The milreis ($0.546) is the monetary unit of Brazil. Its gold coins are 5, 10, and 20 milreis pieces; its silver coins, ½, 1, and 2 milreis.

Bulgaria.— The monetary unit is the lev ($0.185) which is supposed to correspond to the franc of other double standard countries. In fact, but few Bulgarian gold coins are in circulation, the necessary gold coins being supplied by foreign 10 and 20 franc pieces. The silver coins are the ½, 1, 2, and 5 leva pieces; the nickel coins are the 2½, 5, 10, and 20 stotinki ($0.0385), and there are copper coins of 1, 2, 5, and 10 stotinki.

Canada.— The gold dollar ($1) is the monetary unit. The silver coins are the 50, 25, 10, and 5 cent pieces. Some penny (2 cents) and half penny pieces are in circulation.

Chile.— The value of the peso, the monetary unit, is ($0.365). The gold coins of the country are the escudo ($1.825), doubloon ($3.65), and the condor ($7.30). The peso and its divisions are coined in silver.

China.— The monetary system of China is in an extremely chaotic condition. The unit and sole official coinage is the copper cash, 11 of which are equal to one cent. The silver tael, or liang, varies in value in different parts of the country, as follows:

THE CHINESE TAEL.

PLACE	Value	PLACE	Value
Amoy	$0.719	Nankin	$0.712
Canton	0.717	Ninchwang	0.674
Chefoo	0.688	Ningpo	0.691
Chin Kiang	0.703	Pekin	0.701
Fuchau	0.665	Shanghai	0.657
The Haikwan or customs tael	0.732	Swatow	0.664
		Takau	0.724
Hankow	0.673	Tientsin	0.697

In Hong Kong and Labuan, the "British Dollar" has the same legal value as the Mexican dollar.

Colombia.— The gold dollar ($1.) is the monetary unit. Other gold coins are the condor ($9.647) and the double condor. The silver peso ($0.9352) and its divisions are coined.

Costa Rica.— The gold colon ($0.465) is the unit of the country. Two, 5, 10, and 20 colon pieces are coined in gold; 5, 10, 25, and 50 centimor ($0.2326) pieces in silver.

Cuba.— As Cuba is a gold standard country, its monetary unit, the peso, is a gold coin valued at $0.91. The gold doubloon, valued at $5.017, and the Alphonse, valued at $4.823, are also used, as well as several for-

eign coins. The silver coinage of Cuba is the peso ($0.455) and its divisions.

Denmark.— The monetary unit is the crown ($0.268) and gold 10 and 20 crown pieces are coined. The minor coinage, in silver and bronze, is represented by the 50 ore ($0.1247) and its divisions.

Ecuador.— The gold sucre ($0.487) is the unit, but the 10 sucrae piece is the only gold coin. The minor coinage, the 10 and 5 real ($0.0467) pieces, is of silver.

Egypt.— The gold pound, representing 100 piasters ($4.943) is the unit, and 50, 20, 10, and 5 piaster pieces are also coined in gold. The silver coinage is represented by the 1, 2, 5, 10, and 20 piaster pieces.

Finland.— The markkaa ($0.193) is the monetary unit, and the gold coins are 20 and 10 markkaa pieces. The 50 penni ($0.0794) and the 10 and 1 penni ($0.0019) pieces, in bronze, constitute the smaller coinage.

France.— The gold franc, valued at $0.193, is the unit of the country. Gold 5, 10, 20, 50, and 100 franc pieces, and silver 5 and single franc pieces are coined. The minor coinage is represented by the 50, 20, 10, and 1 centime ($0.0019) pieces.

German Empire.— The gold mark ($0.238) is the unit, and 5, 10, and 20 mark pieces are coined in gold. The 50 pfennigs ($0.1039) and the thaler ($0.6928) represent the silver, the 5 pfennigs, the nickel, and the single pfennig the bronze coinage.

Great Britain.— While the monetary unit for the colonies varies, that for Great Britain itself is the gold pound sterling ($4.8665). The pound sterling (the sovereign), and the half sovereign are coined in gold; the crown ($1.0872), half crown, florin ($0.4348), shilling ($0.2174), sixpence ($0.1017), four pence ($0.0724), three pence ($0.0543), and the two pence ($0.0362) in silver, with the penny ($0.02), half penny, and farthing ($0.005) in bronze.

Greece.— The drachma ($0.193) is the monetary unit. Five, 10, 20, 50, and 100 drachma pieces are coined in gold, 5 drachma pieces in silver, 20 and 5 lepta ($0.0096) in nickel, and 1 and 2 lepta pieces in bronze.

Guatemala.—The silver peso ($0.439) is the monetary unit and this coin and its divisions are coined in silver.

Haiti.— The gourde ($0.965) is the unit of the country; 1, 2, 5, and 10 gourde pieces are coined in gold, and the single gourde and its divisions in silver. The smaller coin is the bronze centime ($0.0096).

Hawaii.— Same as United States.

Honduras.— The peso ($0.439) is the monetary unit and this coin and its divisions are coined in silver.

India.— The pound sterling, or sovereign, is the standard coin of India, but the rupee ($0.324433) and its divisions is the money of account.

Italy.— The lire ($0.193) is the monetary unit. The 5, 10, 20, 50, and 100 lire pieces are coined in gold; 5 lire pieces in silver, while the 20, 10, and 1 centesimo ($0.0019) in nickel and bronze represent the minor coinage.

Japan.— The yen ($0.498) is the unit of the country. Gold 5, 10, and 20 yen pieces are coined; 10, 20, and 50 sen ($0.448) silver pieces, with 5 sen, 1 sen, and 5 rin ($0.0024) pieces in bronze.

Liberia.— The only official coin of Liberia is the gold dollar ($1.).

Mexico.— The silver dollar, valued at $0.458, has long been the monetary unit of Mexico, but a change to the gold standard, which is about to be established, will give the country a gold dollar of the value of about fifty cents. The several divisions and multiples of the dollar will also be coined.

Netherlands, The.— The gold florin ($0.402) is the monetary unit. Gold 10 florin pieces are coined as well as ½, 1, and 2½ florin pieces in silver. The cent ($0.004) is of bronze.

Newfoundland.— The gold dollar of Newfoundland is valued at $1.014.

Nicaragua.— The silver peso ($0.439) is the unit, and this coin and its divisions are coined in silver.

Norway.— Same as Sweden.

Panama.— The balboa, valued at $1. in gold, is the monetary unit. At present no gold is coined, the only coin being the silver dollar ($0.50) and its divisions.

Paraguay.— The country has no coinage, but the silver pesos of other South American republics circulate there at the same value as in the countries where they are issued.

Persia.— The silver kran ($0.078) is the monetary unit. Gold ½, 1, and 2 tomans ($3.408) pieces, and silver ¼, ½, 1, 2, and 5 krans are coined. The copper coins are the chai ($0.0085) and the abassi, valued at 4 chais.

Peru.— The sol ($0.487) is the monetary unit. Gold libra ($4.8665) are coined, as well as the silver sol and its divisions.

Philippine Islands.— By act of the 57th Congress the authorized coins of the Philippines are silver pesos of 10, 20, and 50 centavos (cents) value, and of copper ranging from ½ cent to 5 centavos in value.

Portugal.— The milreis ($1.08) is the monetary unit and 1, 2, 5, and 10 milreis pieces are coined in gold. The silver coins of this country are 1,000 reis ($0.9526) and 50 reis; the nickel coins, 100 reis and 50 reis, and the bronze coins, 20 and 5 reis.

Rumania.— The gold lei ($0.193), corresponding to the franc, is the monetary unit. Twenty and 10 leis pieces are coined in gold, 5 and single lei pieces in silver, and 10 and 1 bani ($0.0019) pieces in bronze.

Russia.— The ruble ($0.515) is the monetary unit. Gold imperials, valued at 15 rubles, and half imperials are coined. The ruble, as well as the 50 and 5 copeck ($0.0187) pieces, are of silver, while the single copeck and a 5 copeck piece are coined in copper.

Salvador.— The silver peso ($0.439) is the unit, and this coin and its divisions are coined in silver.

Servia.— The dinar ($0.173) is the monetary unit. The 20 and 10 dinar pieces are of gold; the 5 and 1 dinar pieces of silver, while the 20, 10 and one para ($0.0019) pieces, in nickel and bronze, represent the minor coinage.

Siam.— The monetary unit is the silver fical ($0.28). The other coins current are the salung (¼ fical) and the juang (⅛ fical).

Spain.— The peseta ($0.193) is the monetary unit. The several divisions and multiples of the peseta are coined in gold and silver, while the minor coinage, ranging from one centimo ($0.0019) to 50 centimos, are of silver or bronze.

Sweden and Norway.— The gold crown ($0.268) is the unit, and 10 and 20 crown pieces are coined in gold. The silver coinage includes the 2 crown piece, the single crown, and the 50 and 10 ore ($0.0241), while the single and the 5 ore pieces are of bronze.

Switzerland.— The gold franc, valued at $0.193, is the monetary unit. Gold 5, 10, 20, 50, and 100 franc pieces, and silver 5 and one franc pieces are coined. The minor coinage includes the 50, 20, 10, and single centimes ($0.0019).

Turkey.— The piaster ($0.044) is the monetary unit and the gold coins include the 25, 50, 100 (the lira), 250, and 500 piaster pieces. The ½ piaster, the single piaster, and the 20 piaster pieces are of silver, while a piaster and the para ($0.0001) are of copper.

Uruguay.— The peso ($1.034) is the only gold coin authorized in Uruguay, but the silver peso ($0.403) and its divisions are also coined.

Venezuela.— The bolivar ($0.193) is the monetary unit. Gold 5, 10, 20, 50, and 100 bolivar pieces are coined, while the silver coinage includes a 5 bolivar piece as well as the single bolivar and its divisions.

Foreign Judgment, in law, is the term applied to the judgment of a foreign tribunal. Such judgment is proved in common law by exemplifications certified under the great seal of the state or country where the judgment is recorded, or under the seal of the court where the judgment remains; the fulfillment of its conditions depends upon treaty stipulations or on international comity. With regard to judgments in courts of sister States of the United States, it is enacted by the acts of 26 May 1790, and 27 March 1804, that they shall be proved or admitted in any other court within the United States, by the attestation of the clerk and the seal of the court annexed; together with a certificate of the judge, chief-justice, or presiding magistrate, as the case may be, that the said attestation is in due form; and that such records and judicial proceedings shall have such faith and credit given to them in every court within the United States as they have by law or usage in the courts of the State from whence they are or shall be taken.

Foreign Laws, the laws of a foreign country. The courts do not judicially take notice of foreign laws; and they must, therefore, be proved as facts. Exemplified or sworn copies of written laws and other public documents must, as a general thing, be produced when they can be produced; but should they be refused by the competent authorities, then inferior proof may be admitted. The effect of foreign laws, when

proved, is probably referable to the court; the object of the proof is to enable the court to instruct the jury what is, in point of law, the result from foreign laws to be applied to the matters in controversy before them. The court is, therefore, to decide which is the proper evidence of the laws of a foreign country, and when evidence is given of those laws, the court is to judge of their applicability to the matter in issue.

Foreign States. In law, every nation is foreign to all other nations; and the several States of the American union are foreign to each other, with respect to their municipal laws. The reciprocal relations between the national government and the several States, however, are considered not as foreign, but as domestic.

Foreign Trade. While political economists have engaged in fierce disputations over many economic theories regarding money, wages, distribution and similar subjects, they have allowed the theory of international trade, as it was set forth by John Stuart Mill, to remain unchallenged and unchanged. The principle involved is one of advantage. In general, a given nation will export those articles in the production of which it has an advantage over other nations and import such articles as can be produced cheaper by other nations. This advantage may be absolute, depending upon location, soil, climate, etc., or it be merely relative and artificial, depending, for instance, on a system of protective tariff.

Modern international trade, in all its vastness and complexity, is a comparatively recent development. It may be said to have first begun with the multiplication of steamships and the extension of railroads throughout the world. Among important recent changes affecting foreign trade, and destined to affect it even more in the future, may be mentioned: (1) The acquisition by the United States of Hawaii and the Philippine Islands; (2) the construction of the Trans-Siberian Railway; (3) the expansion of steam-carrying trade on the Pacific; (4) the opening of China; (5) the definite assurance of a Panama Canal by the United States. These changes mean new markets for us, with better and cheaper facilities of transportation. The location of Manila makes it the logical collecting point for all articles of trade in southern Asia except tea, and under American control, with changed conditions of shipping, this city is destined to become a great commercial emporium. The fact that our factories are located on the Atlantic coast has placed us at a disadvantage in the oriental trade. This condition will be greatly alleviated by the construction of the Panama Canal; not to mention the advantages we shall gain in our trade on the west coast of South America. Indeed, the trade of that group of countries lying south of us is important. They buy of us manufactures and food-products. Their principal employment being agriculture, they form one of the most important groups of those nations known to political economists as "neutral markets." In recent years special efforts have been made to cultivate the South American trade. Witness, for instance, the assembling of the International American Conference, under act of our Congress for the explicit purpose of extending inter-American trade; the completion by an American company of telegraphic communication with the southermost cities of South America; the appointment of an inter-American commission to report on a route for an inter-continental railway; the establishment of the Bureau of American Republics for the publication of information for those engaged in American trade; the unification of customs regulations and the monetary conference to study plans for facilitating inter-American exchange; the unanimous recommendation of all the republics to establish an international American bank, with branches in every American republic; the celebration of treaties of reciprocity and the proposal to establish a permanent inter-American court of arbitration for the settlement of all American disputes; and finally, the opening of our great consuming market to our sister republics by continuing the free admission into the United States of coffee, rubber, nitrate of soda and other products, and by the removal of the duties on hides, sugar and wool. In addition to these means of promoting trade must be mentioned the activity and persistence of our American merchants and manufacturers in advertising their wares, and in this way stimulating the market for them.

Nor have our commercial leaders proved less equal to the demands of international trade in the widest sense. In the trade of the world the United States has taken an important place. In fact, the development of our foreign commerce has been almost phenomenal. It is interesting to examine the figures giving the total values of our imports and exports by decimal periods for the past fifty years, and to note the rate of increase:

Imports.

1855	$257,808,708
1865	238,745,580
1875	533,005,436
1885	577,527,329
1895	731,969,965
1905	1,117,512,629

Exports.

1855	$218,909,503
1865	166,029,303
1875	513,442,711
1885	742,189,755
1895	807,538,165
1905	1,518,561,720

With few exceptions the volume of our foreign trade has increased steadily year by year, the figures for the fiscal year 1905 showing the largest imports and exports. For the fiscal year 1904 the imports and exports were $991,087,371 and $1,460,827,271, respectively. The gain of $126,425,258 in imports alone almost equals the total volume of our foreign commerce in 1812, the year in which the United States first made a clear start in the race for recognition as a world power.

The gradual increase of exports over im-

ports is noteworthy and important. Roughly, from 1855 to 1905 imports have increased fourfold, while exports have increased sevenfold. Whereas in 1855 there was a trade-balance of $40,000,000 against us, in 1905 there was a balance of $400,000,000 in our favor. It is further significant that about half of our imports are manufacturers' materials. See COMMERCE; COMMERCE, INTERSTATE; COMMERCIAL ORGANIZATIONS; COMMERCIAL TREATIES; EXPORTS AND IMPORTS, AMERICAN; EXPORTS AND IMPORTS OF THE LATIN-AMERICAN REPUBLICS; ALASKA, COMMERCIAL; CANADA, COMMERCE, TARIFFS AND TRANSPORTATION; UNITED STATES: FOREIGN COMMERCE OF; HISTORY OF THE TARIFF; RECIPROCITY; COMMERCIAL DEVELOPMENT; FINANCES OF THE, ETC.; FREE TRADE; BALANCE OF TRADE.

Foreign Wars, Military Order of, a national patriotic society founded in 1894 in New York, under the name of the Military and Naval Order of the United States, but known from 1895 by its present designation. The objects of this order are (1) to preserve and honor the memory of those who assisted in the maintenance of the government of the United States in the Revolution, the war with Tripoli, the War of 1812, the Mexican war, and the Spanish-American war; and (2) to collect all records and documents appertaining to the wars above mentioned. The order is sub-divided into 22 State commanderies, and includes in its membership commissioned officers of the army, navy, or marine corps who took part in any of these wars (Veteran Companions), and direct lineal descendants of commissioned officers in the main line (Hereditary Companions). The present membership (1903) exceeds 1,600.

Fore'lands, North and **South,** two headlands on the southeast coast of England, county of Kent. North Foreland projects into the sea in the form of a bastion, and consists of chalky cliffs nearly 200 feet high. South Foreland consists also of chalky cliffs, and has two lighthouses, with fixed lights, erected upon it.

Forensic Medicine. See MEDICAL JURISPRUDENCE.

Foreordination, or **Predestination,** a term appropriated by theology; in the Calvinistic system, the assignment of the Deity, at the time of creation, of some of his creatures to eternal life and happiness and others to eternal death or suffering. Of course the decree was not, as usually stated, irrespective of the spiritual merits of the subjects; but if human beings it was irrespective of their actual conduct on earth. This was supposed to be irrelevant, as through the fall of Adam they had lost all possibility of merit, and owed any escape they might have from utter destruction to God's grace and Christ's vicarious atonement, which restored some of them to moral health. As none of them deserved anything, there could be no injustice in leaving such as he chose to suffer the penalty assigned. The first noun or its verb is not taken from the Scriptures, which uses «ordain» instead (Acts xiii. 48; Jude iv. 13). It was not alone Adam's dereliction which had caused this liberty of choice, however, as angels were included: the Westminster Confession says, «By the decree of God, for the manifestation of his glory, some men and angels are predestinated unto everlasting life, and others foreordained to everlasting death.» This implies that no created being has any claim to other than destruction except by divine grace.

Foreshortening, in art, the method of drawing in strict accordance with the rules of perspective, by which objects are so represented as to convey to the observer an idea of their just length, although but a portion of that length is actually given. The method was known to the ancients, and in more recent times has been notably employed by Correggio.

Forest-fly, the British name for the minute parasitic, flea-like flies called bird-ticks, bat-ticks, and the like, in America; specifically *Hippobosca equina,* which is especially a torment to horses by thrusting its long beak through the skin and sucking the blood. See BIRD-TICK.

Foresters, Ancient Order of, a fraternal order founded 1745, at Yorkshire, England, with a membership 1903 of over 1,000,000, divided among 9,000 courts. The order was introduced into the United States in 1832, and despite the fact that over 175,000 members withdrew and organized the Foresters of America in 1895, the order in this country has a membership of 187,000.

Foresters of America, a fraternal, benevolent order known under this title since September 1895. Orignally the order was part of the Ancient Order of Foresters (1745), but freed itself from the High Court of England (1889), and became a separate order. There were 1,600 courts in 1902, with a membership of 195,200.

Foresters, The Independent Order of, was organized in 1874 in New Jersey. It was reorganized in Canada by the Hon. Dr. Oronhyatekha, a full-blooded Mohawk Indian of scholarly distinction, high character, and great ability, who was educated under the patronage of the present king of England, in 1881. In 1881 the society consisted of 369 members and was in debt. It now numbers 214,000 and has a surplus of $6,700,000 in its treasury, having already paid to widows and orphans of deceased brethren about $14,000,000. The membership extends throughout all of the provinces of Canada, nearly all of the States of the American Union. England, Ireland, Scotland, Wales, Norway, Denmark, France, Belgium, India, Newfoundland, and Australia. In 1902 it added to its membership 13,000, and for the first half of 1903 its net increase was about 9,000. During the year 1902 the number of members initiated was 100 per month greater than in 1901. The death rate of the year was 6.60 per 1,000 or a fraction less than the year before. The average age of its membership at the close of 1902 was a little over 36. The society rejects a large percentage of applicants, being very careful in the selection of its risks. Its accumulated funds increased during 1902 by $957,239. This meant a betterment in assets of 18.19 per cent. The increase in assurance at risk during the year was 4.52 per cent. The increase in the premium income of the order in 1902 was 8.37, while the demands upon that income for the purpose of meeting claims was only 1 per cent greater than in 1901. The order is governed by a supreme body, which meets once in three years. The local jurisdictions are governed by high courts of the various States and Prov-

inces. The funds, however, are all forwarded to the head office, there being invested under the insurance law of Canada which prevents investment in anything except first-class gilt-edge securities. The last reports show that no losses have ever been made in investments. The head office of the order is in Toronto, Canada, the building being a magnificent structure known as the Temple Building, which was built and is owned by the order. In addition to the head office it contains a number of banks, loan companies, insurance companies, and is the headquarters of masonry for the city of Toronto. The order pays out daily (1903) $6,500 to widows and orphans. The rates of premium may be judged from the following: Age 35; amount $1,000; mortuary premium $1.38 (small court dues in addition). All premiums cease at 70 years of age, or at any time when the members become totally and permanently disabled, at which time they are allowed to take in cash one half of the amount of their policy, the balance to be paid to their heirs at death. After 70 years of age members are permitted to draw one tenth of their policy for each of 10 years if they live so long, the balance to go to their beneficiaries at death. The order also has a sick and funeral benefit division. It admits lady members, these being called companions, who are gathered in separate courts. Of its total membership of 214,000 about 17,000 are companion members. The growth and progress of the institution is the life work of Hon. Dr. Oronhyatekha. He has been supreme chief ranger for 22 years and is a man of wonderful strength and power. Associated with him are the following: Hon. Judge Wedderburn, Hampton, N. B.; J. D. Clark, Dayton, Ohio; John A. McGillivray, K. C., Toronto, Ont.; H. A. Collins, Toronto, Ont.; T. Millman, M.D., M.R.C.S., Toronto, Ont.; Hon. Elliot G. Stevenson, Detroit, Mich. Benj. Greer, London, Ont., and Charles A. Fitzgerald, Buffalo, N. Y., are the supreme auditors.

Forestry in the United States. Forestry is the art of using the forest continuously to meet the needs of men. In the United States forestry has to do principally with the supply of wood for various purposes, with the maintenance of waterflow in streams, with the prevention of floods, and with the supply of forage for grazing animals within the forest. Nowhere else are forest problems of more vital importance to the welfare of the people than here, and in no other country of similar civilization has so little progress been made in their solution. This condition follows naturally from the vast area of the United States, its comparatively sparse population per square mile, and from the nature, location, and extent of the forests themselves.

The forests of the United States occupy an area of approximately 1,100,000 square miles, or about 36 per cent of the total land surface. They may be divided into five principal regions.

(*a*) The *Northern Pine Forest* extends from western Minnesota east to the Atlantic Ocean and southward to middle Tennessee, northern Georgia, central Virginia, and northern Maryland. Its characteristic tree is the white pine (*Pinus strobus*, Linn.), a tree of the very first commercial importance, which has hitherto supplied much more of the lumber cut in the United States than any other tree. In its western and more important centre of distribution in Michigan, Wisconsin, and Minnesota, the white pine is found both in pure stands and associated with other, principally hardwood, trees. The cut of white pine in the northern pineries reached its maximum in 1890, when the production for Michigan, Wisconsin, and Minnesota was 8,597,623,000 feet. During the census year 1900 the cut had fallen to 5,419,333,000 feet. This reduction in the cut has been accompanied by so marked a fall in the quality of the lumber that at present very many mills are sawing logs of which 50 or 60 are required to produce 1,000 feet of lumber, while the former average of logs to the thousand was seven or less. In the eastern part of the Northern Pine Forest red spruce (*Picea rubens*, Sarg.) is now the principal lumber tree, since the majority of the merchantable pine has been removed. The spruce grows usually in mixture with hardwood trees such as birch, beech, and maple. Formerly used mainly for lumber, spruce is now cut principally for paper pulp. The production of spruce pulp wood in the census year 1900 was 1,160,118 cords, the majority of which was used for news and other coarse grades of paper. In its southern extension the white pine forest penetrates the extensive hardwood belt of the Southern Appalachians, into which it merges as the white pine and its associates cease to be the characteristic trees. In its northern portion the white pine forest is predominantly of value for the production of wood. Its use as a regulator of stream-flow, while very great, is there far less conspicuous than along its southward extension in the Appalachian Mountains, and in many other forest regions of the United States. The loss from floods in streams which head within this forest in the Southern Appalachian Mountains during a certain period of 12 months ending in 1902 was, according to official estimates, more than $18,000,000. Congress has been asked to undertake the control of these floods by the purchase of lands for a Southern Appalachian forest reserve, but the plan, although thoroughly good, has not yet been carried through.

(*b*) The *Interior Hardwood Forest* follows the southern boundary of the Northern Pine Forest from the edge of the treeless region eastward to the mountains of Virginia and southward along the Appalachian Mountains and the Piedmont region, skirting the northern boundary of the Southern Pine Forest until it meets the prairie in western Texas. Its principal trees are the oaks. It is in this forest that the black walnut, now almost exhausted as a timber tree, reached its best size and most important distribution.

(*c*) The *Southern Pine Forest* extends from northern Maryland south along the Atlantic and Gulf coasts and up the valleys of the principal rivers until it meets the open country in western Texas. Its most important and characteristic tree is the longleaf pine (*Pinus palustris*, Mill.), in many respects the most valuable and important timber pine of the globe. Frequently associated with the longleaf pine, and serving elsewhere to delimit the boundaries of the Southern Pine Forest, is the loblolly or rosemary pine (*Pinus taeda*, Linn.), a tree of rapid growth and great dimensions. Other characteristic trees are the shortleaf pine (*Pinus echinata*, Mill.), which occupies the higher ground back from salt water, and the bald cypress (*Taxodium*

distichum, Linn.), a swamp and tideland tree of high commercial importance, whose wood, for many purposes, is taking the place of the white pine, as clear lumber from that tree becomes progressively scarcer and higher in price. The cut of pine in the Southern Pine Forest in 1900 was 8,523,000,000 feet, and it is increasing with great rapidity. The cut of cypress in 1900 was 495,000,000 feet. The naval stores produced from the longleaf pine in 1900 were valued at $20,344,888.

Along the western border of the Northern Pine Forest, the Interior Hardwood Forest and the Southern Pine Forest extend the region of the Great Plains, destitute of timber except along the margins of the streams and on occasional elevations. There is a strong probability (and in many places conclusive evidence) that great areas of this region at one time bore trees and are still capable of growing forests. The clothing of such areas again with trees is one of the most important problems to be attacked and solved by the American forester. Ultimate success, of which there is now no doubt, will be of enormous value to a region whose principal industries, agriculture and grazing, are both so dependent for their future development upon a cheap and accessible timber supply.

(*d*) To the west of the Plains region lies the ***Rocky Mountain Forest,*** occupying more or less isolated mountain chains or mountain masses separated by grazing lands, deserts, or cultivable valleys. The Rocky Mountain Forest has its eastern extensions far in the heart of the Plains country, as in the case of the Black Hills Forest in North Dakota. Its predominant characteristic at middle and lower elevations is semi-aridity, and its distribution is limited by a combination of forest fires and deficient rainfall. Its principal timber trees are the western yellow pine (*Pinus ponderosa*, Laws.), the Engelmann spruce (*Picea engelmanni*, Engel.), the red fir (*Pseudotsuga taxifolia*, Lam., Brit.), and the lodgepole pine (*Pinus murrayana*, "Oreg. com.") The principal products of the Rocky Mountain Forest are water, wood, and grass, in the order named. The chief industry of this region is, or is about to become, irrigated agriculture. Since the passage of the National Reclamation Act of 1902, which provides for the reclamation of vast areas of irrigable arid land under the auspices of the Federal government, the watersheds of the region have taken first place in its economic resources, for here water, not land, is the measure of value of the farm. All the industries of this region hang with peculiar dependence upon the forest. The distance from which supplies of timber for mining, for railroads, and for domestic purposes must come if the Rocky Mountain forests are once exhausted makes their preservation an imperative necessity on these accounts, while the existence of summer range in the forest for herds of cattle, sheep, and horses gives value to immense areas of winter range which without it would be of little use, and thus maintains one of the most important industries of the region. Because of the aridity of the country the forests of the Rock Mountain region are destroyed with peculiar facility by fire, by overgrazing, and by overcutting. The reproduction is less rapid and abundant than on either the eastern or western coast, while the preservation of the forest, of vast importance everywhere throughout the United States, is here more peculiarly and immediately essential to the well-being of the people than is the case elsewhere.

(*e*) West of the Rocky Mountain Forest stretches the *Pacific Coast Forest,* probably the most densely timbered and prolific forest region of the earth. In California the forest of the Sierras, characterized by the big tree (*Sequoia gigantea*, Decaisne), the sugar pine (*Pinus lambertiana*, Dougl.), and numerous magnificent firs, is perhaps the most beautiful and attractive in existence, while the forest of coast redwood (*Sequoia sempervirens*, Lamb., Endl.) has a larger stand of merchantable timber per acre than any similar area of which we have knowledge. In Oregon and Washington, the red fir (*Pseudotsuga taxifolia*, Lam., Brit.), the coast cedar (*Thuya gigantea*, Nutt.), and the tideland spruce (*Picea sitchensis*, Bong., Trautv. and Mayer) are lumber trees of the highest commercial value and the chief economic components of the forest, while the coast hemlock (*Tsuga mertensiana*), for the present less sought after than the fir, and the red fir itself alternate as the most numerous tree in the forest. Water is the most important product of the Sierra forest, wood of the redwood belt and of the coast forests of Washington and Oregon. The cut of redwood in 1900 was 360,000,000 feet, the lumber product of Oregon 740,000,000 feet, and that of Washington 2,300,000,000 feet. During the year 1902 the loss from fire in the State of Washington was said to be about twice the cut. Although it is true that wood is by far the most important product of the coast forests of Washington and Oregon, yet the prevention of floods from the heavy rainfall and snowfall of the coast is of critical importance to many agricultural valleys.

Forests of the Philippine Islands.— The forest lands of the Philippine Islands cover an area which certainly exceeds 40,000,000 acres. They are rich both in the number and in the value of their species, and their total stand of merchantable timber is exceedingly large. Except for occasional private or monastic holdings, they are entirely in the possession of the United States, and are being administered by an Insular Bureau of Forestry in competent and reliable hands. The development of practical and systematic forestry in the Philippines is likely to be even more rapid than in the United States, and the returns from the government forests there, already more than double the expense of administration, will form one of the most important sources of revenue from the islands.

Forest Protection.— The early settlers in New England and Pennsylvania, coming as they did from regions where forest protection was rigidly enforced for the sake of the game, brought with them the survival of their habits at home, and made provision among their earlier laws for the preservation of the forest. This transplanted care for the woodlands did not long survive either in legislative or in effective public desire. It was succeeded by a reasonable appreciation that the forest, in the early days on the Atlantic Coast, was the enemy of the settler. The state of mind which was thus produced survived in enmity to the forest long after the progress of civilization had converted it from an enemy of the settler to his best friend, and the eagerness for forest destruction which has characterized the great majority of frontier com-

munities in the United States has, after the early days, had no more legitimate cause. Until the immense expansion of the railroads which followed the close of the Civil War, the demand for timber was comparatively local in character, and the great operations of destructive lumbering had not begun. Since that time forest destruction has increased progressively until the exhaustion of the timber supply has almost been accomplished in certain regions and is imminently threatening elsewhere. Even before the era of gigantic lumbering operations, organized bodies began to take action for the preservation of the forest, but it was not until the resolutions of the American Association for the Advancement of Science in 1873 that such action achieved results. These resolutions called upon the National government to investigate the forest situation of the United States and to move accordingly. In 1876 the Commissioner of Agriculture, through Dr. Franklin B. Hough, one of the most honored pioneers of forestry in this country, organized such an inquiry. The work which Dr. Hough then began developed into the Division of Forestry in the United States Department of Agriculture, which division was greatly enlarged and became the Bureau of Forestry in 1901.

The Bureau of Forestry.— The Bureau of Forestry is divided into six offices. The Office of Forest Management prepares working plans for conservative lumbering for the National forest reserves (see below) and for State and private forest holdings. Its practical assistance to the owners of timberlands is given on the ground, either without cost in the case of small areas, or at the cost to the owner of expenses only in the case of larger tracts. The area of private forest land for which applications for assistance had been made on 1 July 1903 was 5,656,171 acres, an area far larger than the force of the Office of Forest Management has been able to cover. The total area of private lands put under management at the same date was 679,194 acres. The Office of Forest Extension gives assistance in tree planting under conditions similar to those described for the Office of Forest Management, studies methods of re-establishing the forest on areas which it once occupied, and gives special attention to the study and prevention of forest fires. On 1 July 1903 the area for which planting plans had been made amounted to 10,807.47 acres. The Office of Forest Measurements calculates, drafts, and puts into final form the very extensive measurements and maps made in the field by the Offices of Forest Management and Forest Extension. The Office of Forest Products studies the uses of timber and other forest products, makes timber tests and chemical examinations of by-products of the forest, and gives special attention to the preservation of wood. The Office of Dendrology deals with the natural history and nomenclature of trees and forests, and has charge of the forest library and the collection of forest photographs of the United States. The Office of Records is charged with the routine and the business operations of the Bureau. The appropriation of the Bureau of Forestry for the year ending 30 June 1904 was $350,000. It will be evident from what has been said that the work of the Bureau is to forward both the study of the forests of the United States and the application of practical forestry upon them regardless of the character of their ownership.

National Forest Reserves.— Parallel with the development of the Bureau of Forestry, two other lines of National forest work have sprung up, one in the General Land Office, the other in the United States Geological Survey. To the General Land Office the custody and disposal of the lands of the public domain have been given, together with the care and management of the National forest reserves created from time to time by proclamation of the President of the United States under the Act of 3 March 1891. These reserves, situated in all the Western States and Territories except Nevada, occupied on 1 July 1903 an area of 62,343,645 acres. When the first reserves were created, it was natural that their administration should be placed in the hands of the Land Office, which had had charge of these lands before they were reserved, but the development of the other government forest work has made it evident that a change is required.

In 1895 the president of the National Academy of Sciences was requested by the secretary of the interior to appoint a committee to examine the forest lands of the public domain and report a policy for their management. Upon the recommendation of this committee, President Cleveland, on 22 Feb. 1897 created some 22,000,000 acres of forest reserves. The proclamation of these reserves was immediately followed by protests in the Western States and Territories so vigorous that Congress suspended the operation of the President's proclamation for a year in all the States affected except California, whose senators, recognizing the value of reserves to their State, protested against the suspension. At the expiration of the year of suspension the proclamation of President Cleveland became effective in spite of some opposition in the West, and the forest policy of the government has never been seriously threatened since that time. The law of 3 June 1897 conferred upon the secretary of the interior all necessary powers for the management of the forest reserves through the General Land Office, and gave to the director of the Geological Survey, who had been instrumental both in saving the reserves from permanent suspension and in procuring the passage of the law, certain duties in connection with them.. He was charged with the survey and description of the reserves, with mapping their topography and timber, and with recommending to the secretary of the interior their proper boundaries and marking them permanently upon the ground. The duplication of work and the loss of energy involved in the dispersion of the National forest work under these three independent agencies has been called to the attention of the Congress by the President of the United States and is likely soon to come to an end.

State Forestry.— While the national government was making the progress described, various States were taking active measures in forestry. Among those Minnesota and Pennsylvania are conspicuous for the excellence of their fire laws, New York and Pennsylvania for their forest reserves, Michigan, California, and a few other States for peculiar excellencies of State organization or public sentiment on the forest question, but except in some of the States already named

and a few others the state movements for forest protection have not usually been notable either for efficiency or good results.

Forest Schools.— Instruction in forestry began in this country under the mistaken impression that forestry differs but little from horticulture and botany. But the character of forest teaching has been revolutionized within the last few years, and at present opportunity for education in professional forestry is not wanting in the United States. One of the earliest practical courses of forestry, discontinued shortly after it began, was given in the State University at Bozeman, Montana, under Capt. George P. Ahern, U. S. A., now in charge of the Bureau of Forestry in the Philippine Islands, but the first effort toward the establishment of professional instruction was in the simultaneous opening in the autumn of 1898 of the Biltmore Forest School at Biltmore, North Carolina, and the New York State College of Forestry as a part of Cornell University. The former offered a one year course without entrance examination and is still continuing to do so. The Cornell School, which offered a four year undergraduate training in professional forestry and had begun to graduate students capable of passing the government examinations, was discontinued in 1903. The Yale Forest School, which offers a two year post graduate course to the holders of a bachelor's degree from any recognized institution of learning, was established in 1900. It has already graduated more professional foresters than all other schools combined. The University of Michigan has just instituted a two year post graduate course, the University of Nebraska has established a four year undergraduate course, the State Agricultural College of Minnesota has established a four year course; Harvard University offers some instruction in forestry in the Lawrence Scientific School, and many other institutions afford the opportunity for more or less complete and effective training in various branches of forestry.

American Forestry Association.— The American Forestry Association, organized in 1882 as the American Forestry Congress, has been one of the most effective agencies in the progress of forestry and forest preservation in the United States. Its influence upon legislation has of late years been a notable one, and its summer meetings, held in whatever portion of the country needs its influence most, have been exceedingly effective in educating public opinion. Its official organ, formerly 'The Forester,' now called 'Forestry and Irrigation' because it has become likewise the organ of the National Irrigation Association, is the best forest periodical in the United States and one of the best in existence. In the publicity which it gives to forestry, it has been of late most cordially and helpfully joined by the lumber journals and the daily press of the country. The newspaper press as a whole has been a most effective agent in the dissemination of right ideas of forestry and in bringing about in Congress, among lumbermen, and among the people at large the strong support of practical forestry which is now perhaps the most hopeful sign of the forest situation in the United States.

The Practice of Forestry.— The practice of forestry in the United States naturally falls under two heads: First, those forms of conservative lumbering which were practised by farmers, lumbermen, and others without the assistance of professional foresters. Second, those forms of conservative lumbering which have been introduced under the supervision of the latter. In both cases a factor of the utmost importance is found in the methods of logging adopted or devised by the American lumbermen in different parts of the country.

Destructive Lumbering.— The methods of felling timber, except for variations in the forms of axe and saw, are approximately similar throughout the world, but the methods of handling the felled timber vary greatly. In the United States the mechanical and inventive capacity of the people has led them to develop forms of logging cheaper and more effective than those in use elsewhere. These methods have become highly specialized in response to the requirements of the market, the topography, and the forest itself in the different forest regions. In the Northern Pine Forest the final operations of logging await the fall of sufficient snow to make possible the preparation of solid ice roads over which the logs can be hauled to the bank of a stream or to the railroad. In the Southern Pine Forest and throughout the larger part of the interior hardwood region snow is not a factor in the logging. Its place is taken to some degree by timber slides or by installations of wire rope cables which drag or carry the logs from the stump to a logging train. In the Rocky Mountain region the methods vary greatly, but on the whole they are less highly developed there than in the denser timber on the Pacific slope, where wire rope logging has reached a very high point of economy and efficiency. Here the logs are dragged over specially prepared skid roads by wire cables of great length attached to the drums of donkey engines, which transport themselves about the woods by their own power whenever change of location is required. Forestry being in many respects more closely akin to lumbering than to any other occupation, it is of first importance to the forester that effective and economic methods of logging should be employed. These methods hitherto have been wasteful and destructive both to an unnecessary and to an unprofitable degree, and the future of the forest has been needlessly sacrificed to the idea of immediate gain. Conservative lumbering harvests the present forest crop economically and profitably at the same time that it provides for future growth.

Forestry by Private Owners.— The idea of perpetuating the forest by wise use, which is the essence of forestry, had found hospitable lodgment in the minds of many Americans before forestry had become a recognized profession in the United States. Examples of the treatment of the forest from this point of view were more common in the northern spruce forests than elsewhere, and especially on the Androscoggin River in Maine, where great permanent value was given to very considerable tracts of spruce land by careful handling. Among the farmers of New England, New York, and New Jersey the harvesting of successive crops of hardwood sprouts for fuel, fencing, etc., was a common practice during the last century, but as a rule the methods used, like those for the spruce in Maine, were less effective than they might easily have been.

FORESTRY IN THE UNITED STATES

Beginnings of Professional Forestry.— In 1891 the first example of professional forest management in the United States was begun on the Biltmore estate near Asheville, North Carolina, in a mixed forest of hardwood and pines which had been severely damaged by the mismanagement of former owners. The object of the management was to secure what revenue was possible from the forest while conducting such operations as were required to put it in good condition. Even in the first year the forest work paid for itself, and it has been conducted successfully ever since. No further examples of professional forest management were created until, in the summer of 1898, practical forestry was introduced, under the care of the then Division of Forestry of the Department of Agriculture, on two tracts in the Adirondacks of a total area of more than 100,000 acres. Other instructive examples of co-operation in practical forestry between private owners and the government have been created in Maine, Tennessee, Georgia, Texas, and many other States and Territories, and the plan is still in increasingly effective operation. Under it the great majority of the conservative forest management now in existence in the United States has been brought about. The types of practical forestry which have been adopted or devised for application in these various cases include improvement cuttings of various degrees of refinement, several types of treatment of sprout lands, and a variety of forms of the high forest and selection systems, the most typically American of which is what is called localized selection. In all cases their application has been reduced to the utmost simplicity, and a definite effort has been made to limit interference with the ordinary methods of logging to the smallest possible amount. As a result they have not interfered as a rule with the profits of the forest, while the reproduction and perpetuation of the forest, the other principal object of the management, has been fully secured. Through the application of these simple and effective methods forms of forest management peculiarly adapted to American conditions are growing up. In the early practice of American foresters many of the important tenets of European forestry, such as the doctrine of the sustained annual yield, have wisely and necessarily been abandoned, and effort has been confined to insuring the profitable use of the forest and its continuance in productive condition, not seldom at the expense of a long hiatus in the yield, provided such a form of management was satisfactory to the owner. The conditions of the lumber trade here justify the transportation of forest products for longer distances than is possible in Europe, and localities are far less dependent in America upon the local supply than is the case abroad. A fundamental consideration in determining forms of management in the United States is the extremely moderate price of low grade forest products such as firewood and the cheaper kinds of lumber. This fact, together with the cost of transportation, decides what kinds and grades of timber can be profitably cut and how closely what is cut can be put to use. Logging under the conditions of which not more than 50 per cent of the growing tree ever reaches the market, is still practised in several parts of the United States. The duty of perpetuating the forest is not less imperative under such conditions than where the price of lumber is higher. The methods of the American forester, although they must be the product of ripe training and experience if they are to succeed, are often summary and rough. In every case they must pay and in every case they must insure the perpetuity of the forest. If they succeed in these two essentials, their roughness may be disregarded.

Principal Forest Problems.— The efforts of American foresters are at the present time largely grouped about a few principal forest problems which arise from the nature of the forest, from the dangers which threaten it, and from the economic conditions by which it is surrounded.

The National Forest Reserves.— Since it is the general experience of all countries that the only forests which are permanently safe are those in the hands of a permanent owner, namely the government, the United States has by the creation of forest reserves undertaken to set aside and hold in the public hands those areas within the public domain whose preservation is essential to the public welfare. The establishment of these forest reserves met at the beginning, and in certain instances continues still to meet, unthinking opposition in certain parts of the Western States where lie the 863,000,000 acres which remain of the public lands. But in each State public sentiment is crystallizing rapidly and effectively in favor of forest preservation. This trend of the public mind makes it continually easier for the national government to set aside and hold those forest lands which it should retain, and is rapidly making possible a better administration of the reserves themselves. The latter are located either at the headwaters of streams whose protection is essential to irrigated agriculture on the lands below them, or in more densely forested regions where the preservation of the timber supply is the first consideration. In either case their preservation alone can meet a critical public need. It is unfortunate that the personnel of forest supervisors and forest rangers available for their protection has remained far below their requirements. The natural result has been that the diminution of forest fires, although striking in amount, has been less than might have been accomplished, while the stock ranges have continued to suffer from overgrazing and the reserves have been injured to some extent by timber stealing and by minor depredations. They have nevertheless answered a most important and beneficent public purpose, and under the policy which controls their administration their value to the people will steadily increase. This policy briefly stated is the employment of all their resources for the good of the people, and thus, in the language of President Roosevelt, the making and maintaining of prosperous homes.

Forest Fires.— It is altogether probable that more timber has been destroyed in the United States since the landing of the Pilgrims by fire than by the axe. In every country where timber is plenty and settlers few, fire has been harmfully employed to assist the settler in his warfare against the forest. With the progress of civilization railroads have scattered along their rights of way fires which have destroyed thousands of square miles of timber. The transcontinental railroads are lined for hundreds of miles, where they traverse the forest regions, with the bleached fire-killed remnants of the

former stand. Prospectors often set fires in heavily timbered countries to uncover the surface of the mineral soil, and campers, hunters, and others, either by the injudicious location of their fires or by neglect in leaving them unextinguished, have been responsible for much important loss. The use of steam machinery in logging and the supposed necessity for burning away the debris, as in the case of the coast redwood of California before skidding the logs, has been responsible for many fires. The loss from forest fires is confined to no section of the country and its percentage has diminished but little of late years, if at all, in proportion to the total stand of timber which remains. Although exact figures are not obtainable, it probably exceeds on the average a total of $50,000,000 a year. The Hinckley fire of 1894 in Minnesota destroyed property valued at $25,000,000 and cost the lives of 418 persons. For two weeks before the high wind which gave it its destructive power this fire was smoldering in the neighborhood of Hinckley and could have been extinguished easily and cheaply at any time. During the autumn of 1902 fires destroyed property valued at $13,000,000 in the States of Washington and Oregon, while in the spring of 1903 about 650,000 acres were burned over in the Adirondack Forest in New York. Such losses are as unnecessary as they are appalling, for a small fraction of the cost of these fires expended in preventive measures would have rendered their occurrence practically impossible. There is but one effective safeguard against fire in the woods, an enlightened public sentiment with regard to it. Such a sentiment is rapidly being created within and near the National forest reserves and in certain other portions of the country. While the effort to produce it is in progress the National Bureau of Forestry is studying the natural history of forest fires and devising the cheapest and most effective means for extinguishing them. It is studying likewise their effect upon the condition and production of the forest, and the amount of loss, as special means of awakening public opinion. In the dense and moist forests of the northern pine belt, forest fires of importance almost invariably originate in the debris of cut-over lands and not seldom are unable to penetrate the untouched virgin forest. In unusually dry seasons, however, fires may burn throughout any woodlands without distinction, and it is in such seasons that conflagrations like the Hinckley and the Peshtigo fires take place. Except under extraordinary conditions, fires in forests of this type are apt to move slowly, but they are difficult to extinguish because of the mass of inflammable material in the forest floor. Mature trees in the Interior Hardwood Forest and the Southern Pine Forest are seldom killed by fire if the bark is unbroken and sound. Fires in these regions usually travel along the ground with moderate speed and are seldom dangerous to human life. The damage they occasion is in the destruction of young growth and the unsoundness which they produce in trees of larger size. They are especially destructive in those portions of the Southern Pine Forest where the longleaf pine is boxed for the production of naval stores. Where a boxed tree catches fire it is lost for such production, and most often succumbs to the attack. In the Rocky Mountain Forest fires are less uniform in type. Where the timber is dense, and especially where it is composed of a thin-barked species such as the lodgepole pine, not infrequently vast areas of the forest are killed by a single fire. In such cases the trees are not consumed, but stand bleaching long after they have lost their bark, and finally fall in an almost impassable tangle of prostrate trunks, to be consumed later by another fire together with the young growth which has sprung up among them. In the more open forests of the western yellow pine, the damage is to the young growth and to the soundness of the old trees. In many regions it is practically impossible to find a tree of any size that does not bear the marks of fire. The most serious effect of fires in the coast redwood of California is to prevent the sprouting of the old stumps after logging, and thus to convert highly valuable timberland into indifferent pasture. In the fir forests of Oregon and Washington fires are common and difficult to extinguish, but usually slow-burning and not of great extent. It is only in seasons of exceptional dryness that losses of appalling magnitude are to be expected. The State of Washington has recently passed a forest fire law, the operation of which will be watched with peculiar interest.

Some Uses of Wood.— The yearly product of wood in the United States is about 35,000,000,000 feet. In 1900 the lumber industry employed 283,260 wage-earners, to whom it paid $104,640,591. The perpetuation of this industry is of vital concern to all the people. Its ramifications are as wide as the industrial life of the nation, and its perpetuation is a most pressing concern of the forester. The use of wood for the maintenance of railroad tracks, for example, rises to about 120,000,000 ties a year, together with vast amounts of bridge timber, piling, etc. Since the use of metal ties is believed to be impracticable by American railroad engineers, the maintenance of the supply of wooden ties is of vital importance to the railroads, and through them to the nation at large. In a similar way, the permanence and success of the mining industry is dependent upon cheap and accessible supplies of timber. In most portions of the West such supplies can be expected only from the national forest reserves. In the creation of the reserves, therefore, the special needs of mining and other industries have been kept carefully, and it is also believed successfully, in mind.

Summary.— The profession of forestry, which has already reached high standing on the continent of Europe, in British India, and elsewhere, is being born in the United States. Its establishment on a high plane is of the first importance to the solution of every problem of American forestry. The forest wealth of this country, although vastly diminished, is still very great, and the reproductive capacities of its forest are usually of the first grade. Wood is cheap and methods of the lumberman are wasteful. The low cost of transportation permits the movement of forest products from vast distances, so that local markets are supplied from distant points. In view of all these conditions, the task of the American forester is to secure the reproduction of the forest without materially impairing the profit of lumbering, and wherever possible to bring into public ownership whatever forest lands are required to supply in permanence the public need. GIFFORD PINCHOT,

Bureau of Forestry, Washington.

Forests, Petrified, fossil remains of forest trees and plants found in the Potsdam sandstone formations in America and the Cambrian rocks of Europe. Large forest trees, fossilized and converted into stone are found in many sections of the United States, particularly west of the Mississippi River. Those of Arizona are well known. PALÆOBOTANY.

Forey, Elie Frédéric, ā-lē frā-dā-rik fō-rā, French military officer · b. Paris, France, 10 Jan. 1804; d. there 20 June 1872. He took part in several Algerian campaigns as well as in the Crimean and Sardinian wars, and when the expedition to Mexico was decided upon in 1861, Forey received the command of the French troops. After several sanguinary engagements, he attacked and stormed the strong post of Puebla, thereby throwing open the road to the city of Mexico. For this service he was made marshal of France.

Forfeiture, fôr'fit-ūre, a legal penalty, by which an owner is absolutely deprived of his property for crime or other unlawful act. This applies to personal as well as real property, and forfeiture may be a decree of civil as well as criminal courts. The penalty is of feudal origin. The lord owed protection to the life and property of the vassal; the latter owed fealty and service to his lord. When the vassal failed to yield these, he lost the shelter of the law, became an outlaw, and incapable of holding property. Loyalty to the feudal relation being the condition on which life and property were secured to him, when he failed in loyalty he had no longer any claim on life or property.

Treason was punished by forfeiture long before the Norman Conquest in 1066. After that period forfeiture became the ordinary penalty for felony, which was styled petty treason; while treason, or disloyalty in regard to the sovereign, was called high treason. Forfeiture was accompanied by what was styled corruption of blood. This was the sentence of legal bastardy passed on the offender so that he could neither inherit nor bequeath property.

Felony in the United States has never been considered ground for forfeiture. The Federal and State laws have modified all precedents in the matter of forfeiture, which they restrict within very narrow limitations. See ATTAINDER.

In England civil forfeiture may be incurred by tortious alienation, by wrongful disclaimer, by alienation in mortmain (see MORTMAIN), by breach of condition, and by the commission of waste (see WASTE). In Scotland civil forfeiture may arise either from statutory enactment, at common law, or by agreement. In the United States civil forfeiture is only imposed for acts of waste committed by tenants for life or years, or for breach of contract in violating the conditions on which lands were granted. Some States have abolished even this degree of forfeiture. By particular statutes enacted by Congress smuggling, or importing goods on fraudulent invoices involve confiscation, and forfeiture of the entire invoice (see INVOICE), or the balance wrongly imported. Piracy has always entailed confiscat'on or forfeiture of the piratical craft.

Forge, Forging, and **Forging Machines.** A forge is a furnace or open fireplace, having a forced draft, for heating metals, especially iron and steel, to be shaped by hammering or pressure. Previous to the 19th century, most iron work was forged by smiths on avils. Then came the period of cast iron, when everything that could be cast was made that way because it was cheaper, and during the last half of the century the use of forged iron and steel increased enormously owing to improved and cheapened methods of production. Now, in 1893, a vast quantity of steel for machine-made forgings finds its way into machines and structures, giving greatly increased strength and durability. A simple blacksmith's forge is a brick structure, with a chimney at one side. The coals and fire are located at the mouth of the chimney, and a bellows or rotary fan furnishes a blast of air which is driven from underneath through the mass of coal. This coal is usually soft, sometimes being termed blacksmith's coal. Portable forges are made for light work, and a common form of these has four legs made of iron tubing, a shallow bowl to hold the coal and contain the fire, and a hood above. At the rear is a small rotary fan; operable by a wheel-crank. As forges increase in size and capacity, they develop into what are more properly called furnaces, such as the immense heating furnace of a steel works. In forging iron by hand the smith thrusts the metal into the centre of his fire, and its color tells him when it is ready to be worked. As it heats, it becomes black red, then a low red, then bright red, then a white heat, and if the heating continues it next begins to burn. If the smith desires the iron to be very soft, that it may yield quickly to his blows, he lets it come to a white heat, then takes it with his tongs on to his anvil, and begins to hammer it rapidly into the desired shape. Often a helper stands by to strike blows alternately with the smith, in order that as much hammering as possible may be done before the iron cools to a point where it requires reheating. Long practice makes very expert smiths, and many of them will shape a bar of iron into intricate form in a surprisingly short space of time. When the smith desires to weld together two pieces of iron, he must heat both pieces at the same time to a uniform white heat. As the iron approaches a white heat he throws sand on it, which, if done at the proper temperature, adheres and melts, forming a liquid glass-like fluid that flows over the surface of the iron and keeps the air from it, thus preventing its burning. If the ends of two bars are to be welded, each is first brought to a flat point, so that there will be considerable surface to weld together. After the surfaces adhere, the weld may be reduced by reheating and hammering down to the size of the other portions of the bars. When pieces are joined end to end, this is termed a butt-weld, which is not apt to be as strong as a lap-weld. Where forgings are so large that a smith and helper cannot work them satisfactorily, because there is too much and too heavy hammering to be accomplished in the short time the metal retains its great heat, the machine hammer is resorted to. This was made in various forms, and was an important tool during the early part of the 19th century, finding its culmination in the great steam-hammer of Neysmith, which was devised especially for such large forgings as the shafts of paddle-wheel steamships, then coming into use. The trip-hammer and the steam-hammer were the chief tools used for large forgings until about 1890

when the hydraulic press began to supersede the hammer for large work. About 1884, when the United States government began to seriously take up the rebuilding of the navy, and the construction of steel battleships and cruisers, there came a demand to American manufacturers for very large forgings, which had not previously been produced here. The forges of that date were equipped with power hammers, of a capacity suited to welding wrought iron into forgings of moderate size. The introduction of steel rails taught American iron manufacturers that steel forgings were desirable in all classes of machinery, as greatly reducing the size of the parts, because of the increased strength.

The hydraulic compression system of forging, which was introduced in America when our steel plants were called upon to provide the large forgings for the navy, has met with general approval, and is steadily increasing in use. It has been demonstrated that forgings made by hammering were subject to all sorts of internal strains due to differences in compression and differences in cooling. When such a forging is cut, as for making a keyseat, a distortion of form follows as the result of certain strains that have been relieved. A large forging requires a pressure great enough to penetrate to every part of the mass of metal, so that the flow of metal resulting shall take place uniformly throughout. Such a flow requires time and a pressure that can not be obtained by a quick hammer blow, and a series of blows does not produce the same effect as does the persistent pressure of the hydraulic forging machine. Fluid steel begins to crystallize at the point where the degree of heat is reduced so that it solidifies (about 2,600° F.), and the more slowly it is cooled from this point downward, the larger will be the crystals of the ingot. Forging during the cooling tends to check crystallization, just as stirring water at a temperature below the freezing point would check the formation of ice crystals. The more irregular the method of forging is, as in the case of hammer blows, the more it interferes with an even crystallization. The pressure system not only interferes much less than hammering, but forgings are farther improved in modern practice, by reheating above the recalescent point, which is between 1,200 and 1,300° F., depending on the percentage of carbon and annealing to secure a new crystallization, and oil tempering.

An examination of the grain or fibre of hydraulic forgings shows that the steel tends to arrange itself in layers following the outer contour of the piece of metal, thus securing the most strength. A sharp angle in the pattern will tend to cut off the flow of metal, and if such is required, the method is to round out the place in the forging, to secure the best flow of metal, and then machine off the surplus later.

To avoid internal strains as much as possible such large forgings as steamship shafts are preferably made hollow. That is to say, the cylindrical ingot from the furnace after cooling is bored through the centre, mounted on a steel mandrel, heated and forged by compression. Ingots produced with fluid compression are well adapted to being bored and hollow-forged, and this method produces the most perfect forgings. These large forgings are subjected to a hydraulic pressure of about 7,000 pounds to the square inch, which pressure is maintained while the mass slowly cools. Shafts of more than a foot diameter are best bored, as the bore hole not only assists uniform heating, but gives opportunity for inspection.

Small forgings of iron, steel and other metals are now most commonly produced by the method known as drop-forging. A press containing a top and bottom pattern (die and counter) receives the roughly shaped hot metal, and at a single blow brings it to the desired shape. Parts of machines that were formerly made of cast iron or steel are now drop-forged at moderate cost, and the metal is so much stronger that they can be lightened materially in weight, thus sometimes actually reducing the cost, while increasing the durability. See BELLOWS; FURNACE; HAMMER; IRON; PRESS; STEEL; WELDING.

CHARLES H. COCHRANE.

Forgery, the fraudulent making or alteration of a writing to the prejudice of another man's rights, or making of any written instrument for the purpose of fraud and deceit; the word *making*, in this last definition, being considered as including every alteration of or addition to a true instrument. The offense of forgery may be complete though there be no publication or uttering of the forged instrument; for the very making with a fraudulent intention, and without lawful authority, of any instrument which, at common law or by statute, is the subject of forgery, is of itself a sufficient completion of the offense before publication. Most of the statutes, however, which relate to forgery make the publication of the forged instrument, with knowledge of the fact, a substantive offense. A deed forged in the name of a person who never had existence is forgery at law. A writing is forged when a person drawing up a will for an invalid, inserts legacies therein falsely. It is not material whether a forged instrument be drawn in such manner that if it were in truth that which it counterfeits it would be valid. The punishment of forgery at common law is, as for a misdemeanor, by fine, imprisonment, and such other corporeal punishment as the court in its discretion might award. The penalty varies in different States, in some the statutes having been much enlarged to include acts which were not punishable formerly as forgery. The punishments ordained for the offense by the statute law in England were once, with scarcely an exception, capital.

Forli, Melozzo da, mā lōts'ō dä fōr lē', Italian painter: b. Forli, about 1438; d. 1494. He was the first who applied the art of foreshortening to the paintings of vaulted ceilings About 1472 he painted the 'Ascension' in the great chapel of the Santi Apostoli at Rome for Cardinal Riavio. In 1711, when the chapel was being rebuilt, this painting was cut out of the ceiling and placed in the Quirinal palace, where it still remains.

Form, in philosophy, a term used (1) objectively, to denote the assemblage of qualities which makes a thing what it is. Only the essential and permanent is considered, the accidental or adventitious being disregarded. The word is employed also (2) subjectively, to express the idea which the mind may supply of an object, as distinguished from that object as it is in itself. In this sense it is peculiar to the philosophy of Kant, who postulated two such ideas, namely space and time, supplied to the

object by the mind through the operation of experience.

In botany, the term used to designate the unit of ecology, as that division of the study which treats of the relations existing between plants and their environments is now called. The word is frequently met with in such combinations as "form of vegetation" or "plant form." See BIONOMICS; PLANT GEOGRAPHY.

In music, that theory in the general art of composition in accordance with which themes, tonalities, phrases, and sections are so arranged as to obtain a correlated and symmetrical whole. The principal three recognized forms are those of the *lied*, *rondo*, and *sonata*. These admit of numerous variations. In so-called cyclical forms, as, for example, the symphony, the necessary correlation and symmetry is secured by the relation of the movements as to proportion and key, the succession of various tempi, and sometimes also the employment in one movement of a theme previously used in another.

Formâ Pauperis, fôr'ma pâ'pėr-is, **In,** signifying — in the character of a poor person — is the legal term both in Great Britain and the United States for suits carried on by individuals who are too poor to pay the usual fees. As early as the reign of Henry VII., a statute provided that any one taking oath that he was not worth £5 beyond his wearing-apparel and the subject in dispute, was entitled to have writs, according to the nature of the case, without paying fees, and the judges were to assign him counsel and attorney who should act gratuitously. This indulgence is granted to plaintiffs only at common law, and is granted to defendants only in prosecutions. A plaintiff must have a counsel's certificate of a good cause of action, and an affidavit of the party or his attorney must be laid before court that the case contains a full and true statement of material facts. A person admitted to sue *in formâ pauperis* is not entitled to costs from the opposite party, unless by order of the court or of a judge. In several of the United States the provision is governed by statute, while in others it is considered part of the common law.

Formaldehyde. See BACTERICIDE; DISINFECTANTS; FUMIGATION.

Form'alin, a solution produced by dissolving in 60 per cent of water 40 per cent of what is known as formaldehyde gas, CH_2O. This solution has hitherto been looked upon as a powerful disinfectant. Dr. Charles C. Barrows has recently employed formalin as a specific for sepsis or blood poisoning. The patient was a colored woman, 26 years of age, who was on the point of death; the virulent bacteria of septicæmia, streptococci, had been recognized in her blood, her pulse ranged from 150 to 160 and her temperature was 108. Into one of the large veins of the right arm an attempt was made to inject one litre of formalin solution of the strength of one part of formalin to one thousand parts of water. About 500 cubic centimetres of the solution found its way into the circulation. The temperature fell almost immediately and the pulse showed an instantaneous improvement. The day after another injection was made and examination showed that bacteria were no longer present in the blood. A third injection into the patient's left arm introduced 750 cubic centimetres into the circulation. The temperature fell to normal, no more bacteria were developed and the woman recovered rapidly.

For'man, Harry Buxton, English author: b. London 1842. He entered the Civil Service in 1860 and is an assistant general secretary at the General Post-office, London. Besides editing the poems of Shelley (1876–80), of Keats (1883) and other works, he has published: 'Our Living Poets' (1871); 'Elizabeth Barrett Browning and Her Scarcer Books' (1896); 'The Books of William Morris' (1897).

Formation, in geology, a term used of groups of rock, whether stratified or unstratified, having a similar origin or character. Thus it is usual to speak of a limestone, a sandstone, or a clay formation. The word has also been by some extended to be synonymous with system, or to denote a group of strata of the same age, as Canadian series, Carboniferous system, etc.

Formen'to, Felix, American surgeon: b. New Orleans, La., 16 March 1837. He studied at Jefferson College, Louisiana, and the University of Turin, Italy, and was a surgeon in the Franco-Sardinian army during 1859, and in the American Civil War was chief surgeon of the Louisiana Confederate hospital at Richmond, Va. At one time he was president of the American Public Health Association, later president of the Confederation of State and Provincial Boards of Health of North America, and in 1898 was appointed surgeon to the Louisiana Soldiers' Home. His publications include monographs on cremation, military surgery, alcoholics, and other professional subjects.

For'mes, Karl Joseph, German-American operatic basso: b. Mülheim-on-the-Rhine, Germany, 1810; d. San Francisco, Cal., 1889. He made his first appearance at Cologne in 1841 as Sarastro in Mozart's 'Flauto Magico.' He quickly obtained an European reputation, and after connection in 1852–7 with the London Royal Italian Opera, came to the United States, where he was received with much approval and remained during the greater part of his life.

For'mic Acid, a monobasic organic acid having the formula CH_2O_2, or H.COOH, the final H in the last of these formulæ being the one that is replaced when the acid combines with bases to form its salts (which are known as "formates"). It is an important substance in organic chemistry, and may be obtained by the oxidation of methyl alcohol, as well as of starch, sugar, and other organic substances. The most convenient method of preparing the acid is by heating anhydrous glycerin with crystallized oxalic acid. The reaction is not a simple one, monoformin being one of the intermediate products; but the obvious part of the reaction is that the oxalic acid is converted into formic acid with liberation of carbon dioxid. Pure anhydrous formic acid is a pungent, colorless liquid, boiling at about 212° F. at ordinary atmospheric pressure (its vapor burning with a bluish flame), and freezing at about 47° F. into a white crystalline mass. Formic acid is completely resolved by strong sulphuric acid into water and carbon monoxid, $H.COOH = H_2O + CO$. It reduces Fehling's solution (q.v.), and also reduces gold and platinum to the metallic state, from their solutions. When boiled with the nitrates of silver and mercury, formic acid precipitates these metals in the form of grayish metallic powders.

Formic acid and its salts are used to a certain extent as disinfectants and preservatives. The acid takes its name from the fact that it exists, in the free state, in the bodies of red ants (*Formica rufa*), from which it may be obtained by crushing the ants and distilling the mass with water.

Formica, fôr-mī'ka; **Formicidæ,** fôr-mĭs'ĭ-dē, the genus and family respectively which contain the typical ants. See ANT.

Formicariidæ, fôr"-mĭ-ka rī'ī-dē, a family of small, tropical American birds, the so-called «ant-birds.» They are numerous in genera and species, are related to the tree-creepers and plant-cutters, and frequent forests and thickets, flying badly from the shortness of their wings and consequently feeling most at home on the ground, where they devour beetles, spiders, and insect larvæ and berries, but are not known to eat ants at all. The nests are usually made in low bushes. They wear sober colors, as a rule, and the sexes are similar.

Formigé, Jean Camille, zhoṅ kä-mēl fōr-mē-zhā, French architect: b. Bouscat, Gironde, 1845. He was a pupil of Laisné, and received from the French government a commission for a series of plans for, and restorations of, public structures; the latter including the Roman theatre at Orange, Vaucluse. He executed decorations in the Paris Hôtel de Ville, became architect of Paris streets and parks in 1885, built the Liberal Arts and Fine Arts buildings at the Paris Exposition of 1889, and the buildings of the Rumanian government at that of 1900.

Forming Machines, a term has been applied generally to the lathe, planer, shaper, and all that class of tools used by the machinist to produce the parts of machines that he manufactures. It has also been used to designate presses used for drop-forging, and for shaping metal in the cold, particularly to drawing-presses that receive a sheet of metal, grip it between two surfaces and then subject a part of it to slow pressure until it is drawn out to a cup-shape or the like, if properly done without any wrinkling. A form of rope-twisting machine is also known as a forming machine as well as a machine for forming tin cans. See FORGING AND PRESS.

Formosa, fôr-mō'sä, called by the Chinese *Taiwan,* an island lying off the coast of the Chinese province of Fu-chien, from which it is separated by a strait from 90 to 220 miles wide. Formosa, which was ceded by China to Japan in 1895, is crossed by the meridian 121° E. and the tropic of Cancer, and has a maximum length of 235 miles, while its breadth varies from 70 to 90 miles; area, 14,978 square miles. Forming one link in the volcanic chain that extends from the Aleutian Islands southward to New Guinea, it constitutes the eastern escarpment of what was once the great Malayo-Chinese continent, and is connected by a submarine plateau with the Chinese mainland. The backbone of the island, extending north and south, is formed of a range of densely wooded mountains, called by the Chinese Chu-Shan, which rise to upward of 14,000 feet, the highest known peak, Mount Morrison, being given as 14,362 feet. Eastward of this range lies a narrow strip of mountainous country, presenting to the Pacific a precipitous cliff-wall with in many places a sheer descent of from 3,000 to 7,000 feet, while a very short distance farther east the floor of the ocean sinks to a great depth at an extremely steep gradient. The western side of the range consists of a single broad alluvial plain, stretching from north to south of the island, seamed by innumerable water channels, and terminating at the coast-line in mud flats and sand-banks. Yet on this side of the island the land is rapidly encroaching upon the sea, as the consequence of the gradual elevation of the western seaboard and the deposition in and around the embouchures of the rivers of the large amount of sediment brought down by them from the mountains. This latter process is primarily due to the heavy rainfall of the northern, central, and eastern portions of the island, where the rain-clouds of the northeast monsoon, after crossing the warm Kiosiwo, or Japanese Gulf Stream, on coming in contact with the mountain barrier of the island become chilled and discharge their contents in rains of excessive violence. Apart from this heavy rainfall, the climate is not exceptional, the insular position ensuring a modification of the heat by sea-breezes. The mean of summer is 80° to 90° F.; of winter, 50° to 60°. Malarial fever is, however, prevalent in the north, and violent typhoons are very common at certain seasons.

The island is famous for the luxuriance of its vegetation; many of the hothouse plants of warm temperate climes grow wild on the mountain slopes and in the valleys, such as orchids, azaleas, lilies, rhododendrons, and convolvulus; besides which there is a profusion of ferns, tree-ferns, camphor- and teak-trees, pines, firs, wild fig-trees, liquidambars, bananas, bamboos, palms, indigo and other dye plants, fibre and paper plants, oil and soap plants, tobacco, coffee, and tapioca. «Rice paper» is prepared from the pith of a tree peculiar to Formosa. Of animal life it is noticeable that there are at least 43 species of birds peculiar to the island, that insects are scarce and that noxious wild animals are few; but that fish is plentiful near the coast. The resemblance of the animals found on the island to those on the mainland is one reason for believing there was once a land connection. However there are a number of animals on the island which appear to be of quite a different species from those found in China. This is especially true of some of the birds, mice, squirrels, and deer. The chief minerals are coal, of which there is a large supply, gold, salt, petroleum, and sulphur. Agriculture is an important industry, but the people engaged in mining are becoming more numerous.

Since the treaty of Tien-tsin, in 1858, there have been ports open for foreign commerce; those opened in accordance with the conditions of the treaty are: An-ping, Tainan, Takow, and Tam-sui. An-ping and Tam-sui have the largest amount of commerce. The principal exports are camphor, tea, rice, sugar, jute, hemp, and dye-woods. The chief imports are a coarse cloth for clothing, opium, fruits, lumber, metal goods, and manufactured tobacco. The most of the trade is with Japan. Formosa controls the camphor markets of the world. The eastern slope of the mountains is covered with the largest camphor forest yet discovered. The amount of camphor exported each year from the forests of China and Japan is about 500,000 pounds; and from

Formosa alone there is shipped between 6,000,000 and 7,000,000 pounds. Since Formosa was annexed to Japan, the Japanese government has made most successful efforts to preserve the sources of supply of camphor. When the island belonged to China the camphor-trees killed to collect the gum were not replaced and the camphor forests were being destroyed. The Japanese government insists that for every tree destroyed another one must be planted; and it is also establishing camphor plantations, so that in future the Formosa cultivated camphor will be a commodity of commerce. The price of the camphor varies because of the dangers incurred in collecting it. Savage tribes which have never been subdued inhabit the camphor forests, and they never hesitate to attack the camphor gatherers unless the latter are well armed and in bands large enough to protect each other. The Japanese government has now a large armed force of policemen, over 1,400, to protect the camphor gatherers, and the cost of protection is added to the selling price of the gum. The sale of the camphor is a government monopoly; it is not difficult to obtain a permit to gather camphor, but every pound must be sold to the Japanese government, which determines the price. Japan limits the amount to be exported, and will not buy a pound in excess of the limit. The cultivation of the tea fields is receiving attention from Japan.

The inhabitants, estimated to number about 3,000,000, consist of Chinese settlers, some Japanese, and the aborigines. Respecting the ethnological origin of these latter there exists some doubt; they seem to consist of several different tribes, mainly of Malayan and Negrito descent. The Chinese distribute them into three classes, Pepohwan, a race of civilized and sinicized agriculturists; Sekhwan, settled tribes who acknowledge Chinese rule; and Chinhwan, the untamed savages of the mountains, who wage fierce and unceasing warfare against the Chinese immigrants. The administrative headquarters were formerly at Taiwan, but on the constitution of the island into an independent province of the Chinese empire in 1887 — it had formerly been incorporated with Fû-chien on the mainland — they were transferred to Tai-pei or Bangka. The island was known to the Chinese before the Christian era, but does not seem to have seriously attracted their attention until the year 605 or 606 A.D. In the 14th century they established several colonies in Formosa, which, however, were withdrawn in the middle of the 17th century. Although Portuguese and Spanish navigators began to visit the island a century earlier, the first European people to establish themselves on it were the Dutch, who in 1624 built Fort Zealandia, near the modern Taiwan. They were, however, expelled in 1661 by a Chinese adventurer, Koxinga, who retained possession of the island for 22 years. Some years later a regular Chinese colonization of the western half of the island was carried through, the colonists coming principally from Fû-chien and Kwang-tung. Subsequently the island became notorious for the piracy of its inhabitants and the ill-treatment they inflicted upon navigators who chanced to be wrecked on their coasts. Accordingly in 1874 the Japanese invaded Formosa; but on the Chinese undertaking to check the evils complained of they withdrew. Ten years later the French, during their contest with China in Tongking, held for a time the coal districts of Kelung. The occupation by the Japanese troops did not take place without opposition from the natives and Chinese "Black Flags," but the Japanese were practically in full possession of the island before the end of 1895, and set themselves at once to the work of reorganization. Consult: Davidson, 'The Island of Formosa' (1903); Guillemard, 'Cruise of the Marchesa'; Girard de Rialle in 'Revue d'Anthropologie' (1885).

Formosa, South America, a province of Argentine, in the northeastern portion of the republic. It has an area of 42,000 square miles, and pop. (1900) 6,000.

Formo'san Deer, a small spotted deer (*Cervus taevanus*), allied to the Japanese sika (q.v.) and a favorite pet among the people of Formosa, who catch the fawns in the mountains.

Formosus, fôr-mō'sus, Pope: b. about 816; d. 896. He became cardinal bishop of Porto in 891 and succeeded Pope Stephen V. in 891. He condemned Photius, excommunicated the Emperor Lambert, Duke of Spoleto, and nominated in his place Arnoul, king of Germania. Stephen VI., his successor, had his body disinterred as that of a usurper, but under John IX., in 898, his pontificate was pronounced valid.

Forms of Address in the United States are neither so complicated nor so rigidly arranged as in countries where careful gradations of rank and title obtain. Usage, however, sanctions the forms given in the following list:

The President of the United States, governors of States ambassadors, and ministers,— "His Excellency."

The Vice-President of the United States, the heads of the executive departments, justices of supreme and superior courts, lieutenant-governors of States, and mayors,— "The Hon. ——."

Senators and representatives of the United States, or of States,— "The Hon. ——."

Ex-presidents, or ex-officials of any of the ranks above cited,— "The Hon. ——."

Archbishops, if cardinals,— "His Eminence the Cardinal Archbishop of ——."

Archbishops, if not cardinals,— "The Most Rev. the Archbishop of ——."

Bishops, in the Roman Catholic and Protestant Episcopal Churches,— "The Right Rev." or "The Right Rev. the Bishop of ——."

Bishops, in the Methodist Episcopal Church,— "The Rev. Bishop."

The designation "Esquire," once chiefly applied to lawyers, is now frequently employed in addressing gentlemen of position.

The forms of address used in foreign countries, particularly those monarchical in government, are arbitrary and elaborate.

Formula, Chemical. See CHEMISTRY.

Form'ulary, National, a volume published by a committee of the American Pharmaceutical Association containing prescriptions with directions for making a large number of widely used combinations of drugs. These combinations have been used in the treatment of disease for many years, and a more extended use of the formulary by the physician would do away with many of the proprietary remedies on the market.

Fornáris, José, hō sā' for-nä'rēs, Cuban poet: b. Bayamo, Cuba, 1826. He wrote the dramas 'The Daughter of the People,' and 'Love and Sacrifice'; and is the author of: 'The Harp of the Home'; 'Songs of the Tropics'; and other volumes of verse.

For'ney, John Weiss, American journalist: b. Lancaster, Pa., 30 Sept. 1817; d. Philadelphia 9 Dec. 1881. He was apprenticed in the office of the Lancaster *Journal* in 1833; was clerk in the National House of Representatives from 1851-5; and secretary of the United States Senate from 1861 to 1868. He was connected with several papers in Philadelphia and Washington. Author: 'What I Saw in Texas' (1872); 'Anecdotes of Public Men' (1873); 'Forty Years of American Journalism' (1877).

Fornix. See BRAIN.

For'rest, Edwin, American actor: b. Philadelphia 9 March 1806; d. there 12 Dec. 1872. In 1820 he made his first appearance in public in the part of Douglas in Home's tragedy of that name, and coming before the New York public in 1826 in the character of Othello, at once gained popularity. In 1836 he crossed the Atlantic and entered on a season at Drury Lane Theatre, London. In the parts of Macbeth, Lear, and Othello he achieved distinguished success, and acquired the friendship of Macready, Kemble, and others. He again visited England in 1845, and on this occasion quarreled bitterly and causelessly with Macready, whom he accused of trying to damage his reputation from professional jealousy. This quarrel crossed the Atlantic, and when Macready was playing in the Astor Place Theatre, New York, in 1849, the partisans of either actor stirred up a riot that was accompanied by serious loss of life. Between 1853 and 1860 he retired from professional life, but when he returned to the New York stage he filled the role of Hamlet with all his former acceptance. Latterly he suffered considerably from illness, and his last engagement was in 1871. He was a man of fine presence, well equipped for his profession, naturally frank and engaging. He left a large fortune. See Rees, 'The Life of Edwin Forrest' (1874); Alger, 'Life of Edwin Forrest' (1877); Barrett, 'Edwin Forrest' (1882).

Forrest, SIR **John,** Australian explorer and politician: b. Western Australia 22 Aug. 1847. He entered the survey department of Western Australia in 1865, and in 1874 was at the head of a party which explored the interior from Champion Bay on the west to the overland telegraph line connecting Adelaide on the south with Port Darwin on the north coast. After holding various government posts he was returned unopposed in 1890 to the first Western Australia Legislative Assembly for Bunbury, and became the first premier and treasurer of the colony. In 1897 he presided over the Federal Council of Australasia, and was postmaster-general of Australia 1900-1. His publications are: 'Explorations in Australia' (1876); and 'Notes on Western Australia' (1884-7).

Forrest, Nathan Bedford, American soldier: b. Bedford County, Tenn., 13 July 1821; d. Memphis, Tenn., 29 Oct. 1877. He was descended from ancestors famous for gallantry on the patriot side during the American Revolution. Moving with his father to Marshall County, Miss., he was in a short while, by the death of his father, left to support his mother and family as best he could with a small hill farm. He undertook this work with devotion and energy, and, getting into business in Memphis, became able to purchase a large plantation, and was at the outbreak of the Civil War one of the wealthiest planters in Tennessee. Circumstances had forced him to neglect his own education, though he provided liberally for that of his brothers and sisters. On 14 June 1861 he entered the Confederate service as a private in White's mounted rifles, but soon obtained authority to raise a regiment, which he did, purchasing at his own private expense its equipment in Louisville, Ky. These supplies he carried to Memphis, displaying remarkable ingenuity and daring both in eluding the Federal authorities and in defeating a body of their troops with 75 Kentucky Confederates who had come to his assistance. Joining his regiment to the force defending Fort Donelson in February 1862, he was distinguished in the fighting at that point, and, when his superiors had determined upon surrender, led his men through a sheet of icy water past the Federal lines and escaped. Joining Albert Sidney Johnston (q.v.), he was distinguished at Shiloh, where he received a painful wound, which, however, did not long keep him from the field; and by a series of successful movements in Middle Tennessee, then occupied by the Federals, he rapidly rose to great distinction as a cavalry leader, and on 21 July 1862 was promoted brigadier-general. During Bragg's Kentucky campaign he performed great services both on the advance and retreat. Among his most famous exploits in Middle Tennessee was the expedition in which, with less than 1,000 men, he captured McMinville, and, surprising a garrison of 2,000 Federals at Murfreesboro, captured all the survivors of the fight, including Gen. Crittenden. On 8 May 1863 he captured a raiding force of Federals under Gen. Streight, near Rome, Ga., the Federal force being so much larger than his own that he pressed into service all the citizens in reach in order to form an adequate guard.

After highly distinguished service at the battle of Chickamauga, he was so dissatisfied with the failure to reap the full fruits of that great victory that he tendered his resignation. This was not accepted, but, instead, he was promoted major-general and assigned to the command of all the cavalry in West Tennessee and North Mississippi. Entering West Tennessee with a small force, he was reinforced by several thousand hardy volunteers, who, with his veteran troops, were soon welded into an invincible body known as «Forrest's cavalry.» In February 1864 he routed Gen. S. Smith at Okatona, Miss.; then swept northward through Tennessee to the Ohio River, capturing Fort Pillow, Union City, and other posts, with their garrisons. In June 1864, with a much smaller force than the enemy, he defeated Gen. Sturgis at Brice's Cross Roads (or Tishamingo Creek), near Guntown, in North Mississippi, capturing all his trains and a third of his men. Gen. A. J. Smith then advanced against him, but after fighting a desperate battle at Harrisburg, near Tupelo, in Mississippi, retreated. Receiving reinforcements from Memphis, Smith advanced again, but Forrest foiled him by making a 60-hour ride to Memphis with half of his force, and by his daring entry into that city compelled Smith's rapid retreat. Then Forrest made havoc with Federal transportation, capturing garrisons and depots in Tennessee, and crowning his exploits by the capture and destruction of $6,000,000 worth of Federal supplies and a gunboat fleet at Johnsonville. Sherman

wrote of this as a feat of arms which excited his admiration. Upon Hood's advance into Tennessee, Forrest joined him at Florence and performed important services. As commander of the rear guard of the Confederate army during the retreat from Nashville, his display of heroic qualities and brilliant leadership increased his already great fame. In February 1865 he was promoted lieutenant-general, and to him was assigned the duty of guarding the Confederate frontier from Decatur, Ala., to the Mississippi River. The surrender of the remnant of his command took place on 9 May 1865. During his career he had captured 31,000 prisoners. After the War he returned to civil life.

JOSEPH T. DERRY,
Author of 'The Story of the Confederate States.'

Forrester, Fanny, pen-name of EMILY CHUBBUCK JUDSON (q.v.)

Forsh'ey, Caleb Goldsmith, American engineer: b. Somerset County, Pa., 18 July 1812; d. Carrollton, La., 25 July 1881. He was educated at Kenyon College, Ohio, and the United States Military Academy, was professor of mathematics and civil engineering in Jefferson College, Mississippi, 1836–8, and from 1851–3 was engineer-in-charge of the governmental survey of the Mississippi delta. Though actively opposed to the secession movement, he became lieutenant-colonel of Confederate engineers upon the withdrawal of Texas from the Union. He collaborated in 'The Physics of the Mississippi River' (1861).

Forskâl, fôr'skâl, **Peter,** Swedish botanist: b. Helsingfors 11 Jan. 1732; d. Djerim, Arabia, 11 July 1763. In 1761 he was selected by Frederick V. of Denmark to join the scientific expedition to Arabia, to take charge of the department of natural history. He set out on this expedition with Niebuhr, Von Haven, and Kramer, and collected plants in the environs of Marseilles, of which he published a 'Flora' at Malta. Niebuhr collected Forskal's papers, accompanied them with remarks, and published them under the titles: 'Descriptiones Animalium, Avium, Amphibiorum, Piscium, Insectorum, quæ in Itinere Orientali observavit P. Forskal' (1775); 'Flora Ægyptiaco-Arabica, etc.'; 'Icones Rerum Naturalium, quas in Itinere Orientali depingi curavit Forskal' (1776).

Forster, Johann Reinhold, yō'hän rīn'hōlt fôr'stĕr, German naturalist: b. Dirschau, Prussia, 22 Oct. 1729; d. Halle 9 Dec. 1798. In 1753 he became pastor at Nassenhuben, but devoted most of his time to the study of mathematics, natural philosophy, natural history, and geography. In 1772 he received the offer of naturalist to Capt. Cook's second expedition to the South Seas. In association with his son, he published a work on the botany of the expedition, and 'Observations Made During a Voyage Round the World.' He wrote also: 'Introduction to Mineralogy'; 'Flora of South America'; 'Zoology of India'; etc.

Forster, fôr'stĕr, **John,** English historical writer: b. Newcastle-on-Tyne, England, 2 April 1812; d. London 2 Feb. 1876. He was educated for the law; held one or two public offices, and finally engaged in literature and journalism and was editor of the London 'Examiner' for nine years. He is best known for his 'Life of Charles Dickens' (1871–4). He also wrote: 'Statesmen of the Commonwealth of England' (1831–4); 'Life of Oliver Goldsmith' (1848); 'Walter Savage Landor' (1869;) etc.

Forster, fôr'stĕr, **William Edward,** English statesman: b. Bradpole, Dorsetshire, 11 July 1818; d. London 5 April 1886. He was educated at the Friends' School at Tottenham, and was active in the woolen trade in Bradford. In 1850 he married the eldest daughter of Dr. Arnold of Rugby. In 1865 he became under-secretary for the colonies; in 1868 was appointed vice-president of the council on education and a privy councilor; and in 1870 accepted a seat in Gladstone's cabinet, and carried through Parliament the Elementary Education Bill (1870) and the Ballot Bill (1872). In 1880 he accepted the post of chief secretary for Ireland at a time when that country was distracted by political and agrarian tumults. To mitigate the severity of the numerous evictions he introduced a Compensation for Disturbance Bill (1880), which was rejected by the House of Lords. The following year he introduced a Land Bill and a Coercion Bill, both of which were passed, and in order to check the growing power of the Land League he declared that organization illegal, and imprisoned Parnell and other members of his party. In April 1882 the government resolved to release the Parnellites and adopt a more conciliatory policy, whereupon he resigned his office. Subsequently he was often found acting in opposition to the government, chiefly in reference to foreign affairs, and he was also opposed to a separate Irish parliament in Dublin. His opinion on the latter question carried great weight because of his well-known sympathy for Ireland, his abilities as a statesman, his experience in affairs, and his unquestioned honesty. Consult 'Life of Forster,' by Wemyss Reid (1888).

Forsyth, George Alexander, American military officer: b. Muncy, Pa., 7 Nov. 1837. He served with distinction in the Civil War; was brevetted colonel for gallant services at Five Forks, and brigadier-general in 1868 for his action in an engagement with hostile Indians. He was a member of the board of officers to inspect the armies of Europe and Asia in 1875–6, and on staff and frontier service till 1890, when he was retired on reaching the age limit. He has published: 'Thrilling Days in Army Life' (1900); 'The Story of the Soldier' (1900).

Forsyth, John, American politician: b. Fredericksburg, Va., 1780; d. Washington 21 Oct. 1841. He was graduated at Princeton College in 1799, and was admitted to the bar in Augusta, Ga., in 1802. He was elected attorney-general of the State in 1808, representative in Congress in 1812, and United States senator in 1818. In 1820 he was sent to Spain as resident minister, where he conducted the negotiations concerning the ratification and execution of the treaty by which Florida was ceded to the United States. In 1823 he was again chosen to the House of Representatives, and was one of the main supporters in Congress of Gov. Troup of Georgia in his contest with the national government concerning the removal of the Creek and Cherokee Indians. He became governor of Georgia in 1827, and in 1829 was again returned to the United States Senate. He opposed the South Carolina movement of nullification from

its beginning, and voted in favor of Mr. Clay's compromise act of 1833. In the debate in 1834 on the removal of the deposits from the United States bank, he supported the President, who afterward appointed him secretary of state, an office which he retained till the retirement of President Van Buren in 1841.

Fort Adams, R. I., a United States military post established 1841, at Brenton's Point, R. I., near Newport. There was a garrison here during the Revolution. See MILITARY POSTS, U. S.

Fort Anderson. See WILMINGTON, CAPTURE OF.

Fort Ann, N. Y., a village and former fort in Washington County; on Wood Creek and Champlain Canal. The first fort was built here in 1709, rebuilt in 1757. The British captured the fort in 1777, and partially destroyed it. Pop. of village (1901) 430.

Fort Blakely, Siege and Capture of. Fort Blakely was erected by the Confederates as one of the inland defenses of Mobile, on the east bank of the Apalachee River, and opposite its confluence with the Tensas, about 10 miles northeast of the city. It was on high ground and nearly 3 miles in extent, with 9 well-built redoubts or lunettes armed with about 40 guns. In front was a deep and broad ditch, also an abatis. The garrison consisted of Gen. F. M. Cockrell's division of veteran troops and Thomas' division of Alabama Reserves, in all about 3,500 men, under command of Gen. St. John Lidell. On 20 March 1865 Gen. F. Steele set out from Pensacola and, by a circuitous march of 100 miles, reached the rear of the fort 1 April and invested it on the 2d with Garrard's division of the 16th corps, Veatch's and Andrews' divisions of the 13th, and Hawkins' division of colored troops, in all 13,000 men. Gradual approaches were made, accompanied by heavy and constant skirmishing, and by the 8th Steele had portions of his advanced lines within 450 to 600 yards of the works and 28 guns in position. A general assault was made about 6 P.M. of the 9th; there was a severe struggle in overcoming the obstructions in front of the work; but they were carried and the main works taken by assault, with 3,432 prisoners, 40 guns, and 16 battle-flags. The Union loss was 113 killed, 516 wounded. The Confederate loss is not known. The assault on Blakely was the last considerable engagement of the War, and was followed by the fall of Mobile and surrounding forts and by the surrender of the Confederate navy in the harbor. Consult: 'Official Records,' Vol. LI.; Andrew, 'Siege of Mobile.'

Fort Darling (Drewry's Bluff), Attack on, 7 May 1862. President Lincoln, then at Fort Monroe, received a dispatch from Gen. McClellan that his cavalry had made a reconnaissance to Jamestown, on James River, that a Confederate battery at that point had been abandoned, and if it were possible for the Galena and other gunboats to move up James River, it would aid him in his movement up the Peninsula on Richmond. The President directed Flag-officer Goldsborough, if he deemed it proper, to send the Galena and two gunboats. On the morning of 8 May Capt. John Rodgers, with the Galena, Aroostook, and Port Royal, went up the river and engaged two batteries of 10 guns each, one of which he silenced; the other he passed, two Confederate gunboats retiring up the river as he approached. Rodgers worked his way up the river, meeting with no serious opposition until he arrived at Fort Darling, on Drewry's Bluff, eight miles below Richmond, a strong position on the right bank of the river, about 200 feet above it, and mounting five heavy guns, manned by the crews of the destroyed Merrimac and other ships at Norfolk, under command of Captain Farrand, C. S. Navy. The guns were mounted in such position as to give a close and plunging fire upon an advancing vessel. At the foot of the bluff the river had been obstructed by piles and sunken vessels secured by chains, and the shore was lined with rifle-pits, sheltering sharpshooters. Rodgers was now joined by the Monitor and Naugatuck, and on the morning of the 15th ran up and opened fire, the Galena leading and anchoring within 600 yards of the fort. The Monitor could not bring her guns to bear, and the action was principally confined to the Galena, which, after a contest of nearly three and a half hours, withdrew, having been struck 28 times, and losing 24 men killed and wounded. Two of the Confederate guns were dismounted, and Farrand reported a loss of 7 men killed and 8 wounded. Two or three

days later, recognizing the fact that the co-operation of the army was needed to carry the position, Goldsborough proposed to McClellan a joint attack, but McClellan preferred waiting until he got his army across the Chickahominy. The Confederates strengthened the position and it remained in their possession until the close of the war, an obstacle to the advance of the gunboats up the James to Richmond, and also to the operation of the army investing Richmond and Petersburg. Consult: 'Naval War Records,' Vol. VII., Allan, 'Army of Northern Virginia.'

Fort Edward, N. Y., colonial, on the upper Hudson at its great bend, where stands the present village of Fort Edward; then known as the Great Carrying Place (that is, to Lake George), and an obvious advanced post for Canadian wars. Francis Nicholson built a stockade there for that purpose in 1799; it rotted away in disuse, but in 1755, at the opening of the French and Indian War, Phineas Lyman began another called by his name. It was finished by Col. Blanchard under Sir William Johnson, who after the battle of Lake George (q.v.) renamed it Fort Edward, after the Duke of York, grandson of George II. In 1757 it was raided from Canada and 11 soldiers killed. Later, the survivors of the massacre of Fort William Henry (q.v.) were sent there by Montcalm, and shortly afterward several thousand militia flocked thither to the rescue, but had to be sent home as too late. In March 1758 an expedition from there under Major Robert Rogers was nearly destroyed by the Indians. In the Revolution it was successively the headquarters of Schuyler and Burgoyne. Jane McCrea (q.v.) was living there when she started on her ill-fated journey 27 July 1777 to meet her lover in Burgoyne's camp, and was buried within the fort. See Parkman, 'Montcalm and Wolfe' (1884); 'Fort Edward in 1779-80,' 'Historical Magazine,' 2d series Vol. II. (1867).

Fort Erie, Canada, a former fort opposite Buffalo, built during the War of 1812; also a former fort at Erie, Pa.

Fort Ethan Allen, Vt. See MILITARY POSTS, U. S.

Fort Fisher, in North Carolina, erected by the Confederates on the peninsula between Cape Fear River and the Atlantic to defend the entrance to the port of Wilmington, was one of the most formidable earthworks on the Atlantic coast and was built to withstand the heaviest artillery fire. Its parapets were 25 feet thick, with an average height of 20 feet, and mounted 44 heavy guns. At the close of 1864, when it was determined by the United States forces to reduce it and close the port of Wilmington to blockade-runners, it had a garrison of 1,400 men, under command of Col. William Lamb. The combined naval and army expedition sent against it was under command of Admiral D. D. Porter and Gen. B. F. Butler. Porter's fleet of about 150 vessels, the largest that had ever sailed under the Union flag, left Hampton Roads 13 Dec. 1864 and arrived in sight of the fort on the 20th. As a preliminary to the attack the old steamer Louisiana was loaded with 215 tons of powder which was to be exploded under the walls of the fort, with the expectation that the explosion would dismount the guns, level the works, and demoralize the garrison, thus allowing the troops to land and easily take the work. At 1:40 A.M. of the 24th, without notifying Butler of the fact, when the Louisiana was within 300 yards of the beach and 400 yards of the fort, the powder was exploded, but did no damage, scarcely disturbing the slumbers of the garrison. At daylight the fleet ran in, and at 11 o'clock opened a furious fire, which was continued several hours, doing no material damage, and was responded to with spirit and effect. On the 25th the bombardment was renewed and under cover of it Butler landed 3,000 men two miles above the fort, and was assured by Porter that the navy had so completely silenced the work that all he had to do was to march his troops into it. But Butler and Weitzel, who was in immediate command of the troops, after a careful reconnaissance found the fort uninjured, deemed it unadvisable to attack it, re-embarked the men, and returned to James River to assist in the siege of Petersburg. Porter's fleet lost 83 men killed and wounded. The Confederates had 58 killed and wounded. The failure to take the fort produced great disappointment; it is now generally conceded that Butler and Weitzel acted wisely in not making the attempt. A second expedition against the fort sailed 12 Jan. 1865, and on the 13th 8,000 men were landed under Gen. A. H. Terry, who had been designated to command the land forces, which, as before, were under the immediate command of Gen. Weitzel. At 3.30 P.M. the fleet stood in and began a furious bombardment, which was continued next day, causing a loss to the garrison of 200 men, and silencing many of the guns. A combined naval and land attack was planned for the 15th, and 1,600 sailors and 400 marines were landed to co-operate with the army. The fleet opened fire at 9 A.M. and continued it until 3 P.M., when 50 steam-whistles from the fleet gave the signal for the land assault. The naval column, armed with cutlasses and pistols, charged the right flank or sea-face of the work, reached its foot, and those in advance began to climb the parapet, but the Confederates mounted on it repulsed them, and the entire body retreated in disorder with a loss of 82 killed and 269 wounded. The army was more successful; advancing on the left flank or land-face of the work, it forced a lodgment, and

after a hard struggle, which was continued far into the night, carried the entire work, capturing, as reported by Gen. Terry, about 2,000 men, with a loss of over 900. The Confederate defense of the fort was one of the most gallant of the War, and cost them about 500 killed and wounded. The Union loss, army and navy, was 266 killed, 1,018 wounded, and 57 missing. The fall of Fort Fisher closed the port of Wilmington, and was soon followed by the fall of that city. Consult: 'Official Records,' Vol. XLII.; 'Naval War Records,' Vol. XI.; Ammen, 'The Atlantic Coast'; Maclay, 'History of the Navy,' Vol. II.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

Fort Gaines and **Fort Morgan.** Fort Gaines was a walled work on Dauphine Island, at the western entrance of Mobile Bay, and with Fort Morgan, a much larger work, on Mobile Point, nearly four miles distant, at the eastern entrance, was seized by the governor of Alabama 5 Jan. 1861. Both forts remained in Confederate possession until August 1864, at which time Fort Gaines had 30 guns. Fort Morgan was armed with over 40 guns, and had a mortar battery in front of seven heavy guns. Admiral Farragut attacked and passed both works when he ran into Mobile Bay, 5 Aug. 1864, and virtually destroyed the Confederate squadron. Gen. Gordon Granger landed troops on Dauphine Island on the 4th and began to invest Fort Gaines; on the 6th Farragut shelled it, and on the 7th the fort and its garrison of 818 officers and men surrendered. Fort Morgan held on longer, but Granger transferred his troops from Dauphine Island to the rear of the fort, invested it, got 34 guns in position to bear on it, and on the morning of the 22d, in co-operation with Farragut's fleet, opened his guns upon it, and kept up a continuous fire until the morning of the 23d, when the fort surrendered to Farragut.

Fort George, Canada, a former fort on the Canadian side of the Niagara River. On 27 May 1813 it was captured by the American forces under Col. Winfield Scott. On 10 Dec. 1813 the fort was evacuated by Gen. McClure. See FORT GEORGE, BATTLE OF.

Fort George, Battle of, 27 May 1813, in the War of 1812. The fort was near the mouth of the Niagara River, on the Canada side, nearly opposite Fort Niagara, and was garrisoned by about a thousand British regulars and several hundred militia under Gen. Vincent. The American force of some 4,000 undertook to take it in rear and capture the garrison; the nominal commander was Morgan Lewis, the real one Winfield Scott. The forces were landed from the fleet, nominal commander Chauncey, real one Oliver Hazard Perry, and a joint attack was made. The fleet enfiladed the beach; Scott advanced along the shore, and made a flanking movement. Vincent evacuated the fort, spiked the guns, and slowly retreated, parallel to the river, beyond Queenston Mt., losing 51 killed and 305 wounded and missing, from his regulars, while most of the militia were captured. American loss, 40 killed, 120 wounded. The other forts on the river were soon abandoned by the British.

Fort Getty, S. C. See MILITARY POSTS, U. S.

Fort Greble, R. I. See MILITARY POSTS, U. S.

Fort Griswold, Conn. See FORT GRISWOLD, MASSACRE OF; MILITARY POSTS, U. S.

Fort Griswold, griz'wōld, **Massacre of,** 6 Sept. 1781. Hearing of Washington's southern march, Sir Henry Clinton, as the only available diversion, sent an expedition against New London, Conn., where a quantity of stores were collected, with slight defense from Fort Trumbull on the New London side and Fort Griswold on the Groton side of the Thames, and which was a nest of privateers that had greatly annoyed the British. Benedict Arnold was selected to head it, as a Connecticut man; an ugly method of making him seal his new allegiance. On taking possession of Fort Trumbull, it became evident that the American shipping would escape unless Fort Griswold were captured also; it was reported unfinished and occupied only by 20 or 30 men, and he ordered an attack on it. Shortly seeing that it was stronger than he supposed, and garrisoned by those who had escaped from Fort Trumbull, and that the ships were escaping up the river, he countermanded the order, but too late. The British detachment of 600 regulars had assailed the fort, where 157 militia had gathered; and after 40 minutes' assault, with the loss of 192 men, the British carried it, and despite the appeals for quarter, massacred nearly the whole garrison. Col. Ledyard, the commander, and 70 others were killed, 60 wounded, 35 mortally, and only 26 escaped unhurt. The British officers, however, did their best to stop the slaughter, and the atrocious story formerly told of the murder of the colonel is fiction. The massacre of garrisons *in terrorem,* to teach them not to defend untenable places, was justified by the European rules of war at the time, but had not been practised in America. Even American officers, however, spoke of it at the time as a regrettable but almost inevitable incident of war.

Fort Hancock, N. J. See MILITARY POSTS, U. S.

Fort Harrison, Battle of (including Chaffin's Farm, Fort Gilmer, and New Market Heights). In the latter part of September 1864 Gen. Grant ordered a movement against the Confederate troops north of James River, defending Richmond. Grant hoped to make Gen. Lee so weaken the garrison at Petersburg that the Union forces might carry it. The great object, however, was to prevent Lee sending reinforcements to Early in the Shenandoah Valley. September 28, during the night, Gen. Ord crossed from the south to the north bank of the James, and on the 29th, with 4,000 men, driving before him the Confederate outposts, appeared before Fort Harrison, on Chaffin's Farm, the strongest work on the Confederate line. Birney, with 10,000 men, moved by roads farther to the right. Stannard's division, which led the ad-

vance of Ord's column, moved to the assault of Fort Harrison, under a very severe fire of artillery and musketry, and after a sharp encounter carried it with its 16 guns and nearly 300 prisoners, at a loss of over 500.

Ord, being severely wounded, the command of his corps fell to Gen. Heckman, whose division, following Stannard's, passed to the right of Fort Harrison, attacked Fort Gilmer, and was repulsed with heavy loss. Meanwhile Gen. Birney had advanced on the New Market road, captured some of the advanced rifle-pits, running northeast from Fort Harrison, and established connection with Heckman. Gen. Grant now appeared and ordered an advance on the right. At 3 P.M. Birney made another assault upon Fort Gilmer, but was badly repulsed. Grant ordered the troops to entrench. Gen. Lee transferred seven brigades from his lines at Petersburg to the north side of the river, and massed 10 brigades at and near Fort Gilmer to assault and retake Fort Harrison. The assault was made at 2 P.M. of the 30th by Gen. R. H. Anderson, commanding Longstreet's corps, with five brigades, and was repulsed. Twice the Confederates re-formed and renewed the assault, but were repulsed, leaving a large number of killed and wounded and seven battle-flags on the ground, and the effort to dislodge the Union troops was abandoned. The Union loss on the 29th and 30th was 383 killed, 2,299 wounded, and 645 missing, an aggregate of 3,327. The loss of the Confederates is not definitely known, but it was near 2,000 in killed, wounded, and missing. Consult: 'Official Records,' Vol. XLII.; Humphreys, 'The Virginia Campaign of 1864-65.'

E. A. CARMAN.

Fort Henry and Fort Donelson. These forts were constructed by the Confederates just south of the boundary line between Kentucky and Tennessee, the former on the right bank of the Tennessee River, the latter on the left bank of the Cumberland; the distance between the two being 12 miles. On 28 Jan. 1862 Commodore Foote and Gen. Grant asked Gen. Halleck's permission to take Fort Henry. Halleck assented, and on the morning of 2 February Foote's flotilla of ironclads and gunboats, followed by a fleet of transports, carrying Grant's troops, left Cairo, anchoring 6 miles below Fort Henry on the morning of the 4th. The fort was defended by 17 heavy guns, and its land approach was covered by rifle-pits held by 3,000 men. Gen. Lloyd Tilghman was in command. About 11.20 A.M. of the 6th Foote steamed up toward the fort and attacked it with four ironclads, Tilghman, with about 90 men to work 11 guns bearing on the river, returning the fire. After a contest of an hour and a quarter Tilghman hauled down his flag and surrendered with 78 men, having lost 16 killed and wounded. The 3,000 men in the rifle-pits retreated to Fort Donelson. The fleet had 29 killed and wounded. Grant, who had landed his troops 6 miles below the fort, arrived too late to take part in the action.

Grant reported to Halleck that on the 8th he would take and destroy Fort Donelson. Foote, however, was compelled to return to Cairo for repairs to his fleet, and the movement was deferred until the morning of the 12th, when Grant marched across the country, with about 16,000 men, arriving before Fort Donelson in the evening. The fort was on a commanding hill, 120 feet above the level of the Cumberland, with three heavy batteries commanding the river, and a line of rifle-pits to defend the land approach. On the morning of the 13th the fort and works were held by 18,000 men, under command of Gen. Floyd. The rifle-pits 2½ miles in extent, were held by Gen. Buckner on the right and Gen. Pillow on the left.

Grant formed his line of investment with Gen. McClernand on the right and Gen. Smith on the left, and at dawn of the 13th opened a furious cannonade and sharp skirmishing. In the evening Foote's flotilla and reinforcements for Grant arrived — Crufts' brigade and several regiments from Fort Henry and Cairo. These were formed into a division of 10,000 men, under Gen. Lew Wallace, and put in the line between McClernand and Smith, raising Grant's force to 26,000 men. At 2 P.M. of the 14th Foote attacked the fort, and at the end of an hour and a half was compelled to withdraw, two of his ironclads being entirely disabled and the other two partially so. He had 54 men killed and wounded. It was then concluded that Foote should return to Cairo and repair damages, while Grant should perfect his investment, fortify his lines, and await the arrival of reinforcements and the return of Foote.

The Confederates shaped the course of events otherwise. They decided to break the right of Grant's investing line and escape by roads leading to Nashville. In pursuance to the plan adopted, Pillow, on the Confederate left, supported by a part of Buckner's command, advanced at daybreak of the 15th, with 10,000 men, and after a hard fight gained the right of McClernand's line and forced it back. McClernand called for assistance and, in the absence of Grant, who had gone to confer with Foote, Lew Wallace sent Crufts' brigade to his support, but the Confederates continued to gain the advantage, pushing back McClernand's two right brigades and their supports. Buckner made an attack upon McClernand's left and was repulsed; but rallying his men, he renewed the attack, and the whole right wing of Grant's army was forced back, the Confederates still following up their advantage, when Wallace threw Thayer's brigade to the right and across their line of advance and, after a sharp fight, checked them, driving some back to their entrenchments. It was 2 P.M. when Grant came on the field to find nearly half his army driven from position and the way open for Confederate escape. He ordered a counter-attack. Smith, commanding on the left, formed a brigade in column, led it under severe fire, and seized the Confederate works in his front and on the high ground surrounding the fort. Wallace and part of McClernand's force, advancing on the right, gained the greater part of the ground lost early in the day, and by night the line of investment was re-established. Grant made preparations to renew the attack early next morning, but during the night the Confederate commanders came to the conclusion that escape was impossible, that Grant was too strong to be beaten, and that nothing remained but a surrender. Floyd, senior in rank, announced personal reasons against a surrender and passed the command to Pillow, who in turn passed it to Buckner. Floyd and Pillow, with the aid of two small steamboats, succeeded in getting away with about 1,200 officers and men, principally

of Floyd's old brigade, and Col. Forrest, with some 500 cavalry and other small detachments, escaped in the night by the river road.

At an early hour of the 16th, as Grant was about to renew the attack Buckner sent him a note proposing "the appointment of commissioners to agree upon the terms of capitulation," and suggesting an armistice until 12 o'clock. Grant replied: "No terms except unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner surrendered 14,500 men, 57 guns, and a large amount of ammunition and stores. The Union loss, army and navy, was 510 killed, 2,152 wounded, and 224 missing. The Confederate loss, killed and wounded, was about 2,000. The capture of Forts Henry and Donelson broke the first line of Confederate defense in the Mississippi Valley, and caused the abandonment of Columbus, Bowling Green, and Nashville. Consult: 'Official Records,' Vol. VII.; Force, 'From Fort Henry to Corinth'; Swinton, 'Decisive Battles of the War'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. I.; Grant, 'Personal Memoirs,' Vol. I.

E. A. Carman.

Fort Hindman, or **Arkansas Post, Battle of.** After Gen. Sherman's failure at Chickasaw Bayou (26–31 Dec. 1862), his army and Admiral Porter's fleet returned to Milliken's Bend, where, 4 Jan. 1863, Gen. J. A. McClernand superseded Sherman in command and moved against Fort Hindman, situated on the north bank of the Arkansas River, 50 miles from its mouth, commanding the approach to Little Rock and protecting the valley of the Arkansas. The fleet, 3 ironclads and 6 gunboats, entered White River, and from it passed through a cut-off to the Arkansas, 9 January. The army of 29,000 men landed about four miles below the fort, a large square-bastioned work, on high ground, at the end of a horseshoe bend in the river, mounting 18 guns, and garrisoned by about 5,000 men, under command of Gen. T. J. Churchill. A line of rifle-pits surrounded it. The ironclads began the attack on the 10th, and the entire fleet, gradually moving up, shelled the Confederates out of the rifle-pits and back into the fort. On the 11th the navy opened a furious fire upon the fort, McClernand's artillery joining in the fire from the land side. Churchill's guns were silenced, and McClernand ordered a general assault. After a severe contest the fort was carried with a loss to the Union army of 134 killed, 898 wounded, and 29 missing. The naval loss was 6 killed and 25 wounded. The Confederate loss was 60 killed, about 80 wounded, and 4,791 captured. On the 12th McClernand received peremptory orders from Gen. Grant to return to Milliken's Bend with his entire command. The prisoners were sent to St. Louis, the fort was dismantled and blown up, and the fleet and troops went down the Arkansas to Napoleon, on the Mississippi. Consult: 'Official Records,' Vol. XXII.; Greene, 'The Mississippi'; Mahan, 'The Gulf and Inland Waters'; Maclay, 'History of the Navy,' Vol. II.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

Fort Independence, Mass. See Military Posts, U. S.

Fort Jackson and **Fort St. Philip.** Fort Jackson was built between 1824 and 1832 on the right bank of the Mississippi, about 80 miles below New Orleans. Together with Fort St. Philip on the opposite bank, half a mile above, it defended the city from water attack. Both forts were seized by Louisiana State troops 11 Jan. 1861, were strengthened and garrisoned, and remained in Confederate possession until taken by Admiral Farragut in April 1862, at which time they were garrisoned by about 700 men each. Fort Jackson was armed with 74 guns, Fort St. Philip with 52. In March 1862 Farragut assembled a powerful fleet at Ship Island and at Southwest Pass, at the mouth of the Mississippi, for the capture of New Orleans, and 18 April Commodore Porter, in command of a strong flotilla, opened fire upon Forts Jackson and St. Philip. During six days he threw 16,000 shells, but was unable to reduce the forts.

It was found necessary to run past the forts and destroy the Confederate navy above before New Orleans could be taken. On the 24th Farragut, with 17 vessels, in single line, carrying 192 guns, steamed up the river, engaging both forts with heavy broadsides, of shot, shell, and canister, receiving heavy fire in return. Passing the forts and obstructions, he engaged and destroyed the Confederate fleet, in one of the most spectacular naval battles of the War. Within an hour and a half after leaving its anchorage Farragut's fleet had passed the forts and destroyed 11 Confederate vessels. With 13 of his own vessels Farragut proceeded up the river, and at noon of the 25th anchored before New Orleans, which was abandoned by the Confederate troops holding it, and surrendered by the civil authorities. Porter, who had remained below, continued his bombardment of the forts, which were surrendered on the 28th. The Union loss was 37 killed and 147 wounded. The loss in the forts was 14 killed and 39 wounded; that in the Confederate navy is not known. Consult: The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.; Mahan, 'The Gulf and Inland Waters'; Maclay, 'History of the Navy,' Vol. II.

Fort Lafayette, N. Y. See Military Posts, U. S.

Fort Leavenworth, lev'en-worth, Kan., a United States military post and reservation, three miles from Leavenworth, established in 1827. There is here a military prison and national cemetery.

Fort Lee, N. J., a former fort in Bergen County, on the west bank of the Hudson River. On 20 Nov. 1776 Gen. Greene and the American forces evacuated Fort Lee, and narrowly escaped capture by 5,000 British under Cornwallis.

Fort Logan, Colo. See Military Posts, U. S.

Fort McAllister, an earthwork erected by the Confederates at Genesis Point as one of the defenses of Savannah. It was 12 miles south of the city and 6 miles from Ossabaw Sound. On 27 Jan. 1863 Admiral Dupont attacked it with five vessels, and again on 1 February, but without effect. On 3 March three monitors,

under command of Commodore Drayton, bombarded it, but did little injury. When Sherman, marching from Atlanta, appeared before Savannah the fort prevented communication between his army and the Union fleet, and Hazen's division of the Fifteenth corps was ordered to assault it. Hazen reached the vicinity of the fort about 11 A.M., 13 Dec. 1864, drove in the Confederate skirmishers, and at 4.15 P.M. had deployed nine regiments within 600 yards of the work. At that time the bugle sounded, and the line went forward over exploding torpedoes and under a close and severe fire of artillery and musketry, carrying the fort at 5 P.M. and capturing its garrison of about 250 men, 22 guns, and a large amount of ammunition. The Union loss was 24 killed and 110 wounded. The Confederate loss was about 50 killed and wounded.

E. A. CARMAN.

Fort McHenry, Md., a United States military post, on the Patapsco River, established in 1794. It was bombarded in 1814 by the British fleet, and was used as a rendezvous during the Civil War. See MILITARY POSTS, U. S.

Fort McPherson, Ga. See MILITARY POSTS, U. S.

Fort Macon, a work commanding Beaufort Harbor, N. C., constructed of brick and stone, and mounting nearly 50 guns. It was seized by Gov. Ellis, of North Carolina, about the middle of April 1861. After Burnside's capture of Newbern, 14 March 1862, Gen. Parke was sent to reduce the fort, then garrisoned by about 450 men. Parke captured Moorehead City and Beaufort, and then proceeded to invest the fort He cut off its communications, planted 11 siege-guns, and at 5:40 A.M. 25 April, in co-operation with four vessels of the navy, opened fire, and at 4 P.M. the fort surrendered with its entire garrison. Parke occupied it next morning and it remained in Union possession until the close of the War.

E. A. CARMAN.

Fort Madison, Iowa, a city and county-seat of Lee County, 18 miles from Burlington, on the Chicago, B. & Q. R.R. Here is the State penitentiary and the Catermole Memorial Library. There was a fort here as early as 1808, but was abandoned in 1832 when the town was established. Pop. (1900) 9,278.

Fort Meade, S. D. See MILITARY POSTS, U. S.

Fort Meigs, mĕgz, Ohio, a former fort on the Maumee River, where the Americans made a gallant defense in 1812 against the British and Indians. See FRENCHTOWN.

Fort Mer'cer, N. J., a former fort at Red Bank, on the Delaware River, that figured somewhat prominently in the Revolution. It was destroyed by the British 20 Nov. 1777.

Fort Mif'flin, Pa., a United States military post on Mud Island in the Delaware River. It was built in 1771 as one of the defenses for Philadelphia. It figured in numerous engagements in the Revolution. It is garrisoned at the present time. See MILITARY POSTS, U. S.

Fort Mims, Ala., Massacre of, a massacre of whites by Creek Indians at the temporary stockade, near Mobile, Ala., 30 Aug. 1813. Over 500 men, women, and children were killed by a large force of Indians under Weathersford, a half-breed.

Fort Monroe, Va., a United States military post at Old Point Comfort, commanding the entrance to Hampton Roads. Jefferson Davis (q.v.) was kept a prisoner here for two years after the Civil War.

Fort Montgomery, N. Y. See MILITARY POSTS, U. S.

Fort Morgan, Ala. See FORT GAINES AND FORT MORGAN.

Fort Moultrie, mōl'tri, S. C. When Major Anderson transferred his garrison from Fort Moultrie to Fort Sumter, 26 Dec. 1860, he spiked and dismounted the 52 guns of the fort and burned the gun carriages. The South Carolina authorities took possession of the fort on the 27th, remounted the guns, strengthened the work, increased its armament, and it became one of the strong defenses of Charleston Harbor, resisting all efforts of the Union fleet to pass it, or reduce it, and remained in Confederate possession until the evacuation of Charleston and all the forts in the harbor 17–18 Feb. 1865. See FORT SUMTER; FORT WAGNER. For early history see FORT SULLIVAN.

Fort Myer, Va. See MILITARY POSTS, U. S.

Fort Necessity. After the capture of Jumonville's force (see GREAT MEADOWS), Washington threw up earthworks and made a stockade fort, which he named as above. It soon became crowded with Indians and colonial companies, and a South Carolina company of regulars under Capt. Mackay; and Washington left the latter in command and moved 13 miles farther on, where was a small settlement. But the place was indefensible; and after summoning Mackay and his men it was decided to retreat to Fort Necessity. The next morning the French were upon them, 900 men besides Indians. Washington led out his men to battle, but the enemy kept off and fired from the woods, in a heavy rain. Washington withdrew his men behind the low, flimsy embankment; and after an entire day of mutual firing, with heavy loss on both sides, the French proposed a parley. The English were at the last extremity, with food and ammunition nearly exhausted, and guns in bad condition; and Washington would not consent to let them send an officer to his camp to observe this, and only yielded when they proposed to have him send one to theirs. The French terms were that the English should retire with all their baggage except artillery, agree to build no more forts beyond the Alleghanies for a year, return the Jumonville prisoners, and leave two officers with the French as hostages. The terms were accepted; but had the French held out a few hours more they could have killed or captured the entire force.

Fort Niag'ara, N. Y. As early as 1669 La Salle built a stockade at the mouth of the Niagara River, and Fort Conti, a fortified trading post was built here 10 years later. In 1686 it was called Fort Denonville and in 1725 it was named Fort Niagara. In July 1759 it was captured by the British and Indians under Johnson (see COLONIAL WARS), and was again captured by the British 19 Dec. 1813.

Fort Ninety-six, S. C. See NINETY-SIX.

Fort Payne, Ala., a city and county-seat of Dekalb County, on the Alabama G. S. R.R. It has large coal and iron industries. Pop. (1900) 1,037.

FORTRESS MONROE. OLD POINT COMFORT, VA.

Fort Pickens, a strong work on Santa Rosa Island, Fla., commanding the entrance to Pensacola harbor, and with Forts Barrancas and McRee opposite, defending the harbor and United States navy-yard at Warrington. Early in January 1861 it was under command of Lieut. A. J. Slemmer and practically unoccupied, Slemmer, with a small garrison, being at Fort Barrancas. Fearing that the secessionists would seize the fort, Slemmer, 10 January, transferred to it his garrison of 81 men from Barrancas, and on the 12th the governor of Florida seized Forts Barrancas and McRee, with 175 heavy guns, also the navy-yard, and demanded the surrender of Fort Pickens, which was refused. A second demand was made on the 15th and a third on the 18th, both of which were refused. Slemmer strengthened the work and held it until relieved by the arrival of reinforcements 12-13 April, when Col. Harvey Brown assumed command. Additional reinforcements were sent, and in June a regiment of New York troops, known as Wilson's Zouaves, was landed on Santa Rosa Island and encamped. On 9 October a body of Confederate troops, that had crossed from Pensacola and landed on the island during the night, surprised the camp of the Zouaves, and drove them back toward Fort Pickens, but the Zouaves being reinforced by four companies from the fort, the Confederates were driven in disorder to their vessels, with a loss of about 90 killed, drowned and wounded. The Union loss was 67 killed, wounded, and captured. No other serious attempt was made upon the fort, which remained in Union possession until the close of the War.

E. A. Carman.

Fort Pillow, constructed by the Confederates on the east bank of the Mississippi, about 40 miles above Memphis. It was bombarded by the Union fleet in its descent of the river and attack upon the Confederate fleet near Memphis, abandoned by the Confederates 4 June 1862, and 5 June was occupied by a small Union force. On 12 April 1864 it was garrisoned by parts of the 2d and 4th (colored) U. S. Artillery, and a detachment of the 13th Tennessee Cavalry, in all 557 men, with six guns, under command of Maj. L. F. Booth. At daybreak of the 12th Gen. J. R. Chalmers, of Forrest's cavalry command appeared before the fort with about 1,500 men, and after some hours of hard fighting drove the Union troops from their advanced rifle-pits back into the fort, which was attacked, and the Confederates repulsed, but securing a sheltered position within 100 yards of it. Forrest had come up while the fighting was in progress, and at 3.30 P.M. demanded the surrender of the fort, saying that he had sufficient force to take it, and would not be answerable for consequences should he be compelled to assault. Maj. Booth had been killed, but in his name an hour was asked for consideration. There were U. S. gunboats in the river, and believing that the request for an hour's consideration was to gain time for reinforcements to arrive, Forrest would give but half an hour. When the time was up the bugles sounded the charge, the assault was made, there was a short and severe struggle, many of the garrison were killed in the fort, and those who attempted to escape by the river were shot or, rushing over the bluff into the river, drowned. More than half of the garrison were killed or wounded, a very large proportion being killed. About 160 white and 40 colored prisoners were taken. The defenders of the fort fought bravely, but were simply overpowered. Forrest says in his report: "The river was dyed with the blood of the slaughtered for 200 yards. The approximate loss was upwards of 500 killed; but few of the officers escaped. There was in the fort a large number of citizens who had fled there to escape the conscript law. Most of them ran into the river and were drowned." Forrest reports his own loss as 20 killed and 60 wounded. Consult: 'Official Records,' Vol. XXXII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. Carman.

Fort Porter, N. Y., a United States military post on the Niagara River in the city of Buffalo. It was established in 1867, but prior to that date the government maintained a defensive work at Black Rock.

Fort Preb'le, Me., a United States military post, at Spring Point, in Portland Harbor, established in 1808.

Fort Pulaski, erected by the United States on Cockspur Island, for the defense of Savannah, Ga., and commanding both channels of the Savannah River. It was a brick work, with walls 7½ feet thick and 25 feet high above water. It was seized by Georgia State troops 3 Jan. 1861, and in January 1862 mounted 48 heavy guns and was garrisoned by nearly 400 men. Gen. Q. A. Gillmore was put in charge of operations to reduce it, and in February 1862 2 regiments of infantry, 2 companies of engineers, and 2 of artillery were landed on Tybee Island, mostly a mud-marsh, lying southeast of the fort, and soon constructed 11 batteries of 36 heavy guns, at distances from the fort varying from 1,650 to 3,400 yards. Causeways had to be constructed across marshes, over which mortars of 17,000 pounds were moved; the work was done entirely at night; all difficulties were overcome; and on 9 April the batteries were ready to open fire, the three breaching batteries being established at a mean distance of 1,700 yards from the fort. At sunrise of the 10th the fort was summoned to surrender; its commander, Col. C. H. Olmstead, replied that he was there "to defend the fort, and not to surrender it." Fire was opened at 8 A.M., and an hour later all the batteries were in full play, the Confederates replying vigorously, the fire continuing on both sides until dark. Firing was resumed at sunrise of the 11th, and the Confederates replied steadily; but by noon several of the guns were dismounted; the walls of the fort began to crumble under the weight of metal; and at 2 P.M. the white flag was raised, firing ceased, and 385 officers and men were surrendered, several of whom were severely, one mortally, wounded. The Union loss was one man killed. The result of the fall of Fort Pulaski was the closing of the Savannah River to blockade runners.

E. A. Carman.

Fort Riley, Kan., a United States military post on the Kansas River, near Junction City, Kan. It was established in 1852 on a reservation of 19,000 acres and was first called Camp Centre. It is about 140 miles from Fort Leavenworth, with which place it is connected by a military road completed in 1854. An appropriation of $100,000 was made by Congress in 1855 for the extension of this road to Bridger's Pass,

between Nebraska and Utah, making it one of the finest roads in the country. The fort is the seat of the United States Cavalry and Field Artillery School and has accommodations for a large force of cavalry and infantry.

Fort Robinson, a United States military post in the Red Cloud Agency, situated in the western part of Dawes County, Nebraska, and on a fork of the White River, about three miles southeast of Crawford. The post dates back to 1874 and occupies about 20 square miles. There are accommodations for over 500 troops, with stables for the same number of horses.

Fort Royal, West Indies. See FORT DE FRANCE.

Fort Saint David, a town in the presidency of Madras, Hindustan, on the Coromandel coast, situated on the Tripapolore River, about 12 miles south-southwest of Pondicherry. It was besieged by the French in 1746, but withstood the siege and finally forced the French to retire. It remained in possession of the British and was the capital of their possessions in that section of India until 1750, when the French army under Gen. Lally again attacked the fort, this time with success, and razed the fortifications.

Fort St. Philip, La., a fort lying on the Mississippi River about 80 miles below New Orleans and nearly opposite Fort Jackson. The Spaniards originally built the old river front and it was not until the War of 1812 that the works were entirely enclosed by the United States government. Extensive alterations were made by the government after 1841. At the outbreak of the Civil War it was taken by the Confederates, but fell before the attack of Admiral Farragut's fleet in April 1862. See FORT JACKSON AND FORT ST. PHILIP.

Fort Sam Huston, hūs'tŏn, Texas, a United States military post near San Antonio, established in 1865. There is a reservation here of 469 acres.

Fort Sanders. See KNOXVILLE, SIEGE OF.

Fort Schuyler, New York harbor. See MILITARY POSTS, U. S.

Fort Schuyler (Old), N. Y. See FORT STANWIX; ROME, N. Y.

Fort Scott, Kan., city and county-seat of Bourbon County; on the Marmaton River, and on the Saint Louis & S. F., the Missouri, K. & T., and the Missouri P. R.R.'s., 100 miles south of Kansas City.

Industries.— The chief income of the city is derived from the railroad shops, the Saint L. & S. F. employing 500 hands and the Mo. Pac. 550 hands. The city is situated in a rich agricultural region, this in itself a valuable source of income. Besides these industries there are manufactories of cement, syrup, brick and machinery. Fort Scott is also the largest horse and mule market in the State.

Banks, Public Buildings, etc.—There are three banks with a combined capitalization of $200,000. Among the public institutions are the library containing 18,000 volumes, the Goodlander Home for Children, the old government fort buildings which have been preserved, and the National cemetery.

Church and Educational Institutions.— Religious services are held in 11 church edifices. The educational system is excellent, consisting of a high school and seven public schools. There are two commercial colleges in the city and the Notre Dame De Lourdes Academy is also located there.

History, Government and Population.— The city was first settled as a military post in 1844, became a municipality in 1850 and was chartered as a city of the first class in 1882. The public administration is vested in a mayor, and a city council composed of 10 members, five of whom are elected each year. The major portion of the population are native born, with a sprinkling of negroes, Germans, Jews, and Irish. Pop. (1900) 10,322; (1905) about 14,900.

GEORGE W. MARBLE,
Editor 'Tribune and Monitor'.

Fort Smith, Ark., city and county-seat of Sebastian County, situated on the western border of the State at the junction of the Arkansas and Poteau rivers, and on the Saint Louis & S. F., Missouri P., Kansas City S., Midland Valley, F. S. & W., and Ark. Cent. R.R.'s.

Industries.— The city is in a rich agricultural region and derives a greater part of its income from this source. There are also coal mines near by. The city has a wagon factory, several furniture and chair factories, a wood-working establishment, machine shops, cotton compress, and oil wells. There are two daily and several weekly papers published.

Schools and Churches.— The city has eight public schools, a high school, two commercial colleges, a Catholic Girl's Academy, three parochial schools, and two conservatories of music. There are 13 churches, representing nearly all denominations.

Banks, Public Buildings, etc.— There are four banks (three national and one savings), having a combined capital of $900,000. Among the notable public buildings are the Federal and County court-houses, the United States jail, and a hospital and an opera-house. A National cemetery is located on the site of the former "Post" burying ground.

History, Government and Population.— Fort Smith was originally a French trading post, and in 1817 became the headquarters for the gathering and distribution of supplies for the United States army in the Southwest. It was called Belle Point by the early settlers, was incorporated in 1842, and received its city charter in 1886. The city is governed by a mayor, a board of public affairs, and a council of 10 members elected for two years. The city is lighted by electricity, gas, and natural gas, owns its waterworks, and possesses an excellent system of electric railways. Pop. (1900) 11,587; (1905) about 27,000.

E. B. MILLER,
Secretary Commercial Club.

Fort Snelling, Minn. See MILITARY POSTS, U. S.

Fort Stanwix, N. Y., a former fort near the present site of Rome, N. Y., originally built in 1756, but abandoned, and rebuilt in 1758 by

Brigadier Stanwix. Here in the fall of 1768 a treaty was negotiated by Sir William Johnson (q.v.), the British superintendent-general of Indian affairs in North America, with the Six Nations, about 3,200 Indians being present. For the sum of $10,000, the Indians surrendered title to Kentucky, West Virginia, and western Pennsylvania. Soon after this the fort was again abandoned, but in 1776 it was once more rebuilt and named after that intrepid old soldier, Gen. Philip Schuyler. In 1777 the fort was the object of an attack by Gen. Saint Leger with 1,700 British soldiers and allies, but the garrison held out for 19 days, from 3-22 August when they were relieved by a force of Continentals under Gen. Arnold. In 1781 the fort was destroyed by flood and fire, and when rebuilt was again named Fort Stanwix. It was here on 22 Oct. 1784 that the three United States commissioners negotiated the treaty with the Iroquois Indians, known as the "Treaty of Fort Stanwix," which provided for the cession to the United States of western lands claimed by them.

Fort Stedman, Assault on. In March 1865 Gen. Lee prepared to abandon Richmond and Petersburg, unite with Johnston at Danville, and attack Sherman, who was marching northward from Savannah. In order that he might wait for favorable weather, he decided on a sortie against Grant, to hold him near the Appomattox. The sortie was committed to Gen. Gordon, with about one half of the army. The point of Gordon's attack was Fort Stedman. At 4 A.M. 25 March the attack was made, and a rush of Gordon's men overcame the pickets and advance guards, took from 400 to 500 yards of the main line (Willcox's), including Fort Stedman, the defenders of which, after a spirited resistance, were overpowered and captured, turned its artillery upon the Union line, captured between 500 and 600 prisoners, and endeavored to sweep down the intrenchments, but met with a repulse. It was so dark that friend could not be distinguished from foe, but Gen. Parke ordered Willcox to recapture the works, Gen. Hartranft to support him. By 7.30 A.M. Parke had regained a part of the line and drawn a cordon around Fort Stedman, and Tidball's artillery had concentrated a heavy fire upon it and the line adjacent. Hartranft advanced at 7.45 A.M., attacked detachments of the enemy that were moving in the direction of City Point, capturing or driving them back, and at 8 A.M. Fort Stedman and the entire line was recaptured, together with 1,949 prisoners and 9 stands of colors, the Federal loss (Ninth corps) being 72 killed, 450 wounded, and 522 missing. The Sixth corps now attacked and captured the Confederate picket-line, losing 449 killed and wounded, and 30 missing; and the Second corps did the same, capturing 365 prisoners, and losing 51 killed, 462 wounded, and 177 missing. The Confederates made several efforts to recapture their own advanced lines, but failed. The entire Union loss in this engagement was 170 killed, 1,323 wounded, and 729 missing, an aggregate of 2,222. The Confederate loss is not definitely known; Gen. Meade estimates it at 5,000 men; it was probably not over 4,000, of whom one half were prisoners. Consult: 'Official Records,' Vol. XLVI.; Humphreys, 'The Virginia Campaign of 1864-65'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Fort Stephenson, Ohio. See FREMONT, Ohio.

Fort Stevens, a United States military post in Oregon, situated in the extreme northwestern part of the State at the mouth of the Columbia River. It is a little more than 100 miles northwest of Portland and about 9 miles west of Astoria, the fur trading post, which was established by John Jacob Astor in 1811. The grounds surrounding the post which was established in 1864 comprise 1,250 acres, and, beside the quarters for the officers and artillerymen stationed there, has a post office and railway station.

Fort Sullivan, S. C., the early name of Fort Moultrie, in Charleston harbor; notable for its defense against the British in the Revolutionary War. See COLONIAL WARS.

Fort Sumter, built upon a shoal in the narrowest part of the channel of Charleston harbor, three and a half miles from the city, and three fourths of a mile from the north end of Morris Island, was constructed on a rip-rap foundation, its walls of brick being 38 feet high and 7½ feet thick. When South Carolina secede the fort was unfinished and not garrisoned, but men were engaged in the work and in mounting guns. South Carolina passed an ordinance of secession on 20 Dec. 1860, and the secessionists looked to the immediate possession of all the forts in the harbor, one of which, Fort Moultrie, was held by Maj. Robert Anderson, with a garrison of 75 men. Fort Moultrie was indefensible from a land attack, and Anderson, believing that he was about to be attacked, on 26 December, skilfully transferred his command to Fort Sumter, the strongest and most inaccessible work in the harbor. Gov. Pickens demanded Anderson's immediate return to Fort Moultrie, Anderson refused, and the governor took possession of Fort Moultrie and all other works in the harbor, and seized the arsenal, post-office, and custom-house in Charleston, raised the Palmetto flag over them, and thus inaugurated war against the United States. He began the construction of batteries on James, Morris, and Sullivan islands to command the harbor and reduce Fort Sumter. On 9 Jan. 1861 the merchant steamer Star of the West endeavored to land reinforcements and provisions for Fort Sumter, but was fired upon by the secession batteries and driven back. Again Gov. Pickens demanded the surrender of the fort, again Anderson refuced, and negotiations were transferred to Washington. The construction of batteries continued and 1 March Gen. Beauregard was assigned to the command of all the Confederate forces at Charleston, with instructions to perfect preparations for reducing Fort Sumter. Anderson was now in danger of being starved out and, in accordance with promise given, Gov. Pickens was informed 8 April by a special messenger sent by President Lincoln, that an attempt would be made to land provisions, and provisions only, at Fort Sumter. Beauregard notified the Confederate government, and received orders 10 April to

demand the evacuation of the fort, and to reduce it if refused. The demand was made at noon of the 11th. Anderson refused, but made the casual remark to the messengers carrying Beauregard's demand that, if left alone, he would be starved out in a few days, and Beauregard, "to avoid effusion of blood," asked when he would be ready to leave the fort. Anderson said he would evacuate the fort by noon of the 15th, should he not prior to that time receive "controlling instructions" from his government or "additional supplies." The reply was not satisfactory, and 3.20 A.M. of the 12th Anderson was notified that fire would be opened within an hour. At 4.30 A.M. the signal-gun was fired from Fort Johnson on James Island; all the batteries opened fire; Anderson replied deliberately; in 24 hours 2,500 shot and shell struck the fort or fell inside of it; the barracks were burned and the fort much damaged; the relieving fleet could not land; and on the afternoon of the 13th terms were arranged under which, on the afternoon of the 14th, Anderson saluted his flag and, with drums beating and colors flying, marched with his garrison out of the fort, was conveyed to a steamer, and sailed for New York. During the bombardment not a man was killed on either side.

When Fort Sumter fell into Confederate possession it had 78 serviceable guns. Additional guns were mounted in it and it was well garrisoned. The Union authorities sunk a number of old whalers filled with stones in the main channel of Charleston harbor to close the port to blockade-runners, and a blockading force was maintained off the harbor; but it was not until 7 April 1863 that any serious operation was attempted against the fort. Then Dupont, with nine ironclads, made an unsuccessful attack upon it. One of the ironclads, the Keokuk, which had approached nearest to the fort, was struck 90 times, and so much injured that she sunk off Morris Island, and her armament fell into the hands of the enemy, while the others withdrew after an engagement of 40 minutes, most of them being considerably disabled by the fire of the 69 heavy guns brought to bear upon them. The fleet fired 151 shots, not more than 34 of which struck the walls of the fort. Sumter discharged 810 shot, Fort Moultrie and other batteries 1,399, in all 2,209, of which 520 struck the different vessels. It had been expected that the fort would be reduced to a pile of ruins before the sun went down, but the result convinced the Union authorities that the fort and adjoining works could not be reduced by a purely naval attack.

It was now determined that Fort Sumter and Charleston should be taken by combined land and naval attacks, the land attack being by way of Morris Island, the capture of the batteries there, and the establishment of batteries to reduce Fort Sumter. For this purpose Gen. Gillmore was selected. He landed on Morris Island 10 July, made two unsuccessful assaults on Fort Wagner, 11 and 18 July, and then concluded to attempt the destruction of Sumter from ground already in his possession, so that the fleet could enter the harbor and command Charleston. (See FORT WAGNER.) A sufficient number of breaching-guns were in readiness 16 August; fire was opened on the 17th, and on the 24th Gillmore reported the practical demolition of the fort. From 18 guns he had thrown 5,009 projectiles, weighing 552,683 pounds, of which 4,147 struck the fort. Before daylight 23 August five monitors approached to within about 800 yards of the fort and opened fire, which was kept up until 6 A.M. Confederate officers now held a council, and the proposition was offered to abandon the fort, but as a matter of sentiment it was resolved to hold it. On 30 August Gillmore resumed fire, dismounting the remaining barbette guns and leaving but one casemate gun serviceable. As a means of defense against the fleet the work was entirely useless, and it was held merely as an infantry outpost. On 2 September six monitors opened fire on it, but it remained silent, not a single gun being in working order to reply. Early on the morning of 7 September, after the abandonment of Fort Wagner, Admiral Dahlgren demanded the surrender of Fort Sumter, which was refused. Meantime the Confederates were removing the guns from the fort and placing them in other parts of the harbor. During the night of 8 September a naval force of about 400 men, under Commander F. H. Stevens, atempted to carry the fort by assault. It was then defended by about 450 men, under command of Maj. Stephen Elliott, Jr. Stevens' men were in boats, and when towed within 800 yards of the fort the boats were cut loose and rowed for the fort, on approaching which they were met with a fire of musketry; as the men landed, hand-grenades and shells were thrown upon them; and simultaneously, at a signal from the fort, all the Confederate batteries on James and Sullivan islands, with one of their gunboats, opened fire, and the attack was repulsed, all who had landed being killed or taken prisoners. The reported loss was 4 killed, 19 wounded, and 102 captured. On 26 October Gillmore again opened fire with his heavy guns from Forts Wagner and Gregg, aided by the cross-fire of 150-pound rifles on board the fleet, which completed the ruin of the fort, and all aggressive operations for the season against Charleston ended, although a desultory fire was kept up against Sumter during November and December to prevent the remounting of guns. The casualties in the fort from 12 Aug. to 11 Dec. 1863 were 43 killed and 165 wounded. From a tabular statement prepared by an officer in the fort it appears that, from 12 Aug. to 31 Dec. 1863, 26,867 shot were fired at it, 19,808 falling against or into it. On the approach of Sherman's army the fort was evacuated 17 Feb. 1865, and 14 April following the same flag that Anderson lowered in 1861 was raised over it with imposing ceremonies. I.-XXVIII.; Doubleday, 'Reminiscences of Forts Sumter and Moultrie'; Crawford, 'Genesis of the Civil War'; Gillmore, 'Engineer and Military Operations Against Charleston in 1863'; The Century Company's 'Battles and Leaders of the Civil War,' Vols. I. and IV.; 'Naval War Records,' Vol. XIV.

E. A. CARMAN.

Fort Tot'ten, N. Y., a United States military post, established in 1862 at Willett's Point, on Long Island Sound, near Whitestone.

Fort Wadsworth, wŏdz'worth, N. Y., a United States military post on Staten Island, at The Narrows, in New York Bay. It was established in 1827, and was first called Fort Richmond.

Fort Wagner, a work constructed by the Confederates near the north end of Morris Island, a low, narrow, sandy strip of land, about

3½ miles in length, on the south side of Charleston harbor. It was 2,600 yards directly south of Fort Sumter, to which it was an outpost, and was constructed to hold and control all that portion of the island upon which effective breaching-batteries against Fort Sumter could be established. On the northern end of the Island was Fort Gregg, and the southern end was held by a small force of infantry and artillery. Preparatory to a combined naval and land attack on Fort Sumter and Charleston, it was determined to reduce Fort Wagner and take possession of the entire length of Morris Island, and Gen. Gillmore, an engineer officer of skill, was selected to command the land forces. On 10 July 1863, Gillmore, who had concentrated 6,500 men and secretly placed 47 siege guns and field guns in position on the extreme northern end of Folly Island, attacked the Confederate position on the south end of Morris Island, effected a landing, carried the Confederate batteries of 11 guns, and by 9 A.M. occupied three fourths of the island and pushed his skirmishers to within 600 yards of Fort Wagner. The navy assisted with four ironclads. At daylight of the 11th an attempt was made to carry the fort by assault, which failed, with a Union loss of 172 killed and wounded, and 119 taken prisoners, of whom 40 were wounded. The Confederate loss was 12 killed and wounded. After this failure counter-batteries were established against the fort, and it was determined to attempt, with the aid of the ironclads, to dismount its guns, and either drive the Confederates from it, or open the way to a successful assault. The navy kept up an almost incessant fire upon it, and the land batteries were established at distances ranging from 1,330 to 1,920 yards of it. Soon after midday of the 18th the navy and 41 light guns and siege-mortars opened a furious fire upon the fort, which was continued until nearly all its guns were silenced and its defenders driven into bomb-proofs, when about sunset, after 900 shot and shell had been discharged, Gen. G. C. Strong's brigade of six small regiments, supported by Col. H. S. Putnam's brigade of four regiments, made an assault. As the head of the column left the trenches the guns of Forts Wagner, Gregg, and Sumter opened on it, and as it neared Fort Wagner the Confederates mounted the parapet and poured in such a destructive fire of musketry that the leading brigade was repulsed; but the supporting brigade gained a foothold, which it kept for over an hour, when it was driven back. The Union loss in this second assault was 1,128 killed and wounded, and 389 missing; among the killed or mortally wounded being Gen. Strong and Col. Putnam, John L. Chatfield, and Robert G. Shaw (q.v.). The Confederate loss was 56 killed and 133 wounded.

Gillmore now turned his attention to Fort Sumter (q.v.), which, with the aid of the navy was, by 23 August, reduced to a shapeless mass with almost every gun dismounted or silenced. Meanwhile regular approaches were made against Fort Wagner, thousands of heavy shells were thrown against and into it, and by 26 August the trenches were within 250 yards of it, the intervening space being a flat ridge of sand, scarcely 25 yards wide, and for a great part planted with torpedoes. The Confederates were driven from position behind this flat ridge and the approaches continued until within a few yards of the fort, when the heavy guns of the army and navy opened on it. Final operations were inaugurated 5 September at daylight, and in 42 consecutive hours 17 siege guns discharged 1,411 shells at the work, 1,247 of which struck it, the ironclad New Ironsides joined in the attack, the fort was silenced, over 100 of the garrison killed and wounded, and an assault was ordered for the 7th. When morning came the fort had been abandoned and its garrison, with that of Fort Gregg, had escaped, leaving the entire island with the 25 guns of the two works in Union possession. The Union loss on Morris Island (10 July–7 September) was 381 killed, 1,372 wounded, and 565 missing, an aggregate of 2,318; the Confederate loss was 157 killed, 674 wounded, and 238 missing, an aggregate of 1,069. Consult: 'Official Records,' Vol. XXVIII.; Gillmore, 'Engineer and Artillery Operations Against Charleston, 1863'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Fort Wal'la Wal'la, Wash., a United States military post, established in 1857, at Walla Walla.

Fort War'ren, Mass., a United States military post on Georges Island, near Boston, established in 1837. During the Civil War it was used as a military prison.

Fort Washington, Md., a United States military post on the Potomac River, near Washington, D. C. It was established in 1815 as Fort Warburton.

Fort Washington, N. Y., the site of a former fort at 182d Street, New York, overlooking the Hudson River. It was built prior to the Revolution and surrendered to the British under Sir William Howe (q.v.) 16 Nov. 1776, after a terrific engagement. The loss of the fort caused consternation throughout the United States. Consult: De Lancey, 'The Capture of Fort Washington' (1877).

Fort Wayne, Ind., city and county-seat of Allen County. Situated in the northeastern part of the state, 102 miles northeast of Indianapolis, upon the Saint Joseph, Saint Mary's and Maumee rivers, confluence of the first two within the city's limits forming the last named. It is notable as a railway center, the following lines passing through or terminating there: Pittsburg, Fort Wayne & Chicago, of the Pennsylvania Railway system; Wabash; New York, Chicago & St. Louis; Grand Rapids & Indiana; Cincinnati, Richmond & Fort Wayne; Lake Shore & Michigan Southern; Fort Wayne, Cincinnati & Louisville; Cincinnati, Hamilton & Dayton. The city is central in a rich and highly developed agricultural region that produces abundant crops of the cereals of temperate climates. Considerable tracts of hardwood timber yet remain in what once was one of the most richly wooded sections of the northwest.

Manufactures.— These cover a wide range and embrace numerous establishments of large magnitude. In the various industries 10,000 operatives were employed in 1903. The manufactures include carwheels, Corliss and other steam engines, boilers, gas engines, gas machinery, iron and steel bars, freight and passenger cars, locomotives, electrical machinery and electrical fittings and fixtures, hosiery.

gloves, caps, oil tanks, organs and pianos, women's garments, road construction machinery, carriages, wagons, washing machines, furniture, paper boxes, lumber, sash, doors, malt liquors, cigars, harness and leather findings and a considerable variety otherwise of products in iron and steel, wood and textile fabrics. The value of the manufactured products in 1903 was $15,000,000.

Municipal Service and Improvements.— The municipality owns and operates the public waterworks system, an abundant supply of pure water being procured from wells bored deeply into the rock, and distributed by means of two thoroughly equipped pumping stations. There is a handsome and substantial city hall and police headquarters and eight modern and thoroughly equipped houses advantageously situated shelter the city fire department. The public buildings in the city are a court-house (county), completed in 1902 at a cost of $1,000,000; United States post-office and court-house; a public library erected at a cost of $100,000 through a donation by Mr. Andrew Carnegie; county jail; high school and manual training school building, completed 1904 at a cost of $300,000, and 15 grammar and ward school buildings, most of which are of very modern construction and beautiful architecture.

Schools and Colleges.— The free-school system maintained by the city embraces a high school and manual training school, a training school for teachers, and 15 ward and grammar schools, together with kindergarten departments. The free-school system is governed by a board of three trustees, elected triennially by the city council, the immediate executive head of the schools being a superintendent elected by the board. There are 6 Roman Catholic parish schools in addition to a high school for boys and an academy for girls; and 6 German Lutheran parochial schools. Concordia College, founded in 1850, is seated in Fort Wayne, and is maintained under auspices of the German Lutheran church. Near the city is an academy maintained under auspices of Catholic sisters, an academy for the higher education of young women. Among other institutions of learning are a college of medicine and surgery, a conservatory of music, a school of art, two business colleges, and a school of oratory, expression and physical culture.

Churches and Charities.— There are 47 religious congregations and 40 church edifices, many of them beautiful and costly examples of ecclesiastical architecture. The congregations are distributed denominationally as follows: Baptist, 2; Christian, 3; Congregational, 2; Episcopal, 2; Evangelical Association, 1; Evangelical Lutheran (English), 3; Evangelical Lutheran (German), 4; German Lutheran, 3; Methodist Episcopal, 5; Free Methodist, 1; African Methodist Episcopal, 1; Presbyterian, 4; United Presbyterian, 1; Reformed (German), 2; Roman Catholic, 7; United Brethren, 1; Baptist Brethren, 1; Christian Science, 2. The city is the see of the Catholic Diocese of Fort Wayne. The city has a central charities organization and many of the religious congregations maintain comprehensive societies for charitable and benevolent work.

Hospitals and Asylums.— There are 4 large hospitals of modern equipment, 1 non-sectarian, 2 under Roman Catholic and 1 under German Lutheran administration. There are 3 orphan asylums, two sectarian and 1 maintained by the county; home for emergencies and a refuge for women. Just beyond the city limits is the State School and Home for Feeble-Minded Youth of both sexes and home for epileptic women.

Finance and Banking.— There are 4 national banks, 3 private banks, 3 trust companies and 6 building and loan associations. The national banks have (June, 1904) a total capital of $1,050,000, total surplus of $771,879 and total deposits of $6,053,992. One of the banks is a government reserve agent. Trust companies have (June, 1904) a total capital of $900,000, total surplus of $105,105, and total deposits of $2,095,835. Private banks have total individual responsibility of $1,000,000.

Parks and Cemeteries.— The total public park acreage of the city is 95.49, distributed as follows: Swinney, 45.24; Lawton, 31.20; Reservoir, 13; McCulloch, 4; Hayden, 1.12; Piqua, .75; Old Fort (site of stockade built by General Anthony Wayne in 1794), .18. There are 5 cemeteries — Achduth Veshalom (Hebrew), Concordia (German Lutheran), St. John's (German Lutheran), New Catholic (Roman Catholic), and Lindenwood (non-denominational).

Government.— The city is governed under a special charter, conferred by the state legislature, which provides for a municipal legislative body of two councilmen from each of the ten wards, chosen biennially, a mayor and city clerk, chosen quadriennially, and a board of waterworks' trustees, chosen biennially. The board of public works, board of public safety, health commissioner and park and street superintendents and city attorney and city comptroller are appointed by the mayor. Council fixes all municipal tax levies and appropriations and has final approval of all contracts and franchises.

Trade and Commerce.— Fort Wayne is an important and flourishing trade centre and has a commerce that embraces extensive wholesale and jobbing operations in dry goods, groceries, light and heavy hardware, drugs, millinery, paper, etc. The total volume of wholesale trade in 1903 had a value of $9,000,000. The total post-office receipts for 1903 were $177,496.

History.— The city takes its name from a fort built on a part of the present site of the city by General Anthony Wayne in 1794. The place, however, had a history that long antedated this. There is evidence that La Salle had visited the locality as early as 1670. It was the site of Ke-ki-on-ga, the "Central City" of the once powerful and warlike Miami Indians. At different times during the seventeenth and eighteenth centuries French and English had military posts at Ke-ki-on-ga. In 1790 General Harmer led an expedition against the Miami City, but was signally defeated in a fierce engagement on the Maumee River within what is now the limits of the city of Fort Wayne. In 1791 General St. Clair in a similar expedition was overwhelmed a short distance southeast of Fort Wayne by the Indians under the famous Miami Chief, Little Turtle. General Anthony in 1794 headed a third expedition against the Indians in the Northwest and after utterly de-

feating them at the battle of Fallen Timbers on the Lower Maumee in Northwestern Ohio, marched to Ke-ki-on-ga and in September of that year built his stockade on an eminence overlooking the confluence of the St. Joseph and St. Mary's rivers. There was no further serious trouble within the Indians until August 1812, when the conspiracy of Tecumseh and his brother The Prophet ensued in a close investment of Fort Wayne and its meagre garrison. The siege was vigorously pressed for about two weeks, when it was raised by a force that had been dispatched to relief of the beleaguered garrison. Fort Wayne at once assumed importance as a trading post and in 1825 the town itself was laid out. Its growth, however, was slow until 1840, when the Wabash and Erie Canal was completed, giving great impulse to growth. In 1840 Fort Wayne, then with a population of 2,145, took rank as a city. Between 1850 and 1860 began the era of railroads, when growth received fresh and powerful impetus and Fort Wayne came to be one of the foremost industrial and commercial cities of the State.

Area and Population.—The land area of Fort Wayne in acres within the corporate limits of the city is 4,041.7, or about 6 1-3 square miles. Pop. (1900) 45,115; (1890) 35,393; (1904, est.) 56,290.

HARRY M. WILLIAMS,
Managing Editor Fort Wayne 'Sentinel.'

Fort William, Canada, town of Algoma District, Ontario, on the Kaministiquia River, 1½ miles from Thunder Bay, 426 miles east of Winnipeg. Fort William was founded in 1805 and named for Hon. William McGillivary. It is at the head of the Great Lakes system of navigation, a terminus of the Canadian Pacific railway, and has splendid shipping facilities. Gold, silver, and iron ore are found in the neighborhood. The Canadian Pacific has expended more than $5,000,000 in the erection of large wheat elevators, which have a capacity of 7,950,000 bushels. Fort William has several churches, a fine new town-hall, high school, central school, public schools, and daily and weekly newspapers. It has iron foundries, machine-shops, flour-mills, and other manufactories. Pop. (1901) 3,633.

Fort William Henry. See COLONIAL WARS.

Fort Worth, Texas, city, county-seat of Tarrant County; on Trinity River, and on the Fort Worth & D., the Fort Worth & R. G., the Gulf, C. and S. F., the Chicago, R. I. & P., the Texas & P., the Missouri, K. & T., Houston & T. C., International & G. N., Saint Louis & S. W., and Red River, T. & S. R.R.'s; about 32 miles west of Dallas. It was organized as a town, under general State law, in 1873, with a population of 1,100; and chartered as city in 1882, with a population of 11,285. The government is vested in and administered by a mayor, nine aldermen, city marshal and assessor, and tax collector, elected by popular vote; city secretary, auditor, treasurer, superintendent of waterworks, chief of fire department, street commissioner, and other subordinate officials elected by the city council. The city owns and operates the waterworks and the street-lighting plant. The city-hall and fire halls are commodious structures of stone and brick. It has over 80 miles of improved streets; 68 miles of sewers, and nearly 100 miles of pipes. There are eight national banks and two trust companies and savings banks, with a capital and surplus of $2,965,353, and deposits amounting to $7,928,577. Fort Worth is the centre of the cattle interests and grocery trade of the State, and of the grain and milling interests of the northwestern portion of the State. Having 11 trunk lines of railway with 16 outlets, it is the greatest distributing point of the Southwest. The flour mills, breweries, packing houses, and foundry and machine works are the principal industrial enterprises of the city. The county court-house is constructed of granite and marble from the Texas quarries. The passenger station is one of the largest and finest in the country in a town of this size. The banking houses, colleges, medical schools, high-school building are costly and imposing structures. Fort Worth has one high-school building, 11 ward school buildings, Fort Worth University, Polytechnic College, Medical School, Saint Ignatius Academy, and the public free library. There are 42 church buildings, representing all denominations. There are also sanitariums, a free kindergarten, Rescue Home, a local Benevolent Home for Children, the Saint Joseph's Infirmary, and the State Masonic Widows' and Orphans' Home. There is one public park of 50 acres, several small parks, and three cemeteries.

The growth of population has been rapid but not unhealthful. The vital statistics show less than nine deaths to 1,000 for a series of years. There are no local causes for disease. It is nearly 700 feet above sea-level, and is fanned by cooling gulf breezes during the summer, making a pleasant and healthful place of residence. Pop. (1890) 23,076; (1900) 26,688; (1903 est.) 45,000.

B. B. PADDOCK,
Fort Worth, Texas.

Forth, fōrth, a river of Scotland, rising on the east side of Ben Lomond, in Sterlingshire.

Forth Bridge, The. See BRIDGE.

Fortifications («to fortify,» precisely following its Latin derivative, is *facere fortis*, «to make strong»), such artificial positions as are required for military use. Primarily, such positions are for defense; but no less important in operations against defensive works already established by an enemy. Two definitions, used in another connection, but officially approved by the late Col. Edward Bruce Hamley, president of the Queen's Staff College, London; by the late William T. Sherman, general of the American army, and by the late Theodore D. Woolsey, president of Yale University, indicate the drift of the subject-matter under immediate notice.

1. «Military Science,» the mother of all such constructive relations, «while that of force, as in all police or other protective law, is founded upon the adaptation of all possible means to meet an impending crisis. The wisdom of the statesmen differs only in degree from that of the ordinary householder, and both alike aim at a wise constraint of offensive elements and the radication of such as are adapted to that end. Hence, to meet the demand adequately, wisely, and successfully, thereby to secure ultimate public safety, is the expressive logic for personal action, municipal action, and military action. The brain-power is banded to various shaftings, and the mental processes differ by virtue of different adaptations, but the prime activities are

the same." The citizen who is to be protected, equally with the technical expert, should be sufficiently interested to become actively sympathetic in whatever relates to the national defense.

2. "Military engineering," as the second preliminary definition, "is the application of mathematics and mechanics to the maintenance, or the reduction of fortified positions, the interposition, or the removal of artificial obstacles to the passage of an army, and the erection of suitable works for the protection of territory or troops." Rival systems of practical military engineering, stimulated by successive inventions, have so multiplied their technical terms, borrowed from many languages as well as from their authors, or local customs, that the ordinary citizen who desires but a suggestive history of that progress would be compelled to have both lexicon and scientific text-book by his side in order to fathom their mysteries.

The origin of artificial defense and the development of primitive types until isolated families or groups of families gradually crystallized into independent and self-supporting nations, are so familiar to the willing reader of general history as to need but brief mention. The defense of the retired domicile from wild beasts and the forays of irresponsible robbers was as distinctly a matter of prime necessity for the head of a family, as for the tiger, the wolf, or the robber, to find in thicket, cave, or mountain fastness, his own protection from pursuit and punishment. The simplicity of weapons of offense and defense harmonized with the demand for artificial protection against violence of every kind. The bow-and-arrow and javelin, with the sling, for long range; and the knife, sword, club, and battle-ax, of stone or metal, for hand-to-hand conflict, required protection from each. The hide-bound protective shield at first, and later, the more impenetrable metallic armor, were but types of the development which gradually evolved the fortification proper, in proportion as weapons enlarged their range of stroke as well as their destructive effect. The shield was, in fact, both the simplest as well as the true prototype of defense against superior force. Under its cover, one man could hold several antagonists at bay. When flanking assailants neutralized its protective value, men, in groups, enlarged its functions, until, by the hollow square, or the solid mass, a phalanx could withstand the onset of many times their number. Their uplifted shields were like a modern bombproof against falling flights of arrows while the men, thus protected, supplied constant reinforcements for those in front who were disabled by ax, sword-thrust, or javelin.

Social Conditions.— The sanctity of the home-domicile was, from earliest times, the basis of its protective and stubborn defense. The Hebrew, the Chaldæan and Egyptian traditions and records, as well as those of Greece and Rome, still later, perpetuated that philosophy; and the ancient German, Goth, Moor, and Briton, through all their feudal, racial, and political rivalries, alike honored precepts thus coincident with the first groupings of families for a common defense.

The "Home, as a Castle," was not merely of British conception, but a vital factor in human happiness and safety. With the gradual accumulation of both numbers and wealth, the protection of the many became the duty of each individual, and the assertal of tribal or national superiority, on the part of the more numerous and powerful, engendered such competitive conflicts that centres of influence exacted more systematic and elaborate national defenses. Excursions against other states, and responsive invasions, were the means employed by ambitious rivals to increase their territorial domain and subject inferior peoples to their dominating control.

By this complex evolution of warring peoples, led by daring spirits, systems of more speedy intercommunication, transportation, and the accumulation of war material, arms and food included, became indispensable to the public safety, until warehouses, detached strongholds, internal citadels, and organized armies were the result. All draft animals and beasts of burden were utilized for attack or defense, so that the horse of the warrior might, in turn, drag the war chariot with its out-reaching scythe blade; and both camel and elephant carried miniature castles upon their backs for archers and spearsmen, mounted above.

Military Conditions.— The fundamental principle in all substantial fortifications has been the effort to ensure a destructive fire upon every available avenue of approach to the place protected, and, with this, to secure such enfilading and cross-fire that no position remained unprotected. Human competition has ever been the same in essence, and where no reliable historic record responds to inquiry, exhumed ruins, memorial tablets, and deciphered hieroglyphics, solve all doubt as to the proposition that military science and military engineering belonged to all human activity, ever the same in principle, and differing only in application and development. The paramount object was, to eliminate disparity in physical strength and enable the few to resist the many. Personal combat at short range came to a limit as people gathered in cities; and breastworks first, and then solid walls, became essential in proportion as the numbers of non-combatants gathered there for shelter and safety.

Illustrations.— The most primitive forms of which the earth retains an outline were oval, or circular, mounds or entrenchments, even before walled towns were constructed, these being more compact for defense of each front, or exposure, by defenders from the centre. More modern defenses, especially against savages, of the blockhouse type, had this peculiar value, and even women could prepare arrows, or load weapons, for defenders who in turn acted in all directions.

Such defenses were upon commanding positions, to guard against surprise, with wood and water always within easy reach. These were transient, and usually against predatory or nomadic peoples, of no greatly superior strength. As populous centres increased, defenses were of stone or brick walls of such height and breadth that large armies could mount their summits and chariots convey men and munitions from one point of defense to another. These were surrounded by a flooded moat, or ditch, and were easily made impregnable against an army of equal force and equipment. Towers at angles of quadrangular defenses, and to protect gates of entrance, exit, or for sallies upon an enemy, were supplied with lifting or draw-bridges, and mines and tunnels were excavated under the ditch itself for more ready surprise

of a careless adversary. Cæsar describes a mine which he advanced beneath both ditch and wall, supporting the wall with timber until he could fill the shaft with dry branches, and upon setting all on fire, the wall crumbled, and he stormed the breach.

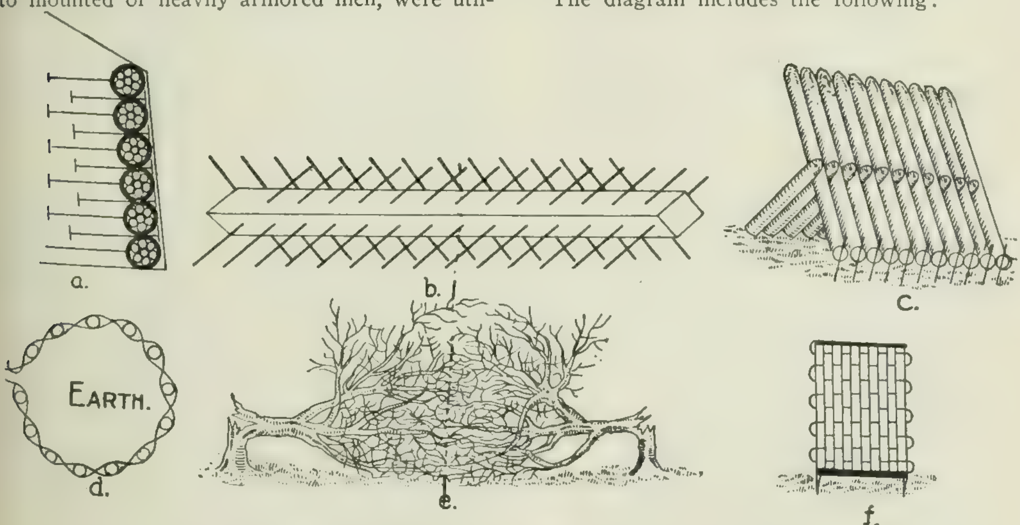
Great machines were made by which to reach engirdling camps, or crush assailants who attempted to bridge, or fill the ditch, and thus gain access to the wall summit by scaling ladders, when unable to force the gates. The catapult and ballista were two of these, which, on the principle of the spring-board and sling, and the increased length of its vibrating arm, the radius of its centrifugal force, would hurl heavy stones at a great distance and send blazing balls of tallow, or pitch, congreve-rocket-like, to destroy a hostile camp.

To meet these mighty forces, corresponding engines of swinging, battering timbers, called "rams" from the device curiously shaped in front, would strike a blow equal to the force of a 30-pound shot, powder-driven. Movable towers, protected by wet hides from fire, were advanced, putting its archers upon a level with those upon the city wall. Titus, at the siege of Jerusalem, brought such towers sufficiently near that, with grouped lances and timbers, he bridged the intervening distance and fought on the city wall itself.

With the increase of territorial domain, subordinate but correlated military engineering had its special province. Territorial boundaries, mountain passes, sharp defiles, river fords, and watercourses, had to be guarded by detached outworks, and these must have close relation, each to the next in order. Swamps, impervious to mounted or heavily armored men, were utilized, and their narrow approaches, or shallow portions, were so fashioned and guarded as to keep assailants from fire-range upon defenders. Outlying summits were made signal stations, both against herds of wild beasts, which in early times were as dangerous to flocks and herds as robbers or hostile invaders were to the inhabitants themselves. Bonfires and flaming torches, as well as a chain of vocal and flag-shaking sentries, became adjuncts to a better external defense. Cæsar had "soldiers who shouted to each other until the alarm reached his camp, through a great distance." The ancient Persians, and later the Scotch and Swiss, were noted for this signal service, but no experience of the kind has such memorial emphasis as that described by the Hebrew prophet Isaiah, who saw in the system of his own people the forecast of a distant future, when "the watchman, from peak to peak, should see eye to eye, and together lift up the voice" in jubilant rejoicing over universal peace to be proclaimed the world around.

Before treating upon fortifications proper, within the limits of this article, there are subsidiary defenses, pro and con, which have antiquity for their use, and the latest of modern battlefields for their equally advantageous application to-day. Their names are familiar as household words, and yet are generally treated as simple types of barbarous usage, before firearms and the sphere of smokeless powder and electricity alike defied stone and iron defenses, and sent destructive missiles beyond human aim and human sight. A few plain illustrations indicate many which had effective use during the American Civil War of 1861–5.

The diagram includes the following:



(*a*) A parapet forming the front of a modern fort, with fascines, behind which earth is packed as they rise, one upon the other, and are locked into the trampled or rammed earth by hoop-poles or common sticks, the fascine being but a bundle of sticks, hooped, or tied with chain or rope.

(*b*) The Chevaux-de-frise, an iron cylinder, or a trunk of a tree, filled with spikes of iron or wood, to which, in case of wood, sword blades, and bayonets may be applied.

(*c*) Inclined and sharpened posts, really an inclined palisade, or stockade material, fastened to the earth, and its parts fastened together by chains or ropes.

(*d*) A basket, open at both ends, made by inserting stakes in the ground in a circle, braiding them by willow, or other flexible green wood, and when filled with earth, forming material for building a parapet, or strengthening a low breastwork.

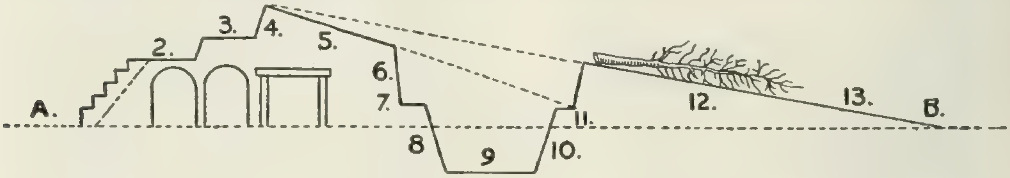
(*e*) A sample of felled trees, across roads, creeks, ravines, and obstructive to approach by horse or foot.

(*f*) A species of hurdles, when horizontal sticks, or poles, vertical or horizontal, are interlaced by willow, brush, or modern wire (as in Cuba), making a fence of stout resistance, and holding assailants under deadly fire.

The farmer's common harrow also was utilized extensively.

All these «obstacles» have been utilized in filling a surrounding ditch to prepare the way for storming the fort itself. Only old soldiers who participated in the American Civil War, or the Spanish war, can realize the extent of their use in actual service, and Cæsar himself, when establishing winter quarters, writes: «Having bastion system, which must under no conditions be neglected in any defense against a superior force.

The Bastion.— The *profile* thus noticed obtains throughout the fort, even when it assumes other forms than that of the simple quadrangle. The *pentagon* and *hexagon* have generally been



A.— B. Level of parade ground, occupied by buildings and by bomb-proof magazine and hospital, so far as the same are not included in chambers beneath the parapet.

(1) The interior slope of the parapet, on a slight incline for easy ascent, or with steps, and these broken at intervals for entrance to chambers beneath.

(2) Level ground, or platform (*terre-plein*), for troops supporting guns.

(3) A step (*banquette*) for gun.

(4) Parapet.

(5) Exterior slope of parapet.

(6) A facing of wood, or masonry, or of *fascines* linked into the earth as it is built (see OBSTACLES, *a*), to hold the parapet in place, and called the *revetment*.

(7) A narrow shelf, path, or *berme*, between parapet and ditch.

(8) The side of ditch next to parapet, *scarped* down at an angle, and therefore called the *scarp* or *escarp*.

(9) The ditch itself, and faced with masonry in permanent works.

(10) The opposite side of the ditch, and therefore called the *counter-scarp*.

(11) A path, or border (*berme*), commanded by rifles from the parapet and used for defending the interior slope of the *glacis*, and for sallies through openings outward, or beneath, and called the *covered way*.

(12) The superior slope of the covered way, called the *glacis* because of its smooth descent to the general surface without the fort.

(13) *Abattis*, felled trees, with shortened and sharpened branches, directed outward, with the butt securely fastened at head of the *glacis*.

cut young trees and bent them, by means of their numerous branches extending on the sides, and the quick briars springing up between them, made these hedges present a fortification like a wall, through which it was not only impossible to pass, but even to penetrate with the eye.» It will be noticed, later, that at the battle of Franklin, Tenn., during the Civil War, prickly osage-orange was a material factor in a successful defense.

Fortifications Proper.— Impregnable fortresses no longer exist. All along the trend of history the term has been fanciful and merely relative. Even Gibraltar, as an isolated fortress, aside from its political and moral force, has its military value as a well located rendezvous for troops and shipping, and the theoretical guardian of the passage from the Atlantic to the Mediterranean Sea. Of this passage, it has no supreme control, without a sufficient naval contingent. In all other respects, it simply defends itself, with no interior at its back, and when without control of the sea, by fleets, imprisons a valuable garrison. In modern times the stationary must yield to the mobile. The art of destruction is more potent and far-reaching than the skill of man to preserve his own workmanship.

Reference has been made to towers, as well as walls, and even after the invention of gunpowder, systems of defense, as well as isolated forts, had their progressive development, in which the United States followed European antecedents and the progressive systems of one general type until the Crimean war largely revolutionized modern practice. A single profile of a cross-section of defenses, as matured during more than two centuries, is sufficient for this article, with an accompanying sketch of the used, leaving to the province of a simple *redoubt* the simpler outline of defense. Very early *projections* were *built out* from these fortified positions, at their angles, hence their name, *bastion*, to give a wider range of *outward* fire, as well as a more direct *flanking* fire, along the walls covered by these projections. These walls were called *curtains*. The containing lines of the salient angle were called *faces*, and the lines connecting the faces with the main wall were properly called *flanks*.

Before these curtains, or main walls, minor defenses were added, whether *ravelin* or *teneille*, and these might be again covered by ditch and glacis, subordinate to but protected by the superior fire from the main position. A diagram of the simple bastion, similar to those in use around Washington in 1861–5, and common to all modern works, is added.

Inland Positions.— Isolated defensive positions of inferior type have been sufficiently noticed. Their history is common to every mature reader. Transient and movable defenses will be noticed in connection with army movements, although earth defenses already partake of the character once referable only to walls of solid masonry. As against a foreign enemy, the United States has more need of coast defenses than many other nations, as her commercial centres are largely upon the sea; but, as a nation, her capital may be classed with those of other countries, which look to frontier defenses for a substantial protection against foreign attack. But forts, on a frontier, may be ignored, *turned*, *left in the rear*, as when Paris was taken, while idle thousands of her defenders were lost to the national defense. Hence isolated capitals and commercial inland cities must have detached, but closely related outer defenses, beyond the reach

of immediate assault or bombardment by an invading enemy.

During the American Civil War, when internal forces attempted the capital, the city of Washington furnished the best type of a city so assailed; 43 forts and batteries, and 36 additional batteries, mounted 99 rifled cannon in *embrasures* and 25 *in-barbette*, as well as 113 smooth-bore in *embrasures* and 147 *in-barbette*, making a total of 384 guns. But additional platforms were erected and made ready, so that a total of 743 guns could confront any new phases of attack. By direction of Gen. Scott, then in command, the writer was directed to visit all these works during their establishment, and at the time opposing forces were displaying their flag upon Munson Heights, within view from the outer works. The *cordon* of forts, batteries, stockades, block-houses, redans, and bridge-heads was complete.

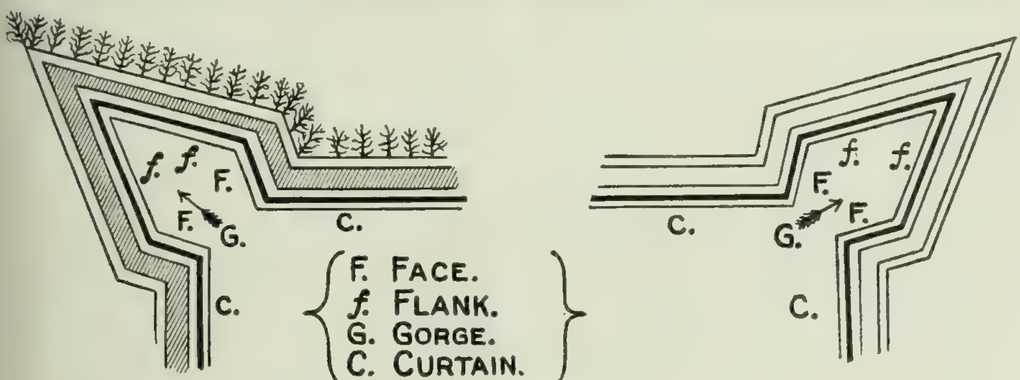
Sea Coast Positions.— Sea coast defenses, from earliest times, have been of massive masonry. Many that still frown innocently upon the American coast, between Boston and New Orleans, are chiefly monumental of obsolete defenses against hostile fleets. Two or three tiers of guns, in as many series of arched chambers, called *casemates*, with a fourth row mounted upon the exposed parapet, or rampart, were expected to cope successfully with the old 120-gun ship-of-the-line. Fort Moultrie, in rude form, in 1776, withstood resistance, with log ramparts, better than with later ones of stone, as in 1861, when sand bags were introduced to support its powers of resistance.

Modern guns, supplied with new explosives, shatter the hardest rock and splinter the toughest timber. The earth alone, and especially sand, will disarm the penetrating projectile of the present day. A single illustration harmonizes with the advent of the new system. Upon the trial of the first 81-ton gun, built at the Woolwich Machine Shops, near London, a mound of sand was erected on the proving grounds against the Thames embankment. Six times a bolt of 1,300 pounds was fired, increasing the powder-charge from 170 to nearly 300 pounds. When the last bolt was dug from the butt, it had entered but 47 feet, 5 feet under the surface of the sand.

Standard tables have long been under consideration to indicate the comparative resistance of earths and gravel, but in all cases, sand, which quickly closes upon what it receives, has been the most obdurate to defy deep penetration. And now, upon the British as well as the American coast, modest mounds or piles of sand present a very indistinguishable target, while, to the nearer view, the abundance of wild grass, daisies, buttercups, and tansy, is its only relieving feature. And yet behind each sand pile, in separate sections, each for a single gun, is to be found the most formidable land defense of modern times. The former «42-pounder» of the casemate and the main battery of a ship-of-the-line, and weighing but 8,750 pounds, is replaced by a gun 40 feet in length, weighing 58 tons, and capable of sending a shot of more than one half a ton, charged by 475 pounds of powder, nearly or quite 7 miles, once each 3 minutes.

A quick release drops the gun below the parapet for reloading. Each battery, however many guns may fall within its control, is operated at will, as if but a single piece were in position. A revetment of solid masonry holds the sand piles in position, and beneath the gun-carriages, which are exposed to the weather, are the necessary passages which communicate with all sections of the battery. Magazines and tackling for handling shot and shell are also under bomb-proof cover, and both placement and independent action of each piece are complete. At suitable distance, but within a practical community of range through adjustable range-finders, sand «pits» for mortars are located. Each mortar revolves upon its own platform, and groups of fours, in closely related pits, can be handled, through signal communication, in connection with the heavy gun batteries, and command a joint delivery of fire upon the same hostile force. As with the gun placements, each mortar pit is independent, in magazine and other appliances, for efficient service.

Floating Batteries.— The battleship as well as the stone fort has also changed character, and become a floating steel fortress. An encircling squadron, in concave formation, can concentrate a weight of metal upon an exposed land defense that cannot be returned by a full equivalent. Other floating batteries, the peer of any, must intervene in support of the land defense, with auxiliary «torpedo boats» and «destroyers.» The contingency of landings to take open batteries, in their rear, is increased by swift steam transportation, and the gravity of defense is more serious in proportion as a nation, having a large coast to defend, has distant, dependent territory, equally demanding a mobile naval force



CLASSIFIED DEFENSES.

for its defense. The submarine boat, the dirigible balloon, and wireless telegraphy, menace modern commercial ports with visitations only less fatal than those of the earthquake and volcano.

Field Fortifications.— This branch of military engineering has a duplex character, but of quite uniform general requisites. They may either constitute the chief defense of a city, or neutralize the numerical superiority of an enemy in the field by wise adjustment of their lines. Two illustrations are suggestive of their value:

On 5 April 1862, when both officers and men were alike inexperiened in operations of war, between large armies and over extended territory, remote from their general base, the Federal army was confronted at Pittsburg Landing, Tenn., by a largely superior force under command of Gen. Albert Sydney Johnson, of the Confederate army. Skirmishing occurred during the day; but Gen. Grant, the chief Federal commander, believing, as he advised his superior, Gen. Halleck, and states in his 'Memoirs,' that there was hardly the slightest possibility of attack, as reinforcements were on the way to his support, failed to entrench. On the following morning, an attack was made in force, driving the Federal army back to the Tennessee River, where the arrival of Gen. Buel's division alone averted a serious disaster. Neither Gen. Grant nor Gen. Sherman committed a similar error of judgment later in the war.

On 30 Nov. 1864 Major-Gen. John M. Schofield retired from Pulaski, closely followed by the two-fold superior army of Gen. Hood. After fighting daily for three weeks, and after frequent rains, leaving with night he marched directly to the city of Franklin, Tenn., where in the bend of the Harpeth River, he gave battle. Between morning and 3 o'clock of that afternoon, when the combined Confederate divisions made an impetuous assault, his wearied soldiers had so utilized the shovel, pick, fence-rails, locust trees, and osage-orange hedges that, behind their shelter, he repulsed the assault, inflicted a loss of nearly 7,000 men upon his adversary, including 12 general officers, in killed, wounded and captured, and safely fell back upon Gen. Thomas, at Nashville, with a loss of but 20 wagons and less than half the casualties of his opponent.

Similar entrenchments had their ancient types in those of Cæsar, who invariably established his camp within a quadrangle surrounded by a rampart of the height of from 7 to 9 feet, with gates on four sides, and sufficiently large in area to include all animals and supplies belonging to his command. On one occasion, seeking winter quarters, he carried a parapet, with ditch, 16 miles, from Lake Geneva to Mount Jura, 15 feet high, and with various small redoubts on the line, so that practically he multiplied his numerical strength three-fold. In modern times, the Crimean war introduced a system of earthworks which withstood a heavy fire before which granite walls had crumbled.

Reduction of Fortified Positions.— Field works, against a fortified position, assume an attitude of counter-defense, as well as a cover for siege or assault. The relative strength of the assailing force belongs to another branch of the military art; but it must be proportionately greater, as the circumference of the investment enlarges, and must prove able, at any vital point, to meet any sally of the garrison, either by numerical superiority, or its equivalent, in artificial defense. Inequalities of the ground, commanding summits, a safe communication with the base of supply, are *strategic* conditions; but all are parts of the position to be assured. After estimating accurately the intervening distance, and at what nearer approach the encircling ditch may be filled, or bridged, for assault, the advance begins. A mortar battery in the rear, or guns in an elevated position, may play upon the intervening space to protect the *pioneers* in locating rifle-pits, while establishing the *first line* of works. The general advance, as thus initiated, is that of a ship beating against the wind, and the zig-zag course adopted borrows its name, *traverse,* from marine usage. Successive files of men dig these traverses, throwing the earth outward to the front, as a cover from fire, and thereby open a way for the advancement of guns, as well as of engineers and troops. A second line, *parallel* with the first, is opened to the right and left, where guns are at once placed in position. A third line, or *parallel,* is so planned as to place the defensive works at the mercy of the besieger. At Yorktown, Va., in 1781, with a river base and no sufficient escape by sea, the effectiveness of the advanced parallel compelled surrender. At Yorktown, in 1862, with works open at the rear for retreat, the scientific soldier in command rightly assumed that the scientific soldier at his front would attempt no assault until his third line was perfected and armed. Hence, he wasted the ammunition of the besieger to the last safe limit, and withdrew his own force in good order, to suit himself.

To this suggestive summary of fortifications, for the unprofessional reader, must be added the statement, that topographical and geographical features largely dominate in matters of attack or defense. *Boundary* lines, whether of mountain or river; interior or coastwise positions; the control of only one or of both banks of a navigable river, give character to defenses and methods for their reduction. Notable illustrations are found in the Dardanelles, the entrance to the Baltic Sea, the Suez Canal, and, prospectively, of vast moment, the Inter-Oceanic Canal in Central America. In proportion as Nature lends her secrets of omnipotent power to the inventive genius of man, so will fortifications change their forms and relations until nations shall control the secret which should inspire all such warlike devices, that of substantial and universal fraternity and peace.

Henry B. Carrington, U. S. A.

Fortifications, Modern Seacoast. The modern science of seacoast fortification wrought marvelous changes during the years intervening from 1893 to 1903. All the great maritime nations expended enormous sums of money to better fortify their coast lines. The United States after 16 years of labor practically completed, during the summer of 1903, the most costly and the most substantial and powerful system of seacoast fortifications in the world. The great improvements made during the latter part of the 19th century in the construction of heavy guns rendered it necessary to revise the system of fortifications formerly in vogue. Iron and steel turrets have taken the place of masonry

on exposed sites, where earth cannot be employed to advantage. These turrets are revolving cupolas with spherical roofs, and in most instances even the largest guns are mounted on disappearing carriages. This is essential since the forts are now called upon to prove their prowess against steel-plated warships.

Great Britain concluded the rebuilding of her forts with iron and steel as long ago as 1880, at a cost of $37,000,000 for nine harbors alone. At Dover, England, solid iron turrets of enormous thickness have been built to carry two 80-ton guns to each turret. Steel cupolas of the Gruson pattern to the number of 28 have been constructed since 1890 in various harbors of Germany, Austria, Belgium and Holland. In 1900 the Italian government placed an order for two of these cupolas to mount two 120-ton Krupp guns each, for the defense of the naval station at Spezzia. The order was conditioned on a test shield or segment of the cupola resisting three shots of the Armstrong 100-ton gun — a test which it successfully withstood, though the same gun had pierced every other known form of construction.

The 20th century fortifications of the United States seacoast finished in 1903 are excelled by those of no other nation in the world. The work was outlined if not actually begun in 1886, when a board of military engineers proposed a system of steel turrets, armored casements, barbette batteries, mortar and floating batteries, and submarine mines. So rapid was the advance of military progress that the original plans were largely changed and modified. The vastness of this work and the great cost can be imagined when America has 5,558 miles of seacoast demanding protection of the most improved kind. Between 1886 and 1903, three fourths of the work was finished, and yet huge rifles and mortars to the value of $15,000,000 were required to complete the undertaking. A modern, high-power coast-defense gun is a huge and elaborate machine, the effective management of which requires great skill. A single 12-inch rifle for one of the modern forts cost $45,000, its carriage $41,000, and the emplacement of concrete in which it stands $60,000, or a total initial cost of $146,000. The total expense for each modern fortress amounts to over $2,000,000. The 20th century fortress is not a walled enclosure as of old, but a hole in the ground, or rather a series of holes called emplacements, built of concrete, and each of them containing one or more guns. No lofty, menacing structure strikes the eye of the observer who approaches the works, but instead there is likely to be rolling greensward with shrubbery, suggesting rather the skill of the landscape gardener than that of the military engineer. The real protection consists of 30 feet of iron and masonry and 30 feet of earth, which form a plane sloping outward, so that any projectile striking is promptly buried or glances off harmlessly.

Fort Warren, on Georgies Island, in the harbor of Boston, Mass., which is one of the most notable fortifications in the world, has an armament of 30 guns and mortars. Several of the guns are 12-inch rifles, but the exact character of the armament is kept carefully secret by the military authorities. The mortars are arranged behind the cannon and are capable of throwing explosive shells for a distance of three miles, and with sufficient accuracy to destroy a vessel at that distance. The projectiles carry an enormous charge of maximite which is three times as powerful as gunpowder. Over 600 of these mortars, each of 12-inch calibre, are distributed among the various coast fortifications. They are a vast improvement on the old-style mortars of cast iron with steel hoops. A mortar of the new, modern type is 13 feet long and weighs nearly 30,000 pounds, and requires a charge of 125 pounds to send its conical projectile on its deadly mission. Weapons of this character have not yet undergone a test in actual war. The modern 12-inch rifle is 40 feet long, weighs 104,000 pounds, requires a charge of 520 pounds, and fires a 1,000-pound projectile a distance of 9 miles, with a velocity, upon leaving the muzzle, of 2,100 feet per second. The 12-inch gun could send the same projectile 14 or 15 miles, if the muzzle was sufficiently elevated, but it would be useless in aiming at an enemy who is beyond the limit of vision, for a ship is out of sight only seven miles away owing to the curvature of the earth. These guns shoot three kinds of projectiles. One is the so-called armor-piercing shot, which is nearly solid, having only a small cavity to contain a high explosive. The second is the armor-piercing shell, which has a larger cavity so as to contain more of the explosive. The third is the torpedo shell, which is in effect a torpedo, having thin walls and containing a large bursting charge of maximite. This explosive is a government secret so far as its composition is concerned. Most of the great rifles are mounted upon disappearing carriages, so they are safe from the fire of the enemy except at the very moment of firing. When its fire has been delivered the gun is lowered promptly below the parapet, and after being reloaded is uplifted again to the firing position.

At Fort Wadsworth, on Staten Island, N. Y., at The Narrows, is located another almost perfect system of coast defense, which is regarded by army officers as a model or typical artillery station. The fortification consists of three separate batteries or groups of guns — one battery of five 8-inch guns and two of two 10-inch guns each, a fire commander's station, three position finding stations, a power and electric plant, a storage battery plant of 60 cells for storing of light and power for the stations when the main power plant is not in operation (for example, if it should be wrecked by a shell), two electric searchlights of 60,000 candle-power beam and wires connecting the electric plant with all parts of the fortification and connecting the stations by telephone.

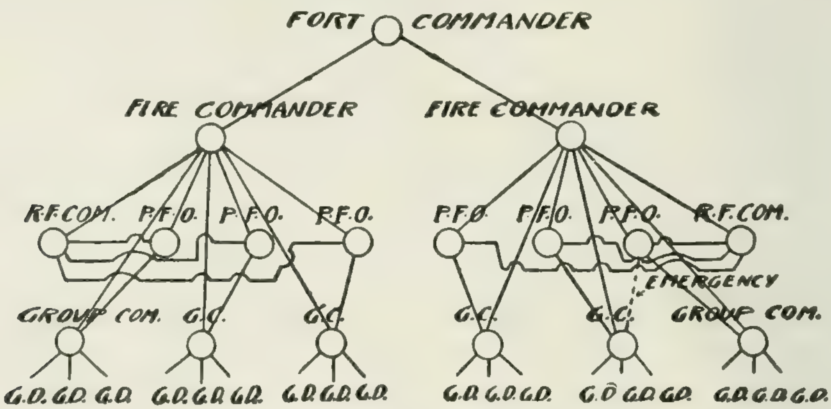
The War Department has prepared the accompanying diagram to illustrate the system of control in the typical artillery station. The diagram is not arranged particularly for the works at Fort Wadsworth. In command of this fortification is a fort commander. Under the fort commander are two fire commanders, each being in control of three groups of guns. Each group in the diagram is composed of three guns, but the number may be more or less. Generally it is the number which one officer can supervise efficiently in action. Each of these officers is called a group commander. Between the fire commanders and the groups of guns is a line of range finders and position finders under a range finder commander and position finding officer. Finally each gun has its firing crew of three, under command of a gun director, who

may be an officer or a non-commissioned officer. The guns are of course behind emplacements. At Fort Wadsworth nature has provided a natural defense in a high hill with a slope terraced to the edge of the water. Behind the hill the fortifications are constructed. On the hill above is the fort commander's station, which controls the approaches to the harbor. The telephone places the fort commander in direct communication with those under his command. The printing telegraph, unknown in the days of the Civil War, is also used in the scheme of communication. The fort commander sitting in his station, communicates his orders to the fire commander by telephone, giving information as to the general scheme of defense. The fire commander communicates with the range finder commander, and then on down the line to the group commander and thence to the three gun directors under him. Under this system the fort commander has perfect control over the guns. If a hostile fleet approaches, he can detect it from his elevated station long before the ships' guns have the fort in range. He can direct the attention of the fire commanders to it, if they have not seen it, and inform them with what guns he wants the firing on it opened. In accordance with a map of the harbor which lies before him he can direct that these guns be turned against a certain target or ship. The fire commanders will transmit his order to the position finding officers, who will indicate the position and range to the group commanders. Then the guns will be aimed and fired. The position finder occupies the most important station, because upon the accuracy of his work depends the effectiveness of a shot which will cost the government $1,000 and possibly cost the enemy $2,000,000 or the value of a modern warship. In aiming the guns allowance is made for the moving enemy and for the force of the wind. The firing is done by stop-watch and every second of time is important.

At the outbreak of the Spanish-American war, the government, owing to the parsimony of Congress, possessed no smokeless powder. In July 1903, millions of pounds of this explosive were safely stored at the various seacoast fortresses. When the American forces took possession of the fortifications at Havana, many of the front sights of the Spanish guns were missing. These cannon were made at Spanish arsenals, and it is supposed that the same defect existed in the guns on the Spanish warships, which may account for the slight damage inflicted upon American ships by the guns of Spain.

The modern system of seacoast defenses of the United States, comprises the following fortifications:

Fort Foster, Maine, on Gerrish's Island, in Portsmouth Harbor.
Fort Gorges, Maine, on Hog Island Ledge, in Portland Harbor.
Fort Preble, Maine, at Spring Point, in Portland Harbor.
Fort Scammel, Maine, on House Island, in Portland Harbor.
Fort Stark, N. H., at Jerry's Point, in Portsmouth Harbor.
Fort Warren, Mass., on Georgies Island, in Boston Harbor.
Fort Strong, Mass., at Long Island Head, six miles from Boston.
Fort Banks, Mass., at Grover's Cliff, near Boston.
Fort Adams, R. I., on Brenton's Point, near Newport.
Fort Greble, R. I., on Dutch Island, Narragansett Bay.



ARRANGEMENT OF FORT BATTERY.

Diagram designed by the War Department.

Fort Wetherill, R. I., on Conanicut Island, Narragansett Bay.
Fort Hamilton, N. Y., at The Narrows, New York Harbor.
Fort Lafayette, N. Y., at The Narrows, New York Harbor.
Fort Michie, N. Y., on Great Gull Island, 12 miles from New London, Conn.
Fort Tompkins, N. Y., on Staten Island, at The Narrows.
Fort Wadsworth, N. Y., on Staten Island, at The Narrows.
Fort H. G. Wright, N. Y., on Fisher's Island, entrance to Long Island Sound.
Fort Carroll, Md., at Seller's Point Flats, Patapsco River.
Fort Howard, Md., at North Point, Patapsco River.
Fort Smallwood, Md., at Rockpoint, 10 miles from Baltimore.
Fort Hunt, Va., Potomac River.
Fort Washington, Md., Potomac River.
Fort Moultrie, S. C., on Sullivan's Island in Charleston Harbor.
Fort Sumter, S. C., in Charleston Harbor.
Fort Oglethorpe, Ga., at Savannah.
Fort Pulaski, Ga., on Cockspur Island, Savannah Harbor.
Fort Taylor, Fla., at Key West.
Fort Barrancas, Fla., near Pensacola.
Fort Pickens, Fla., on Santa Rosa Island, near Pensacola.
Fort Gaines, Ala., on Dauphin Island, in Mobile Bay.

Fort Morgan, Ala., at Mobile Point.
Fort St. Philip, La., 65 miles below New Orleans.
Fort San Jacinto, Texas, near Galveston.
Fort Rosecrans, Cal., at San Diego.
Forts Miley, Baker, and Winfield Scott, Cal., in San Francisco Harbor.
Forts Casey, Columbia, Lawton, Walla Walla and Wright, Wash., in Puget Sound.

The foregoing are the new-type fortifications and in addition to these there are nearly 100 other forts along the Atlantic and Pacific sea-coasts, not yet remodeled or equipped with the modern appliances of warfare. See ARMY OF THE UNITED STATES; ARTILLERY; MILITARY POSTS, U. S.

Fortiguerra, Niccolo, nē-kō-lō' fŏr-tē-gwā'rä, Italian poet and prelate: b. Pistoia 7 Nov. 1674; d. Rome 17 Feb. 1735. A prelate at the court of Pope Clement XI. In his epic poem 'Ricciardetto,' so-called from one of the Paladins of Charlemagne, he wished to show that it was easy to imitate Ariosto. He wrote the first canto of this poem in one night, and continued it to 30 cantos. It appeared (1738) under the name of Carteromaco, which had been assumed by the author during his life. Its principal excellence consists in the description of situations. His short poems and sonnets are to be found in different collections of Italian poets.

Fortu'itism (Lat. *fors,* chance), a doctrine or theory of causation which denies the existence of a final end or object in the course of things. Such a doctrine in the domains of nature results in theories such as that of Darwin, who has been charged with denying design in the changes and developments of organized creatures, that is, the design of a single controlling mind, namely, of a supernatural creator. The opposite to fortuitism is teleology (q.v.), which is the theory of a final end or object in the processes of nature and history, as resulting from the plan or scheme originating in the mind of the Supreme Being.

Fortu'na (Gr. Τυχή), the goddess of success. According to Hesiod she was a daughter of Oceanus; according to Pindar, a sister of the Fates. She had temples at Corinth, Elis, and Smyrna, and worshipped in Italy before the building of Rome, and had a celebrated temple at Antium, in which were two statues, which were consulted as oracles, and gave responses either by signs or by lot. She had also a temple at Præneste, whence she was called *Dea Prænestina.* No less than 26 temples were erected to her in Rome, the first of which was built by Servius Tullius. She is generally delineated with two rudders, with one of which she guides the ship of prosperity, with the other that of misfortune. At a later period she was represented with a bandage over her eyes and a sceptre in her hand, and sitting or standing on a wheel or globe. She is usually dressed as a matron. On a coin of the Emperor Geta she is represented sitting on the earth with her bosom bare, her right hand resting on a wheel, and holding in her left hand, resting on her lap, a horn of plenty.

Fortunate Islands. See CANARY ISLANDS.

Fortuna'tus, a German collection of tales which originated about the end of the 15th century, though many of the tales and legends included in it are of much older date. The substance of the book is that Fortunatus and his sons after him are the possessors of an inexhaustible purse of gold and a wishing-cap, which however, in the end, prove the cause of their ruin. The moral is that worldly prosperity alone is insufficient to produce lasting happiness. The oldest printed edition of the book now extant bears the date 1509. Later German editions mostly bear the title, 'Fortunatus, von seinem Seckel und Wunsch-hütlein.' It has been reprinted in the third volume (1846) of Simrock's 'Deutsche Volksbücher.' Versions of the story have appeared in French, Italian, Dutch, Danish, Swedish, and even Icelandic. The first to dramatize the subject was Hans Sachs, in 'Der Fortunatus mit dem Wunschseckel' (1553), after whom comes the English Thomas Dekker, with his 'Pleasant Comedie of Old Fortunatus' (1600), a work which made its reappearance in German about 1620. The most poetical edition of the story is that given by Tieck in his 'Phantasus' Consult Schmidt, in Ersch and Gruber's 'Encyklopädie' (Sec. 1, Vol. XLVI.).

Fortune, Robert, English author and botanist: b. near Berwick-on-Tweed, England, 1813; d. Scotland 16 April 1880. He learned gardening in early life, and gained a position in the botanical garden at Edinburgh. In 1842 he was appointed collector of plants for the Botanical Society of London in northern China. He published the results of his inquiries in his 'Three Years' Wanderings in the Northern Provinces of China' (1853). In 1848 the East India Company engaged him to visit China to compare the qualities and commercial value of different kinds of tea. He visited the East several times afterward and published an account of his numerous botanical discoveries in 'Two Visits to the Tea-countries of China' (1852); 'Residence Among the Chinese, Inland, on the Coast, and at Sea' (1857); 'Yedo and Peking' (1863).

Fortune Bay. By the fisheries treaty of 1871 with Great Britain (see FISHERIES QUESTION), the American fishermen were granted equal rights on all British coasts. The Newfoundlanders were very jealous of this intrusion on their fishing grounds, and in 1878 the Fortune Bay fishers attacked and drove away some Gloucester vessels. Demand was made on Great Britain for damages, and £15,000 was ultimately paid.

Fortune-telling, predicting the future of an individual, by means of signs or indications noticed by the fortune-teller. Chiromancy is the art of reading the lines or wrinkles on the palm of the hand, as indicative of the future for the person so marked. Necromancy is the art of consulting the dead about the future. In chartomancy playing cards are supposed by their suit or denomination when turned up after being dealt out, to reveal coming events. The ancient astrologer used to decide from the stars the good or bad fortune of an individual, the hour and day of whose birth was taken as data in calculating the planetary conjunctions on which the horoscope was based. In every great city, even of the modern world, there are hosts of people who make a profession of fortune-telling, and there are many more who are credulous enough to believe in their pretensions. The law does not recognize the power of anyone to foretell the future, and the deluded victim of such charlatans, who has paid the wizard for a supposed revelation of the future, can bring the latter to justice for obtaining money on false pretences. In the ancient world there was a

strong belief in fortune-telling, or the power to predict the future. At Rome the government appointed official fortune-tellers of the state, who from the flight of birds or the appearance presented by the entrails of sacrificial victims made calculations as to coming events. The oracles of Delphi and Dodona were consulted by the wisest and best pagan Greeks. At Rome fortunes were told, or believed to be told, by Fortune herself in her temple at Antium. The literature of the Middle Ages is full of allusions to fortune-telling, which also played a part in the fiction and drama of all countries up to the middle of the 19th century. The belief in witches, wizards, and fortune-tellers has utterly disappeared among educated people, as fortune-telling has disappeared from literature. This results, to a large extent, from the advances made in physical science, the clearer views which prevail concerning causation, and the limits of human experience. Rationalism, in its newest form of agnosticism, has likewise cleared the intellectual atmosphere, and made delusion and imposture less and less able to obtain a footing or exercise an influence over sane minds.

Fortunes of Nig'el, The, an historical novel, with scene laid in the London of James I., published by Sir Walter Scott in 1822. The introduction to this work contains interesting self-criticism by the author.

Fortuny y Carbo, Mariano, mä-rē-ä'nō fōr-too'nē ē kär'bō, Spanish painter: b. Reus near Barcelona 11 June 1839; d. Rome 21 Nov. 1874. He studied at Madrid, traveled in Morocco, and settled at Rome, where he became the centre of a school of artists in revolt against over-study of the "masters." In 1866 he went to Paris, where his pictures, mostly genre subjects from Southern and Oriental life, had a great success. Among the best known are: 'A Spanish Marriage'; 'A Fantasia at Morocco'; 'The Academicians at Arcadia'; 'The Seashore at Portici.' The Metropolitan Museum of New York contains his 'Lady in Black,' and 'Camels at Rest,' and many other pictures of his are contained in public and private American art collections. He was also known as an able etcher. See Lives by Davillier (1875), and Yriarte (1886); Muther, 'History of Modern Painting' (1890).

Forty, a number that has sometimes been regarded as peculiarly significant. The idea may have originated with readers of the Bible, who notice that Moses was 40 days on the mount: Elijah was 40 days fed by ravens; the rain of the flood fell 40 days, and another 40 days expired before Noah opened the window of the ark; 40 days was the period of embalming; Jonah gave Nineveh 40 days to repent; our Lord fasted 40 days. He was seen 40 days after his resurrection, etc.

The weather on St. Swithin's Day portends, as it is foul or fair, 40 days' rain or dry weather; a quarantine extends to 40 days; 40 days, in the old English law, was the limit for the payment of the fine for manslaughter; the privilege of sanctuary was for 40 days; the widow was allowed to remain in her husband's house for 40 days after his decease; a knight enjoyed 40 days' service of his tenant; a stranger at the expiration of 40 days was compelled to be enrolled in some tithing; members of Parliament were protected from arrest 40 days after the prorogation of the house, and 40 days before the house was convened.

Forty Immortals, The, the members of the French Academy. See ACADEMY, FRENCH.

Forty Thieves, a band of robbers in the tale 'Ali Baba' in the 'Thousand and One Nights.' They dwell in a cave, the door of which opens at the words "Open, Sesame."

Forum (Lat. for a market-place; connected with *foris*, out of doors), the open space in the centre of a city, in Roman times, where the people assembled, as on common ground, for amusement or the transaction of business. Here elections were held; here were the public buildings, civic and administrative. Included in the forum was the comitium, with its tribunals for the orators who addressed the people. The *curia* or senate house stood, with other buildings, on the forum; and between the public edifices stretched lines of shops or *tabernæ*.

In the days of the kings and under the early republic there was but one forum in each city, small or great. In this open space all public business, political and legal, and all mercantile transactions were carried on. Dramatic representations, exhibitions of gladiators, combats of wild beasts and horse races also took place in the forum. The single forum eventually gave place to two forums, one of which was given up to law administration and politics, and the other to mercantile traffic. Eventually, each important commodity had its own forum. There was the *forum boarium*, cattle market; *forum suarium*, hog market; *forum olitorium*, vegetable market; and *forum piscarium*, fish market. The trade shops, as of gold- and silver-smiths, saddlers, blacksmiths, tinsmiths, money-lenders, booksellers, etc., were ranged round these fora, or occupied streets adjacent to them. The temples that edged the forum at Rome, like the mediæval cathedrals, were sometimes used for secular purposes. Thus, the senate often held meetings in the Temple of Concord, while the Temple of Saturn was used as state treasury, and was also the depositary of public archives, before the erection of the Tabularium. There are a great many ruins which enable us to gain a fair idea of the fora of other cities beside Rome. The fora at Pompeii are as follows. The principal forum; 450 feet from north to south: in its north side was the Temple of Jupiter, the Basilica, or law court, and the temple of Apollo; on the west and on the east side the *macellum* (meat market), the *senaculum* or curia, the Temple of the Genius of Augustus, and the *Scholæ* or corporation building. The triangular forum, *forum triangulare*, contained a Doric temple to the south, and an Ionic portico at the entrance.

In the open spaces of the forum were set up many statues of distinguished men. Even in the days of the republic it was necessary to order the clearing out of such statues, together with crowds of altars, arches, and memorial columns which blocked up the place.

The forum par excellence was of course the original Forum Romanum. It was situated in the hollow between the Palatine, Capitoline and Quirinal hills. The early tribes met on this common and neutral ground. Under the Tarquins the consolidation of the tribes is suggested by the completely adorned and enclosed appearance of the Forum. The Temple of Saturn

appeared in 497 B.C., that of the Dioscuri in 484 B.C., that of Concord in 367 B.C. The first court-house, Basilica Porcia, was not built before 184 B.C.; three more were built later, and it was this increase of buildings that occupied so much of the vacant space that the fish, meat, hog, vegetable and other markets were obliged to retire to other quarters of the city.

Julius Cæsar was the first to add special forums to those already in existence, and his Forum Julium was followed by the Forum Martis of Augustus, sometimes called Forum Augustus. Then came the Forum Pacis of Vespasian, the Forum Transitorium of Domitian and Nerva, the Forum Trajani of Trajan. These all lay side by side, north and east, with the Forum Romanum. The Forum Julium had in its centre a temple of Venus Genetrix, the patron goddess of the Julian gens round which it formed a sort of sacred precinct. The Forum Augustum was dedicated to Mars and in it was situated the Temple of Mars Ultor. This building was flanked by two triumphal arches, and Cæsar had intended that it should commemorate, with appropriate statues, the extension of Roman dominion. The Forum Nervæ was dedicated to Minerva and contained her temple. As the main thoroughfare through this district of the city crossed this forum it was commonly known as Forum Transitorium. The most gorgeous architectural group in the imperial city was exhibited in the Forum Trajani, which had its own special Basilica, like the great forum. It was entered by a triumphal arch, surrounded by a double colonnade; an equestrian statue of the emperor stood in the centre, flanked on each side by a half circle. The Library, Column and Temple of Trajan completed the cluster of marble structures.

The appearance of the Forum Romanum during the last days of the empire may be described as follows: Looking toward the Capitol the spectator would see the Temples of Concord, of Vespasian, and the Dii Consentes. The Temple of Saturn stood between the slope of the Capitol and the Vicus Jugarius. Beside it was the Arch of Tiberius, near that of Septimius Severus. Between these two arches were the rostra. The political buildings stood on the farther side of the arch of Severus. Here was the Senate house or the Curia, while the Temple of Janus rose side by side with the Basilica Æmilia. On the south and opposite side was the vast Basilica Julia, and the beautiful Temple of the Dioscuri. East from this group of buildings was an open space occupied by the Temple of Julius, side by side with which was the triumphal arch of Augustus, and beyond these is the most interesting tract of the old forum, the centre of antique and primitive Roman religion. The Shrine of Vesta, the Temple of Antoninus and Faustina, the Templum Urbis made up a magnificent range of noble and solemn structures, and we are reminded also that at this point once stood the arch of the Fabii at the opening of the ancient Via Sacra.

The invasions of the Goths did not bring much destruction upon the forum. It was in the 11th century that the buildings were devastated at the sacking of Rome (1084), when Gregory VII. was delivered from the Castle of San Angelo by Duke Guiscard. The rarest monuments of the antique world were employed as fortresses. The 16th century witnessed the antiquarian curiosity and reckless vandalism of the Renaissance. The Forum of Cicero and Augustus became a wilderness with only a few isolated columns to mark the site of temples or palaces. Under the learned and liberal Pius VII. the relics were preserved from further destruction and the archæologist Carlo Fea then began those excavations which have been continued by Lanciani.

Forum Ecclesiasticum, a church tribunal or court. It is either internal or external — *Forum Internum, Forum Externum.* The *Forum Internum* is what is known as the tribunal of penance, the confessional, where the penitent is both accuser and accused; and the confessor is the judge who condemns or acquits or pardons, and exacts satisfaction for wrongs and reparation of injury done to others whether in reputation or property. The *Forum Externum* is any ecclesiastical tribunal outside of the sacrament of penance that is concerned with church government. What are the sanctions by which the judgments of the Church's tribunals are enforced? Has the Church the right to inflict temporal pains and penalties on offenders against her laws? That the Church does possess such power is the teaching of the Church herself: the doctrine which declares she does not possess it has been explicitly condemned. The proposition that "the Pope or the whole Church collectively cannot punish any man, however wicked he may be, with a coercive penalty" unless the civil power gives them authority to do so, is condemned by Pope John XXII., and a similar proposition was condemned by Pope Pius VII. in the bull *Auctorem Fidei:* one of the propositions condemned by Pope Pius IX. in the *Syllabus* (1864) declared that "the Church has no power to employ force." In proof of the necessity of such power in the Church, the case of a bishop is cited who teaches heretical doctrine: has not the Church, it is asked, power to depose him; or must the matter go before a tribunal of the civil power? It is held that to make such resort to the secular courts necessary is to render the Church powerless to execute her divine commission, and to make a civil judge the judge of a purely ecclesiastical cause. On the ground of the canon law the Church has the right in herself "to inflict stripes, to impose fines, to imprison in a monastery" offenders against her laws; in short, to impose all penalties short of the effusion of blood, *citra sanguinis effusionem,* or its equivalent. Practically, the power of the Church at present is confined to the infliction only of her spiritual penalties, and these only when they do not in any degree directly or indirectly impair the civil rights of the person who incurs the spiritual censures; when they do so trench on his civil rights, the person has recourse to the secular courts. Thus in this country cases are often brought into the civil tribunals of rectors of parishes or pastors of churches who have been deposed by bishops or

other ecclesiastical superiors; and courts find it within their competence to decide whether the act of the superiors has been done in entire conformity with the constitution and laws of the religious body concerned, and the civil and contractual rights of the complainant.

Forward, Walter, American statesman: b. Connecticut 1786; d. Pittsburg 24 Nov. 1852. He studied law and was admitted to the bar in 1806. In 1822 he was elected to Congress; and in 1841 was appointed by President Harrison first comptroller of the treasury, and was reappointed by President Tyler in September of the same year. On retiring from the cabinet in 1843 he resumed law practice. In 1849 he was appointed *charge d'affaires* to Denmark, but resigned in 1851.

Forwood, William H., American military surgeon: b. Delaware 7 Sept. 1838. He was graduated at the medical department of the University of Pennsylvania and at Georgetown University, Washington, D. C.; entered the regular army as an assistant surgeon in 1861, and served throughout the Civil War. He also served in many Indian campaigns; was surgeon and naturalist with the exploring expedition through Wyoming, Montana, and Idaho, in 1883; located military hospitals in Savannah, Ga., and the camp hospitals in Montauk Point, during the Spanish war; and was appointed surgeon-general of the army with the rank of brigadier-general in 1902.

Foscari, Francesco, frän chĕs'kō fŏs kä'rē, doge of Venice: b. 1372; d. Venice 1 Nov. 1457. In 1416 he was named procurator of St. Mark's, and in 1423 was elected doge. His son Giacopo, being accused of ordering the assassination of a senator Donati, the enemies of the family created such commotion in the state that, unable to clear himself to their satisfaction of the charge, he was banished from the city, the father having to ratify the sentence. Love of his country, and devotion to his wife, compelled the banished Foscari at all hazards to revisit his beloved Venice, where, being discovered by his enemies, he was denounced, again made prisoner, put to the question of the rack, and a second time banished, dying soon after of his wounds, or the torments of his secret punishment, and of grief at separation from his idolized family. The fate of the son had such an effect on the doge that the bereaved father went mad, in which state the enemies of his family compelled him to abdicate. He died three days after in a spasm, upon hearing the bells of St. Mark's announce to Venice the election of a new ruler. Byron has written on the subject a tragedy entitled 'The Two Foscari.'

Foscolo, Ugo, oo'gō fŏs'kō-lō, originally **Niccolo,** Italian author: b. Zante, one of the Ionian isles, 26 Jan. 1778; d. Turnham Green, near London, 10 Oct. 1827. A man of passionate temperament, and withal an ardent patriot, Foscolo was bitterly disappointed when by the Treaty of Campo Formio Venice was given to Austria, and his disappointment found vent in the 'Lettere di Jacopo Ortis' (1802), a sort of political Werther. Becoming finally undeceived as to Napoleon's intentions with regard to his native land, he returned to Milan, where he published in 1807 his best poem, 'I Sepolcri,' a work composed in the spirit of the ancient classic writers, and remarkable for its smooth and polished versification. About this time he wrote a translation of Sterne's 'Sentimental Journey,' and two tragedies, 'Ajace' and 'Ricciarda,' both showing political tendencies. In 1899 he was appointed to the chair of eloquence in Pavia. His inaugural address, 'Dell' Origine e dell' Ufficio della Letteratura,' although full of the same love of classic beauty which marks the 'Sepolcri,' is turgid and affected in style. When in 1814 the Austrians entered Milan, Foscolo withdrew to Switzerland, and in 1816 he went to London. There some of his best writings were published, namely: 'Essays on Petrarca'; 'Discorso sul testo del Decamerone'; 'Discorso sul testo di Dante.' His remains were finally deposited in the Church of Santa Croce, Florence, in 1871. His works and letters were published at Florence in 12 volumes by Le Monnier (1850–62). Consult Lives by Pecchio (1836); Carrer (1842); Artusi (1878); Antona Traversi (1884); and De Winckels (1885–6).

Fos'dick, Charles Austin («Harry Castlemon»), American writer of juvenile books: b. Randolph, N. Y., 6 Sept. 1842. He served in the Union navy in the Civil War from 1862 to 1865. Besides contributions to periodicals, he has published under the pseudonym «Harry Castlemon» over 30 books for boys, among which are: 'The Gunboat Series' (1864–8); 'Rocky Mountain Series' (1868–71); 'Rod and Gun Series' (1883–4); 'The Buried Treasure'; 'The Steel Horse'; 'Jack the Trader'; 'The Houseboat Boys'; etc.

Fosdick, William Whiteman, American poet: b. Cincinnati, Ohio, 28 Jan. 1825; d. there 8 March 1862. He gained some distinction as a poet by a drama entitled, 'Tecumseh.' He also published: 'Malmiztic the Toltec' (1851), and 'Ariel and Other Poems' (1855).

Foss, Cyrus David, American Methodist bishop: b. Kingston, N. Y., 17 Jan. 1834. Having been graduated at Wesleyan University in 1854, he became an itinerant in the New York Conference of the Methodist Episcopal Church in 1857, was pastor at Chester, N. Y. (1857–9), Brooklyn (1859–65), and New York (1865–75). In 1875–80 he was president of Wesleyan University, and in the latter year was elected bishop. He made official missionary tours of the stations of the Methodist Episcopal Church in Europe (1886), Mexico (1893), and India and Malaysia (1897–8).

Foss, Sam Walter, American poet: b. Candia, N. H., 19 June 1858. He has been librarian of the Somerville, Mass., public library from 1898. His published works include: 'Back Country Poems' (1894); 'Whiffs from Wild Meadows' (1895); 'Dreams in Homespun' (1897); 'Songs of War and Peace' (1898).

Fos'sa, or **Foussa,** a large, brown, unstriped carnivorous mammal of Madagascar (*Cryptoprocta ferox*), which has the form of a huge weasel (twice the size of a house-cat), and like a weasel is lithe, active and bloodthirsty. Its systematic place is by no means decided. It is placed by Beddard as representing a distinct sub-family of the civets; while Mivart and Lydekker regard it merely as a genus of civets. Zittel, in view of its dentition and the retractibility of the claws, among other features, re-

gards it as occupying an intermediate place between the civets and the cats, and associated with such composite extinct forms as *Dinictis, Proælurus* and *Pseudælurus*, but classifies it in the *Felidæ*. It is the largest carnivore in Madagascar, and preys chiefly on birds and lemurs.

Fossil Footprints. See ICHNOLOGY.

Fossil Plants. See PALÆOBOTANY.

Fossil Vertebrates. See FOSSILS; PALÆONTOLOGY.

Fossilif'erous Rocks, rocks in which are found embedded the petrified remains, or molds of plants and animals. See FOSSILS; PALÆONTOLOGY; etc.

Fossils, the impressions or remains of plant or animal forms preserved in rocks by natural causes. Fossils supply data, from which the geologist can determine the relative ages of sedimentary rocks. The first man to realize their chronological importance was the English surveyor, William Smith, known as the father of historical geology, although acute observers like Leonardo da Vinci had pointed out long before that fossil shells were not freaks of nature, but had been laid down where found in the sediments of some body of water.

Most fossil remains are of marine types; many are of fresh-water and land-and-water types; comparatively few are of land types. The reason is plain. Animal remains lying on the ground are eaten by animals, or if not eaten, soon decay, and the bony skeleton, if buried by sand or loam, is slowly dissolved by percolating water. Plant remains decay even more rapidly. In water, decay is retarded. Thus mastodon remains have been found in swamps where the animals were occasionally mired, but of the infinitely greater number of mastodons that died on drier ground no trace is left. Old lake beds are frequently rich in plant and animal remains. Fishes, insects, birds, and land animals, and the leaves, flowers, and fruits of trees are preserved in the fine-grained shales or the sands and clays of the lake deposits in several western States. In old swamps, plants formed thick masses of vegetable matter, now turned to coal, imprints of leaves and stems being common in the shale overlying a coal-seam. In the sea, conditions are most favorable for the preservation of organic remains, and marine deposits have formed thick and extensive beds. Hence, of all the fossils found, marine types are most numerous. Fossils are preserved in several ways, which may be classified under three heads. (1) Some of the original substance may be preserved, as the carbon in a leaf, or the bone or shell of some animal. (2) All the original substance may dissolve away, but its shape may be preserved. This may happen in two ways: (*a*) the external form may be preserved in the sediments, forming a mold, or (*b*) the internal form may be preserved, forming a cast. A mollusk dies; its soft parts decay; the interior of the shell fills with sand or ooze; the shell is deeply buried. The sediments consolidate; the calcareous material of the shell may dissolve; but both its external and internal form are preserved. (3) In rare cases the structure of organic remains is preserved by a true petrifaction, the organic substance being replaced, atom by atom, by some mineral compound, like silica or calcium carbonate. A striking illustration of this method of preservation is fossil wood, in which the replacing silica preserves minute details of structure. See COAL; CORAL ISLANDS; GEOLOGY; PALÆONTOLOGY; PALÆOBOTANY.

Foster, Abby (KELLEY), American reformer: b. Pelham, Mass., 1811; d. 1887. She was married to S. S. Foster (q.v.) in 1845. At first a teacher, from 1837 she appeared as a platform lecturer in support of the abolition of slavery, being the first woman to assume this role, and she suffered much harsh treatment from the opposition. After her marriage she traveled and lectured with her husband, and later spoke also in behalf of woman's suffrage and prohibition.

Foster, Benjamin, American artist: b. North Anson, Maine. A pupil in New York of Abbott Thayer, and in Paris of Luc Oliver Merson, and Aimé Morot, he obtained various recognition of his excellence in landscape, including a bronze medal at the Paris Exposition of 1900, and the Webb prize of the Society of American Artists in 1901. Among his works are: 'Mists of the Morning,' for which he received the Webb prize, and 'Night Scene at the Paris Exposition,' purchased by the French government for the Luxembourg Gallery.

Foster, Birket. See FOSTER, MYLES BIRKET.

Foster, Charles, American legislator and cabinet officer: b. near Tiffin, Ohio, 12 April 1828; d. Springfield, Ohio, 9 Jan. 1904. He entered a mercantile career at Rome, now Fostoria, Ohio, and became the proprietor of the largest country business in the State. At the time of the Civil War he was active in the recruiting of troops. In 1870 he was elected to Congress in a district previously strongly Democratic, and in 1872, 1874, and 1876 was rechosen. While in Congress he was for some time a member of the ways and means committee. He was elected governor of Ohio in 1879, and again in 1881, his administration being marked by special attention to the non-partisan management of public institutions. In 1891 he was appointed secretary of the treasury by President Harrison, and in that post he negotiated a loan of $25,364,520 at the unprecedentedly low rate of 2 per cent. Subsequently he was a commissioner on several diplomatic missions of importance and performed his duties with great skill and satisfaction to his government.

Foster, David Skaats, American author: b. Utica, N. Y., 1852. After a common-school education at Utica, he there entered the coal and iron business. His publications include: 'Rebecca the Witch and Other Poems'; 'Elinor Fenton,' a novel; 'Spanish Castles by the Rhine,' and 'Prince Timoteo.'

Foster, George Eulas, Canadian statesman: b. Carleton County, New Brunswick, 3 Sept. 1847. He was graduated at the University of New Brunswick in 1868, studied also at Edinburgh and Heidelberg, was professor of classics and history in the University of New Brunswick in 1872–9, and in 1882 was elected to the Canadian Parliament. In 1885–8 he was minister of marine and fisheries; in 1888–96 minister of finances. Upon his visit to England in 1894 in connection with Dominion finances, he

negotiated a loan of $11,250,000. He was government leader in the Commons in 1895.

Foster, Gilbert, English artist: b. Manchester, England, 9 May 1855. He studied art with his father, a portrait painter, and exhibited his first picture at the Academy in 1876, since which date he has been a yearly exhibitor. Among his paintings are: 'Lingering Light' (1890); 'Birds of a Feather' (1891); 'The Last Faint Pulse of Quivering Light' (1892); 'The Azure Mead' (1895); 'Hush of Night' (1898); 'A Garden of Lyonnesse' (1900); 'A Garden of Memories' (1901).

Foster, Hannah (WEBSTER), American novelist: b. 1759; d. Montreal, P. Q., 17 April 1840. Her published works are: 'The Coquette, or the History of Eliza Wharton,' one of the earliest of American novels; 'The Boarding School' (1796); and 'Lessons of a Preceptress' (1798).

Foster, Henry, English scientist: b. Woodplumpton, Lancashire, 1797; d. Isthmus of Panama 5 Feb. 1831. He entered the royal marines, but after the peace of 1815 devoted himself chiefly to astronomical studies. The gold medal of the Royal Society of Great Britain was awarded him for his services on the Arctic Expedition of Capt. Ross in 1818–19. On 27 April 1828, he sailed on the Chanticleer, as commander of an expedition to determine the direction of the principal ocean currents in both hemispheres. He was drowned while exploring the Chagres River in Panama.

Foster, John, English essayist: b. Halifax, Yorkshire, 17 Sept. 1770; d. Stapleton, near Bristol, 15 Oct. 1843. A Baptist clergyman, self-educated and with an advanced point of view, he contributed to the 'Eclectic Review' regularly as well as delightfully; but his volume of 'Essays' (1805) constitutes his chief title to recognition. Four in number, these compositions are respectively: 'On a Man's Writing Memoirs of Himself'; 'On Decision of Character'; 'On the Application of the Epithet Romantic'; and 'On Some of the Causes by which Evangelical Religion has been Rendered Less Acceptable to Persons of Cultivated Taste.' All are marked by great solidity and depth of thought, combined with a lucidity and nervousness of style which no English author has surpassed. Of the four essays the palm is generally given to that 'On Decision of Character,' though in the opinion of Robert Hall the fourth of the series was the work on which Foster's fame with posterity would rest. As a preacher Foster never succeeded in attracting much attention. His discourses, though solid and philosophical, were of too abstract and unadorned a nature to be readily appreciated by a popular audience. In 1817 he wrote his 'Essay on the Evils of Popular Ignorance, in which he exposed the fearful condition of the masses in the large towns of England, and strenuously urged the establishment of a national system of education.

Foster, John Gray, American military officer: b. Whitefield, N. H., 27 May 1823; d. Nashua, N. H., 2 Sept. 1874. He was graduated at the United States Military Academy in 1846, entering the engineer corps. At the outbreak of the Civil War he was assigned to duty at Fort Sumter and was one of its garrison during the siege. In 1861 he was commissioned a brigadier-general of volunteers; took a leading part in the capture of Roanoke Island in 1862; was promoted major-general of volunteers; and became commander of the Department of North Carolina, defending that region with skill. Subsequently he commanded the Departments of Ohio and Florida, and in 1865 was brevetted major-general, United States army.

Foster, John Watson, American diplomatist: b. Pike County, Ind., 2 March 1836. He was graduated at the Indiana State University in 1855; studied law, and was admitted to the bar in Evansville, Ind. After the Civil War, during which he served in the Federal army with distinction, he was editor of the Evansville *Daily Journal* and postmaster of that city; minister to Mexico in 1873–80, to Russia 1880–1, and Spain 1883–5. He was special commissioner to negotiate reciprocity treaties with Spain, Germany, Brazil, and the West Indies in 1891; and United States secretary of state 1892–3. Subsequently he was the agent for the United States before the Bering Sea Arbitration Tribunal at Paris; participated in the peace negotiations with Japan; and in 1898–9 served as a member of the Anglo-American Joint High Commission. He has published a pamphlet, 'The Alaskan Boundary' (1899), and 'A Century of American Diplomacy 1776–1876' (1900).

Foster, John Wells, American geologist: b. Brimfield, Mass., 1815; d. 1873. He was graduated at Wesleyan University in 1834, and having removed to Ohio, studied law and was admitted to the bar there; in 1837 became an assistant in the geological survey of Ohio; and in 1847 was appointed an assistant to Prof. Jackson in a survey of the region about Lake Superior. The results of this survey, executed in connection with J. D. Dana, appeared in several volumes published by authority of Congress. Foster aided in the organization of the Republican party in Massachusetts, and from 1858 was resident in Chicago, where he made a notable study of the ethnology and palæontology of the Mississippi basin. Among his works are: 'The Mississippi Valley' (1869); 'Prehistoric Races of the United States' (1873).

Foster, Judith Ellen (HORTON), American temperance advocate: b. Lowell, Mass., 3 Nov. 1840. She was married to E. C. Foster in 1869. She studied law and in 1872 was admitted to the State bar of Idaho. In 1870–84 she was superintendent of the legislative department of the National W. C. T. U., and upon the affiliation of the society with the Prohibition party, joined the Non-Partisan W. C. T. U., of which she was president in 1889–93. Her publications include: 'Constitutional Amendment Manual' (1882); 'The American Renaissance.'

Foster, Lafayette Sabine, American statesman: b. Franklin, Conn., 22 Nov. 1806; d. Norwich, Conn., 19 Sept. 1880. He was graduated at Brown University in 1828 and admitted to the bar in 1830; took an active part in Connecticut politics, and was elected to the legislature in 1839, serving several terms. He was elected to the United States Senate in 1854; was president pro tem. of the Senate in 1865; and, after Andrew Johnson became President, was acting Vice-President of the United States. His senatorial term expired in 1867, but on account of his moderate and conservative course in the Senate his re-election was strongly opposed,

and he withdrew his name. In 1870 he was again elected to the State legislature, but resigned in June of that year to take his seat on the bench of the Connecticut supreme court. In 1878 he was appointed a member of the commission to devise simpler forms of legal procedure for State courts, and in 1878–9 was commissioner from Connecticut to settle the disputed boundary question with New York.

Foster, Sir **Michael,** English physiologist: b. Huntington 8 March 1836. He was a surgeon in his native town 1860–6; became prælector of physiology at Trinity College, Cambridge, in 1870, and since 1883 has been professor of physiology at Cambridge. He was president of the British Association in 1899 and was knighted the same year, and has been member of Parliament for London University from 1900. He has published: ‘Text Book of Physiology’; ‘Lectures on History of Physiology,’ etc.

Foster, (Myles) Birket, English artist: b. North Shields 4 Feb. 1825; d. Weybridge, Surrey, 27 March 1899. He began his artistic career as a wood-engraver, executing illustrations for ‘Punch’ and the ‘Illustrated London News,’ and for several volumes of English classics. From 1859 he drew much in water-color, being particularly successful in his presentation of rural life and landscape. Among his subjects in this genre are: ‘Nutting’; ‘Feeding the Ducks’; and ‘Cows in the Pool.’ His works are widely popular in England, where they have been much engraved.

Foster, Randolph Sinks, American Methodist clergyman: b. Williamsburg, Ohio, 22 Feb. 1820; d. Newton, Mass., 1 May, 1903. He was educated at Augusta College (Millersburg, Ky.), entered the Methodist Episcopal ministry as an itinerant in 1837, was transferred from the Kentucky conference successively to Ohio and New York, and was president of the Northwestern University 1857–60. In 1868 he became a professor in Drew Theological Seminary (Madison, N. J.), and in 1872 president of the institution. In the latter year he was also elected bishop, and in 1896 retired from the ministry. Among his publications are: ‘Centenary Thoughts’; ‘Studies in Theology’; ‘Philosophy of Christian Experience.’

Foster, Robert Verrell, American theologian: b. Wilson County, Tenn., 12 Aug. 1845. He was educated at Cumberland University (Lebanon, Tenn.), and the Union Theological Seminary, and from 1877 has been a professor in the former, originally of Hebrew and New Testament Greek, subsequently of systematic theology. Of his publications may be named: ‘Old Testament Theology’ (1890); ‘Systematic Theology’ (1898).

Foster, Roger, American lawyer: b. Worcester, Mass., 1857. He studied at the University of Marburg, Yale, and the Columbia Law School, in 1880 was admitted to the New York bar, and was special counsel to the board of health of New York in 1896–8. His writings include, besides many pamphlets and articles in periodicals: ‘A Treatise on Federal Practice’ (1890–2); ‘A Treatise on the Income Tax of 1894’ (1895).

Foster, Stephen Collins, American song-writer: b. Pittsburg, Pa., 4 July 1826; d. New York 13 Jan. 1864. He was educated at Athens Academy and Jefferson College, Pennsylvania. He composed the music and wrote the words of over 125 popular songs and melodies, among which are: ‘Old Folks at Home’; ‘Nelly Gray’; ‘Old Dog Tray’; ‘Come Where my Love Lies Dreaming’; ‘Suwanee River’; etc.

Foster, Stephen Symonds, American abolitionist: b. Canterbury, N. H., 1809; d. 1881. He was graduated at Dartmouth College in 1838; studied theology at the Union Seminary, became an anti-slavery orator, and was known for his radical methods. His attacks upon the Church for its position in regard to abolition aroused hostility against him, and his practice of interrupting church services was the cause of several mob disturbances. He published ‘The Brotherhood of Thieves: A True Picture of the American Church and Clergy’ (1843).

Foster, Theodosia Toll («Faye Huntington»), American author: b. Verona, N. Y., 1838. She was married to James H. Foster 1869. She was educated at the Oneida Seminary, and was for many years principal of a school at Verona. Her works include a long series of volumes of fiction, such as: ‘Ripley Parsonage’ (1877); ‘What Fide Remembers’ (1885); ‘The Boynton Neighborhood’ (1895); and ‘Lewis Elmore — Crusader’ (1898).

Fosto'ria, Ohio, a city in Seneca County, 35 miles from Toledo, on the Baltimore & O., and Lake Erie & W. R.R.'s. It was named in honor of Charles Foster, governor of Ohio (1891–3), who was influential in building many factories here. Pop. (1900) 7,730.

Fothergill, fŏth'ėr-gĭl, **Jessie,** English novelist: b. Manchester, England, 7 June 1856; d. London 30 July 1891. Her stories show a keen faculty of observation, and include: ‘Healey, a Romance’ (1875); ‘Aldyth’ (1876); ‘The First Violin’ (1878), in which German life is faithfully portrayed; ‘Probation’ (1879); ‘Kith and Kin’ (1881); ‘Made or Marred’; ‘Borderland’ (1886); ‘One of Three’; ‘The Lasses of Laverhouse’ (1888); ‘A March in the Ranks’ (1890); ‘Oriole's Daughter’ (1893).

Fotheringay (fŏth'ėr-ĭn-gā) **Castle,** the site of which was near Peterborough, England, 27 miles northeast of Northampton. The castle to which a melancholy interest attaches as the scene of the imprisonment, trial, and execution of Mary Queen of Scots, was demolished by her son James I. Several of the illustrious Plantagenets are buried in its church.

Foucault, Jean Bernard Léon, zhŏṅ bār-năr lā-ôṅ foo-kō, French scientist: b. Paris 18 Sept. 1819; d. there 11 Feb. 1868. He was editor of the ‘Journal des Débats’ from 1845, in 1854 became physicist to the Imperial Observatory, and in 1855 received the Copley medal of the Royal Society of London for his measurement of the velocity of light. His inventions include a device much used in the employment of the electric light in microscopic and optical researches. He also demonstrated (1851) by means of the pendulum and the gyroscope, the rotation of the earth upon its axis.

Foucault Currents, or **Eddy Currents,** are electrical currents generated by induction within the substance of a massive conductor that is moving in a magnetic field, or which is exposed to the influence of a variable field. If the con-

ductor is filiform, like a wire, no current can be produced in it save in the direction of its length. If a massive conductor be thought of, however, as composed of an infinite number of closed circuits, each composed of a single wire, and all tangled up and then melted into a solid mass, it is evident that (in general) currents will be induced in all of these imaginary circuits when the conductor moves, or when the field to which it is subjected varies. In the actual case the conductor is not composed of wires melted together, but currents are nevertheless generated within it just as though these wires had an actual objective existence. Mathematical equations can in fact be written down, from which it is possible to compute the direction and intensity of the current that is flowing, at any given instant, through any proposed point of a conductor in a known but varying field. Such calculations are seldom made outside of college class-rooms, however, because it is known from the general principle of the conservation of energy that the direction of the Foucault currents is everywhere such as to oppose the change (of whatever sort it may be) which produces them. Hence such currents tend to diminish the efficiency of all motors, dynamos and transformers in which they occur, and designers therefore strive to avoid them so far as possible. In armatures and in transformers, for example, it is customary to laminate the masses of iron that are exposed to changing fields, the individual parts being insulated from one another by air gaps or otherwise, and their surfaces of separation disposed (as nearly as practicable) so as to be perpendicular to the direction in which the Foucault currents tend to flow. In galvanometers, masses of copper are often purposely disposed near the sensitive needle with distinct advantage; for while they do not affect the total deflection of the needle, they cause it to come to rest very quickly after the circuit is broken, the motion of the needle inducing Foucault currents in the copper, which tend always to bring the needle to rest. The energy that is expended in the generation of Foucault currents is transformed into heat, and raises the temperature of the mass within which the currents are flowing. The name refers to the French physicist Foucault, who studied the subject with much care.

Foucault's Pendulum Experiment, a curious and remarkable method invented by Jean Bernard Léon Foucault (q.v.), of showing the rotation of the earth on its axis, by observing a vibrating pendulum, and his experiment goes under the above name. In this experiment a graduated disk is seen to turn, while a pendulum freely suspended maintained its plane of oscillation. If a heavy ball is suspended by a fine wire and set to vibrate like a pendulum, it may easily be shown, either mathematically or by experiment, that the point of suspension, with the wire and ball, may be rotated round an axis, passing along the length of the wire, without interfering with the vibration. In other words, the pendulum will continue to vibrate in the same plane, although the point of suspension be turned round the axis of suspension. It follows immediately from this that if we could suspend a pendulum at the north or south pole and set it vibrating it would continue to swing in the original plane of vibration; and as the earth is turning on its axis, a marked line on the earth's surface would appear to turn underneath the pendulum; or rather, it would seem to an observer, accustomed to feel as if the earth were at rest, that the plane in which the pendulum vibrates turns round relatively to the marked line on the earth's surface. It is easily shown that a similar phenomenon may be observed in any latitude except at the equator; the amount of rotation, however, that the plane of vibration of the pendulum seems to undergo is not so great in low latitudes as in high latitudes; but still in our latitudes rotation takes place to an extent easily observable. The performance of this experiment requires the greatest nicety. The pendulum is suspended on a fine wire, the support of the wire being constructed with great accuracy, so as not to interfere with the vibrations. The motion of the pendulum must be strictly confined to one plane; and, for that reason, in setting it to vibrate the bob is drawn aside and fastened by a silk thread, and when everything has come perfectly to rest the bob is released by burning the silk thread. During its subsequent motion it is protected from currents of air by glass screens. It need scarcely be remarked, however, that this experiment is nothing more than an illustration. Our knowledge of the rotation of the earth, drawn from astronomical considerations, cannot be strengthened by it. This experiment was first made public in 1851, when it was exhibited by M. Foucault before the Academy of Paris.

Foucaux, Marie Filon, mä-rē fē-lôṅ foo-kō, French author: b. 1842. She wrote several historical studies and works of fiction on the Empire and Restoration periods, among them: 'Les belles amies de M. de Talleyrand' (1880); and 'Une intrigante de la Restauration' (1888). Further publications by her include several volumes on Sanskrit literature under the pen-name "MARY SUMMER." Of these the most noteworthy is her 'Contes et legendes de l' Inde ancienne' (1878), crowned by the Academy.

Fouché, Joseph, zhō-zĕf foo-shā, DUKE OF OTRANTO, French politician and detective: b. Nantes 29 May 1763; d. Trieste 25 Dec. 1820. The Revolution, into which he entered with enthusiasm, found him teaching philosophy in Nantes; he became advocate, and was sent to the convention by the department of Loire-Inférieure. Here he was placed on the Committee for Public Education, voted for the death of the king, and was implicated, at least nominally, in the atrocities of the period. In 1793 he was sent to the department of Nièvre to enforce the law against such persons as had incurred suspicion. In 1794 he incurred the hatred of Robespierre, and thus had a strong stimulus to assist in his downfall. In August 1795, he was expelled from the convention, and kept a prisoner till the amnesty in October. In 1796 he communicated important information to the director Barras as to the designs of Babeuf and was rewarded in 1798 by being sent to Milan as ambassador to the Cisalpine republic. Here he labored with Gen. Brune to establish a second 18th Fructidor; both were in consequence recalled. He appeared in Paris in 1799, after Barras had gained the ascendency, and was appointed ambassador to Holland.

Shortly after Fouché was recalled and named minister of police. Here he first had full opportunity to display his great talents, and exercise an important influence on the interior policy of France. The situation gave him great power during the war. After the battle of Waterloo, Fouché urged Napoleon's second abdication, and advised him to seek an asylum in the United States. He placed himself at the head of the provisional government, negotiated the capitulation of Paris, obtained the removal of the army behind the Loire, and thus prevented useless bloodshed. Louis XVIII., whose return to the throne he had not at all supported, made him again minister of police; and it is to his credit that he labored so zealously in favor of moderate measures as to incur the hatred of all the ultra-royalists. He therefore resigned his office in 1815; and went as French ambassador to Dresden. As he was struck at by the decree issued in 1816 against the murderers of the king, he sought an asylum in Prague. He afterward went first to Lintz, and then to Trieste. It was Fouché who made the famous remark on the execution of the Duke of Enghien, of which he disapproved: "*C'est plus qu'un crime, c'est une faute*" (It is more than a crime; it is a blunder). Consult Martel, 'Etudes révolutionnaires: Etude sur Fouché' (1819).

Foucher, Jean, zhôṅ foo-shā, early explorer and colonizer in South America: b. Cambrai, Flanders, 1508; d. 1567. He was with Sebastian Cabot at the discovery of the Paraguay River, in 1534 shipped as pilot to Mendoza's expedition to Paraguay, led an exploring party to the foothills of the Peruvian Cordilleras, and was a counselor of Cabeza de Vaca (q.v.), with whom he was sent prisoner to Spain. Having received pardon he was appointed governor of Entre Rios, where he maintained a friendly attitude toward the natives and made further explorations.

Fouchet, Jean Antoine Joseph, zhôṅ äṅtwän zhō-zĕf foo-shā, Baron, French diplomatist: b. St. Quentin, France, 1763. The date of his death is not known. He was a law student in Paris when the Revolution broke out and published a pamphlet in defense of its principles. Soon afterward he was appointed a member of the executive council of the Revolutionary government, and was French minister to the United States in 1794–5. Subsequently under Bonaparte he was prefect of Var and, in 1805, of Ain. On Napoleon's return from Elba he was made prefect of the Gironde.

Foucquet, Jean, zhôṅ foo-kā, French painter: b. Tours about 1415; d. Paris about 1485. He received his early artistic training in Italy, where he painted a portrait of Pope Eugenius IV., and later entered the service of Louis XI. of France. For the king he executed several portraits. His best work consists of 40 miniatures in a prayer-book for Etienne Chevalier. Only in comparatively recent times has he been recognized as a founder of the French school.

Foula, foo'la, island, the most westerly of the Shetland group, lying 16 miles southwest of the nearest point of mainland. It is a little over 3 miles in length and is 2½ miles in breadth. Pop. (1900) 326.

Foulis, fowlz, **Robert** and **Andrew,** Scottish printers: b. Glasgow, the former in 1707; d. 18 Sept. 1781; the latter in 1712; d. 178[illegible]. In 1739 Robert commenced business in Glasgow as a bookseller; and in 1742, having obtained the appointment of printer to the university, began in that capacity to issue editions of the ancient classics, which have made his press famous, both from the beauty of their type and their accuracy. In this latter respect one of his editions of Horace stands pre-eminent, and is hence known by the name of the 'Immaculate' edition.

Foulk, George C., American naval officer: b. Pennsylvania about 1860; d. Kioto, Japan, 1894. He was graduated from the United States Naval Academy, and after service on the Asiatic station, was withdrawn from naval duty to act as secretary and interpreter to the embassy of the Korean empire, the first sent by that country to a western nation. In 1884 he became naval attaché to the American legation at Seoul. He traveled widely in the country, and was influential in introducing many western methods and manners. Later he again served in the navy, and became professor in Doshisha University at Kioto, Japan.

Foulke, William Dudley, American author: b. New York 20 Nov. 1848. He was graduated at Columbia in 1869, at the Law School of the University in 1871, practised law in New York, removed to Indiana, and there became a member of the State Senate (1882–6). In 1889–90 as chairman of a special committee of the National Civil Service Reform League, he made important investigations in connection with the United States civil service. In 1893 he was chairman of the Suffrage Congress at the World's Columbian Exposition. His publications are: 'Slav or Saxon' (1887); 'Life of O. P. Norton' (1899); 'Moya' (1900).

Foundation. The term designates either the lower courses of a masonry structure, or a specially prepared surface or bed in contact with the soil or bed-rock upon which a structure of any kind is to be built. In practice there are many cases, however, in which the bed and the lower courses of the masonry structure jointly comprise the foundation proper, and render difficult or unnecessary the drawing of any marked distinction between them. Such combinations generally afford foundations of great permanency and strength, the most important qualities in connection with architectural and engineering works.

Oftentimes, in the erection of such works of great magnitude as well as those of lesser importance, the requisite care and attention are not devoted to the construction of the foundations, thus seriously impairing the integrity of the superstructure. This carelessness, however, appears to develop periodically; but, the errors of one period are naturally so fruitful of injurious results that they not only lead to the exercise of greater care during the period following, but stimulate the development and adoption of more scientific and skilful methods.

This is very clearly shown in the works constructed during the Roman Period. The earlier Romans erected their buildings on the most solid foundations constructed of large blocks of concrete, composed of quarry rubbish, gravel, or burnt earth, bonded by an excellent mortar. This material formed under the superstructures

homogeneous basements of veritable artificial rocks capable of sustaining the heaviest of buildings without rupture or settlement. During the later Roman period, however, the foundations were much neglected, so that the architects of the 12th century were afforded so many examples of important edifices fallen on account of bad foundations, and for no other reason, that they were compelled to exercise greater care, and employ more skilful methods.

These remarks are especially applicable to the foundation methods practised at the present time. The architectural and engineering works of to-day have passed from the types of comparatively light superstructures to those of mammoth size and enormous weight, requiring the strongest and most permanent foundations that modern engineering skill is capable of designing, and the application of reinforced concrete or concrete steel methods to the construction of practically all classes of foundations appears to represent the best practice of modern times.

The employment of a particular type of foundation depends upon the character of the soil and the presence of water, and the widely varying conditions met with in practice have developed several classes of foundation structures which may be briefly designated as peat foundations, sand foundations, hard soil foundations, pile foundations, etc., which may be more intelligently described in the special paragraphs following a few very general but necessary remarks on foundation soils.

Foundation Soils.— These vary in character from hard and solid bed-rock, hard-pan, and firm sand to liquid mud, quicksand and silt. It is clear that hard bed-rock, hard-pan, firm sand, and various kinds of compact clays are the best materials to sustain foundation structures; but practical experience has very satisfactorily demonstrated that almost every substance in nature is capable of supporting the weight of any other substance, no matter how small the sustaining capacity of that material may be, provided the weight to be sustained is distributed over a sufficiently large area, and provided the conditions of the soil are permanent. Under any conditions, however, other than those obtaining in the case of solid rock, the adoption of the particular type of foundation requires the exercise of the highest order of forethought on the part of the constructing engineer in arranging for the proper distribution of the weight of the superstructure, and in providing means to counteract the injurious effects of any vibration to which it might possibly be subjected.

The sustaining power of soils depends upon their composition, the amount of water which they contain or which may drain through them, and the degree to which they are confined. Sound hard bed-rock of ledge formation will support loads up to 36 tons per square foot, but if the rock is seamy and rotten its sustaining capacity will be materially less, and will require special treatment in the construction of foundations thereon. In general, the composition of the different kinds of substrata varies so greatly that it is impossible to apply specific rules; but the latest practice assumes the following safe allowable pressures: For hard-pan, eight tons per square foot; compact sand and clean gravel free from lateral movement, five tons per square foot; dry clay, three tons per square foot; and loam, one ton per square foot Soft, watery clays, mud, quicksands, and silt have very little or no sustaining power, and have to be penetrated until firmer material is reached, and require to be compacted by draining, or consolidated by other means. If piles are employed, and they are driven to bed-rock or to refusal, the sustaining power is determined by the crushing strength of the material of the pile — timber, iron, or reinforced concrete, as the case may be.

Peat Soil Foundations.— In soils such as peat, it is almost impossible to carry the walls down to a sufficient depth to reach a solid base. In such cases one of three methods has to be adopted — to lay a strong concrete floor spread over a sufficient area; to use cylinders of iron or brick work; or to employ piles. If a concrete floor is employed, it should cover the entire surface to be occupied by the building, and should extend to some distance beyond the footings of the walls in order to prevent cracks and settlements. These injuries are usually caused by heavy walls being placed too close to the edge of the concrete floor, causing it to buckle and crack, and to settle irregularly under the unequal weights of walls of different thickness. This condition is somewhat obviated under the French system by forming a lip under the edge of the concrete floor, converting it into a kind of inverted tray which confines the substratum within its limits. The material of the foundation should be strong and homogeneous, while that of the superstructure should be of the coursed and bonded, or articulated, construction, so that if necessary it would yield slightly at the joints and thus accommodate itself without fracturing to any slight or unequal settlements during construction.

Sand Soil Foundations.— In hard stable sand or gravel, or in compact dry clay above water level, the construction of strong, permanent foundations require comparatively simple methods. If the location is in cold countries, the preliminary excavation is carried well below the frost line, and the bottom is carefully leveled off to receive the concrete bed, or the broad footing formed by the lower courses of the masonry.

In the case of compressible soils, artificial means in the form of piles, or of beds of concrete are first employed to reinforce the sustaining power of the substratum, and upon the platforms thus obtained the foundation proper is then constructed. On the other hand, if the foundations have to be constructed upon running sand, the greatest care and skill is required to prevent the work from being undermined by pumping out sand with the water during constructing operations. About the only way to handle such a case is to make a good concrete floor the entire width of the trench by putting it in as quickly as possible, sealing up the sides of the trench, and then pumping out the water when it reaches the level of the top of the concrete, and not from a sump. In building dock-wall upon running sand, the probable effects due to the cessation of pumping operations in the course of construction, require to be carefully considered. In such a case, the entering water will exert a varying pressure on the floor of the dock and the foundations of the walls according to the difference of tide levels on the outside of the dock.

Foundations for bridge piers on or across

sand are usually constructed by sinking iron tubes or piles equipped with large disks or screw shoes at their lower ends, the diameters of which are regulated to support the weight intended to be placed upon them.

Clay Soil Foundations.— As in the case of sand and gravel free from lateral movement, the construction of foundations i.. dry clay calls for the application of the simplest methods; but, in clay strata impermeated with water, and having a tendency to slide, especially in the case of hillside excavations, the problem becomes more difficult and complex, and requires special methods for its successful solution. As a rule, such soils do not slide piecemeal, but move as a mass with an almost irresistible energy capable of rupturing the strongest timbers as if they were toothpicks. The only way to proceed in such cases is to disturb as small a section as possible at a time so that any forward impulse may not be communicated to the entire mass, and to provide strong cross walls in the basement to act as buttresses. The foundations should be carried down to or below the ultimate drainage level so as to prevent shrinkage by any subsequent draining of the subsoil which will lead to disastrous settlements.

Pile Foundations.— These consist of groups of piles of timber, iron, or concrete, plain or reinforced, sunk into the substrata and capped with platforms of timber or concrete upon which the superstructure is finally built.

Timber piles are tree trunks of varying diameter and length, with the bark removed and the knots and lateral branch stems cut off. Iron piles are of two kinds: the screw pile, consisting of a shaft of iron or wood, equipped at the foot with an iron casting in the form of two screw blades ranging in size from one to five feet in diameter; and the disk piles, consisting of hollow tubes carrying disks at their lower ends instead of screw blades. Concrete piles consist of cylinders of concrete formed in place, and of columns of reinforced concrete of rectangular cross-section made above ground and subsequently driven into place by means of a pile driver.

Various methods are employed to sink or drive piles into place. Timber piles are driven by the use of hammers which are raised and dropped by some form of engine developed power, and by the aid of jets of water under pressure, as suggested by Sir James Brunlees as early as 1850, and first employed by him in connection with the sinking of iron piles in the construction of the foundations to carry a railway across the treacherous sands of Morecambe Bay. Some of the most notable deep pile foundations constructed by the driving method are those under the new Public Library building, and the Illinois Central Railway passenger station in Chicago, Illinois. The passenger station consists of a structure 180 by 220 feet in plan, 9 stories high, with a tower 13 stories high, and a station 3 stories high connected with a train shed 680 feet long. Borings taken on the site showed the substrata to consist of ten to twenty feet of rubbish accumulated by dumping, and below that, several irregular layers of stiff blue clay and quicksand down to bed-rock, more than 60 feet below the surface. These conditions led to the adoption of a deep pile foundation, and about 1,700 piles, arranged in groups or clusters, were driven under the columns. These piles ranged in size from 40 to 60 feet in length, and from 11 to 16 inches in diameter at the butt. Thirty-two per cent were black gum, 22 per cent pine, 21 per cent oak, 7 per cent basswood, and 15 per cent hickory, with a few maple and elm. They were driven with drop hammers weighing 2,800, 3,200, and 3,800 pounds respectively, the fall ranging from 35 to 50 feet. A cast iron cap was fitted over the heads of the piles to prevent them from being crushed or split, but in spite of this protection over 8 per cent of the heads suffered serious injuries of that character. The piles were all driven in groups until the tops of all were below the leads, then the driving was completed by the use of a follower. Water was kept running continuously around the pile at the surface during the driving operations and was found to materially aid in the sinking of the piles. After the piles had been driven home, the tops were sawed off to a uniform height of three feet below datum, thus placing all the timber below low water level. As this was at least ten feet below the surface, the trenches had to be sheathed, and were kept drained by continual pumping. The earth was excavated to the depth of 18 inches below the top of the piles and rich Portland cement concrete was tamped in flush with the tops. Finally, oak caps 12 inches square were drift-bolted to the centre of each pile, and the space between the timbers was filled with concrete.

When piles are sunk with the aid of jets of water, the work is accomplished much more simply and rapidly than by driving. A pipe two or three inches in diameter is attached to the side of the pile and connected to a pump. The pile is first covered with pitch and then the water is forced through the pipe under the bottom of the pile, so that the sand is converted to a degree of fluidity that allows the pile to descend rapidly to the desired depth. When one pile has been put down home, the feed pipe is detached and spiked onto another and the operation is repeated. The accuracy and certainty of this method is so great, that it is a common practice to make the holes for the bolts in the piles before they are brought into position. After the pile is down and a reasonable length of time has been allowed for the churned up sand to subside, it recovers its solidity and grips the pile so tightly, that it is almost impossible to start it again.

When hollow iron piles are used, the water is conveyed through the centre of the tube under hydraulic pressure, disturbing the sand under the piles and allowing them to sink by their own weight to the proper depth. Upon withdrawing the pressure and stopping the flow of water, the sand returns to its former consistency and holds the pile stationary. Numerous valuable and interesting experiments show that the gripping power of quicksand is equivalent to a uniform supporting power of five tons per square foot, and that such sands possess this power at the depth of only a few feet below the surface, and, furthermore, that an increase in depth is not accompanied by a relative increase in the supporting power. Under favorable conditions the water jet method can be applied equally well to the sinking of cylinders and caissons.

Concrete piles have been used during a comparatively recent period, but their success has

been so great that their development in the future promises to bring them into general use in the place of timber and iron piles. These piles, as previously mentioned, are either formed in place, or they are molded above ground. A great many methods have been suggested for forming the hole to contain the concrete when the pile is formed in place. One method consists in driving a double shell of metal into the ground and then withdrawing the inner shell, leaving the outer shell as a mold for the concrete. Another method, shown by Fig. 1, employs a single shell equipped with a concrete or a steel point. The shell is first driven to the desired depth and then withdrawn slowly and the space it occupied filled with concrete, the surface being kept at a sufficient depth below the end of the tube to maintain the head required to resist the pressure of the ground. Concrete piles used for underpinning are usually sunk with the aid of the water jet to a depth sufficient to reach firm strata, and the bottom of the excavation is enlarged by means of a spiral expanding device so as to form a base, as shown in Fig. 2.

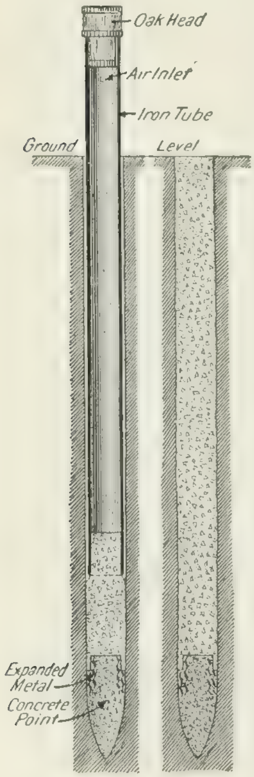

Fig. 1.

Piles made in place may be reinforced, if desired, but usually reinforced concrete piles are formed above ground. They are designed like columns, the reinforcement consisting of vertical bars of steel connected at intervals with horizontal wire rods or plates. Up to the present time they have been made only in square and triangular cross-section, circular molding being too expensive, and the arrangement of the required reinforcement being too complex. The general character of these piles is illustrated by Fig. 3, which shows the construction of the piles designed (but not used) for the foundations of the Hallenbeck building, New York city.

The supporting power of piles depends upon their action as a column resting on a hard base, or upon the friction against their sides developed by the gripping action of the material through which they have been driven. Very often the supporting power is a combination of both actions. The amount of this power may be calculated in various ways, but at their best the results are of necessity only approximations. The supporting power of a pile driven to bed-rock is determined by the crushing strength of the material of which it consists, but if it is supported wholly or in part by friction, its supporting power is calculated by a formula based upon factors obtained by experiment, or upon the distance penetrated by the pile under the blow of the driving hammer. A formula based upon the last named factor and commonly used for determining the safe loading on piles is given by the expression —

$$P = \frac{2Wh}{p + 1},$$

in which P = safe loading in tons upon a pile, W = weight of hammer in tons, h = height of fall in feet, and p = penetration in inches under last blow.

The construction of the pile foundations for the Chicago Public Library building afforded valuable information relative to the supporting power of piles as determined under actual conditions. Piles of Norway pine were driven with a steam hammer having a total weight of 8,300 pounds, the hammer alone weighing 4,500 pounds and delivering 54 blows per minute, with a stroke of 42 inches. The last 20 feet of driving was accomplished by means of a follower. The piles were placed about two and one-half feet centre to centre and the supporting power of four piles was tested by building a platform on top of them and loading it with pig-iron. Levels were carefully taken on each pile. They stood four days with a loading of six tons on each pile, eight days with a loading of 37 tons per pile, and 10 days with a load of 50 tons

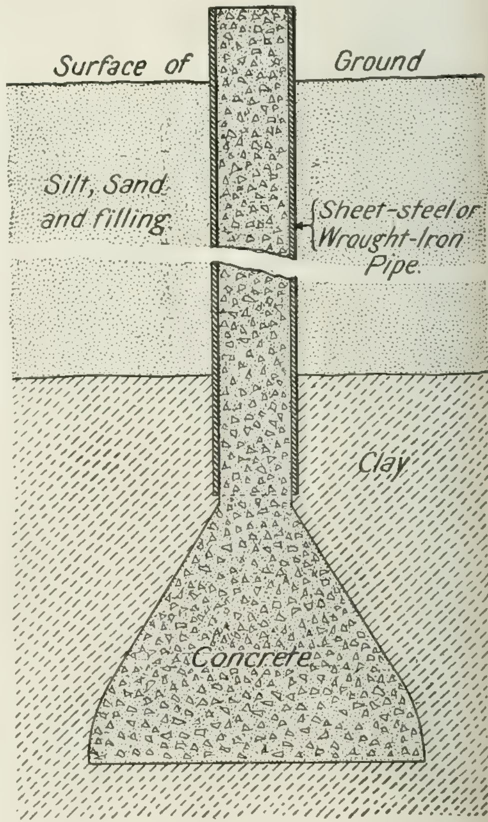

Fig. 2.

per pile. The settlement did not exceed 0.01 of a foot. These tests indicate that if 250 pounds per square inch be assumed for point resistance, the average frictional resistance will amount to about 3.2 pounds per square inch of side surface of pile, or about 432 pounds per square foot. In the case of an ordinary pile, seven inches through the top and 14 inches at the butt, driven to a depth of 45 feet, the point resistance would be 6,000 pounds, and the frictional resistance 59,000 pounds, a total earth resistance of 65,000 pounds, equivalent to the supporting power of the pile considered as a column, and allowing a factor of safety of 3 to 4.

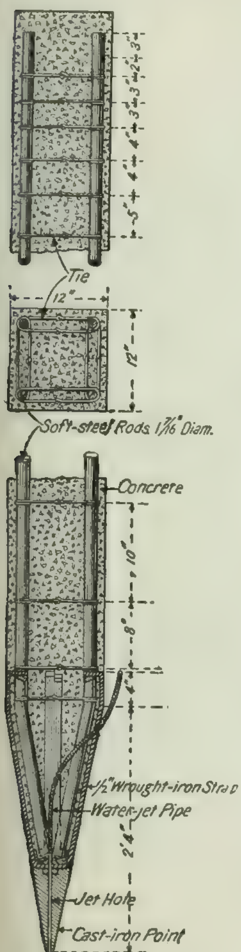

Fig. 3.

Usually, the determination of the point at which a pile is considered as having been driven to a firm bearing depends greatly upon the judgment of the engineer in charge, based upon his experience in the particular locality in which the work is being performed. The best practice, however, affords the following safe specifications of allowable penetration. For piles meeting a hard resistance a penetration of one inch under the blows of a 2,000-pound hammer falling 10 feet, and for piles held by friction, a penetration of three inches under the blows of a 2,000-pound hammer falling 15 feet. The minimum distance between centres usually depends upon the hardness of the substrata and the size of the butts. Spruce piles may be advantageously driven 24 inches between centres, while large and long piles ought not to be driven closer than 30 inches between centres. Another factor that must be carefully considered is the supporting power of the soil as a whole. For example, if that power is equal to two tons per square foot, and each pile is capable of sustaining 18 tons, it is useless to place the piles closer than three feet between centres.

In connection with the use of timber piles in places where the durability of the timber is very liable to be seriously impaired by the attacks of the Teredo worm, the latest practice appears to favor the system of armoring them with concrete. In such cases the timber piles are usually driven in sets of three to a firm bearing. They are then cut off, one two feet, one four feet, and one eight feet, below the level of the wharf platform. A wooden stave cylinder of three-inch planking is then placed around the piles and driven into the mud to a depth of 12 feet, and the bottom of the cylinder sealed. The contained water is then pumped out, and a cylinder of expanded metal is set within the wooden cylinder, and the remaining

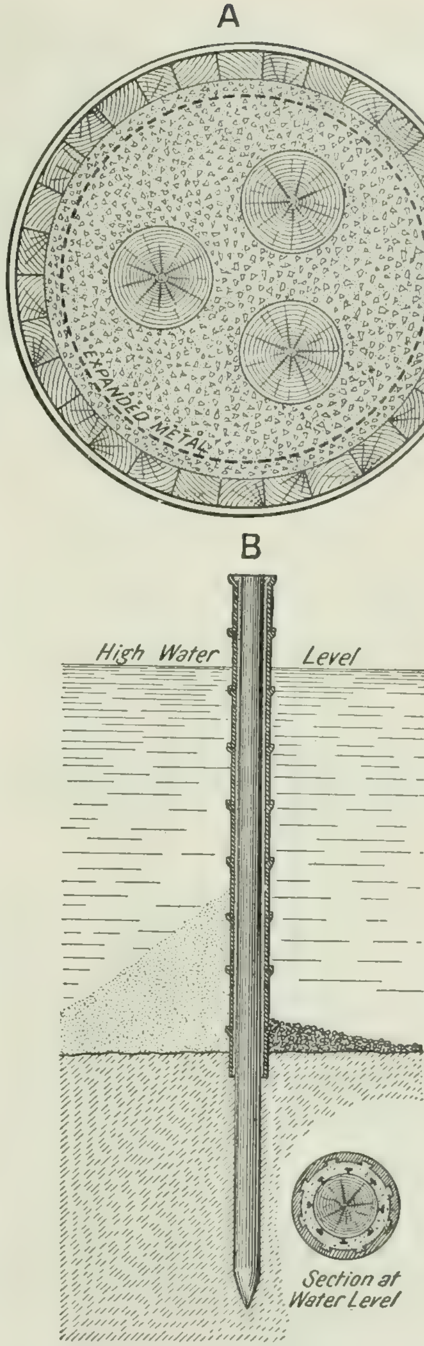

Fig. 4.

space filled with concrete. Diagram A, Fig. 4, illustrates this protective method as employed in wharf construction on the Pacific coast.

Another method still more recently introduced consists in the use of terra-cotta pipes as an outer covering for the piles. In this case the armoring is limited to individual piles. Before driving the pile, large-headed nails are driven into the surface of the wood near the level of the water line. The pile is then driven into place and the sections of terra-cotta pipe placed around it. The annular space of about two inches between the inner surface of the pipe and the pile is then filled with concrete. The method is especially applicable to works along the coasts of the South Atlantic and Gulf States, where there are no ice fields to contend with, and where no strong tidal and river currents necessitate the use of heavy masses of stone to protect the piles from the great force thereby exerted against them. This method is illustrated by diagram B, Fig. 4.

Platform Foundations.— These structures are designed to distribute a concentrated weight over a large area in soft substrata when piles are not employed. They may consist of beds

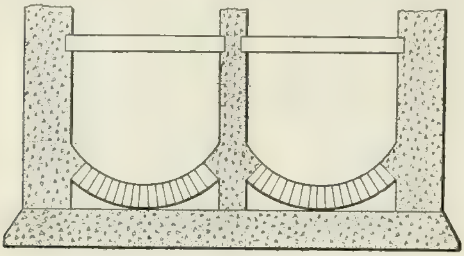

Fig. 5.

of concrete, or of masonry or brick arches sprung between supporting piers or columns, as shown by Fig. 5. They may also consist of platforms of timber grillage — timbers placed across each other in alternate layers, or of platforms of concrete or masonry reinforced with a grillage of steel bars, as illustrated by Fig. 6, which shows the platform foundations of a World's Fair building in Chicago, consisting of a concrete bed reinforced with a steel rail and I-beam grillage, to support the base castings of the main columns.

Subaqueous Foundations are those constructed in the substrata of river beds or other bodies of water, or where the existing conditions necessitate the building of structures in water and below the level of its surface. This class of work is accomplished by the use of cofferdams, cribs and open caissons, pneumatic caissons, by dredging through wells, by forcing cement into the substrata under pneumatic pressure, and by freezing the substrata.

Cofferdam Method.— The use of cofferdams is limited to the construction of foundations in shallow waters where the depth of the necessary excavation to reach a firm bearing is small, or in water bearing substrata on land. They are usually constructed by driving a double row of sheet piles — heavy timber planking — around the area in which the foundation is to be built. The space between the piles is then tamped in solidly with clay, and the water pumped out of the enclosure, so that the work of excavating and the subsequent masonry construction may be carried on in the open air. Cofferdams are sometimes constructed of walls composed of bags of clay piled around the foundation area, and reinforced with barrels of sand banked on the outer side of the walls.

Crib and Open Caisson Method.— Under this method, the foundation bed is first prepared by dredging until a solid material is reached, or by driving piles to a sufficient depth to reach a firm bearing. When piles are employed they are cut off at a uniform depth below the level of the water surface and constitute the supporting bed of the caisson. The caisson consists of a water-tight box-like structure open at the top. It is floated over the position of the bed, previously prepared by dredging, and the masonry work built up in its interior until it gradually sinks and rests upon the bed. The side walls are then removed, leaving the bottom of the structure — the crib — in the foundation between the masonry and the supporting bed. Fig. 7 illustrates the foundation for a pier constructed by this method, the crib being supported by piles.

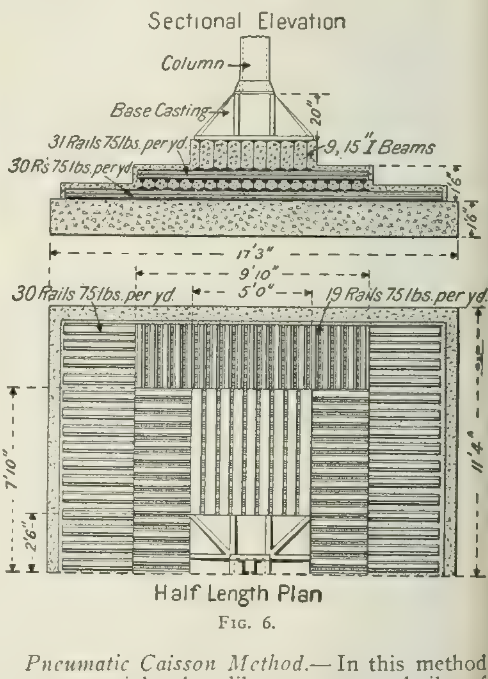

Fig. 6.

Pneumatic Caisson Method.— In this method two water-tight box-like structures built of timber or of metal are used. They are connected together one above the other, the lower caisson being inverted, that is placed bottom up, and the upper one open at the top. This structure is floated and anchored over the position selected for the pier and the masonry built inside the upper caisson until the lower edge of the lower caisson rests on the bed of the body of water. The contained water in the lower caisson is then expelled by compressed air, allowing men to enter and excavate the underlying material within the limits of the caisson. As the excavated material is discharged by being passed out through the top of the caisson, and the masonry work is added to course by course, thus keeping it always

above the surface of the water, the caisson sinks lower and lower into the substrata until it reaches solid rock or other firm material. The lower caisson is then filled with concrete, and the sides of the upper caisson are removed, leaving the masonry on the foundation formed by the lower caisson with its concrete filling. Fig. 8 shows the longitudinal section of a caisson of this type.

The pneumatic method, although one of the most effective, is limited in its application to work at a depth of about 100 feet below the surface of the water, as it is impossible for men to work conveniently and effectively under a

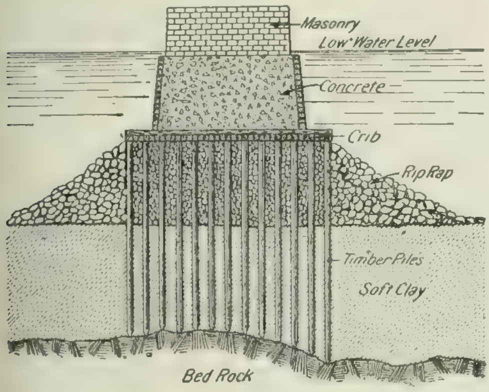

Fig. 7.

greater air pressure than that required to sustain a column of water of that height.

Although the iron-lined timber caissons used in the construction of the first East River or Brooklyn suspension bridge, measuring 102 feet by 168 feet each, with a working chamber 9 feet 6 inches in depth, are among the largest ever constructed, a clearer idea of the application of the pneumatic caisson method to works of great magnitude may be obtained from a description of the caissons used in constructing the foundations for the piers of the second East River or Williamsburg suspension bridge, completed in 1904.

This structure, although having a suspension

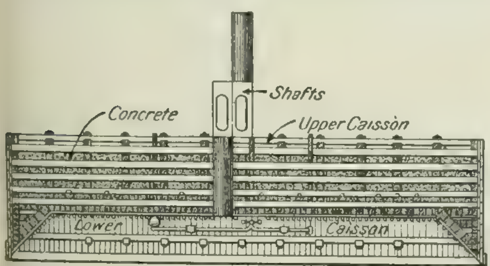

Fig. 8.

span the same length as that of the older bridge, is of much greater magnitude in many other ways. Each of its two steel towers is supported by two piers, as shown by Fig. 9. The following description is that of the north caisson of the New York tower, but it also applies in almost every particular to the other three. As determined by borings, the bed consisted principally of sand, and some clay and boulders. Below this, at a depth varying from 45 to 75 feet below high water level, the formation consisted of gneiss rock with a very irregular surface. The caisson was sunk through the sand, clay and boulders until it rested on the rock, which was then blasted away and stepped so as to make a fair bearing for the edge on all sides. The caisson measured 60 feet by 76 feet on the sides, with a total depth of 19 feet, and a working chamber 7½ feet in height. The walls were two feet nine inches thick and were built of two courses of 12 by 12-inch timbers, the outer course placed longitudinally and the inner vertically. Two layers of 3-inch planking were placed on the outside, and one layer on the inside. The bottom of

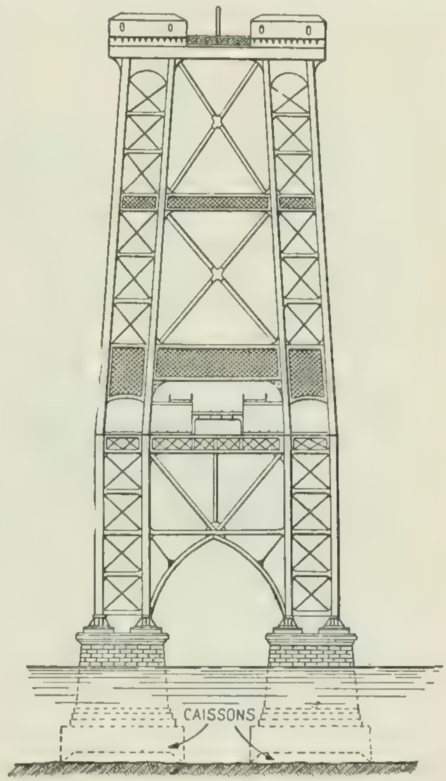

Fig. 9.

the walls was provided with a cutting edge, as shown by Fig. 10, which extended continuously around the whole caisson. This cutting edge was constructed of ½-inch steel plates, stiffened at intervals of 2½ feet of its length by knee braces. It extended two feet below the bottom of the lowermost timbers, and the lower 12 inches were stiffened with reinforcing plates, so that it had a total thickness of two inches. The cutting edge was not provided for the purpose of cutting through the bed of the river, but to enable the workmen to use their tools close to the outer edge of the walls of the caisson, which were nearly three feet in thickness, and also to facilitate the removal of obstacles, such as boulders, which could be dis-

lodged with less difficulty from underneath the two-inch edge than the bottom of the three-foot wall. The roof of the working chamber was five feet in thickness, and consisted of several layers of 12 by 12-inch timbers laid alternately crosswise and covered with alternate courses of 3-inch planks laid diagonally. The roof, and in fact the whole caisson, was stiffened with eight massive steel-plate riveted-trusses, which extended across from wall to wall. All the timbers of the caisson and of the roof were drift-bolted together so as to give great rigidity to the structure, and to make it perfectly water-tight. Additional strength was given to the working chamber by two solid bulkheads, which extended entirely across and divided it into three compartments, openings being provided for the passage of workmen. A massive framework or gridiron formed of 16 by 16-inch timbers was bolted together and to the side walls at the level of the lowermost timbers with 1½-inch steel tie-rods. From each

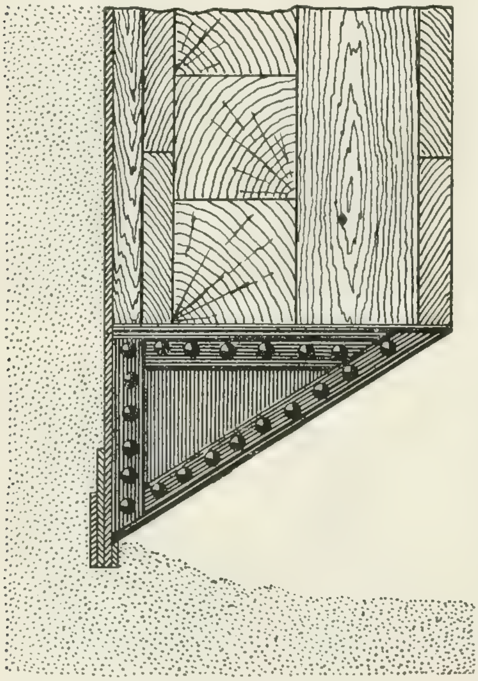

FIG. 10.

intersection of this framework vertical posts reached to the roof and were tied together and stiffened to resist lateral distortion, by diagonal struts and tie-rods, as shown in Fig. 11, practically forming two steel trusses nine feet three inches in depth, with a weight of 10 tons each. They were a novel feature in this class of work, but were rendered necessary on account of the shallowness of the caisson. The roof was pierced with seven shafts, each about three feet in diameter, for the passage of men and material, and several pipes ranging from one to five inches in diameter, for supplying air and water, blowing-out sand, and for carrying electric light wires. These shafts were of circular section, and were put in place in lengths of eight feet as the masonry work was carried upwards.

The piers on the Brooklyn side were constructed in a similar manner, with the exception that they were carried to a depth of 107 feet below high water. The last caisson to be sunk passed through 50 feet of water, 20 feet of sand, gravel and boulders, 30 feet of hard clay and hard-pan, and 12 feet of rock. The excavating of the rock was rendered necessary by the steepness of its slope.

The lower caisson measured 63 feet by 79 feet, and contained 74,700 cubic feet of timber, and 98 tons of iron, the greater portion of which was in the form of drift-bolts. Without the concrete filling it weighed 1,965 tons, and contained 6,000 yards of concrete above the roof of the working chamber. The upper caisson was 50 feet deep and contained 29,000 cubic feet of timber, and 32 tons of iron.

The sinking and concreting was accomplished in three months and six days, a very rapid piece of work considering the great depth to which the caisson was sunk. Down to the depth of 55 feet the men worked in eight-hour shifts. Below this depth the shifts were successively shortened as greater depths were attained. From 55 to 70 feet the shifts were six hours long; from 70 to 80 feet, four hours; from 80 to 90 feet, two hours; from 90 to 100 feet, one and one-half hours, and from 100 to 107 feet, 45 minutes. The pay of the men was increased in proportion to the depth at which they worked, and ranged from $2.50 for the eight-hour shift to $3.75 for the short shifts at the lowest levels. Although the air pressure at the depth of 107 feet was 46 pounds per square inch, there was very little sickness among the workmen, and only one serious case. The piers above the caisson foundation were built of limestone masonry up to low-water level, and, above that, of limestone with a granite facing.

Other notable examples of the pneumatic caisson method, both in the United States and in foreign countries, are the foundations of the centre pier of the Harlem River bridge, New York city; the Benares bridge over the Ganges River, India; the Poughkeepsie bridge over the Hudson River, New York; the Hawkesbury bridge, New South Wales, Australia; and the Jubilee bridge over the Hooghly River in Bengal. The centre pier of the Harlem River bridge supports the thrust of a 510-foot steel arch on each side of it, and stands on a timber caisson 54 feet by 104 feet, with a depth of 13 feet. It is divided into three compartments by vertical partitions, which not only served to strengthen the caisson, but protected the men during the blasting operations necessitated by the greatly inclined surface of the rock.

Foundations for piers or abutments of bridges, or for the main columns of high buildings, where the individual piece of work is of lesser magnitude than those already cited, are usually constructed by the use of cylinders of iron, as illustrated by Fig. 12. The arrangement consists of a cylinder of metal divided into two unequal parts by a horizontal partition — the upper and larger part, essentially a coffer-dam, being the caisson proper, and the lower part within which the excavating operations are carried on being the working chamber. It is provided with one or two shafts made of boiler-

plate, which are connected with the air chamber on top adjoining the equilibrium chamber or air-lock through which the workmen and materials must enter. A pipe from the air compressor furnishes the air chamber with compressed air, which is subsequently introduced by a system of locks to the working chamber below.

Dredging in Wells.— Beyond the limit of the effective application of pneumatic methods, about 100 feet below the water surface, all excavating must be accomplished by dredging, and special care has to be exercised in planning the method of operations to prevent any contingency arising at the bottom that would require to be dealt with by the use of human labor, as diving operations are impossible. It is also important to observe that the skin friction, quite unimportant in a cylinder of moderate depth, becomes so great at lower levels that special means have to be employed to overcome it. In the Benares bridge mentioned in the foregoing paragraphs, the principal piers are sunk to the depth of 140 feet below the level of the water, and consist of oval brick wells each 28 feet by 65 feet in diameter, the bottom lengths being cased in iron, as it was necessary to begin operations in the water. Each well is divided into three vertical compartments in which the dredging was carried on. In constructing the Poughkeepsie and the Hawkesbury bridges, almost identical methods were employed. In the case of the former, the caisson is of timber; it measures 60 feet by 160 feet, with a depth of 125 feet. It is divided into 40 vertical cells, and was sunk to a depth of 130 feet by filling in some of the cells and excavating in others. In the case of the latter, the caisson is of steel and iron, of oval form, 20 feet by 48 feet diameters, and splayed out at the bottom an additional two feet all around. It is divided into three dredging wells set on the centre line and parallel to its length. They splay out at the bottom so as to meet each other and the outer skin, thus forming a cutting edge. It was sunk to a depth of 161 feet below the water level by dredging in the wells, and by filling the space between the wells and the outer skin with concrete. This is probably the greatest depth ever reached in the construction of a bridge foundation.

The foundations of the piers of the Hooghly bridge were constructed by the use of similar caissons. The outer skin of the caisson, however, is entirely vertical, and the three dredging wells extend right across the structure, occupying the semicircular ends and the central portion. The weight for sinking was obtained by filling the two 15-foot intermediate spaces with concrete, and by placing a brick lining around the semicircular ends. It will be understood that in all these cases the dredging wells were finally filled up with concrete when the proper depth was reached.

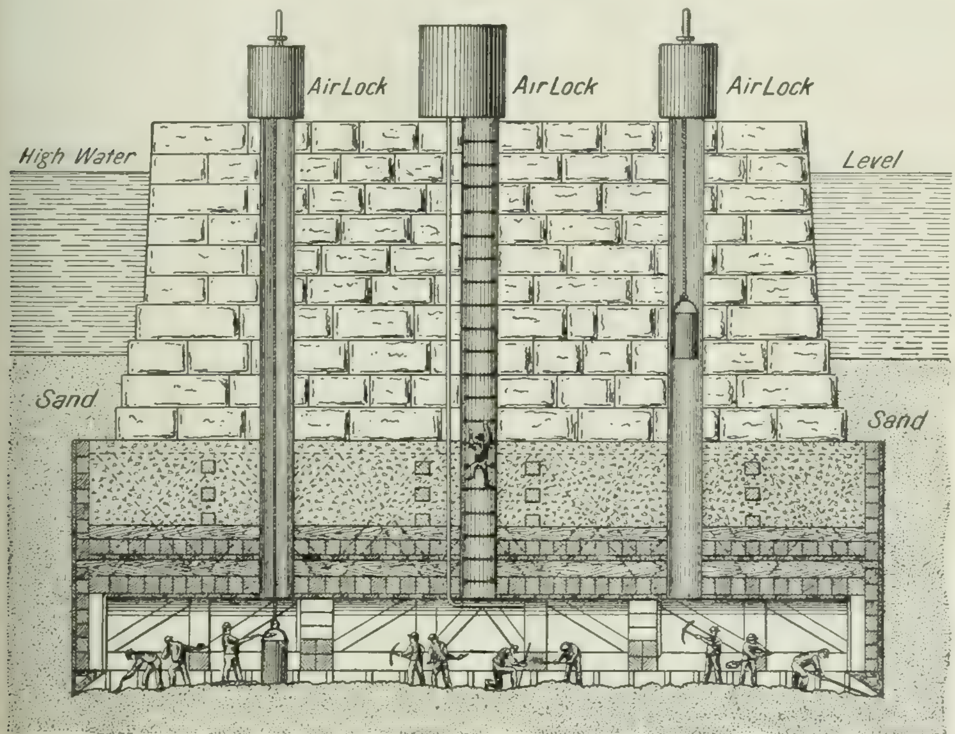

Fig. 11.

Pneumatic Forcing Method.— This is an improved method of constructing subaqueous foundations in sand or gravel substrata by converting it into a solid in the form of sand or gravel concrete. This is effected in place, without excavating operations, by forcing cement

in the form of the dry powder in which it is furnished commercially, through a pipe by air pressure into the substrata. The charging pipe, called the lance pipe, has an internal diameter of 1½ inches, and is drawn to a point at the lower end, and perforated with three or more holes ⅜ of an inch in diameter. The upper end of the pipe is connected by means of a bend and rubber tubing with the air pressure supply pipe, suitable arrangements being provided to raise, lower, or move it while in operation. The air pressure supply pipe is provided with suitable branches fitted with stop-cocks to permit of its being connected to an injector device by which any desired quantity of cement powder may be fed into the current of air. In operation, the air pressure forces the cement powder through the small openings at the lower end of the lance pipe and drives it into the substrata of wet sand or gravel, with which it combines and forms sand or gravel concrete as the case may be. The lance tube may be sunk to depths of 16 or 19 feet in a comparatively short time, and in order to insure a uniform mixture in the foundation pit, the foundation area is divided into small fields 8 to 12 inches square, into each of which the proper quantity of cement is blown. The proper amount of the cement charge is determined by dividing the cubic contents of the field by the required proportion of the mixture. Usually, the saturation of the sand is so thoroughly accomplished that when the forcing operations are discontinued, the particles of sand, if allowed to come together, would adhere to each other with a great deal of energy, so much so that it is well known to all makers of concrete, whether by hand, mixer, or mill methods, that the volume of the resulting material is always less than the sum of the volumes of the ingredients in their free and uncombined state. Experience has demonstrated that the best proportions of the two ingredients are one part by volume of cement to five parts of sand, or sand and gravel, measured in the same manner. This method was first suggested by Fr. Neukirch, of Bremen, Germany, and is being extensively used in various ways other than the construction of foundations proper, for such purposes as the consolidation of the soil around brick sewers, in the building of quay-walls, and in many other cases where the driving of cofferdams would be dangerous or impracticable.

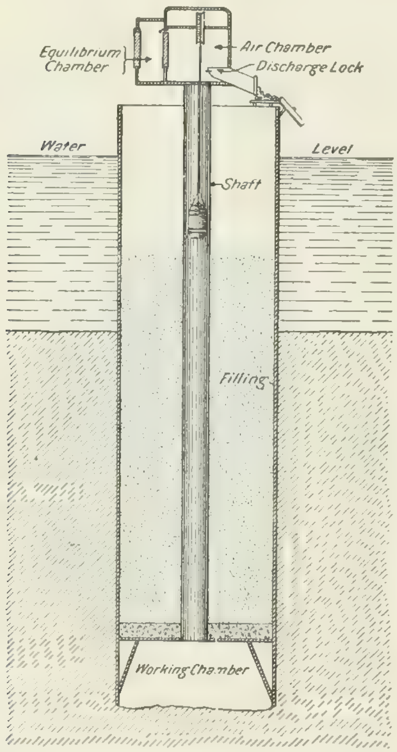

Fig. 12.

Another method by which bodies of cement or concrete may be placed in quicksand substrata employs pipes in the following manner: Two or more iron pipes are sunk through the quicksands to the desired depth, and water pumped into one of the pipes, thus converting the substrata into a condition of fluidity sufficient for the purpose of pumping it out through the other pipe. The cement is then introduced through the forcing pipe and filled into the agitated area at the bottom of the pipes.

Freezing Method.— This method is employed in the construction of subaqueous foundations, or of foundations in quicksand, or in soft water-bearing substrata, where the fluidity or lack of plasticity of the soil requires it to be artificially consolidated before excavating work can be instituted therein. In the Poetsch process, a large number of pipes are distributed as uniformly as the unstable conditions will permit, and are then filled with a strong freezing liquid which is maintained in a state of constant and active circulation until the substrata becomes solidly frozen. The excavation is then made in the frozen material, and the foundation put in and allowed to set firmly, after which the freezing operations are discontinued and the substrata allowed to thaw and assume its normal condition around the work. The method is not one that bears recommendation for works of magnitude. The thawing sands usually return to a state of unstable equilibrium not very conducive to the permanency and stability of the structures built therein, and besides that, the cost of the refrigerating plant, together with the accessory machinery and appliances, is so excessive as to be practically prohibitory in ordinary cases. It may be advantageously applied, however, in many special cases, especially in the construction of subaqueous tunnels and for making repairs to all classes of subaqueous structures.

Consulting Civil and Mechanical Engineer, N. Y.

Founder, also called **Laminitis,** consists of inflammation of the vascular sensitive laminæ of the horse's foot Occasionally the laminæ are strained from severe exertion; more frequently they suffer from the morbid effects of cold, which is especially injurious after excitement and over-fatigue. The shoes must at once be removed, and the toes, if long, reduced, but no further rasping or cutting is permissible. The feet must be enveloped in hot bran poultices, and kept off the hard ground by a plentiful supply of short litter. Purgatives, if required, must be used with extreme caution. See HORSE, DISEASES AND CARE OF.— *Care of the Feet.*

Founders and Patriots of America, The, a society founded in 1896, and incorporated 18 March, of the same year, the object stated in the articles of incorporation being «to bring together and associate congenial men whose ancestors struggled together for life and liberty, home and happiness, in the land when it was a new and unknown country, and whose line of descent from them comes through patriots who sustained the colonies in the struggle for independence in the Revolutionary War; to teach reverent regard for the names and history, character and perseverence, deeds and heroism, of the founders of this country and their patriot descendants; to teach that the purpose of the founders could have had no lasting result but for their patriot sons; to inculcate patriotism; to discover, collect, and preserve records, documents, manuscripts, monuments, and history relating to the first colonists and their ancestors and their descendants, and to commemorate and celebrate events in the history of the colonies and the republic.» The order admits to membership any male citizen of the United States above the age of 21 years who is lineally descended, in the male line of either parent, from an ancestor who settled in any of the colonies prior to 13 May 1657, and whose intermediate ancestors in the same line during the Revolutionary period adhered as patriots to the cause of the colonies.

Founding. The art of making molds in sand, loam, or plaster of Paris, with or without the aid of patterns. The molds thus made are filled with molten metal which is subsequently allowed to cool and solidify into a metal casting corresponding to the form of the mold.

The various founding processes are characterized by the kinds of metal employed in the castings, such as iron, steel, brass, bronze, etc., and by the class of work produced, such as water pipes, car-wheels, ordnance, statues, bells, etc., involving the applications of special methods in the work of molding; in the melting of the metal; in the filling of the mold with the molten metal; and in the manner in which the metal is allowed to cool.

Molding in Sand.— The process of molding in sand by means of patterns embedded in flasks containing sand, is substantially as follows: The flasks, which are box-like arrangements provided with suitable handles by which they may be lifted and moved around, are generally used in pairs — the upper flask being commonly designated the «cope,» and the lower one, the «drag» or «swivel.» The patterns, usually of wood, are made either in one piece when the design of the casting is simple, or in several pieces when the form of the casting is more complicated. In molding, the drag is filled with sand and the pattern embedded in it. The cope is then placed over the drag and the sand rammed in tightly around the pattern. The pair of flasks is then turned over and the loose sand taken out of the drag and replaced by sand firmly rammed in its place. The flasks are now returned to their original position; the cope is taken off and the pattern removed. The cope is then replaced upon the drag, and the mold is thus made ready to receive its filling of molten metal. This is accomplished by pouring the metal through suitably formed gates or holes which extend through the cope and connect with the molded spaces in the drag.

The use of a separate appliance for a drag is very often dispensed with, the pattern being embedded in a bed of sand upon the foundry floor. This method is especially applicable when a large number of small castings are made at each pouring. Also, very often the patterns are made in two parts, that is, divided in the middle horizontally, so that one half of the mold is made in the drag and the other half in the cope. In the case of hollow cylindrical castings such as water pipes and the tubes of heavy ordnance, a cylindrical core of the proper dimensions is suspended in the drag mold before the cope is placed in position, and the annular space between the core and the interior walls of the mold is filled in with the molten metal.

Molds are made either in green or in dry sand. Those in green sand are suitable for the making of small and simple castings: but molds in dry sand are employed in the production of castings of large size and great intricacy of design. In such cases, after the molds have been finished, they are placed in drying ovens until they are thoroughly dried.

Molding in Loam.— In this process, the molds instead of being made by the embedding of patterns in sand, are formed by means of cores of metal or of brickwork which are covered by several coatings of loam — mixed sand and clay, to correspond with the form and dimensions of the desired castings. An outer shell constructed around the core thus thickened, provides the annular space for the reception of the metal. The method is especially applicable to the founding of hollow cylinders, bells, and statues. See titles FOUNDRY AND FORGE SHOP TERMS, and ORDNANCE, in this Encyclopedia.

Foundling, a child abandoned by its parents, and found by strangers. Though infanticide was not punished among the ancient nations, with the exception of Egypt, where the child's corpse was fastened to the guilty parent's neck for three days and nights, yet natural feeling would prompt parents to expose their offspring, and leave their fate to accident rather than kill them. They usually selected places which were much frequented, where there was a greater chance of the child being saved. In Athens and Rome they were exposed in especially appointed places. In the 4th century under the Emperors Valentinian, Valerius, and Gratian, the practice was prohibited. The Bishop of Treves in the 6th century allowed foundlings to be placed in a marble basin in front of the cathedral, thus entrusting them to the care of the Church.

In 787 a foundling hospital was established at Milan; one was established at Paris in 1362, but among the most famous of modern institutions is the foundling hospital in Paris formally established in 1670. It receives not only foundlings strictly so called, that is, deserted children of unknown parentage, but also deserted children of known parents, and destitute children generally, as well as children pronounced incorrigible by the courts or declared to be so by their parents.

England has no foundling hospital properly so called; all exposed children are brought up at the expense of the parish in which they are found. The Foundling Hospital in London, established by Thomas Coram, a master-mariner, in 1739, was originally a hospital for exposed and deserted children. It was for a time extremely popular, and was repeatedly assisted by parliamentary grants; but the enormous increase of abandonments, and the expense which they occasioned, produced such an alteration in public opinion that the hospital was changed to what it now is, a hospital for poor illegitimate children whose mothers are known.

In the United States foundlings are usually consigned to the county poor farm, but Foundling and Maternity Hospitals exist in the principal cities. Foundling hospitals are said to diminish not only the exposing of children, but also to render infanticide and intentional abortion less frequent. The objection that they contribute to the corruption of morals, if they receive children indiscriminately, and that they encourage parents to rid themselves of responsibility, is the strongest which can be urged against such institutions, and is not easily answered. In Massachusetts foundling hospitals are legally forbidden. In New York city foundlings are sent to Bellevue Hospital, and formerly were transferred to the Infants' Hospital on Randall's Island or in the borough of Brooklyn, to Flatbush. The rate of mortality among them was alarming; in 1897 all children received at the Randall Island institution died before reaching the age of two years, chiefly owing to the change of food and neglect before and exposure during abandonment. At baby farms, private institutions where babies were boarded for gain, the same conditions also prevailed. The attempt to remedy these deplorable conditions has met with great success since 1899. The work is supervised by the Joint Committee on the Care of Motherless Infants under the control of the State Charities Aid Association and the New York Association for Improving the Condition of the Poor, and their fifth annual report for the year 1903 shows the rate of mortality has decreased to 11 per cent as compared with 55.9 per cent in 1899, the first year of their work. Foundlings of whose parentage nothing is known are baptized alternately Roman Catholic and Protestant, the Roman Catholic children being in charge of the Guild of the Infant Saviour, while the committee care for the Protestants. In connection with this admirable work is an agency for providing situations in the country for destitute mothers with infants. The *mothering* system has been long enforced in the Chicago Foundling Asylum, and is being adopted in similar institutions throughout the States. Consult: Folks, 'Care of Neglected and Dependent Children' (1901); 'Reports of the Joint Committee on the Care of Motherless Infants'; 'New York Association for Improving the Condition of the Poor' (1903).

Foundry and Forge Shop Terms. The following list of terms includes some of the most significant words and phrases commonly used in connection with foundry and forge shop operations.

Angles.— Strengthening pieces which run around the angular portions of castings.

Annealing.— The subjection of brittle and non-elastic metals to the action of long continued heat, which effects a rearrangement of the ultimate molecules, and makes the metal tougher or more homogeneous. Steel castings, old chains and rods, and other forms of hammered work, which have been used for a long time, are improved by annealing; but, newly rolled plates and bars, the fibrous condition of which has not deteriorated, are weakened in tensile strength by the process. Annealing is carried on by means of "annealing-ovens" into which the "annealing-pots" containing the articles which require to be annealed are run, and exposed to the action of the heat for periods ranging from several hours to several days as the circumstances may require. The function of the annealing-pots is the preservation of the contained articles from the action of the atmosphere during the process of annealing.

Bars.— The stays or bridges placed in molding boxes to support the sand which encloses the pattern. They are purposely cast as rough as possible in order to insure the adherence of the sand. Vertical or "cope-bars" have their edges kept about three-quarters of an inch away from the pattern and about the same distance from the joint of the box. "Flat-bars" or "drag-bars" are placed in the "drag" or bottom-half of the mold, and therefore, do not follow the outline of the pattern.

Battering-off.— The finishing of the surfaces of forged work by hammering while the metal is dropping to a low red or black heat.

Bead Slickers or Bead Tools.— Sleeking tools used by molders for smoothing the impressions of beaded work such as the ornamental fillet or strip curved around the edge of a casting.

Bedding-in.— The method of molding in which the pattern is embedded in a bed of sand on the foundry floor instead of being placed in a box mold and "rammed-up" with sand.

Binders.— Rosin, glue, wheat and rye flour, linseed oil, etc., employed for the purpose of giving strength to "core-mixtures."

Blackening.— Pulverized charcoal, coal, coke, and plumbago or graphite used by molders for sleeking over the surface of a mold in order to prevent the castings from becoming "sand-burnt."

Black Wash.— A solution used on loam-molds and dry-sand molds for the same purpose that blackening is used in green-sand molds.

Blast.— The volume of air artificially forced into furnaces and forges by means of bellows, blowers, and rotary fans, to accelerate the combustion.

Blowers.— Machines employed for the production of blast, ventilation, etc. The principal forms consist of blowing cylinders and pistons, and the rotary blowers or centrifugal fans which are operated by power driven belting. Ordinarily they deliver a blast ranging from four to six ounces, approximating to a pressure ranging from seven to ten inches as indicated by the water gauge.

Blowholes.— Hollow cavities in castings caused by the presence of bubbles of air, or gas in the mold due to imperfect venting. When of a bluish color, they indicate the presence of sulphur in the metal.

Bottom Board.— The board on which the joint of a pattern is placed when it is being rammed-up, either to sustain a weak pattern, or to make the molders' "sand-joint."

Bottom Part.— The "drag" or bottom-half of a mold. In "bedding-in" work, the portion of the mold in the foundry floor.

Burning-off.— A process of tempering springs. The spring to be tempered is first hardened by immersion in linseed oil. When cold, it is taken out and the adhering film of oil ignited and allowed to burn off, thus producing a temperature of at least 600° Fahr., which draws the temper of the spring and coats it with a black surface that makes it practically rust proof.

Burning-on.— The replacing of a broken-off or incomplete portion of a casting. A mold of the portion which is to be burned-on is placed in the proper position against the main casting, and the molten metal poured in. The metal is allowed to flow over the broken face of the casting and out through a gate at the side of the mold, until the broken face is in a state of local fusion. The gate is then stopped, and

the metal allowed to cool. Perfect amalgamation is attained by the method.

CASE HARDENING.—The treatment by which wrought-iron is hardened on the surface. It is first heated to a red heat in the presence of carbon, and absorbs enough of the carbon to transform it into steel on the outside. It is then chilled suddenly to harden the steel.

CHAPLET.— The metallic devices used for supporting the "core" of a mold. Chaplets are of various forms — the single-headed chaplets, the double-headed chaplets, the spring chaplets, and the adjustable chaplets. They are placed under the cores to support them, or above the cores to hold them down, or at the sides of the cores to enable them to resist the lateral pressure exerted by the flowing metal.

CHARGING.— The supplying of furnaces with fuel and ores. In a reverberatory furnace, the "charging-door" or the opening through which the charge is introduced, is located at the side; while in a blast furnace or cupola, it is located near the top at the level of the charging platform.

CHART METHOD.— A method for computing the weight required for holding down the cope and core against the raising effort of the head of flowing metal. It consists in the drawing to scale the outline of the form and size of the lifting surface, and the height of the fluid head, and computing from the figure thus obtained, the cubical contents, which multiplied by the decimal .26 gives the data for the necessary weight.

CHILLS.— Metallic molds into which specially mixed molten iron is poured for the production of chilled or surface hardened castings. They are made of a quality of iron of sufficient strength and ductility to allow for the alternate expansion and contraction to which they are subjected, otherwise they would not last longer than one heat. Chills used for casting chilled-rolls are made in sections. "Contracting-chills" are used for casting chilled car wheels, and are so constructed, that as the metal of the wheel cools and contracts, the chills close in and keep in constant contact with it.

CINDER-BED or COKE BED.— The first layer of coke placed in a cupola previous to the introduction of the iron. Its weight bears a definite relation to that of the iron, but varies with the condition of the furnace. The term "cinder-bed" is also applied to the beds of cinders sometimes placd under the molds and with which the vents are connected.

CLAMPING.— The weighting down of the cope of a closed mold preparatory to "pouring," to prevent its raising by the lifting force of the metal. It is accomplished by means of various forms of clamps and weights, the latter consist of piles of pig-iron piled in separate pigs on the cope, or cast-iron bars ranging from 1,000 to 2,000 pounds in weight, which are hoisted into position by a crane.

CLEANING or CLEANING-UP.— The smoothing of the surfaces of a foundry mold with trowel and cleaners, and blackening, preparatory to "closing" and "casting." Also, the removal of sand from castings by means of wire brushes and files, by means of tumbling-barrels, and by various pickling processes.

CLOSING-UP.— The placing on of the top-box or cope of a mold in readiness to pouring in the molten metal.

COLD SHUTS.— When cast metal pours thick, or when it is poured into the mold too slowly, it is liable to thicken and partly solidify in those portions of the mold where the casting is thin, thus preventing the metal which follows from properly amalgamating with it. The imperfectly united contact surfaces thus formed are called "cold-shuts," "cold-shorts," or "cold-shots."

COPE.— The top-box or upper-half of a green-sand mold.

CORE.— A body of green or dried sand placed in a mold to exclude the central or inner portion of a casting. They are made either in boxes called "core-boxes," or struck to shape upon a revolving bar, a mixture of loam being used for the body, and the required outline imparted to it by revolving it against the bevelled edge of a templet board called the "loam-board."

DRAWING OF PATTERNS.— The lifting of patterns from the sand. Also called "rapping," "delivery," etc.

DRAWING PLATES.— See Rapping.

DRAWING OF TEMPER.— The heating of steel to redness and then allowing it to cool slowly in the air. The reverse of "hardening" and "tempering."

DROP FORGING.— The method of forging iron by driving or pressing it into a die placed under a drop hammer. It is employed when a number of forgings of the same pattern are required. A great deal of this class of work is now accomplished by the use of steam-hammers and forging-presses.

FAGOTING.— The piling up of lengths of puddled bar-iron in fagots or bundles for the purpose of reheating and rolling.

FEEDING.— When molten metal cools, the outside portions will set first, while the inside portions will remain fluid for some length of time. As the inner portion cools, it will contract and shrink upon itself and leave a depression on the top face of the casting. To avoid this condition the heavier portions of the casting are fed with metal through a small rod called the "feeding-rod," inserted through the runner or the riser, which by its motion keeps a passage open for the inflow of the fresh metal introduced to compensate for the contraction. The metal used for this purpose is called the "feeding-head."

FLASK.— The box which holds the sand in which the pattern is rammed-up in the making of a mold. Flasks are made either of wood or of metal, and are parted horizontally into two or more sections. In a mold composed of two parts, the lowermost or the one which is molded first is called the "nowel" or "drag," and the uppermost or the one which is on top when the casting is poured, is called the "cope." When a flask consists of more than two parts, the sections between the cope and the drag are called "cheeks" or "intermediates." Flasks are provided with two loose covers called top and bottom boards, and they are designated as "two-part flasks," "three-part flasks," "four-part flasks," etc., according to the number of the component parts.

FLOOR RAMMER.— A flat-ended iron tool employed for ramming over large surfaces of sand.

FLUXES.— Substances used in a smelting, or in a melting furnace for combining with the earthy and other infusible matter present in ores, and which require to be separated from the metal, and which cannot be rendered fluid by itself at the temperature of the furnaces. The flux most widely used is a carbonate of lime in the form of limestone, clam and oyster shells, chalk, dolomite and calcite. Magnesia, fluorspar, feldspar, and calcspar are also suitable for this purpose. This by-product of the furnaces is called "slag."

FORGE.— The structure upon which a smith's fire is maintained. Forges are constructed of brick, of brick and iron combined, or entirely of iron. A forge consists of a hearth, tuyere, chimney, bonnet, and troughs for water and coal. The blast is produced either by bellows, or by rotary blowers and fans.

GAGGERS.— Short, conical projections cast upon the core-plates and the plates of loam-molds for the purpose of assisting the adhesion of the loam. The term is also applied to the hooks of cast-iron or of wrought-iron which are hung from the cross-bars of a molding box into the mold to prevent the sand from sliding out when the cope is lifted. They are necessary when the body of sand is more than sixteen inches square in area.

GATE.— The opening in the sand of a mold, which connects the "sprue" with the interior of the mold. The sprue is the orifice through which the molten metal is poured into the mold. Both terms are also applied to the bodies of metal which occupy the respective passages after the casting has been poured.

HARDENING.— The hardening of a metal is the result of an increase in its density. Few metals are capable of being hardened. The hardening of steel is effected by heating it to a cherry-red temperature and then chilling or cooling it suddenly by plunging it in water, oil, or other suitable solution, or by exposing it to a cold blast. The degree of hardness that may be attained depends upon the suddenness of the chilling. In hardening and tempering tools such as machine knives, taps, long twist-drills, reamers, milling cutters, etc., the danger of warping them by uneven heating, or by cold draughts, is avoided by heating them in special hardening and tempering furnaces. See Case Hardening and Tempering.

LIFTING.— The drawing out of a pattern from a mold. Also applied to the raising up or springing up of the cope or top-part of the mold caused by the pressure due to the head of the molten metal. This tendency is counteracted by the use of screw-bolts, clamps, and dead-weights. See Clamping.

LOAM WORK.— The making of molds in loam, as distinguished from that of molding in sand. The loam used in foundries consists of a mixture of clay, sand, and horsedung, ground up with water by means of a form of mortar mill called the "loam-mill." When cold, the loam has sufficient consistency to be struck up to any desired outline by means of a "loam-board." See Cores.

LYCOPODE.— A material used for "parting."

MATCH-PLATES.— A match-plate is a wooden board or plate of metal on the opposite faces of which two different portions of a pattern are attached. When the boxes containing the impressions are brought together, they constitute a complete mold. In some cases they are very useful for facilitating the making of joints, but they are generally used for making

molds for castings having plain outlines, without sharp corners, cores, or projections.

Mold-boards.— Boards used for making molds for small castings having irregular joints. Their chief advantage consists in the saving of time and labor in forming the joints. They are made of various kinds of material. The wooden mold-board is carved out in the desired shape of the joint. The plaster of Paris mold-board is used in cases where the pattern is very crooked, and where the other types cannot be made as cheaply, or to fit with the same amount of accuracy. The sand-and-composition mold-boards are the kind generally used, and obviate the necessity of ramming the sand. The composition consists of twenty parts of fine dry sand to one part of litharge, tempered with linseed oil. The match-plate is a form of mold-board.

Molding or Founding.— The making of molds for metal castings. The molds are made in sand, loam, and plaster of Paris, with or without the aid of patterns. There are three classes of molding — green-sand molding, in which damp sand is used, and the castings are made in damp molds, or in molds the surfaces of which have been "skin-dried;" dry-sand molding in which the damp sand molds are thoroughly dried in an oven preparatory to casting; and loam molding. See Loam Work.

Molding Sand.— Sand is used for molding, in preference to all other materials, on account of its refractory nature, which enables it to resist the destructive action of molten metal at high temperatures; on account of its porosity, which allows the free escape of the gases generated in casting; and on account of its peculiarly compact and adhesive properties, which not only permits of its being molded to any desired shape, but also enables it to resist a great amount of pressure exerted by a liquid. The best molding sand is obtained from the coal measures, and the later red sandstone formations. Sand from the green-sand and chalk formations is also very satisfactory. The most suitable sand is that which contains a large percentage of silica, with alumina and magnesia present in small quantities. The various grades of molding sand are designated as green-sand, dry-sand, core-sand, facing-sand, and parting-sand, according to the purposes for which they are used.

Odd Sides.— See Mold-boards.

Parting.— The act of separating the different parts of a mold-box. Also applied to the process of making the sand-joint between two contiguous mold-boxes. Also to the joint itself.

Pouring.— The filling in of a mold with molten metal in making a casting.

Print.— A projection placed upon a pattern to indicate the position of a cored hole, and to form an indentation for the reception of the end of the core. "Pocket-prints" and "parallel-prints" are used at the sides of the patterns.

Rapping.— The process of loosening a pattern from the sand previous to its withdrawal therefrom. This is effected by inserting the pointed end of the "rapping-bar" into the "rapping-hole" bored in the pattern or in a plate of malleable iron called the "rapping-plate," screwed on the face of the pattern. Small round-faced wooden mallets, called "rapping-mallets," are used in the actual process of withdrawal, which, unless carefully performed, will not only damage the pattern, but will enlarge the molds of small castings to a very appreciable extent.

Riddle.— A coarse sand sieve of about half-inch mesh, used for sifting coarse and old sand.

Riser or Air Gate.— A vertical opening which extends from the mold, through the cope, to the outer air. When it fills up with the molten metal it indicates that the mold itself is full.

Tempering.— In foundry work, it is applied to the process of mixing various grades of sand. In forge shop work, it signifies the imparting of a definite degree of hardness, or elasticity to steel. It is effected by either raising or letting down the metal to a certain temperature and then cooling it from that temperature by plunging it in water or oil. The degree of temperature is indicated by the various colors assumed by the steel during the heating part of the process. It may also be determined by the flashing point of a fat.

Venting.— The piercing or honeycombing of the sand of a mold by means of a long wire-rod, one-eighth or one-quarter inch in thickness, thrust in all directions, for the purpose of allowing the free escape of the gases generated by the decomposition of the moisture in the sand by the heat of the inflowing metal.

For further information relative to the various processes such as riveting, welding, boring, etc., which form an important part of foundry and forge shop work, see articles under the titles, Boiler Shop Terms, and Workshop Terms, in this Encyclopedia.

William Morey, Jr., C. E.
Consulting Civil and Mechanical Engineer.

Fountain, or **Artificial Fountain,** in hydraulics, a machine or contrivance by which water is violently spouted or darted up; called also a *jet d' eau.* There are various kinds of artificial fountains, but all formed by a pressure of one sort or another on the water, namely, either the pressure or weight of a head of water, or the pressure arising from the spring and elasticity of the air, etc. When these are formed by the pressure of a head of water, or any other fluid of the same kind with the fountain or jet, then will this spout up nearly to the same height as that head, abating only a little for the resistance of the air, with that of the adjutage or pipe from which the water spouts, etc., in the fluid rushing through; but when the jet is produced by any other force than the pressure of a column of the same fluid with itself, it will rise to such a height as is nearly equal to the altitude of a column of the same fluid, whose pressure is equal to the given force that produces the fountain. In ancient Greece every principal town had public fountains or conduits, some of which were of handsome design and of beautiful execution. In the city of Megara there was a public fountain established by Theagenes, which was celebrated for its grandeur and magnificence. The fountain of Pirene, a fountain at Corinth, was encircled by an enclosure of white marble, which was sculptured into various grottoes, from which the water ran into a splendid basin of the same material. Another fountain in Corinth, which was called Lerna, was encircled by a beautiful portico, under which were seats for the public to sit on during the extreme heat of summer to enjoy the cool air from the falling waters. In the sacred wood of Æsculapius, at Epidaurus, there was a fountain that Pausanias cites as remarkable for the beauty of its decorations. At Messina there were also two elegant fountains, one called Arisinoë and the other Clepsydra. Pausanias also alludes to several other fountains in various parts of Greece, celebrated for the grandeur and beauty of their architectural and sculptural decorations.

The ancient fondness for fountains still exists in Italy and the East. The French are celebrated for their fountains, but Italy, more particularly Rome, is still more so. The fountains of Paris and of the Tuileries, of the orangery at Versailles, at St. Cloud, and other places in the neighborhood, are splendid structures. The principal and most admired fountains at or near Rome are those in front of St. Peter's, of the Villa Aldobrandini at Frascati, of the Termini, of Mount Janiculum, of the gardens of the Belvedere, in the Vatican, of the Villa Borghese, which has also in the audience chamber a splendid fountain of silver, five Roman palms in height, ornamented with superb vases and flowers; the fountains of Trevi, the three fountains of St. Paul, of the Aqua Acetosa, etc.

In the United States the ornamental type of fountain is the one in common use. Large display fountains were attractive features of the Centennial Exhibition, and at the Chicago World's Fair and Buffalo Pan-American Exposition. Among these was the Fountain of the Republic of Chicago, which was

designed by MacMonnies, and at Buffalo were costly examples dedicated to Man, Nature, Progress, etc. In Central Park, New York; Fairmount Park, Philadelphia; Lincoln Park, Chicago; Golden Gate Park, San Francisco, and other large parks, will be found numerous fountains of elaborate design. In all the larger cities drinking fountains for men and animals have been erected by individuals and local humane societies.

Fountain Pens. See LITERARY LABOR-SAVERS.

Fountains Abbey, one of the largest and best-preserved monastic edifices in England, in the West Riding of Yorkshire, 3 miles southwest of Ripon. Founded for Cistercians in 1132, it was not completed till the 16th century, and thus presents examples of every variety of style, from Norman to Perpendicular.

Fouqué, Friedrich Heinrich Karl, frēd'rĭh hīn'rĭh kärl foo-kā', BARON DE LA MOTTE, German poet and novelist: b. Brandenburg 12 Feb. 1777; d. Berlin 23 Jan. 1843. He was a grandson of H. A. Fouqué (q.v.); served as lieutenant of the Prussian guards in the campaign of 1792, and was present in 1813 at the most important battles in the War of Liberation. As a writer he is remarkable both for variety and fecundity, and has published poetry in almost all its forms — dramatic, epic, romantic, etc. Several of his short romantic tales in prose, such as 'Der Zauberring,' 'Aslauga's Ritter,' but more especially his 'Undine,' enjoy an extraordinary popularity. The last mentioned tale, a charming mixture of fairy ideality, the reality of humble life, and the glow of chivalry, has gone through many editions, and has been translated into every European language. It must be admitted that Fouqué, while possessing many of the virtues of the romantic school, was guilty of all its extravagances, and that the descriptions of chivalric and feudal life, in which he delighted, are mere fancy pictures.

Fouqué, Heinrich August, hīn'rĭh ow'goost, BARON DE LA MOTTE, Prussian general; b. The Hague, Holland, 4 April 1698; d. Brandenburg 2 May 1774. Fouqué possessed the confidence of Frederick the Great; and the 'Mémoires du Baron de la Motte Fouqué' (1788, by Büttner, the secretary of Fouqué), which contain his correspondence with Frederick the Great, are of great interest.

Fouquet, foo-kā, **Nicolas,** French statesman, VISCOUNT DE MELUN AND DE VAUX, AND MARQUIS OF BELLE ISLE; b. Paris 1615; d. Pignerol 23 March 1680. He received in 1650 the important appointment of procureur-général to the parliament of Paris, and three years later was advanced to be superintendent of finance. His rapid advance made him ambitious of succeeding Mazarin as first minister, but he had a formidable rival in Colbert. Fouquet's plans were, however, brought to naught; for in the first place Louis himself took the reins of power into his own hands when they slipped from the grasp of the dead cardinal, and in the second place, instigated thereto by Colbert, he suddenly arrested Fouquet in September 1661. After a trial extending over three years, Fouquet was sentenced to perpetual exile and the loss of all his property, but the sentence was afterward altered to life-long imprisonment. From the circumstance of his imprisonment at Pignerol, Fouquet, in spite of the fact that he died in 1680, has been identified with the Man With the Iron Mask (q.v.), who, however, lived till 1703.

Fouquier, foo-kē-ā, **Henry,** French publicist: b. Marseilles 1 Sept. 1838. After study of law and medicine he became a journalist in Paris, general-secretary of the prefecture of Marseilles (1870), and director of the press in the ministry of the interior. He wrote much for the *Figaro* and *XIX. Siècle,* but particularly for *Gil Blas,* under the pen-names "COLOMBINE" and "NESTOR," and was a founder of the *Echo de Paris.* In 1889 he was elected deputy for Alpes-Maritimes. His articles have been collected in several volumes under such titles as 'Etudes Artistiques' (1859); 'Au siècle dernier' (1884); 'La sagesse parisienne' (1859).

Fouquier-Tinville, Antoine Quentin, äṅ-twäṅ kĕn-tăṅ foo-kē-ā tăn-vēl, French revolutionist: b. Hérouelles, near St. Quentin, 1747; d. Paris 7 May 1795. As a member of the revolutionary tribunal he distinguished himself by his alacrity in pronouncing the verdict of guilty, and attracted the attention of Robespierre, who gave him the office of public accuser before this tribunal. The victims now became numberless. Fouquier drew up the scandalous articles of accusation against the queen, Marie Antoinette. His thirst for blood seems to have been increased by gratification, until it became a real insanity. He proposed the execution of Robespierre and all the members of the revolutionary tribunal 9th Thermidor, 1794, was himself removed on the 14th Thermidor (1 Aug.), 1794, and arrested. He died under the guillotine. There does not appear to be a trait in the life of this monster which can entitle his crimes to the same palliation as those of Robespierre, who considered the extermination of the aristocracy as a necessary evil. Consult Domenget, 'Fouquier-Tinville, et le tribunal révolutionnaire' (1878).

Four-eyed Fish, a fish of the genus *Anableps.*

Four-horned Antelope, or **Chousingha,** the genus *Tetraceros* of the antelope group, native to India, and differing from all other living ruminants in that the male generally bears two pairs of horns. It is closely related to the African duikerbok (q.v.), which it resembles in the position of its larger horns, and the shape of its eyes, as well as in other ways. The smaller horns rise from just above the eyes. This antelope is a pretty, brownish creature, standing about 25 inches at the withers, and is found from the foot of the Himalayas southward over India, in wooded hill-country, but it avoids dense jungles. It drinks daily, and hence never wanders far from the water. It is exceedingly shy, and escapes, when discovered, in a series of jerky, though very rapid, bounds, into the cover of long grass or low bushes.

Four Lakes, a chain of lakes in Dane County, Wis.; known respectively as First, Second, Third, and Fourth lakes. First Lake, the smallest and lowest of the chain, is about 3 miles long by 2 miles wide; Second Lake is 3½ miles long by 2 broad; Third Lake is 6½ miles long by 2 miles wide; Fourth Lake, the largest and most beautiful, is 6 miles long by 4 wide. The waters of these lakes are navigable for small steamers. The two last are now called lakes Monona and Mendota.

Four-o'clock. See FRIAR-BIRD.

Fourcroy, Antoine François de, äṅ-twän fräṅ-swä dė foor-krwä, French chemist: b. Paris 15 June 1755; d. 16 Dec. 1809. Having adopted the profession of medicine he applied himself closely to the study of the sciences connected with it, especially to chemistry, and published in 1776 a translation of Ramazzini's 'Treatise on the Diseases of Artisans.' He was professor of chemistry at the Jardin du Roi, 1780-1805. He organized the central school of public works, out of which the polytechnic school afterward sprang, and co-operated in the establishment of the normal schools. In 1799 Bonaparte gave him a place in the council of state, in which place he drew up a plan for a system of public instruction, which, with some alteration, was adopted. His works are numerous, among which the following are the most important: 'Leçons Elémentaires d'Histoire naturelle et de Chimie' (1791); 'Système des Connaissances chimiques, et de leurs Applications aux Phénomènes de la Nature et de l'Art' (1805); 'Philosophie chimique'; 'Tableaux synoptiques de Chimie' (1805); and 'La Médecine éclairée par les Sciences physiques.'

Fourdrinier (foor-drĭ-nēr') **Machine,** a paper-making machine, the first to make a continuous web. It was invented by Louis Robert, of Essonne, and patented by him in France. A Mr. Gamble and the brothers Fourdrinier improved it. The machine was perfected by others.

Fourier, François Charles Marie, fräṅ-swä shärl mä-rē foo-rē-ā, French social economist: b Besançon 7 April 1772; d. Paris 10 Oct. 1837. He studied at the college in his native town, and obtained a mercantile position at Rouen; he later entered into business on his own account at Lyons, having inherited a small fortune from his father, but the siege of the city by the troops of the convention in 1793 and the subsequent disorders were fatal to his prosperity; he was arrested and kept a prisoner for some time, and afterward served two years in the Revolutionary army. When he was 19, while employed at Marseilles, his employers retained a cargo of rice in order to keep up the price, and when it became unfit for use ordered Fourier to throw it into the sea. This experience led him to question the righteousness of the existing industrial system and to develop his own social theory known as Fourierism (q.v.). He first published 'Theorie des quatre Mouvements et des Destinées generales' (1808), in which he explained the basis of his system, which he developed more completely in 'Traite de l'Association domestique agricole' (1822), republished under the title 'Theorie de l'Unité universelle,' and in 'Le Nouveau Monde' (1829-30). See Pellarin, 'Charles Fourier, sa vie et sa théorie' (5th ed. 1871; American translation, 1845).

Fourier, Jean Baptiste Joseph, zhöṅ bäp-tēst zhō-zĕf, BARON, French mathematician: b. Auxerre, France, 21 March 1768; d. 16 May 1830. He was an active Jacobin during the French Revolution. His later energies were divorced from politics and given up to science. 'Analytical Theory of Heat' (1822) is his most noted work; but in mathematics his speculations and methods are of high permanent utility.

Fourierism, foo'rĭ-ėr-ĭzm, the social system advocated by F. M. C. Fourier (q.v.). It was based on the theory that the social order depends upon fixed moral and intellectual laws, and that man must discover and live according to these laws. According to Fourier society must be so organized as to give freedom to the passions or desires of man, since these are naturally capable of harmony, and, if developed under proper conditions, would, in accordance with the law of attraction, lead to a perfect society. In this society industry should be carried on by phalanxes, each phalanx to be divided into series, and the series combined in groups; each group was to have charge of one kind of work, and each series of one special branch of that work. In the distribution of products a certain minimum was to be assigned to each member of the society, whether capable of labor or not; the remainder to be shared in certain proportions to be previously determined among the three elements, labor, talent, and capital. The capital of the community might be owned in unequal shares by different members of the community; inheritance was to be permitted, and the individuals could expend the remuneration they received as they pleased. The government was to be republican, with elective officers. Fourierism, though socialistic, is not properly socialism, and is related to modern socialism by its sharp criticism of existing conditions, rather than by its plan for the future of society.

Fourierism won many converts in France; among those who advocated the theory were Victor Considerant and Mennier; an association was formed; a periodical, the 'Phalange,' was published for a short time; and a number of communities were organized in accordance with the Fourieristic plan, none of which long survived. Fourierism was introduced into the United States in 1842, by Albert Brisbane, who for a time published 'The Phalanx,' in New York. He was welcomed by the members of the Brook Farm community, and the Fourieristic organization was adopted there. For a time the 'Brook Farm Phalanx' published 'The Harbinger,' the most important periodical published by the Fourierists in the United States. An organization, known as the American Union of Associationists, was formed for the "popular diffusion of the principles of the associative sciences as discovered by Charles Fourier, with a view to their ultimate realization by the establishment of phalanxes." Horace Greeley (q.v.) became its president, and George Ripley (q.v.) secretary. A large convention of the "associationists" was held in New York in 1844. In 1847 'The Harbinger' was transferred to New York under the charge of this association, and was published till 1849. About 34 communities were organized by the Fourierists, of which the most important (besides Brook Farm) were the North American Phalanx, which lived 12 years, and the Wisconsin Phalanx. Most of them existed but a short time, and by 1850 the Fourierist movement had practically come to an end. Consult: Brisbane, 'Social Destiny of Man'; Ely, 'French and German Socialism'; Noyes, 'History of American Socialisms'; Shaw, 'A Forgotten Socialism' ('New England Magazine,' new series Vol. VIII., p. 773). See BROOK FARM; COMMUNISM; NORTH AMERICAN PHALANX; SOCIALISM.

Fourier Series, in mathematics, a trigonometric series first extensively employed by the French mathematician Jean Baptiste Joseph

Fourier, in connection with the theory of the movement of heat in a solid body. It was primarily intended for effecting the development of an arbitrary periodic function in the form of a series whose terms are sines and cosines of increasing multiples of the variable. The subject is too technical for discussion in a general encyclopædia. Consult: Fourier, 'The Analytical Theory of Heat' (translated by Alexander Freeman); and more especially, Byerly, 'An Elementary Treatise on Fourier's Series, and Spherical, Cylindrical, and Ellipsoidal Harmonics.'

Fourth Nerve, one of the pair of cranial nerves, and the chief motor nerve of the superior oblique muscle of the eye. It originates in a group of cells in the floor of the medulla and runs outward over the superior elevator muscle of the eyelid, and is distributed to the orbital surface of the superior oblique.

Fourth State of Matter. See ELECTRON; MATTER; RADIUM.

Foussa. See FOSSA.

Fouthill Abbey. See BECKFORD, WILLIAM.

Fouke (originally **Smith**), **Gerard,** American archæologist: b. Maysville, Ky., 25 June 1855. In 1885–8 and 1891–3 he was connected with the United States Bureau of Ethnology in surveys and explorations of aboriginal remains in the eastern part of the country. Further research by him includes explorations for the American Museum of Natural History, New York, on the lower portion of the Amur River, Siberia, and on Vancouver's Island, British Columbia; and excavations of so-called Norse remains in the vicinity of Boston, Mass. His published writings comprise essays on archæological subjects in the bulletins and reports of the Bureau of Ethnology and elsewhere.

Fowl, a word originally synonymous with bird, now used in a stricter sense to designate the genus *Gallus,* of which the common domestic fowl (cock and hen) is a familiar example. The general form and characters of the bill, feet, etc., agree with those of the pheasants, but the crown of the head is generally naked and furnished with a fleshy comb, the base of the lower mandibles also bearing fleshy lobes or wattles — characters which are most conspicuous in the males. The jungle fowl of India (*Gallus ferrugineus,* or *bankiva*) is regarded as the source of domestic poultry; it is known also in southern China and throughout the Malay islands. The male closely resembles the game-cock. The comb and wattles are of the brightest scarlet, the long hackles of the neck and lower parts of the back are fine orange-red, the upper part of the back is deep blue-black, and the shoulders ruddy chestnut. The long, arched, and drooping tail is blue-black, glossed with green, and the breast and under parts black. The word is also commonly applied in such combinations as wildfowl, waterfowl, seafowl, and the like. For the characteristic of domestic fowls, see POULTRY.

Fowler, Charles Henry, American Methodist clergyman: b. Burford, Ontario, Canada, 11 Aug. 1837. He was graduated at Genesee College in 1859 and at the Garrett Biblical Institute in 1861; studied law; was pastor for 11 years in Chicago, Ill.; president of the Northwestern University in 1872–6; and corresponding secretary of the Missionary Society in 1880. He was elected a bishop of the Methodist Episcopal Church in 1884; visited Japan, Korea, and China in 1888; organized the Peking and Nanking universities; was stationed for eight years on the Pacific coast; founded the Maclay College of Theology in Southern California, and assisted in founding Wesleyan University in Lincoln, Neb. He was sent as a fraternal delegate to the Wesleyan Conference in Great Britain in 1898.

Fowler, Ellen Thorneycroft, English novelist. She is the daughter of Sir Henry Fowler, secretary of state for India 1894–5. Her published works include: 'Verses Grave and Gay' (1891); 'Verses Wise and Otherwise' (1895); 'Concerning Isabel Carnaby' (1898); 'A Double Thread' (1899); 'The Farringdons' (1900); 'Love's Argument' (1900); 'Sirius, and Other Stories' (1901); 'Fuel of Fire' (1902).

Fowler, Frank, American artist: b. Brooklyn, N. Y., 12 July 1852. He studied at Florence as pupil of Edwin White, at Paris with Carolus Duran and in the Beaux-Arts, established a studio at New York in 1880, and became known as a portrait painter. His subjects include S. J. Tilden, Archbishop Corrigan, C. A. Dana, and other notabilities. He was elected a National Academician, and has published manuals of art: 'Oil Painting'; 'Drawing in Charcoal and Crayon'; 'Portrait and Figure Painting.'

Fowler, Sir John, English civil engineer: b. near Sheffield 1817; d. London 20 Nov. 1898. In 1844 he was appointed to superintend the construction of the Manchester, Sheffield, and Lincolnshire system, a connected group of railways, and other works of vast extent and complexity. He subsequently was employed on many civil engineering works both in England and elsewhere; but the work with which his name will probably be most lastingly connected is the great bridge across the Forth, of which he was chief engineer, having as his colleague Sir Benjamin Baker. (See BRIDGE.) On its completion in 1890 he was made a baronet.

Fowler, Joseph S., American lawyer: b. Steubenville, Ohio, 31 Aug. 1820. He became professor of mathematics at Franklin College, Tenn., and was president of the Howard Female College in Gallatin, Tenn., in 1856–61. Subsequently he was State comptroller under Andrew Johnson, and was a United States senator 1866–71. In 1871 he retired from political life and engaged in law practice in Washington, D. C.

Fowler, Lorenzo Niles, American phrenologist: b. 1811; d. 1896. He was a brother of Orson Squire Fowler (q.v.). From 1863 he resided in England. He was a publisher of the 'Science of Health' (originally the 'Water-Cure Journal') and the 'American Phrenological Journal,' and wrote 'Phrenology and Physiology' (1844).

Fowler, Montagu, English Anglican clergyman: b. London 12 Nov. 1858. He was educated at Harrow and Cambridge; took orders in the Established Church, was vicar of St. Lawrence, Isle of Thanet, Kent, 1889–93, and has been rector of All Hallows, London Wall, from 1900. He has published: 'Christian Egypt'; 'Some Notable Archbishops of Canterbury'; 'Church History in Queen Victoria's Reign.'

Fowler, Orson Squire, American phrenologist: b. Cohocton, Steuben County, N. Y., 11 Oct. 1809; d. Sharon, Conn., 18 Aug. 1887. He was graduated at Amherst College in 1834, and opened a phrenological office in New York in 1835. In 1836 he and his brother Lorenzo wrote and published 'Phrenology Proved, Illustrated and Applied,' and in 1838 issued the first number of the 'American Phrenological Journal.' Subsequently he lectured on his specialty and allied subjects in the United States and Canada, and wrote and published numerous books, including 'Self-Culture and Perfection of Character'; 'The Self Instructor in Phrenology'; 'Human Science'; etc.

Fowler, Thomas, English philosopher: b. Burton-Stather, Lincolnshire, 1 Sept. 1832. He was educated at Merton College, Oxford, and from 1873 to 1889 was professor of logic in the university. Since 1881 he has been president of Corpus Christi College. His published works include: 'Elements of Deductive Logic' (1867; 10th ed. 1892); 'Elements of Inductive Logic' (1870; 6th ed. 1892); an edition of Bacon's 'Novum Organum,' with introduction and notes (1878; 2d ed. 1889); a little work on 'Locke' (1880); an edition of Locke's 'Essay on the Conduct of the Understanding' (1881; 3d ed. 1890); 'Francis Bacon' (1881); 'Shaftesbury' (1882); 'Hutcheson' (1882); 'Progressive Morality: an Essay in Ethics' (1884; 2d ed. 1895); 'History of Corpus Christi College, Oxford' (1893); 'Principles of Morals' (Part I., introduction written with J. M. Wilson, 1885; Part II., the body of the work, by Prof. Fowler alone, 1887; both in one volume, revised 1894); and 'Popular History of Corpus Christi College' (1898).

Fowler, William Warde, English ornithologist: b. Somerset 1847. He was educated at Marlborough College and Oxford, and has been sub-rector of Lincoln College, Oxford, from 1884. He has published: 'A Year With the Birds' (1886); 'Tales of the Birds' (1888); 'Life of Julius Cæsar' (1892); 'The City-State of the Greeks and Romans' (1893); 'Summer Studies of Birds and Books' (1895); 'The Roman Festivals of the Republican Period' (1899); 'More Tales of the Birds' (1902).

Fowler, William Worthington, American author: b. Middlebury, Vt., 24 June 1833; d. Durham, Conn., 18 Sept. 1881. He was the author of 'Ten Years in Wall Street' (1870); 'Fighting Fire' (1873); 'Woman on the American Frontier' (1877); 'Twenty Years of Inside Life in Wall Street' (1880).

Fowler's Solution. See ARSENIC.

Fox, Charles James, English statesman: b. London 24 Jan. 1749; d. Chiswick, Surrey, 13 Sept. 1806. He was the son of Henry, 1st Lord Holland, and was educated at Eton and Hertford College, Oxford. His father procured him a seat for the borough of Midhurst in 1768 before he was of legal age, and in 1770 the same interest procured him the office of one of the lords of the admiralty, which post he resigned in 1772, and was appointed a commissioner of the treasury.

After being a supporter of the administration for six years, Fox was ejected owing to a quarrel with Lord North, and was thrown into the ranks of the Opposition. The adoption of the disastrous measures which terminated in the independence of the American colonies enabled him to take this part without opposing any of the policy which he had previously supported. During the whole of this eventful contest he spoke and voted in direct opposition to the ministerial system, and, in conjunction with Burke, Barré, Dunning, and other eminent parliamentary leaders, displayed the highest talents both as a statesman and orator. On the final defeat of the administration of Lord North and the accession of that of the Marquis of Rockingham, Fox obtained the office of secretary of state for foreign affairs. But the death of the Marquis of Rockingham suddenly divided the party, and on the Earl of Shelburne becoming first lord of the treasury Fox retired and soon after a union took place between his friends and those of Lord North, under the name of the coalition. The temporary success of this party movement served only to render popular disgust the more general; and the dismissal of the coalition excited general satisfaction. Though in the new Parliament Pitt had a decided majority, Fox headed a very strong opposition, and political questions were for some years contested with a display of talent on both sides which the House of Commons had seldom previously exhibited.

In 1790 and 1791 Fox regained a share of popularity by his opposition to war with Spain and Russia, and also by his libel bill, regulating the rights of juries in criminal cases and rendering them judges both of the law and the fact. On the breaking out of the French Revolution he was disposed to regard it as likely to prove extremely beneficial. The contrary views of Burke, and the extraordinary manner in which that ardent politician on that account publicly renounced his friendship, is one of the most striking incidents in parliamentary history.

The opinions formed of this eminent leader as a practical and theoretical statesman have been as various as the shades of party difference. That he was a sincere friend to all the broad and generous principles on the due development of which rest the freedom and best interests of mankind, is not to be doubted, and that they were alloyed by great latitude on the subject of party and political expediency is equally clear. As a powerful and purely argumentative orator he was of the very first class; though as to eloquence and brilliancy he perhaps yielded to Pitt, Burke, and Sheridan; nor were his voice and manner prepossessing, though highly forcible. Of his amiability in private life, after making allowance for a dissipated youth, all accounts agree. Friends and foes equally testify to his ingenuous and benign character. As an author, besides some Latin poetry and a Greek dialogue, by which he highly distinguished himself at Eton, and a few numbers of a paper, entitled 'The Englishman,' he published nothing during his lifetime but 'A Letter to the Electors of Westminster' (1793). To his nephew, Lord Holland, the world is indebted for his posthumous publication, entitled 'The History of the Early Part of the Reign of James II.' It is written with unpretending simplicity, but disappointed expectation, and has never been popular. See Lord John Russell, 'Life and Times of C. J. Fox' (1859–66); Wakeman, 'Life of Charles James Fox' (1890); Trevelyan, 'Early History of Charles James Fox' (1881).

Fox, George, English religionist, founder of the Society of Friends: b. Drayton, Leicestershire, England, July 1624; d. London 13 Jan. 1690. While yet a boy he was distinguished by his gravity and exemplary conduct. When in the 20th year of his age, and for some two or three years afterward, Fox describes himself as having been in a distressed state of mind, but from this condition he was at length delivered by that which he regarded as the voice of God in his soul, directing him to Christ as alone able "to speak to his condition." Very soon after this he commenced his public ministrations at Dukinfield, Manchester, and the neighborhood. From the first his preaching seems to have made many converts and excited much opposition. Fox's first imprisonment took place in the year 1648, in consequence of his opposing the preacher in "the great steeple-house at Nottingham," on a point of doctrine. In 1650 he was imprisoned at Derby under a false charge of blasphemy. One of the committing justices, Bennet, acted with great violence on this occasion, and it was he who on Fox's bidding him "tremble at the word of the Lord" first applied to him and his friends the name of Quakers. Fox lay in prison at Derby for about a year, the time having been lengthened in consequence of his refusal to accept a commission as captain of one of the regiments then being raised by Parliament. To his belief of the unlawfulness of all war, which prompted this refusal, was added at the same time a clear view of the enormity of the punishment of death for crimes affecting property only, and he exerted himself to save the life of a poor woman then in jail for theft. Within 10 years of Fox's appearance as a preacher, meetings of the Friends were established in most parts of England. At the same time, so actively were they persecuted, that for many years there were seldom less than 1,000 of them in prison. Cromwell, though himself favorable to liberty of conscience, seems to have been unable to curb the excesses of popular hostility launched in all quarters against a sect which denounced all state interference with religion and maintained that the gospel should be preached without fee or reward. About a month after the restoration of Charles II., Fox was committed to Lancaster Castle, "on the charge of being a common disturber of the peace, and of endeavoring to make insurrection and embroil the whole kingdom in blood." After lying in jail some months, a habeas corpus was obtained, and the authorities showed their disbelief of these grave charges by allowing Fox himself, unbailed and unguarded, to convey to London the sheriff's return to the writ. The hopes entertained by the members of the young society that they would be allowed a breathing-time from persecution were dispelled at the commencement of 1661 by the atrocious measures which followed the mad attempt of Venner and his Fifth-Monarchy men. The act empowering magistrates to tender the oaths of allegiance and supremacy to any person whom they thought fit to suspect, also operated with great severity against the Friends; under its provisions Fox was committed to prison at Lancaster in the beginning of 1664, whence he was removed to Scarborough Castle, where he lay till the autumn of 1666. In 1669 Fox married Margaret Fell, the widow of one of the judges of the Welsh courts. The year 1670 witnessed the passing of the most stringent of the Conventicle Acts, forbidding under heavy penalties the assembling for religious worship, in any house, of more than four persons besides the family, except according to the usages of the Church of England. Soon after his recovery from a severe illness he sailed for Barbadoes, where he exerted himself greatly in the interests of religion and humanity. It was while in this island that Fox drew up a statement of his own and his friends' belief in all the great doctrines of Christianity — a statement clearly disproving their alleged sympathy with Socinian tenets. After a considerable time spent in Barbadoes, Jamaica, and the North American continent, he returned to England in 1673, where further persecutions awaited him. He underwent 14 months' imprisonment in Worcester jail, and was at length liberated by the Court of King's Bench on account of the errors in his indictment. In 1677, in company with Penn and Barclay, who had joined the Society about 10 years before, he paid a visit to Holland and some parts of Germany, where his services seem to have been well received. The last 15 years of his life were tranquil as regards personal molestation, but he continued to be actively engaged in various ways in promoting the welfare of his brethren. Their persecutions continued throughout the reign of Charles II. In the first year of William and Mary was passed the bill which nullified the Conventicle Acts, and allowed the Friends to make a solemn declaration in lieu of taking the oaths, and Fox had the gratification of seeing the public worship of the Society legally recognized before his death. (See FRIENDS, SOCIETY OF.) His works were issued in three volumes 1694–1700. Consult: Sewell, 'History of the Quakers'; Lives by Marsh (1848); Janney (1853); Watson (1860); Tallack, 'George Fox, the Friends and the Early Baptists' (1868); Bickley, 'George Fox and the Early Quakers' (1884).

Fox, George L., American actor: b. Boston, Mass., 3 July 1825; d. 24 Oct. 1877. He first appeared at the Tremont Street Theatre in the 'Hunter of the Alps'; became known as a low comedian at the National Theatre, New York; was a lieutenant in the Union army at Bull Run, and later became manager of the New Bowery Theatre. Here he gained for himself a distinct position by his burlesque imitations of favorite tragedians of the time, and his pantomimes, the best of which was 'Humpty Dumpty,' in which from 1867 to his retirement in 1876 he appeared as the clown.

Fox, Gustavus Vasa, American naval officer: b. Saugus, Mass., 13 June 1821; d. New York 29 Oct. 1883. He was appointed to the United States navy in 1838, in which he served till 1856, when he resigned with the rank of lieutenant. He was subsequently appointed assistant secretary of the navy, and held this post till the end of the Civil War. He planned a number of operations for the navy, including the capture of New Orleans; and was sent by the government on the Monitor Miantonomoh to convey the congratulations of Congress to Alexander II., on his escape from assassination. His visit to Russia materially aided the acquisition of Alaska by the United States, and was the longest voyage then made in a monitor.

Fox, John William, American novelist: b. Bourbon County, Ky., 1863. He was graduated

from Harvard 1883 and has published: 'Hell for Sartain and Other Stories' (1897); 'A Mountain Europa' (1899); 'The Kentuckians' (1898); 'Crittenden' (1900); 'Blue Grass and Rhododendron' (1901); 'The Little Shepherd of Kingdom Come' (1903).

Fox, Margaret, American spiritualist: b. Bath, Canada, 1836; d. Brooklyn, N. Y., 8 March 1893. She was about 12 years old when her family were startled by mysterious rappings. All endeavors to trace them to any physical source proved unavailing. Various experiments were tried, but the "occult" power refused to act save in the presence of Margaret and her sister Leah. The family moved to Rochester, N. Y., but the raps followed and heavy bodies were moved without appreciable agency. In 1849 the sisters appeared in a public hall; when the same phenomena were freely manifested and tested. In 1850 the two girls went to New York, the "manifestations" became the subject of public discussion, and "mediums" sprang up all over the country. In 1888 Margaret made a public exposure of her pretended "manifestations," which she subsequently contradicted.

Fox, William Carlton, American diplomatist: b. St. Louis, Mo., 20 May 1855. He first came into prominence as United States consul at Brunswick, Germany (1876–88). Subsequently he was United States vice-consul-general at Teheran, Persia. He organized the American Missionary Hospital during the cholera epidemic there in 1892, and established and edited the only strictly diplomatic and consular journal ever attempted in the United States.

Fox, William Freeman, American forester: b. Ballston Spa, N. Y., 11 Jan. 1840. He was graduated at Union College in 1860; studied engineering; served in the Civil War; and subsequently took charge of the Department of Forestry of New York State. He is the author of: 'Regimental Losses in the Civil War'; 'The Adirondack Spruce'; 'State Forestry Reports' for 1885–1901; and magazine articles on forestry, etc.

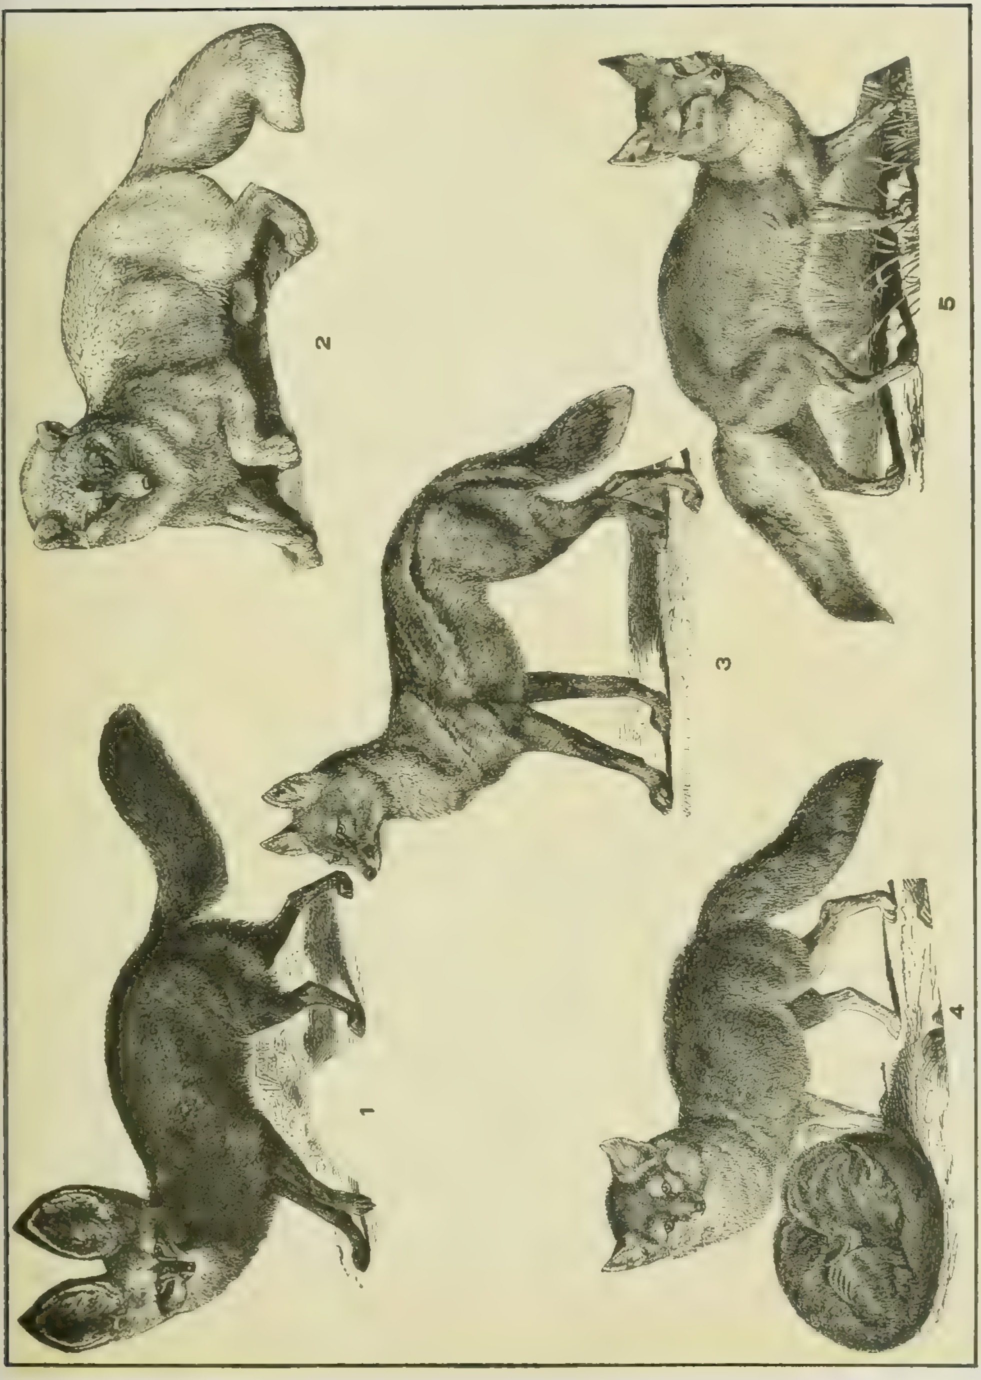
Fox, William Johnson, English orator and political writer: b. near Wrenthaum, England, 1786; d. London 3 June 1864. A weaver's son, he early showed signs of ability and was picked out to be educated for the Independent ministry. Once ordained, his rationalistic opinions cut him off from all the denominations. He became a radical active in politics, and spoke and wrote with persistent vehemence against the Common Laws. He was elected to Parliament in 1847, but was twice defeated at subsequent elections. His vigorous pen and eloquent voice aided the cause of popular social and political progress in England at a critical time in her history.

Fox, one of a group of small, long-eared, bushy-tailed animals of the dog-tribe (*Canidæ*), mostly included in the genus *Vulpes;* specifically, in literary usage, the red fox (*V. vulgaris*), called *renard* by the French and *reinicke fuchs* by the Germans. Foxes differ from wolves and jackals in being smaller, having shorter legs, longer, more furry and pointed ears, a more slender elongated muzzle, and a longer and more bushy tail; and they incline to that yellowish red color called "foxy." But these distinctions are difficult of limitation (see FENNEC; FOX-DOG), and some naturalists refuse to recognize a separate genus for them. One fixed character is found in the pupil of the eye, which when contracted becomes elliptical in the foxes but remains round in other dogs. All the typical foxes are inhabitants of northerly latitudes, and well represented by the common red fox, which may be regarded as distributed throughout the whole northern hemisphere, though variously named in different countries, where local diversities exhibit themselves; thus the American variety is called *V. pennsylvanicus,* but it is not essentially different from those of the Old World. Its variations are as great here as in Europe and Asia, especially among those of the Far North, where certain color-phases have superior value in the fur-trade. Thus a fox marked with a dark line along the spine and another over the shoulders, is called a "cross" fox, and fine specimens are worth an extra price. Wholly black ones are uncommon; but the rarest and most valuable pelt is that of a "silver" fox, that is, a black one in which so many hairs are white-tipped that a hoary or silvered appearance is given to the skin. The red fox is fostered for the sport of fox-hunting (q.v.) in Great Britain, and in some parts of Eastern America, but in most countries he is regarded merely as a fur-bearer, or a poultry thief or worse, and is trapped, shot and poisoned continuously. Nevertheless, the animal survives and multiplies in the midst of civilization, by virtue of its power of comprehension of and adaptation to new conditions; so that he has acquired, very justly, a reputation for alertness, wit and cunning in contrivance for food and safety. In America this species is constantly extending its range southward at the expense of the gray fox. Another species yielding a valuable fur is the Arctic or blue fox (*V. lagopus*), which is found on all Arctic coasts, and although brownish in summer, becomes in winter pure white; but the under fur is always bluish, and in those of Alaska this color prevails over brown in summer. Certain of the Aleutian Islands have lately been devoted by local fur companies to the rearing of these foxes in semi-captivity, where they are cared for, and a selected number annually sacrificed to trade. North America has two other well-marked species. One is the swift or kit fox (*V. velox*) of the plains, which is only 20 inches long, exceedingly swift of foot, expert in digging and cunning at concealment. It has reddish-yellow fur in summer, but becomes dull gray in winter, with black patches each side of the nose. The other species is the gray fox, which was once generally distributed over the United States but has become extinct in the northeastern part since the general clearing and settlement of the country. It is a woodland animal, still numerous in the South and West. Its hair is stiffer and duller in color than that of the red fox, and it is so peculiar in structural respects (among others in having a concealed mane of stiff hairs on the top of the tail) that it has been classified in a separate genus as *Urocyon argenteus.* Several well-known species dwell in Asia, the best-known of which is the familiar fox of northern India (*V. bengalensis*).

Foxes everywhere are burrowing animals or else adapt to family needs holes in rocks, hollows of old stumps, and similar conveniences. They hide by day and go abroad at night in search of small prey, stalking and catching birds on their nests, or at roost on the ground. ground-

RED FOX

FOXES.



1. Cape Fox or Lalande's Dog. 2. Arctic Fox. 3. Side-striped Jackal or Quaha.
4. Silver Fox. 5. Corsac.

squirrels, mice, frogs, and insects, and also eating largely of certain roots, fruits and other vegetable food. They are hardy, hunt all winter and climb mountain peaks. They never hunt in packs, as do wolves; and their voice is nearer a bark than a howl. They do not readily submit to domestication, and seem to have contributed little if anything to the composition of domestic breeds of dogs.

Consult for information on Old World foxes, the writings of Bell, Brehm, Blanford, Mivart and Beddard, well-summed up in Lydekker's 'Royal Natural History,' Vol. I. For American foxes, read Richardson, Hearne, Audubon, Merriam, the writings of Nelson, Turner and Murdoch on the natural history of Alaska, and the general remarks in Cram and Stone's 'American Animals' (1902).

Fox Bats. See Flying-fox.

Fox Channel, in the Hudson Bay, Canada, named after Luke Fox, who explored the region in 1631. The channel lies between Southampton Island and Baffin Land.

Fox-dog, a name given by certain naturalists to the wild dogs of South America, because of their fox-like appearance. Among these are the crab-eating dog (*C. cancrivorous*); the zono, or Azara's dog (*C. azaræ*), of which the "colpeo" of the pampas and southward is probably a local variety; the small-eared Brazilian dog (*C. microtus*, of Mivart), and two other aberrant Brazilian dogs (*C. urostictus*, and *C. parvidens*) for which a separate genus (*Nothocyon*) has been proposed by Wortman. All these animals have a striking external resemblance in color and form to the foxes, and connect them with the typical dogs. They are not well known, however. Consult: Mivart in the 'Proceedings' of the Zoological Society of London (1890); Beddard, 'Mammalia' (1902), and writers upon the zoology of South America. See Bush-dog.

Fox-hound, a breed of hounds, concerning whose origin practically nothing is known, save that they were probably first bred in Great Britain. This, perhaps the handsomest and most perfect of all hounds, is essentially a field dog, presenting an eminently powerful, well-built appearance, with his clean-cut, compact body, and giving evidence of muscular strength and endurance in the hunt. The head is full, with a broad brow, a long, wide muzzle, and open nostrils. The ears are set low and lie close to the cheek. The eyes are soft and brown. The chest is broad, and the ribs are deep, so as to afford plenty of breathing space. The muscular body is set on legs as straight as a post, and very strong; and the feet are round and cat-like. The color varies from black to tan and white, and the coat is hard, smooth and glossy. The American breed is lighter and finer in lines than the English fox-hound, has longer, thinner, and more pendant ears; a slightly narrower chest, and a rougher coat. He is used in fox-hunting as is the English fox-hound; but is also employed in hunting the moose, and other large game, especially in the Canadian forests. See Dog.

Fox-hunting, the chase of the fox with horses and hounds, as a recreation. This sport arose in England with the Restoration, when changes in customs and agricultural conditions caused the disappearance of falconry, and has become surrounded by codes of social usage and of legal enactments. It flourishes most in the south-central counties of England, and in Ireland, and some of the principal organizations or "hunts" as the Belvoir, Quorn, Pytchley and Cottesmore, were founded early in the 17th century. A "hunt" is an association for the promotion and regular practice of the sport in a certain district. It acquires a pack or several packs of fox-hounds (q.v.), kennels and perhaps a club-house, is directed by a "master of fox-hounds," and served by paid employees, the principal of whom are the "huntsman" who arranges and leads the sport for the day, and the "whippers-in," who see that the dogs work properly. These officials, and the sportsmen themselves wear "pink" (that is scarlet) coats when in the field. The expenses are paid theoretically by annual subscriptions, eked out by casual subscriptions for temporary privileges, but usually they must be supplemented by a patron,— probably the "M. F. H.," who has inherited the dignity and its responsibilities from ancestors who founded the hunt. Anyone may join in the chase, and at Melton Mowbray and other famous "meets" large numbers of outsiders are often present. In these districts foxes are carefully preserved, and the abode and habits of each family of them are studied with reference to the autumnal and winter sport. At the appointed time the hunters, men and women, mounted and accompanied by a pack of from 25 to 40 hounds, are led by the huntsman toward the place where he expects to "find" a fox. There the dogs are loosed, and range about searching for the scent-traces in the air or on the ground left by the recent passage of the animal. When one finds a trail he gives tongue, the others come to his aid and the pack dash away following the scent. With a bugle-signal or cry of "Gone away!" the hunt follows as straight and fast as possible, keeping to roads, lanes, and gates where possible, but jumping fences and riding over grain-fields and meadows where needful, the hunt paying such damages as follow. This requires a horse of great speed and leaping power, and has developed the English thoroughbred hunter. When anyone catches sight of the fox he shouts "View! halloa!"; and the ambition of all riders is to keep close to the racing animals and be on the spot, or "in at the death," when the fox is seized. It is then the duty of the huntsman, or the nearest rider, to save the body of the fox from the dogs, cut off its "brush" (tail), "pads" (feet), and "mask" (head) to be given as trophies to the foremost riders. The remainder of the fox is cut up and given to the dogs on the spot. Instead of running "straight away" and leading a long chase the fox will often take refuge in a drain or other hole, unless it has been "stopped." This is called "going to earth," and he must then be ousted by the aid of a fox-terrier.

Fox-hunting has been carried wherever Englishmen have settled, but has found few parts of the world favorable to it. In some countries, as on the North American prairies, in California, and in the Argentine Republic, similar methods are adapted to the chase of other animals, as wolves or kangaroos. In the southern and eastern United States, however, where foxes abound, true fox-hunting has flourished ever since colonial days, when each man brought his own hound or hounds to the assembly; and

is still pursued by several established clubs in Virginia, Maryland, and southern Pennsylvania, where the nature of the country and the agricultural habits of the people favor it. These clubs employ a modified form of hound better adapted to the faster and rougher work required of it than would be the English breed. A special strain, the Magnes hound, has been fostered by the Maryland clubs, the foremost of which is the Elkridge. More nearly conforming to the English models is the establishment and hunting of the Meadowbrook Hunt, on Long Island, N. Y., where, in a level open country, largely occupied by extensive estates and within easy reach of New York, the sport has flourished since about 1876, and is likely to be long maintained.

An extensive and pleasing literature has grown up about this subject, and many thousands of titles would be required for its bibliography. A good general view may be obtained by reading the volumes devoted to the sport in the English 'Badminton Library' and in the American 'Sportsman's Library.'

Fox Indians (French name Renards, «foxes,» from their fox-totem; their own name Musquaki, «red-earthers»; Ojibwa name Outagami, «other-siders»), an Algonkian tribe originally on Lake Superior; driven by the Ojibwa and French south of the Wisconsin River, where their losses forced them about 1760 to unite with the Sacs or Sauks. Hence from early in our acquaintance with them the joint tribe has been known as «Sacs and Foxes,» and they have practically coalesced. They joined the British in the Revolution, and again in the War of 1812; their lands gradually taken away, they moved westward into Iowa, were involved in the Black Hawk war and gave up more land, finally gathered on the Des Moines, and in 1842 were removed to the Osage.

Fox Islands. See ALEUTIAN ISLANDS.

Fox River, a river of Wisconsin, called by the Indians Neenah. It rises in Marquette County, near the centre of the State, and after a course of about 200 miles passes through Lake Winnebago; it enters the head of Green Bay. A canal has been cut from Fox River to the Wisconsin, which is a navigable affluent of the Mississippi, and the channel of the river below Lake Winnebago has been cleared to admit steamboats from Lake Michigan and Green Bay. A grant of land was made by Congress to assist the work.

Fox Shark, or **Sea-fox.** See THRESHER.

Fox-snake, a large harmless snake (*Caluber vulpinus*) of the northern Mississippi valley, light brown in color, marked on the back with small chocolate spots bordered by black, and with a series of smaller spots along the sides and on the yellowish abdomen. It reaches a length of three feet, is irritable and pugnacious, and feeds upon small mammals, especially gophers, mice, and other pests of agriculture.

Fox-sparrow, a large American sparrow (*Passerella iliaca*), notable for its foxy red plumage, and gay song. It is a spring-and-fall migrant in the United States, breeding only north of the Saint Lawrence. See SPARROW.

Fox-squirrel, the largest of the true squirrels (*Sciuriss niger*). These rusty-coated squirrels are denizens of woods. They live in hollow trees or high among the branches, in nests of dry grass, and feed upon fruits, berries, mushrooms, and seeds of various trees. They have been hunted until they have become somewhat scarce in the woods north of Virginia; but southward, they are far more numerous. The flesh is esteemed as food — especially in Florida. Though safe from the depredations of preying birds, because of their size and strength, fox-squirrels are attacked by the foxes and wild-cats, which kill and eat them.

Fox-terrier, a small terrier dog modified from the old-fashioned English white terrier of uncertain origin. It has a dense smooth coat white, with black or black-and-tan markings; and a small black nose; and it generally weighs between 15 and 20 pounds, when in good condition. The fox-terrier has a narrow, tapering face, and small, deep-set eyes, usually gentle, but capable of an expression of keen animation; the jaws are strong and well-shaped; and the V-shaped ears droop forward close to the cheek. The compact little body is set on straight, supple legs, and the tail, usually docked, is carried in a rather jaunty fashion. The dog's appearance is one of alertness; and, though originally bred to run the fox to earth, fox-terriers have, laterly, become popular not only as vermin-destroyers about stables, but as house-dogs,— their cleanly, sprightly, and affectionate ways rendering them extremely amiable and entertaining as companions. One variety, the «wire-haired,» has a rather long coat, of rather shaggy appearance. In all other points this is like the smooth-coated variety. See DOG.

Foxe, John, English martyrologist: b. Boston, Lincolnshire, 1516; d. London April 1587. In 1543 he was elected a fellow of Magdalen College, Oxford. Applying himself to theology with great assiduity, he secretly became a convert to the principles of the Reformation. This tendency being suspected, a charge of heresy followed, and by the judgment of his college he was, in 1545, expelled. In the reign of Mary he went abroad, and gained a livelihood by correcting the press for an eminent printer at Basel, where he laid the first plan of his 'Acts and Monuments of the Church.' On the accession of Elizabeth he returned to his native country, and was received in the most friendly manner by his former pupil, the Duke of Norfolk, who maintained him as long as he lived, and settled a pension on him at his death. Cecil also obtained for him a prebend in the Church of Salisbury. His principal work is the 'History of the Acts and Monuments of the Church' commonly called 'Foxe's Book of Martyrs,' first printed in 1563, in 1 volume folio; reprinted in 1632 and 1641 in 3 volumes folio. In 1684 it had reached the ninth edition.

Foxglove. See DIGITALIS.

Foy, fwä, **Maximilien Sebastien,** French military officer: b. Ham, France, 3 Feb. 1775; d. Paris 28 Nov. 1825. He entered the army at 15, and made his first campaign under Dumouriez in 1792. He received his 15th wound on the field of Waterloo, but refused to quit his post till the close of that engagement. He was afterward employed as inspector-general of infantry; and in 1819 was elected a member of the Chamber of Deputies, where he distinguished himself as an orator, and was a great public favorite.

From his MSS. a ‹History of the Peninsular War› was published by his widow.

Foyle, foil, an Atlantic inlet on the north coast of Ireland, between Londonderry and Donegal. It is 15 miles long, 1 mile wide at its entrance, and 10 miles broad along its south side; but part is dry at low-water and its west side alone is navigable.

Fra Diavolo, frä dē-ä'vō-lō, real name **Michele Pezza**, Neapolitan brigand: b. Itri, Calabria, 1760: d. 1806. He quitted the trade of stocking-weaving for the army, and served for a time in the papal legion. He afterward became a monk, but was expelled on account of misconduct. He then joined a troop of brigands, of which he became in a short time the leader. The government set a price upon his head; but when Cardinal Ruffo undertook to compel the French to evacuate Naples, Fra Diavolo was pardoned, was employed by the cardinal, and received a colonel's commission. At the head of his band he harassed the French, took refuge in Calabria after the conquest of Naples by Bonaparte, and incited the people against the French. He fell into their hands at San Severino in 1806, and was executed as a robber and incendiary. Scribe the dramatist, and Auber the composer, have made the name familiar; but the opera has nothing in common with the real Fra Diavolo except the name.

Fracastorio, Girolamo, jē-rō'lä-mō fräkäs-tō'rē-ō, Italian poet and physician: b. Verona 1483; d. Tacassi 6 Aug. 1553. He was patronized by Cardinal Bembo, to whom he addressed the most celebrated of his works, a Latin poem entitled ‹Syphilis.› In the latter part of his life he wrote a poem on the adventures of the patriarch Joseph, but his poetic fire seems then to have been exhausted, and the virtues of the hero were less happily celebrated than the horrors of the disease. Among the moderns who have exercised their talents in the composition of Latin verse, few have obtained higher reputation than Fracastorio. The elder Scaliger ranks him as a poet next to Virgil, and his merit has been generally acknowledged.

Frackleton, Susan Stuart Goodrich, American artist: b. Milwaukee, Wis., 5 June 1848. She received a private education, and became prominent as a ceramic artist. She has won many prizes in American, European, Canadian, and Mexican competition; invented a gas-kiln for firing decorated china and glass; and was the founder and first president of the National League of Mineral Painters. In 1901 she received a medal at the Paris Exposition for her exhibit of pottery. She published ‹Tried by Fire,› a work on china decoration (1885).

Fraction, a part of any integer (whole number), or unit. For example, "two and a fraction" means two units and that part of a unit which can be distinguished, as one half, two fifths, and so on. In the fraction $\frac{1}{3}$ in arithmetic, or $\frac{a}{b}$ in algebra, the figure 1, or *a*, is the numerator, and 3, or *b*, is the denominator; and they represent that, if a whole number is divided into three or *b* parts, only one or *a* parts are taken. In the addition of fractions, the fractions must be brought down to the same denominator, and their numerators (as expressed in the value of their new denominator) must then be added, when we have one whole fraction. Thus, if we want to add $\frac{1}{3}$ and $\frac{2}{5}$, we must find the least common multiple of 3 and 5, which is found to be 15; then, as 3 goes 5 times into 15, and 5 goes 3 times into the same number, we multiply the numerators of the different fractions by these respective quotients, and then add the two quantities together. Thus, $\frac{1}{3}$ added to $\frac{2}{5}$ will be equal to $\frac{5}{15}+\frac{6}{15}=\frac{11}{15}$. The true definition of a fraction may be thus summed up: It is the division of its numerator by its denominator; as seven eighths are equivalent to the whole number 7 divided by 8 — whence a fraction is obtained. Decimal fractions simplify calculations greatly, as they are constructed on the principle of having one common denominator — a multiple of 10; and thus fractions can be added, subtracted, and divided without repeating over and over the tedious process of bringing them down to a common denominator. See ARITHMETIC; DECIMALS.

Fracture, a break or solution of continuity in a bone, caused by sudden application of violence from without or by sudden muscular strains. Bone diseases and the changes in bone incident to old age predispose to breaks. Compound fractures are those in which a wound allows a communication between the injured bone and the body surface. A fracture is said to be multiple when there is more than one line of cleavage; when the lines of cleavage are joined, the fracture is spoken of as comminuted. Pain in the affected part and more or less loss of function are usually present. Examination reveals a deformity either as a swelling or a deviation from the normal line of the part; palpation elicits exquisite tenderness on direct pressure at the point of injury and on moving the fragments; the bony irregularity may be felt beneath the skin; frequently an abnormal point of mobility may be discovered; crepitus is present as a peculiar grating sensation transmitted to the examining fingers if the ends of the bone can be rubbed together.

Repair of the injury takes place through certain blood-cells organizing the clot of blood and forming a fibrous callus. Later this callus is absorbed and a bony callus formed, the lime-salts being laid down in orderly arrangement by special cells. Nature is assisted in this process by fixation of the fragments in their normal position. This reduction of the deformity requires surgical skill, and all unnecessary manipulation of a bone supposed to be fractured should be avoided. Where removal of the injured from the scene of the accident is necessary, further damage may be prevented by the careful restriction of motion of the part. This can be done by the application of splints or by otherwise securing the part.

Compound fractures are serious because of the great possibility of infection gaining access to the injured bone, with resulting inflammation and necrosis. Measures of fixation are modified to allow of careful aseptic wound-dressing.

The diagnosis of fracture is frequently a matter of great difficulty, so closely may it resemble in its signs a bruise or dislocation. The X-rays render great service in differentiation and study of the kind of break.

Pott's fracture is the name given to a frac-

ture of the lower extremity of the leg-bones, usually accompanied by a turning out of the foot. The ankle-joint is commonly injured and the ligaments ruptured so that more or less permanent disability is usual. Colles' fracture is a break of the lower end of the radius, having generally a characteristic deformity. The upper fragment is jammed down toward the rest and overrides the lower fragment, which is pushed forward. Falls upon the open hand are often apt to cause this injury. Fractures of the patella or kneepan are difficult to treat, owing to the constant pull of the strong muscles on the upper fragment. Entire apposition of the fragments and bony union is rarely possible unless wiring is resorted to. This injury is frequently a result of sudden muscular strain. The upper end of the femur or thigh-bone is frequently fractured in the aged. When the patient is old or feeble the long-continued rest in the recumbent position which is necessary to proper union so lowers the vitality that deformity is frequently accepted through fear of a fatal termination.

Fractures of the skull-bones present some unique features because of the peculiar structure of the bones in two tables, the globe-like arrangement of the skull as a whole, and of the juxtaposition of the easily injured brain. Lines of fracture may travel far from the actual point of injury, and a breaking force may travel to an opposite pole of the skull. The ordinary signs of fracture are absent except the deformity which usually is found as a crack or depression. The element of depression of the fragments is of the greatest importance, usually necessitating the operation of trephining for the relief of cerebral pressure. This operation consists in the removal of the fragments or of the indented area. Hemorrhage from a fracture may cause pressure and necessitate similar relief. Fatal termination is common, particularly where the inaccessible base of the skull is involved.

Fra'denburgh, J. N., American Methodist clergyman: b. Gouverneur, N. Y., 4 March 1843. He was graduated from Genesee College, was professor of mathematics in the Genesee Wesleyan Seminary (1868–9), of ancient languages in the Fredonia Normal School (1869–73), and principal of the Mansfield (Pa.) Normal School (1873–5). After pastorates at Cleveland, Ohio, and elsewhere, he was settled in 1896 at Clarion, Pa. He has published: 'Witnesses from the Dust' (1885); 'Beauty Crowned' (1887); 'Living Religions' (1888); 'Departed Gods' (1891); 'Fire from Strange Altars' (1891); 'Light from Egypt' (1897); 'Life's Springtime' (1900).

Framingham, Mass., a town in Middlesex County, on the Sudbury River, and on the New York, N. H. & H., and the Boston & A. R.R.'s; about 20 miles west of Boston. It comprises the villages of Framingham, South Framingham, and Saxonville. It has a large industry in woolen goods, and an assessed property valuation of nearly $9,000,000. Pop. (1900) 11,302.

Franc, a French silver coin, containing 10 décimes and 100 centimes. Value in American money 20 cents.

Français, François Louis, frän-swä loo-ē frän-sā, French painter: b. Plombières, department of Vosges, 17 Nov. 1814; d. 1897. He was a pupil of Corot and Gigoux at the Beaux Arts, first exhibited at the Salon in 1837, obtained a medal of the first class at the Salon of 1848, and was admitted a member of the Institute in 1890. He became best known as a landscapist, particularly for his views of the Paris environs and glimpses of the Seine. His finest work, 'Daphnis and Chloë,' is in the Luxembourg, together with three other canvases, 'Evening,' 'Orpheus,' and 'The End of Winter.' His style is peculiarly individual in its combination of realism and idealism.

France, fräns, **Anatole.** See THIBAULT, JACQUES ANATOLE.

France, Joseph, French publicist: b. Lorraine 1787; d. 1869. Having entered the French army in 1815, he had become a colonel in 1834, and in 1836–46 was commander of military police in the island of Martinique, West Indies. The publication of his 'La vérité et des faits' (1841), a work descriptive of the ill-treatment of negro slaves in the island, caused his removal from his post and trial for sedition. He was deprived of his commission, but subsequent to the abolition of slavery in the French colonies (1848) was elected from Martinique to the Constituent Assembly, and from 1852 was a member of the council of the island. His publications include: 'Les corsaires français dans les Antilles' (1857); 'Questions coloniales' (1860); 'Statistique de la Martinique' (1861).

France, fräns, **Lewis Browne,** American author: b. Washington, D. C., 8 Aug. 1833. He was educated at Georgetown College, and entered the practice of law in Colorado, of whose supreme court reports he edited volumes III.-XI. His publications include: 'Rod and Line' (1884); 'Mountain Trails and Parks in Colorado' (1886); 'Over the Old Trail' (1894); 'Pine Valley' (1897).

France, in ancient times called Gallia, a maritime country in the west of Europe, since 1870 the largest and most prominent republic in Europe, and the second largest in the world. France is situated between lat. 42° 20' and 51° 5' N.; and lon. 4° 50' W. and 7° 40' E., and is bounded north by the German Ocean and the Straits of Dover; northwest by the English Channel; west by the Atlantic, more especially that part of it called the Bay of Biscay; south by Spain and the Mediterranean Sea; east by Italy, Switzerland, and the German territory of Alsace; northeast by German Lorraine, Luxembourg, and Belgium. The longest lines which can be drawn across France are two diagonals, which intersect each other — the one from the southeast to the northwest extremities, 670 miles, and the other, from the southwest to the northeast extremities, 555 miles. Measured on the meridian of Dunkirk, the greatest length is 600 miles, and measured on the parallel of 48° 20', the greatest breadth is 547 miles. The breadth near the centre is 400 miles, and along the parallel of 46° 15', where it is narrowest, does not exceed 340 miles. The total area of France is 207,054 square miles.

Topography.— While protected by great natural barriers at most parts where it is connected with the continent, a long line of coast on the west and northwest gives it immediate access to the great ocean thoroughfare, while on the

south its harbors in the Mediterranean secure to it a large share in the traffic of that most important of all inland seas. France is traversed from southwest to northeast by several chains of mountains forming the general water-shed of the country. This water shed has two slopes, the one toward the west and north, carrying its waters to the Bay of Biscay, the Atlantic Ocean, the English Channel, and the German Ocean; the other toward the east and south, carrying its waters to the Mediterranean. The ranges of mountains and hills forming this water shed include the western and central Pyrenees, the western Corbières in the department of Aude, the Cevennes, the mountains of Vivarais, Lyonnais, Beaujolais, and Charollais, the Côte d'Or, the Plateau de Langres, the Faucilles Mountains, and the Vosges. This general water shed is met toward the northeast by the eastern mountain ranges of France, namely, the Jura range and various Alpine ranges, one of the peaks of which is Mont Blanc, which may be regarded as the culminating point of the European mountains, although not absolutely the highest mountain in Europe. Near the centre of France, and separate from the great water shed of the country, are several groups of volcanic mountains known by the general name of the Mountains of Auvergne, the chief peaks of which are the Plomb du Cantal in the southernmost group, the Puy de Sancy in the central group, and the Puy de Dôme in the northernmost group. The spurs thrown off by the great water shed divide France into six principal basins, five of which are on the northwestern slope, and one on the southeastern.

Rivers and Lakes.— The great rivers of France are the Seine, Garonne, Lôire, Charente, Adour, Meuse, and the Rhône. In the basin of the Garonne are its affluents, the Ariège, Tarn, Lot, and Dordogne on the right bank, and the Gers on the left bank. To the north of the basin of the Garonne is that of the Loire and its tributaries, the Nièvre and the Maine on the right bank, and the Allier, Loiret, Cher, Indre, Vienne, and Sèvre Nantaise on the left. To this basin also belong the secondary basins of the Vilaine and the Blavet. In the basin of the Seine are its tributaries, the Aude, Marne, and Oise on the right bank, and the Yonne, Loing, Eure, and Rille on the left bank. The secondary basins are that of the Somme in the north, and those of the Orne and Oise in the south. In the basin of the Meuse are its tributaries, the Sambre on its left bank, to which is added the secondary basin of the Escaut or Schelde. The basin of the Rhône occupies the whole of the territory of France which lies to the southeast of the great water-shed. The tributaries of the Rhône are the Ain, the Saône, the Ardèche, and the Gard upon the right bank, and the Isère, Drôme, and Durance on the left. The secondary basins are those of the Var, Argens, and Arc on the east, and those of the Tet, Aude, and Hérault on the west. France has in all more than 212 navigable streams, with a total navigation of 5,700 miles. The lakes are few in number, and individually limited in extent. The largest, Grand-Lieu, in the department of Loire-Inférieure, covers an area of only 27 square miles, and is altogether devoid of interest. The next largest, St. Point, in the Jura, does not cover three square miles. Others of still less dimensions become more interesting from their localities in the lofty regions of the Pyrenees, or in the deep hollows of ancient craters in Auvergne.

Geology.— France possesses all the geological formations in a greater or less degree of development. The mountains generally have a nucleus of granite, which accordingly forms a prevailing rock in the Alps, on the east frontier, and their branches south to the shores of the Mediterranean, in the Pyrenees, the Cevennes, and the elevated plateau of Langres. In the Vosges it is more sparingly developed, its place being often occupied by porphyry; and in the Jura, where limestone occurs in such enormous masses as to have given its name to a peculiar formation. The other crystalline rocks, consisting chiefly of trachytes and basalts, have received a magnificent development in Auvergne, where whole mountains are composed of them, and where the effects of remote volcanic agency are still presented to the eye in extinct craters and lava streams. The granite is overlaid by primitive stratified rocks of gneiss, and of micaceous and argillaceous slates, succeeded, particularly in the Pyrenees, by mountain limestone. The secondary formation, commencing with this limestone and continued in ascending series up to the chalk, always possesses peculiar interest, because within it valuable mines of lead and iron, and all the workable seams of coal, are included. It is largely developed in many parts of France, and furnishes a considerable number of coal and mineral fields. The Tertiary formation, including all the limestones, sands, and clays, above the chalk, occurs continuously in two great divisions, and partially in a number of isolated spots, and covers a vast extent of surface. The larger continuous division is in the southwest, where it commences at the foot of the Pyrenees, and occupies a very large portion of the basins of the Garonne and of the Adour. The lesser but better known division takes the name of the Paris basin, and has been made familiar to the scientific world by the labors of Cuvier and other distinguished naturalists.

Climate.— The climate of France is greatly diversified, and cannot be described accurately without dividing it into different regions. With a very limited exception, it lies wholly within the more moderate portion of the temperate zone. France may be divided into four climatic regions according to the different vegetable products which different districts are able to mature. Within the first, and warmest, the olive is successfully cultivated. It forms the southeast part of France, and is chiefly confined to the departments which border on the Mediterranean. The second region is characterized by the general cultivation of maize or Indian corn. The third region reaches north to the extreme limit of the profitable culture of the vine, and may be considered as determined by a line stretching between the mouth of the Loire and the town of Mézières, in the department of Ardennes. All the country beyond this line is included in the fourth region. In the northwest the prevalence of winds from that direction often produces a superfluity of moisture, which manifests itself in mists or in frequent and heavy showers of rain. At the opposite extremity, the southeast, a contrary effect is produced, and a sultry, stifling wind wrinkles up

the skin, and not unfrequently spreads fever in its most malignant form. But it is only to a few exceptional districts that these remarks apply. After allowing for them, more than four fifths of the surface remains, under an atmosphere remarkable, more especially in its central districts, for salubrity, serenity, and brightness.

Political Divisions.— Before the revolution of 1789 France was divided into general governments, the number of which has varied at different epochs. Under Francis I., by whom they were instituted, there were 9. Under Henry III. there were 12. Under Louis XIV. the number was fixed at 32, to which a 33d was added by the acquisition of Corsica, under Louis XV. In 1789, when the love of change became paramount, the provinces were not permitted to escape; and it was then determined that the whole of France, including the island of Corsica, should be parceled out into departments, and each department subdivided successively into arrondissements, cantons, and communes, an arrangement which was actually carried out in 1790. This division has since maintained its ground, each department being named after the most important physical feature which it contains. The number of departments was originally 83, but it has been at different times increased and decreased. There are now 87 departments, the last formed being Haut-Rhin (Belfort). As the old provinces, though no longer recognized in legal and other formal documents, continue so familiar to the French themselves, and are so frequently mentioned, not only by earlier writers, but in the geographical, historical, and statistical works of the present day, a table is here given exhibiting these provinces in alphabetical order, and in parallel columns, the chief town in each, and the departments most nearly corresponding to them:

Provinces	Departments	Capitals of Provinces
Alsace	(Now German, except Belfort, or dep. Haut-Rhin)	Strasbourg (German)
Anjou	Maine-et-Loire	Angers
Artois	Inland or southeastern portion of Pas-de-Calais	Arras
Aunis	Maritime part of Charente-Inférieure	LaRochelle
Auvergne	Puy-de-Dôme and Cantal	Clermont
Béarn-et-Navarre	Basses-Pyrénées	Pau
Berry	Cher, Indre	Bourges
Bourbonnais	Allier	Moulins
Bourgogne	Ain, Côte-d'Or, Saône-et-Loire, Yonne	Dijon
Bretagne	Côtes - du - Nord, Finistère, Ille-et-Vilaine, Loire-Inférieure, Morbihan	Rennes
Champagne	Ardennes, Aube, Marne, Haute-Marne	Troyes
Corsica	Corse	Ajaccio
Dauphiné	Hautes-Alpes, Drôme, Isère	Grenoble
Flandre	Nord	Lille
Foix	Ariège	Foix
Franche Comté	Doubs, Jura, Haute-Saône	Besançon
Gascogne-et-Guyenne	Aveyron, Dordogne, Gers, Gironde, Lot, Lot-et-Garonne, Landes, Hautes-Pyrénées, Tarn - et - Garonne	Bordeaux
Ile de France	Oise, Seine, Seine-et-Oise, Seine-et-Marne, southern part of Aisne	Paris
Languedoc	Ardèche, Aude, Gard, Hérault, Haute - Garonne, Haute-Loire, Lozère, Tarn	Toulouse
Limousin	Corrèze, Haute-Vienne	Limoges
Lorraine	Meuse, Vosges, Meurthe-et-Moselle (and German Lorraine)	Nancy
Lyonnais	Loire, Rhône	Lyon
Maine	Mayenne, Sarthe	Le Mans
Marche	Creuse	Guéret
Nivernais	Nièvre	Nevers
Normandie	Calvados, Eure, Manche, Orne, Seine-Inférieure	Rouen
Orléanais	Eure-et-Loire, Loiret, Loir-et-Cher	Orléans
Picardie	Somme, maritime part of Pas-de-Calais, N. part of Aisne	Amiens
Poitou	Deux - Sèvres, Vendée, Vienne	Poitiers
Provence	Basses-Alpes, Bouches-du-Rhône, Var, eastern part of Vaucluse	Aix
Roussillon	Pyrénées-Orientales	Perpignan
Saintonge and Angoumois	Charente and eastern or inland part of Charente-Inf.	Angoulême
Touraine	Indre-et-Loire	Tours

The following territories have been acquired since 1790:

Territories	Departments
Avignon and Venaissin (including Orange previously acquired)	Part of Vaucluse
Nice	Alpes-Maritimes
Savoie	Savoie, Haute-Savoie

Agriculture.— About nine tenths of the soil of France is productive, and about one half of the whole French territory is under the plough. In regard to the management of arable land, the French are still far behind the English, but have nevertheless made great advances during the 19th century. During the last 50 years the production of cereals in France has increased by nearly 70 per cent, while the extent of land under cereals increased by only one quarter. This is equivalent to saying that the productiveness of the soil has increased in that time by fully one third. The cereals forming the great bulk of the cultivated crops are wheat, oats, rye, and barley. The crops next in importance to these are meslin or mixed corn, potatoes, hemp, rape, maize, buckwheat, flax, and beet. This last plant is cultivated extensively in some departments, especially in that of Nord, for the manufacture of sugar. The most valuable crops of which the cultivation on a great scale is not general, but confined to particular districts, are madder, tobacco, saffron, and hops. The cultivation of tobacco is monopolized by the government, and is confined to certain departments. It yields an annual gross revenue to the government of about $75,000,000, but from this total there falls to be deducted the expense incurred in the cultivation and manufacture of the tobacco. In France the grass is on a much more limited scale than the arable husbandry, the land in permanent meadow being in extent only one sixth of that under the plough. The breeding of stock, notwithstanding the stimulus afforded by the establishment of numerous societies, general and local, for its encouragement, is, in France, if not imperfectly understood, very indifferently practised. The races of oxen, instead of being confined to a few of the more perfect types, are almost as various as the different districts into which the country is divided, and include a few good breeds, particularly in the rich plains of Lower Normandy. The rearing of sheep is more successful, and much wool, scarcely inferior to that of the merino, is raised. The general employment of cattle for agricultural purposes gives little encouragement to the rearing of draft horses; but the warlike propensities of the nation have always created an extensive demand for horses. Asses and mules, generally of a superior de-

scription, are much used in France. The cultivation of the vine is one of the most important branches of French agriculture. The total quantity of land in vineyards is nearly a twenty-fifth of the whole surface; but as there are extensive and continuous districts where there are no vineyards, the proportion which vine-land on the districts properly adapted to it bears to the whole land under cultivation, attains a much higher ratio. The various first-class wines, under the name of Champagne, Burgundy, Bordeaux, etc., are in high repute and general demand over all Europe. In 1901 France produced 1,784,854,500 gallons of wine. A large part of the wealth of France consists in its fruits. Among the most important fruit-trees are the apple, the fruit of which, in the northern districts, particularly in Normandy, is largely used for the manufacture of cider; the chestnut, which, in barren districts yields an article of food which takes the place of the cereals among the poorer classes; the mulberry-tree, cultivated in 8 or 10 departments in the southeast, both for its fruit and its leaves, the leaves being used as food for the silkworms, on which the French silk manufacture depends; the olive, which grows in the same districts as the mulberry; the pear, plum, cherry, apricot, peach, orange, citron, fig, almond, etc. The forests of France occupy about one seventh part of the whole territory. Their principal localities are the Ardennes, Vosges, and Plateau de Langres, in the northeast; the Jura in the east; and the mountains of Auvergne in the centre. The chief constituents of French forests are the oak, the elm, the pine, the fir, the larch, the birch, the beech.

Mineral Resources.— The coal-fields of France are so numerous that coal-pits exist in no fewer than 33 departments; but most of these are very limited in extent. Several of the smaller fields occur in the northwest, and also in the south, where both anthracite and lignite are found; but the fields whose importance entitle them to particular notice are only two — that of Valenciennes in the northeast, forming the western extremity of the great Belgian coal-field, and that of St. Etienne, to which the manufactures of that town, Lyons, and the surrounding districts, are indebted for much of their prosperity. The annual output is over 30,000,000 tons, but falls so far short of the annual consumption that a large import takes place from England and Belgium, and wood continues to be the common fuel throughout France, at least for domestic purposes. The coal-fields contain seams of iron, which are extensively worked, and furnish ore to a great number of blast-furnaces. Though the number of mines actually worked is great, the quantity of foundry pig annually produced is only about 2,500,000 tons. Few countries have been said to be so rich in lead as France. It occurs in greater or less quantity in a great number of districts, and is generally argentiferous. Manganese is very widely diffused, but is worked only in a few mines. Gold exists both in the sands of rivers and *in situ* in thin streaks embedded in quartz. Attempts have been made to work it, but not with success. A vein of quicksilver was opened about the middle of the 18th century, and was worked successfully for 12 years, and then abandoned. Zinc, copper, arsenic, nickel, and cobalt exist, but not in such quantities as to be workable to profit. The principal saline substances are alum and common salt. The great sources from which salt is derived are the lagoons and salt marshes which line many parts of the coast. Of these the produce is about 300,000 tons. A large revenue is also derived from quarries, and valuable beds of common clay, fine potter's earth, and kaolin.

Manufactures.— The most important manufacture is silk, which, in a great variety of forms, plain and figured, has its principal locality at Lyons and the towns of the surrounding districts. The value of the silk manufactured annually is about $100,000,000. After it follow cotton stuffs, pure and mixed, at Amiens, Rouen, St. Quentin, Troyes, Lille, etc.; woolens, including broadcloths, at Louviers, Elbeuf, Sedan, etc.; lighter woolen stuffs at Roubaix, Tourcoing, Lille, and Rheims; carpets at Paris, Aubusson, Felletin, and Abbeville; and tapestry at Paris and Beauvais; linens, including fine muslin, gauze, and lace, at Valenciennes, Courtray, St. Quentin, Alençon, Caen, etc.; porcelain at Sèvres, Paris, Limoges, and Bayeux; stoneware at Nevers, Montereau, etc.; and common pottery at Paris, Nevers, and elsewhere; beet-root sugar, chiefly in the department of Nord; leather, and the various articles made of it, including gloves; paper, plain and stained; hats, hosiery, steel, iron, brass, and zinc ware, plate and flint glass, etc. Besides these, a great number of articles in which skill, taste, and ingenuity are more especially required, have their common seat in the capital. Among others may be mentioned jewelry, clocks, surgical and mathematical instruments, carriages, works in ivory, printing type, and engravings.

Commerce and Shipping.— The commerce is usually divided into internal and external. The former is unquestionably the larger of the two. In 1902 the imports for home consumption amounted to $883,140,000; the exports of native products and manufactures amounted in 1902 to $847,400,000. The general commerce, including *all* goods entering or leaving France in 1901, was: Imports, $1,121,240,000; exports, $1,043,940,000. The foreign commerce is chiefly with Great Britain, Belgium, Germany, the United States and Italy. Great Britain is far ahead of the others; its imports from France consist chiefly of butter, eggs, grain, silks, wine and brandy, woolens and sugar.

In the year 1901 the merchant navy of France included 15,692 vessels of two tons and upward, with a total tonnage of 1,110,988 tons; and the number of steamers alone was 1,299 of 546,541 tons. The canals are numerous, and furnish signal displays of engineering skill. The Canal du Midi, or, as it is sometimes called, the Canal of Languedoc, starting from a point in the Garonne a little below Toulouse, is continued into the lagoon of Thau, and thereby gives a continuous navigable communication between the Atlantic and the Mediterranean, in the line of the important towns of Bordeaux, Agen, Toulouse, Carcassonne, and Narbonne. In like manner three separate canals cut across the basin of the Rhône: the Canal du Centre, or of Charollais, which commences at Châlons-sur-Saône, and proceeds to Digoin, on the Loire; the Rhône and Rhine Canal, so called from uniting these two rivers, partly by the intervention of the Doubs; and the Canal of Bourgogne,

which, proceeding also from the Saône, communicates with the Yonne, and through it with the Seine. The effect of these three canals is to break down the barriers which isolate the basins of the Rhône, Loire, Seine, and Rhine, and give navigable access from any one of them into the other three. The railways in France partly belong to the state, and partly have been granted to private companies for a limited period, at the end of which they become state property. There are also certain local lines which at the end of a fixed period come into the possession of the departments. In 1900 there were in France 29,125 miles of railway in operation, of which 1,870 miles were described as government lines. In 1901 the total number of letters, book-packets, etc., that passed through the French postoffice was 2,579,797,000. The total length of telegraph lines in France in 1901 was 87,382 miles, and of wires 328,700 miles. The total number of inland messages is about 37,000,000; of international messages about 6,000,000. According to the budget of 1900 the total gross revenue derived from the postoffice service in that year was $54,178,112, including telegraphs and telephones, showing a net working profit of $13,741,921.

Administration of Justice.— In accordance with the general arrangement which divides the whole country into departments, each department into arrondissements, each arrondissement into cantons, and each canton into communes, there is a series of courts, commencing with the lowest of these divisions, and rising above each other in regular order. First, each commune has a justice of peace, who judges in petty causes, but whose more appropriate function is understood to be to act as a kind of umpire between parties at variance, and induce them to settle their differences without proceeding to formal litigation. If the attempt at conciliation fails, the complainant brings his action before a court which, from being that in which the action must originate, receives the name of court of primary or first jurisdiction. Every arrondissement has such a court, and has, moreover, if any more important trading town is situated within it, a *tribunal de commerce*, to which mercantile and commercial causes are appropriated. It has also, occasionally, a court called *conseil de prud'hommes*, in which persons of skill and character, not vested with ordinary legal functions, settle disputes on principles of equity, and pretty much in the character of arbitrators. From these courts of primary resort an appeal lies to a number of courts called *cours d'appel*. They are in all 27, and have each jurisdiction over several departments. These courts generally hold their sittings in the most important town situated within their jurisdiction. The *tribunaux de commerce* in the most important commercial and manufacturing towns consist of members who are elected by the chief business men of the respective places. Above all these courts, and properly the only supreme court of the state, is the *conseil supérieur* or *cour de cassation*, so called from its power of reviewing and annulling the decrees of inferior courts.

Education.— In France education in all its branches has long been taken under the special cognizance of the state, and the superintendence of it is expressly committed to a high functionary, who takes the name of minister of public instruction. The principal educational establishments are classed under three heads — primary, secondary, and superior. At the head stands the university, which is very different from other universities, and embraces the *facultés* or university colleges scattered over the whole of France in the principal towns. These are also connected with the different *académies* or educational centres, of which there are 16 in France, each comprising so many of the departments. At the institutions known as *facultés*, the education given, as in the best modern universities, is of the highest description. Secondary education is given chiefly in the *lycées* or lyceums and in the *collèges*, there being institutions of both kinds for girls as well as for boys. Primary instruction is intended for the whole population, attendance at the primary schools being compulsory and the education free. The public schools are now all under the charge of laymen. There are still numerous private schools and institutions, however, many of which are managed by the clergy and religious bodies, but in all cases children have to undergo a public examination. Religion, in like manner, is taken under the cognizance of the state, and falls within the province of a special minister. The state places all forms of religion on an equal footing, and professes to deal impartially with all by paying salaries to their ministers. With the quality of the particular religion, therefore, the state concerns itself no further than simply to know that it is not obviously subversive of social order or good morals. The Roman Catholics form about 78½ per cent of the total population, the Protestants less than 2; many profess no religion. See ROMAN CATHOLIC CHURCH.

Army and Navy.— By the law of 1892, personal military service is declared to be obligatory. Every Frenchman 20 years old and not unfit for military service, must serve, first in the regular army for 3 years, then in the reserve of the regular army for 10 years, next in the territorial army for 6 years, and finally in the reserve of the territorial army for 6 years. By the law referring to the organization of the army, the territory of France is divided into 18 regions, each of which is again subdivided. Each region is occupied by a *corps d'armée*, and there is also a corps d'armée assigned to Algeria. Each region has general stores, and each subdivision has one or more special stores supplied from the general ones. Each corps d'armée comprises two divisions of infantry, one brigade of cavalry, one brigade of artillery, one company of engineers, one rifle battalion, field-batteries, bridge train, etc. The active army and its reserves are distributed all over France, but the territorial army and its reserves are confined to fixed areas. In 1902 the total strength of the regular army on a peace footing amounted to 616,092 men, of whom 380,881 were infantry, 76,131 cavalry, 81,527 artillery, 13,426 engineers, 20,700 staff and administration, 11,418 military train, and 22,861 gendarmerie.

In 1901 the French navy was possessed of 20 first-class battleships, 11 second-class, and 14 third-class; 14 port-defense ships; 51 first, second, and third class cruisers; 250 torpedo boats, and 35 torpedo gunboats; and 34 submarines. These numbers include ships in course of building, but exclude transports and non-service ves-

sels. The navy is manned partly by conscription and partly by voluntary enlistment. There are 25,000 men serving with the fleet with a reserve of 114,000 men.

Revenue and Debt.— France has now a larger revenue, expenditure, and public debt than any other country in the world. The revenue for 1902 was $720,493,094, expenditures, $720,466,649. The total national debt and interest in 1902 was $6,307,000,000.

Government.— France has been a republic since the overthrow of the second empire by a Paris mob on 4 Sept. 1870. The details of the constitution were fixed by a law dated 25 Feb. 1875, and several amendments have been enacted in subsequent years. This law places the legislative authority in the hands of a National Assembly composed of two chambers, the chamber of deputies and the senate. The chamber of deputies consists of 584 members representing the arrondissements, and the members are elected for four years by universal suffrage. The senate consists of 300 members, who must be 40 years of age at least. They are elected by special bodies of delegates for nine years, one third retiring every three years. The head of the government is a president, elected for seven years by a majority of votes of the members of the two chambers sitting as one National Assembly. No one can be a member of this body who has not undergone the legal military training.

Weights, Measures, and Money.— An account of the present system of weights, measures, and moneys in France is contained in the article METRIC SYSTEM.

Areas and Population.— In addition to its European territory, France possesses extensive tracts in Asia and Africa, with smaller possessions in America and Oceania. These, with their area and population in 1901, are exhibited in the following table:

COUNTRIES	Area in sq. miles	Population.
FRANCE	207,054	38,961,945
IN AFRICA —		
Algeria	184,474	4,739,300
Tunis	51,000	1,900,000
Western Sahara	1,544,000	2,550,000
Senegal	80,000	1,800,000
Senegambia and Niger	210,000	3,000,000
French Guinea	95,000	2,200,000
Ivory Coast	116,000	2,000,000
Dahomey	60,000	1,000,000
Congo	1,160,000	10,000,000
Somali Coast and Dependencies	45,000	200,000
Réunion	966	173,200
Comoro Isles	620	47,000
Mayotte	140	11,640
Madagascar and Islands	227,950	2,505,240
IN ASIA —		
India	196	273,000
Anam	52,100	6,124,000
Cambodia	37,400	1,500,000
Cochin-China	22,000	2,968,600
Tonquin and Laos	144,400	7,641,900
IN AMERICA —		
Guiana	30,500	32,910
Guadeloupe and dependencies	688	182,110
Martinique	380	203,780
St. Pierre and Miquelon	92	6,250
IN OCEANIA —		
New Caledonia and dependencies	7,650	51,410
Establishments in Oceania	1,520	29,000
Total	4,279,130	90,101,285

The principal cities and towns of France, with their population for the year 1901, are as follows: Paris, 2,714,068; Marseilles, 491,161; Lyons, 459,099; Bordeaux, 257,638; Lille, 210,696; Toulouse, 149,841; Rouen, 116,316; Rheims, 108,385; Nice, 105,109.

History.— France or Gaul, at the earliest known period was inhabited by 300 or 400 independent tribes, divided into three great families, the Celts or Gauls, the Iberians or Vasconians, and the Belgæ. The Iberians appear to have been the earliest settlers, and to have entered the country by way of Africa and Spain. Before the arrival of the Celts it is probable that the Iberian tribes had spread a considerable distance northward into the heart of France, but they were gradually driven southward by the new settlers, until at the time of Julius Cæsar they occupied, under the name of Aquitanians, only the southwestern portion of Gaul lying between the Pyrenees and the river Garonne. About 600 B.C. a body of Phocæans founded the most celebrated of the Greek colonies in all Gaul, to which they gave the name of Massilia, now Marseilles. When Rome grew in power the Greeks of Massilia, animated by jealousy and fear of Carthage, became the allies of the Romans, and it was in aid of these allies, against whom the neighboring tribes of Gaul had risen, that the first Roman expedition was sent into Gaul beyond the Alps. This was in 154 B.C., when the Romans, after subduing the insurrectionary tribes, handed over their territory to the Massilians. When the Romans were again called in to aid their Greek allies in Gaul (125 B.C.) the territory which they subjugated was retained by them, and erected into a Roman province. The first Roman settlement was Aquæ Sextiæ (now Aix), which was founded in 122 B.C., and their power was to some extent secured by the foundation, in a favorable situation, of the colony of Narbo Marcius (Narbonne), 118 B.C. This Roman territory in the southeast of Gaul was long known simply as Provincia, whence the modern Provence. Not long after coming into the possession of the Romans this province was in danger of being wrested from them by vast hordes of Cimbri and Teutones who came from the eastern side of the Rhine and inundated Gaul. Having reached the banks of the Rhône they routed five Roman armies in succession, and had they then crossed the Alps might have imperiled the safety of Rome itself. Fortunately, however, they turned their course to the Pyrenees, and before they returned Marius was ready with another army to defend the Roman province. A battle took place at Aix in 102 B.C., in which the barbarian hordes were totally defeated, and another detachment who had made their way into northern Italy met with the same fate in the year following. From that year till 58 B.C., when Cæsar obtained the Roman province in Gaul as his proconsular province, there was comparatively little change in Gaul; but no sooner did Cæsar appear than one pretext after another was found for gradually subduing the whole of Gaul. The conquest was completed between the years 58 and 51 B.C. (Cæsar's authority in Gaul having previously been renewed for another term of five years). Under Augustus the whole territory was divided into 60 municipal districts, each of which was administered by a Roman colonial city, or *municipium*. The chief seat of the government of the whole of Gaul was the colony of Lugdunum. This administrative division of Gaul un-

der the Romans subsisted till the 4th century. In 365 A.D. another important change was made in the administration of Gaul by the institution, by Valentinian I., in all the municipia, of tribunes, a class of officers who were designed to guard the interests of the municipia against any encroachments on the part of the imperial officers. Greater changes, however, had begun to make themselves manifest. The Roman empire was in its decline, and the constant revolutions and civil wars in the heart of the empire emboldened some of the Gaulish people to make attempts to recover their independence. The Romans thus found it difficult at times to maintain their power in Gaul, and the weakness of the empire was also felt by the German tribes bordering on Gaul, who eventually overthrew the Roman legions and established themselves in Roman territory. The most important of the settlers were the members of one of two confederacies of German tribes which had formed themselves on the right bank of the Rhine in the first half of the 3d century. Scarcely had the country begun to settle down under the new arrangements when it was invaded by the Huns, a nation of horsemen who had come from central Asia, and who are described as hideous in appearance and savage in disposition. After destroying the Burgundian kingdom on the east side of the Rhine, they penetrated into Gaul, but were met by the Roman general Aëtius, at the head of an army composed partly of Roman legions and partly of contingents from the Visigoths, Franks, etc., and, after prodigious carnage, were defeated (451 A.D.) in a battle fought on the Catalaunian Plains and compelled to leave the invaded territory. Among the most prominent allies of the Romans in that sanguinary battle were the Salian Franks, under their leader Merovæus. Thirty-five years later they were turned from allies to enemies, and attacked and defeated the Romans, which was the first step in conquering the whole of Gaul and founding a new kingdom, France, which derived its name from the conquerors. The Salian Franks were by no means a powerful tribe. They occupied only a few districts of what is now Belgium, and could scarcely muster more than 5,000 men capable of bearing arms. Their chief or leader, Clovis, proposed to his followers an expedition into the Roman territory, and induced the king of Cambrai to support him in his enterprise. The expedition was actually undertaken, and in the battle which ensued, near Soissons (486 A.D.), the Roman governor, Syagrius, was defeated, and compelled to take refuge among the Visigoths. He was afterward delivered up to Clovis, and put to death. Clovis was now master of all the Roman territory in Gaul except the towns, the inhabitants of which, urged on by the bishops, refused to submit to the conqueror. But what he could not at once effect by force of arms was effected peacefully by his marriage with Clotilda, a Christian and a Roman Catholic, the niece of Gundebald, king of Burgundy. The bishops, hoping that Clovis himself would soon be converted, immediately opened their gates to him. The adoption of the Christian faith by Clovis followed three years after.

Whatever may have been the motives which induced Clovis to take this step, it was undoubtedly the wisest thing that he could have done. It at once secured him the favor and support of all the Gallo-Roman bishops, not only in the formerly Roman territory, but also in that of the Burgundians and Visigoths. During a career of conquest, treachery, and cruelty he added to his dominions all the territory on the north as far as the Rhine, and became the sole Frankish king, the founder of the dynasty which reigned till 752, and which obtained the name of Merovingian, from his grandfather, Merovæus. He died in 511, leaving his kingdom to be divided among his four sons.

The spirit of conquest which was so powerful in Clovis still lived in his sons, and under them the Franks, though divided, succeeded in enlarging their empire still further. Thuringia was conquered (530), Burgundy reduced from a tributary to a subject state (534), and the Alemanni of Suabia fully incorporated in the Frankish empire. Under Clotaire I., the last surviving son of Clovis, the dominions of the Franks, thus extended, were in 558 united under one ruler for the first time since the death of Clovis. Clotaire I. lived till 561, when the dominions of the Franks were again divided. The next unification took place under Clotaire II., who reigned as sole king from 613 till 622, when he appointed his son, Dagobert, king of Austrasia. On the death of Clotaire II. in 628, Dagobert succeeded him as sole king, and his reign saw, in the first place, the Frankish power raised to the greatest height which it reached under the Merovingians, but saw also the beginning of its decline. During the most prosperous part of his reign his dominions extended from the Weser to the Pyrenees, and from the Atlantic Ocean to the frontiers of Bohemia. He was the ally of the emperors of Constantinople; he interfered in the affairs of the Visigoths of Spain, and in those of the Lombards of Italy. In short, he might be regarded as the head of all the barbarian tribes which then occupied the provinces that had formerly constituted the Roman empire in the west. But even during his lifetime the hold of the Franks on some of the more remote parts of their dominions began to be loosened, and after his death in 638 the states which broke away from their allegiance became more numerous. The kingdom was then once more divided, one of his two sons receiving Neustria, and the other Austrasia. Early in the 7th century war broke out between the two kingdoms. A battle was fought at Testry, near Péronne, in 687, in which Roman France, as Neustria had now come to be called, was vanquished by Teutonic France, and the authority of Pépin d'Héristal rendered supreme throughout the kingdom. This date may be regarded as that of the real termination of the Merovingian line. Pépin died in 714 and was succeeded, after a brief period of anarchy, by his son Charles Martel, or Charles the Hammer — a title he earned by the courage and strength he displayed in battle. During his tenure of power all Europe was threatened by the Saracens, who, after traversing the north of Africa, had crossed over into Spain and occupied it, then penetrated into France and seized Aquitaine, at that time ruled over by a member of the Merovingian race holding the title of duke. He appealed for assistance to Charles Martel, who met the Saracen hosts on a plain between Tours and Poitiers, where in 732 he totally defeated them in a battle which, on account of its carnage and the decisive nature of

its results, calls to mind that fought against the Huns on the Catalaunian plains. The Saracens were at once driven from every part of France except Septimania, which they had taken from the Visigoths, who had continued to hold it ever since the overthrow of their kingdom by Clovis. Another consequence of this battle was that the Duke of Aquitaine took an oath of allegiance to Charles Martel. Pépin le Bref, the son of Charles Martel, was the first of his family who was recognized as king of the Franks. He succeeded his father in the possession of Neustria in 741, while Austrasia fell to his brother, Carloman, who died in 747. In 752 Pépin was crowned and anointed king of the Franks by Boniface, archbishop of Mayence. Childéric, the last of the Merovingians, was confined in a monastery. The reign of Pépin was one of almost continuous war and conquest. In Italy he defeated the Lombards, and gave their territory to the popes; in France he wrested Septimania from the Saracens (752–759), and subjugated Aquitaine (759–768). In 768 he died, and was succeeded by his son Charles, afterward known as Charlemagne, and Carloman. The latter dying in 771, Charlemagne then became sole ruler, and he conquered and organized an empire which extended from the Atlantic on the west to the Elbe, the Saale, and the Bohemian mountains on the east, and embraced also three fourths of Italy, and Spain as far as the Ebro. By Pope Leo III. on Christmas Day, in the year 800, he was crowned in the name of the Roman people as emperor of the West. His power was respected by the emperors of Constantinople, and his fame extended so far that even Harun-al-Rashid, the caliph of Bagdad, sent him valuable presents from the far East. He died in 814.

After his death, or at least after the death of his son, Louis I., in 840, the history of the Carlovingians bears a close resemblance to that of the Merovingians, until in 987 it reaches a similar termination. The latter part of the reign of Louis was disturbed by the quarrels of his sons, whom he had now associated in the government with himself, but who were unable to agree as to the share of the empire which should fall to each. After the death of Louis they took up arms against each other, and it was not till after the hard-contested battle of Fontenailles in 841 that peace was brought about and the brothers agreed to the partition of the empire proposed in the Treaty of Verdun (843). From this time the tribes in the east began gradually to fuse together into one nation, and the separation between France and Germany became proportionally more and more distinct. They had not yet, however, been united for the last time under one rule. After Charles the Bald had been succeeded in 877 by Louis II., and Louis II. by Louis III. (879–882) and Carloman (879–884), the whole of the dominions of Charlemagne came under the sway of Charles the Fat, who remained sole ruler of the empire till 887, when he was deposed. From that date the political history of France is distinct from that of Germany.

The royal power in France was then usurped for a time by Eudes, count of Paris, but in 893 Charles III. (the Simple), the brother of Louis III., was recognized as king. His kingship, however, was merely nominal. France had in effect become covered with a multitude of petty kingdoms, the rulers of which bore the titles of dukes and counts. Thus the Duke of Gascony possessed nearly all the district to the south of the Garonne; the counts of Toulouse, Auvergne, Périgord, Poitou, and Berry, the provinces between the Garonne and the Loire; and the regions to the north and east of the latter river belonged to the count of Forez, the Duke of Burgundy, the Duke of France, and the counts of Flanders and Bretagne. The entire possessions of the king consisted of a few towns that he had not as yet been compelled to give away. In the midst of these powerful nobles Charles found himself almost impotent, and was quite unable to offer any adequate resistance to the Norman pirates who had long ruled the seas and devastated the coasts of England, France, and other countries, and who now made more frequent and more destructive incursions into French territory. Charles, accordingly, adopted the wisest policy that he could have followed in the circumstances — surrendering to them in 912 the province which took from them the name of Normandy in order that they might settle there peacefully and cease to lay waste the country by their ravages. Toward the end of his reign Charles found himself so weak as to be unable to resist his own nobles, who in 922 elected one of their number, Robert, Duke of France, king, in opposition to him, and upon the death of Robert in 923 conferred the same dignity upon Rudolph, Duke of Burgundy. During this period Hugh of Paris, as he is generally called, Duke of France, was really the most powerful person in the kingdom, and held King Charles in close captivity. Charles died in 929, when there reigned in succession till 987 the son, grandson, and great-grandson of Charles — Louis IV. (D'Outremer), from 936–954; Lothaire, from 954–986; and Louis V., from 986–987. During these three reigns the real power, such as it was, was held by Hugh of Paris till his death in 956, and then by his son Hugh Capet. On the death of Louis V. without children in 987 Hugh Capet mounted the throne himself, and thus became the founder of the Capetian dynasty.

Hugh Capet died in 996, and his first three successors, Robert (died 1031), Henry I. (died 1060), and Philip I. (died 1106), effected nothing whatever toward the establishment of the royal authority. When Philip I. died he was succeeded by Louis VI. Louis was a complete contrast to Philip, resolute in his endeavors to make his power felt throughout his kingdom, and active in the field, compelling his refractory nobles to yield submission.

Louis VI. died in 1137, and was succeeded by his son Louis VII., who reigned till 1180. Louis VII. was not, like his father, an active soldier, but he followed the same policy. During his reign the stability of the French throne was endangered by the great influence acquired in France by Henry II. of England, who possessed either by inheritance or by marriage the whole of the west of France except Brittany, and obtained some influence even in that province by the marriage of one of his sons with the only daughter of the count. Fortunately for France, Henry, through domestic embarrassments, was unable to pursue any schemes of conquest which he might have cherished against his feudal superior in France. Louis was succeeded by his son Philip Augustus (Philip II.),

who saved the throne of France from the danger with which it was threatened by the great ascendency which the king of England had acquired among the vassals of the king of France. Having summoned the weak King John to appear before the court of peers to answer for his conduct in the case of Prince Arthur, he at once proceeded, when John refused to appear, to execute the sentence by seizing Normandy, Maine, and Anjou. His son, Louis VIII., who succeeded him in 1223, carried on the work by the conquest of Poitou. The unity of France more firmly consolidated in a peaceful way by the wisdom and justice of Louis IX. (St. Louis), whose Establishments, belonging to the close of his reign, may be regarded as having put a formal seal upon this re-established unity, for these formed the first legislative enactments of the house of Capet, the first instance of general legislation for the kingdom of France for nearly 400 years, the last Capitulary or general law having been promulgated in the reign of Charles the Simple.

Louis IX. died in 1270, and from this date, under Philip (III.) the Bold (died 1285), Philip (IV.) the Fair (died 1314), Louis X. (died 1316), John I. (died 1316, after a reign of five days), Philip V. (died 1322), and Charles IV. (died 1328), the Crown continued steadily to increase in power by the acquisition of fresh domains and other means until the outbreak of the wars with England. In the reign of Philip III. a blow was given to the declining power of the nobles by the institution of letters of nobility conferring the rank of nobles upon commoners. Still more important was the recognition by Philip IV. of the bourgeoisie, the new class of society that had grown up in the communes, by calling their representatives as deputies of the cities to form one of the three orders of the States-General. The other two orders consisted of the clergy and the nobility. No small accession of strength to the crown was gained also by the suppression of the order of Knights Templars and the confiscation of their vast possessions, as also by the election of a French pope, who resided at Avignon under the influence of the French monarch.

The first branch of the Capetian line of kings became extinct on the death of Charles IV., the last of the sons of Philip the Fair, for what is called the Salic law (from the fact of its being the rule of succession to fiefs among the Salian Franks), which excluded women from the throne, had become the rule of succession in the case of the crown of France. The right of succession thus reverted to Philip of Valois, son of Robert of Valois, and grandson of Philip the Bold, who actually obtained the crown as Philip VI. His claim was disputed by Edward III. of England, who asserted his own right to the kingdom, on the ground that although the Salic law excluded women from the throne, it did not prevent a woman from transmitting the right of succession to her descendants, and that therefore he was the rightful heir as the son of Isabella, daughter of Philip the Fair. The claim thus set up by Edward led to wars between England and France, which were not terminated for more than 120 years. During this period France was reduced to a state of great misery. While Edward, victorious over Philip VI., and after his death in 1450 over John (II.) the Good, who was taken prisoner at Poitiers in 1456, compelled the surrender to England of some of the finest provinces of France by the Treaty of Brétigny in 1360, the country was plundered by banditti, and the Jacquerie, a mass of furious peasants (about 1358), satiated their spirit of vengeance in the blood of the nobility. Charles (V.) the Wise, who succeeded John the Good in 1364, was able to restore order only for a short time, although during this reign the English were driven out of most of their possessions in France. Then came the long and unhappy reign of the imbecile Charles VI. (1380–1422), disturbed by a rising of the peasantry and finally by foreign war, Henry V. of England having revived the claim of Edward III. to the French crown. The military successes of Henry led to the Treaty of Troyes (1420), by which he was to receive the hand of the daughter of Charles VI. in marriage, and the right of succession was settled on himself and his descendants, to the exclusion of the dauphin, afterward King Charles VII. Charles VI. died in 1422, a few weeks after Henry V., whose son Henry VI., a minor, was acknowledged as king by the greater part of France. But between 1429 and 1431, amid the licentiousness of war, of factions, and of manners, Joan of Arc animated the French in the cause of the dauphin, who was crowned as Charles VII. at Rheims, 17 July 1429, and in 1451 the English had lost all their possessions in France, except Calais.

During the wars of that period the French kings had obtained the means of wielding an almost absolute power by the institution of a standing army. It was the policy of the kings to obtain an unlimited authority by destroying the liberties of the states, and at the same time to turn the warlike spirit of the nation to foreign conquests. The despotic policy of Louis XI. (1461–83), effected this object by violence and cunning. His son and successor, Charles VIII. (1483-98), undertook the conquest of Naples (1494), to which he made pretensions as heir of the house of Anjou. After a triumphant campaign in Upper and Middle Italy he took possession of Naples; but an alliance formed between Milan, Venice, and the Pope soon after compelled him to withdraw.

Charles was the last king of the direct line of Valois, and was succeeded by Louis XII., who was descended from Louis of Valois, Duke of Orleans, brother of Charles VI. He was, on the whole, a just and beneficent ruler; but the ambition of conquest involved him in disadvantageous wars, and in the war with the league formed against him by Pope Julius II. he lost Milan and the supremacy of Genoa. On the death of Louis the crown reverted to another branch of the house of Valois, that of Angoulême, Francis I. (1515–47) being the grandson of John, count of Angoulême, uncle of Louis XII. Francis I. still continued the attempts at foreign conquest that had been made by his two predecessors, and in the great battle of Marignano, fought in 1515, he recovered Milan, with the supremacy over Genoa. But this duchy was now claimed by Charles V. of Germany, the life-long rival of Francis, and from these opposing claims there resulted five wars between France and Germany. In the first Francis was compelled to quit his hold of Milan and Genoa, and retreat across the Alps. He soon after

again invaded Italy, but was taken prisoner at the battle of Pavia (1525), and could regain his liberty only by agreeing to the Peace of Madrid (1526), in which he renounced Milan, and ceded the Duchy of Burgundy to Germany. By the Peace of Cambrai, however, concluding the second war, this duchy was restored to him (1529). The third war was concluded by the truce of Nice (1538), which left to each of the combatants whatever he happened to possess at the time. Finally, in the Peace of Crespy (1544), concluding the last war between France and Germany carried on in the lifetime of Francis and Charles, the former was allowed to retain both Burgundy and the Duchy of Savoy and Piedmont, which he had seized in the third war. Henry II. (d. 1559) pursued the same policy as his father Francis. War was renewed for the fifth time with the house of Hapsburg, then represented by Philip II. of Spain, the son of Charles V., as well as by the Emperor Ferdinand, brother of Charles. In the Peace of Cateau-Cambrésis (1559), by which the war was concluded, Savoy and Piedmont were surrendered by Henry, with the exception of a few towns which were ultimately given up by France. In the same reign Calais was recovered from the English (1558). Francis II., the husband of Mary Queen of Scots, succeeded his father Henry, but reigned little more than a year (1559–60). The foundation of the national debt, the weight of which broke down the throne 250 years later, was laid in this period. Intrigue and corruption gave to women a dangerous influence at court and in public affairs. Under the administration of Charles IX. France was inundated with the blood of Frenchmen, shed in the religious wars from 1562. These continued throughout the reign of Charles IX. and his successor, Henry III. (1574–89), and were only terminated when Henry of Bourbon, king of Navarre, and since the death of Henry III. king of France, went over to the Catholic Church (1593), having hitherto been the leader of the Huguenots.

With Henry III. had expired the last branch of the house of Valois, and Henry IV. was the first French sovereign of the house of Bourbon, which inherited its right to the throne from Robert, count of Clermont, the sixth son of Louis IX. He united to the crown of France the kingdom of Navarre, which he had inherited from his mother, Jeanne d'Albret. In his government of France Henry showed all the qualities of a great prince and a great statesman. After restoring peace to the country within and without, he granted religious toleration and full political privileges to the Calvinists by the Edict of Nantes in 1598. While cherishing the great design of founding, with the aid of the Protestant union in Germany, and other European powers, a great Christian empire offering equal political privileges to Catholics, Lutherans, and Calvinists, and thus of humbling the house of Hapsburg, he was cut off prematurely by the dagger of the fanatic Ravaillac (1610). During the minority of Louis XIII. the French policy was at first wavering, until the prime minister, Cardinal Richelieu, gave it a steady direction. He took advantage of the Thirty Years' war to humble Austria and Spain. He created that domestic despotism in France which rendered the government completely absolute, but finally occasioned the overthrow of the monarchy. Louis XIII. died in 1643, the year after his great minister. The policy of Richelieu was carried on by Mazarin during the regency of Anne of Austria, while Louis was still a minor, and also for some years after Louis was declared of age. Although enjoying the full confidence of the regent, Mazarin, as a foreigner, and, like Richelieu, the oppressor of nobles and commoners, was generally hated, which led to a rebellion and civil war (1648–53). Mazarin was compelled for a time to leave France, but soon returned more powerful than ever. In the first part of his ministry France obtained, by the Peace of Westphalia (1648), which concluded the Thirty Years' war, the German province of Alsace. The last work of Mazarin was the Peace of Pyrenees (1659), by which France received from Spain additions both in the north and in the south, 14 towns of Flanders, Hainaut, and Luxembourg.

After the death of Mazarin, in 1661, Louis XIV. took the government into his own hands, and the period which follows is the most brilliant in French history. His ministers and generals were alike the greatest of their time; and the writers of the period include the greatest names in French literature. Throughout his long reign Louis XIV. was chiefly bent on acquiring glory and increasing his empire by war. The last war of the reign of Louis XIV., the war of the Spanish Succession (1701–14), added little to the military glory of France, but Louis was nevertheless able to conclude it by sufficiently advantageous treaties. He died in 1715, leaving a national debt amounting to no less than 4,500,000,000 livres.

Louis XV., the grandson of Louis XIV., succeeded at the age of five years. During his minority the regency was held by the Duke of Orleans, who squandered in the most reckless manner the revenue of the state. It was during this period that the great Mississippi scheme was started by John Law, which created a perfect mania for speculation in France, but ultimately brought ruin on thousands of those who had a share in it, although many of the great had managed to enrich themselves by it. In 1723 Louis was declared of age. In the first part of his reign, during which he was chiefly guided by the wise minister Fleury, he was the favorite of the nation, but when he sunk under the pernicious influence of the Marquise de Pompadour, the love of his people was gradually converted into hatred and contempt. The extravagance of the luxurious and licentious court, in addition to the useless and costly wars in Germany (1740–48; Seven Years' war, 1756–63), exhausted the treasury and necessitated the increase of the taxes, which already pressed heavily on the bourgeoisie and the peasantry all the more heavily because the nobility and the clergy were exempt from taxation, and because the taxes were not raised by the government itself, but by the farmers of the revenue and their extortionate officers. During this reign two important acquisitions were made by France. These were: Lorraine, joined to France in 1766, in accordance with the treaties of Vienna of 1735 and 1738; and Corsica, bought from the Genoese in 1768, conquered in 1769.

With the reign of Louis XVI. begins the

period of expiation for the crimes of the French monarchy and aristocracy, which had culminated in the preceding reign. The fall of feudalism had left the nobility dependent on the court, but in France the people had no share in this victory. The wretched financial administration and extravagant expenditure of the court made the public taxes intolerably oppressive, at the same time that they reduced the exchequer to bankruptcy. The higher clergy were exempt from taxation, but the lower were not exempt from beggary. An army of 15,000 monks subsisted on the charity of a people which, besides the tithes of the clergy, had already given a large part of its territory to the church. Thus the court, the nobility, and the clergy formed only one privileged class united to oppress the people. The time of reaction had now come, that of repentance and reformation for the privileged orders was already past.

Louis XVI., son of the dauphin and grandson of Louis XV., ascended the throne on the death of the latter, 10 May 1774. The first difficulty of his government, and the rock on which it split, was the hopeless and unmanageable condition of the public finances.

War broke out with England, in consequence of the support afforded by France to the revolted American colonies of Great Britain. A treaty of commerce and alliance with the United States was signed 6 Feb. 1778, and was followed by an immediate declaration of war by England. The war was successful in its immediate object, and was terminated by the Treaty of Versailles, 3 Sept. 1783. Three years afterward a commercial treaty was concluded with England.

A fatal result of the weakness of the king was that the queen, who was naturally of a firmer temper, began to take an interest in the government. Her influence, not being legitimate, necessarily took the form of intrigue, and made her the centre of the reactionary tendencies of the court and the privileged orders; thus exciting the jealousy and suspicion of the lower orders, and arousing against her a hatred without bounds, and which, in spite of her private virtues, could not be satiated until both her husband's blood and her own had stained the fall of the monarchy.

Financial and political discord became rife and in June it became necessary to bring foreign troops to Paris to overawe the assembly. The people demanded arms, which the municipality of Paris supplied; and on 14 July the Bastille was captured and destroyed. The *garde bourgeoise*, formed by the municipality, was now transformed into the national guard. The command was given to Lafayette, who formed its colors by placing between blue and red the colors of Paris, white, the emblem of the French monarchy. Thus was originated the flag of the republic. The spirit of insurrection in the meantime had, since the beginning of 1789, been spreading in the provinces, and the urgency of affairs induced the assembly, on 4 August, to take a decisive step. On the basis of a future compensation all privileges were abolished. A banquet given to the foreign troops at Versailles at a time when the populace was threatened with famine, excited another insurrection. Versailles was attacked by the mob, and the king brought a prisoner to Paris (5 and 6 Oct. 1789). On this occasion, as on the taking of the Bastile, the ferocity and bloodthirstiness of the more lawless portion of the mob began to be fearfully manifested. This popular outbreak occasioned also the beginning of the emigration, so fruitful in future disasters to France. The king's brother, the Comte d'Artois, and others of his more extreme councilors, fled, and by transferring their intrigues to foreign courts, hastened the Revolution, and prepared the way for the devastating wars by which it was followed.

In December 1790, the king began to correspond secretly with foreign powers, and a secret convention had been made with Austria, Prussia, Piedmont, Spain, and Switzerland, to advance their troops to the frontiers with a view to a simultaneous occupation of the territory. To give effect to this plan it was necessary that the king should be free. In concert with the Marquis of Bouillé, who commanded the troops in the north of France, Louis made his escape from Paris (20 June 1791), and endeavored to reach Montmédy; but he was recognized on the road, arrested at Varennes, and brought back to Paris escorted by the commissaries of the assembly. A demonstration in the Champ de Mars, in favor of his deposition (17 July), was put down by force by Lafayette and Bailly, under order of the assembly. The popularity of that body, already declining, was seriously compromised by this step, but its labors were now drawing to a close.

On 30 Sept. 1791, it brought its work to a finish, after having redeemed its oath of 20 June. The constitution was sworn to by the king on 14 September, after which he was reinstated in his functions. The constitution embraced all those civil reforms which, afterward incorporated in the code Napoleon, survived the political changes of the Revolution. It deprived the king of arbitrary powers, and voted him a civil list; it provided liberty of worship, freedom of the press, of commerce, of industry; the laws of primogeniture and entail were abolished, and equal division of property among children made compulsory; confiscation of property for offenses was abolished, and personal punishment substituted; titles were abolished; the clergy were reduced to public functionaries, salaried by the state; the territory of France was declared free through all its extent, and a re-division of it was effected (15 Jan. 1790) into 83 departments. This division afterward proved an admirable instrument of centralization, and in repeated emergencies enabled Napoleon at once to lay his hand with ease upon all the military resources of France. With some excesses these measures swept away at one stroke all the real grievances which supplied the motive force of the revolution, and could they have been peaceably maintained it might have ended here. But they were the result of a sudden flood of enthusiasm which took no account of opposition, and which had only dispossessed and not destroyed the rival interests. One of the measures already mentioned in particular demands further details, as it was the means of meeting the financial difficulty, and at the same time of arming the enemies of the Revolution, at whose expense it was effected. On 2 Dec. 1789, the domains of the church were, in the euphemism of the assembly, put at the disposition of the nation. The minister was authorized to sell these estates to the extent of 400,000,000 livres. Until the sale was effected he

was authorized on the security of these national domains to issue a paper money having a forced circulation and a preference in the purchase of them. In 1792 the estates of the emigrants were confiscated in like manner. Thus was created that seemingly inexhaustible treasury of assignats which brought France so speedily into a financial anarchy worse than any she had yet experienced. Among other reforms was the reorganization of the administration of justice. The parliaments were dissolved by indefinite prorogation, and judicial functions were separated from the administrative, district courts were created and judges appointed for 10 years. The assembly closed with an attempt to recall the émigrés, and it prohibited the re-election of its members. Mirabeau, the greatest orator of the assembly, and one of the boldest leaders of the Revolution, had died prematurely 2 April 1791, from the excesses of his life. The constituent assembly was, according to the constitution, immediately followed by the legislative assembly, which began its sittings on 1 October, but before the period assigned by the constitution it gave place to the convention. In the legislative assembly there were two parties of political importance, the Girondists, who led it, and the Montagnards, who subsequently became all-powerful in the convention. The royalists were already powerless. The assembly was compelled at once to take a decisive course. By the declaration of Pilnitz the emperor of Germany and the king of Prussia threatened an armed intervention to restore Louis to his rights. The king was compelled in March to accept a Girondist ministry, and on 20 April 1792, war was declared against the empire. The first attempts to assume the offensive were unsuccessful. The king maintained a treasonous correspondence with the allies, and refused to sanction the decrees of the assembly. On 20 June, the people invaded the assembly and the Tuileries, and summoned the king to sign the decrees. He refused, but satisfied them for the moment by allowing himself to be crowned with a red bonnet. On 26 July the Duke of Brunswick issued his celebrated manifesto, threatening, if the king was insulted, to deliver Paris to a military execution. The sections of Paris retorted by signing a petition demanding the deposition of the king before the close of the day (9 August). At midnight the tocsin sounded. The Tuileries, after a sanguinary combat, were taken and sacked. The king took refuge with his family in the assembly, which was invaded and compelled to submit to the dictation of the victors by assenting to the suspension of the king and the convocation of a national convention. The convention was an extraordinary assembly, summoned for an emergency, and thus recognized the fact that France was again without a constitution. The war now assumed a more favorable aspect. The victory of Valmy, 20 September, freed France of its invaders; that of Jemappes, 6 November, led to the occupation of Belgium.

The first act of the new assembly was to proclaim the republic. On 3 December the king was cited to appear before it. On 20 Jan. 1793, he was, by four successive votes, sentenced to death within 24 hours, and on the 21st the sentence was executed. This violent inauguration of the republic shocked public opinion throughout Europe, and armed the neutral states against France. England, Holland, Spain, and the empire joined the coalition. A levy of 300,000 men was ordered. It was necessary to send some of these new levies to suppress the Chouan insurrection in Maine, Anjou, and Brittany. Nearly all the officers of rank had emigrated, and Dumouriez, after being defeated at Neerwinden (18 March), had declared against the convention. The army lost confidence in its heads and became disorganized. Mutual suspicion and distrust reigned in the convention itself. The convention took measures suited to the gloomy aspect of affairs. A revolutionary tribunal was appointed to try offenses against the state, a committee of public safety, with sovereign authority, was appointed (6 April), and the convention renounced the inviolability of its members. The period thus inaugurated is known in history as the Reign of Terror. The struggle between the Girondists and the Montagnards became violent. The later, defeated in the convention, armed the sections of Paris. The convention, under pressure, ordered the arrest of 31 Girondists (2 June). Some of them escaped and excited insurrection in the provinces. A new constitution was adopted by the convention on 23 June, called the Constitution of the Year 1, the Republican Calendar being adopted on 5 Oct. 1793. In the meantime the majority of the southern towns declared against the convention, the French territory was invaded both on the north and south, and to all these dangers was added famine. The convention fixed a maximum price for the sale of provisions. A decree was passed excluding English manufactures from France. A levy was ordered of 1,200,000 men, and Carnot organized 14 armies. The revolted provinces were speedily reduced. Bonaparte took Toulon from the English; and Jourdan, as commander-in-chief of the army of the north, was put in a position to oppose the principal forces of the coalition. The energy of the dominant party had risen to the danger, but it was accompanied by a ferocity without example. The revolutionary tribunal had already filled the prisons with victims. On 10 October the constitution was suspended and the government declared revolutionary, a term which included unlimited power. Both in Paris and the provinces executions and massacres followed each other daily, and as new parties succeeded each other in the convention the leaders of the defeated parties were added to the usual list of suspected royalists or reactionaries. Thousands of paid committees were formed throughout France. The queen was executed on 16 October, the Girondists on 31 October, the Hébertists on 24 March 1794, the Dantonists on 5 April. Robespierre had a new law passed on 22 Prairial (10 June) to facilitate these executions, and from this date to 27 July 1400 persons are supposed to have perished. At length the Reign of Terror came to an end by the execution of Robespierre and his associates on 27 and 28 July.

The campaigns of 1793 and 1794 resulted favorably to the French arms. The allies made war on the old system of position and detail, and permitted the French, by a better concentration of their forces, to gain some decided advantages. Jourdan defeated the Prince of Coburg at Wattignies 15 and 16 October. Hoche wintered in the Palatinate. In Italy and Spain the French had also been able to carry the war beyond their own frontiers. In 1794 Pichegru, by

the victory of Fleurus, recovered Belgium, and by the beginning of 1795 had completed the conquest of Holland, which, under French influence, constituted itself into the Batavian Republic. By the successes of Jourdan the allies were driven across the Rhine, and Spain was invaded. These successes induced Prussia and Spain to lay down their arms. By the treaties of Basel, signed by the former on 5 April, by the latter on 12 July (ratified 22) 1795, these countries acknowledged the French Republic. The English had been successful at sea, and had made extensive captures among the French colonies.

In 1795 the convention gave the republic a new constitution, a chamber of Five Hundred to propose the laws, a chamber of Ancients to approve them, an executive of five members, one elected annually, called the Directory. This tame bequest of that once terrible assembly marked the progress of a strong reaction. The royalists conceived sanguine hopes of a restoration. Pichegru was gained, a royalist insurrection organized, and 30,000 men marched on the Tuileries, where the convention sat. Barras entrusted the defense to Napoleon, who, with 5,000 men and his artillery, repulsed the insurgents. This event is called the affair of the 13th Vendémiaire (5 Oct. 1795). Bonaparte was now appointed under Barras to the command of the army of the interior. The convention was dissolved on 26 October.

In the campaign of 1796–97, organized by Carnot, Jourdan, and Moreau, each with 70,000 to 80,000 men, were to enter Germany to reach the basin of the Danube, the first by the valley of the Main, the second by that of the Neckar, and to descend upon the hereditary states of Austria; while Napoleon, with 40,000 men, menaced Italy. One object of the campaign was to make the armies live on foreign territories. Bonaparte's lieutenants in Italy were already experienced generals. He assembled them and unfolded his plans, which silenced the jealousy naturally caused by his appointment. To the soldiers he issued the first of his rousing proclamations: "You are ill-fed," he said, "and almost naked; the government owes you much, and can give you nothing. I am about to lead you to the most fertile plains in the world, and to opulent cities where you will find honor, glory, and riches." During four years the army had been struggling against the Sardinian and Austrian troops, without decisive success, on the southern slopes of the Alps and Apennines. The Sardinians stretched from the Bormida to the Stura, with an entrenched camp at Ceva. The Austrians were cantoned in the neighborhood of Alessandria and Tortona, commanding the roads to Genoa and Milan. Napoleon threatened an attack on Genoa by Voltri, but made his real advance through the valley of the Bormida. By seizing Montenotte he placed himself in their centre; and having first repulsed the Austrians, drove the Sardinians before him to Cherasco, where an armistice was concluded (28 April), which was converted, on 15 May, into a definite treaty, by which Sardinia renounced the coalition and ceded Savoy and Nice to France. Bonaparte now turned upon the Austrians, and by forced marches to Piacenza compelled Beaulieu to retreat toward the Tyrol. He crossed the Po at Piacenza, stormed the Bridge of Lodi, which was held by the Austrians to cover their retreat, and entered Milan on 15 May. Brescia was entered on the 28th, the passage of the Mincio forced at Borghetto on the 30th; and the Austrians, after garrisoning Mantua, retired into the Tyrol. Napoleon followed up his successes by negotiations with the Italian princes and the Pope, upon whom he levied contributions. The king of Naples signed an armistice on 5 June. Besides money, so much wanted by the directory, Napoleon provided a pleasing tribute to French vanity by stipulating for the surrender of pictures, manuscripts, and works of art. On Lombardy he levied a contribution of $400,000,000; the Pope promised $420,000,000. He sent $200,000,000 to the directory, which had not been able to defray the expenses of his campaign. While he besieged Mantua, a fresh army of Austrians under Wurmser advanced against him in three divisions. He raised the siege, beat one division under Quosdanovich at Salo and Lonato, 3 August, and another under Wurmser at Castiglione, on the 5th. Wurmser, reinforced to 50,000 men, again attempted to relieve Mantua. Napoleon, who had entered the Tyrol and had reached Trent after defeating 25,000 Austrians under Davidovich at Roveredo, descended the valley of the Brenta after Wurmser, defeated him at Bassano (8 September), and shut him into Mantua. In the meantime the Archduke Charles had defeated Jourdan and forced Moreau to retreat by the Black Forest to Alsace, which he reached in October. This enabled the Austrians to send a fresh army after Napoleon, consisting of 50,000 men, under Alvinczy and Davidovich. After sustaining a repulse at Caldiero, Napoleon outmanœuvred Alvinczy and defeated him at Arcole, 15–17 November. In January 1797 Alvinczy, with large reinforcements, again advanced from Roveredo to the relief of Mantua. Napoleon defeated him on the 14th, at Rivoli. On 2 February he received the surrender of Mantua. Bonaparte now put an end to his armistice with the Pope, and invaded the States of the Church. A speedy understanding was come to by the Treaty of Tolentino (19 February); the Pope surrendered Avignon, Bologna, Ferrara, and the Romagna to France; these were added to the provinces of Modena and Reggio, taken from the Duke, and formed the Cispadane Republic, as, after the battle of Lodi, Lombardy had been proclaimed as the Transpadane Republic. The Austrians were preparing for another invasion of Italy under the Archduke Charles, and Napoleon resolved to anticipate them before they should receive their reinforcements from the armies on the Rhine. He entered the Tyrol, driving the Archduke before him, and had reached Judenburg, a few days' march from Vienna, when an armistice was accepted (7 April) and preliminaries were signed on the 18th, at Leoben, ceding the Austrian Netherlands and Lombardy to France, and indemnifying Austria with Venetia. These preliminaries were confirmed by the Treaty of Campo Formio, signed 17 October.

In the meantime the internal condition of affairs was becoming worse. The Reign of Terror had been followed by an excessive dissolution of manners. Brigandage prevailed in the provinces. Barras, a member of the Directory, and other high officials, had been guilty of malversation and private jobbing in the public

funds. The returned royalists were intriguing for a counter-revolution. The reactionary party had triumphed in the elections of May 1797, and had succeeded in electing Pichegru president of the Five Hundred, and Barbé Marbois, another royalist, president of the Ancients, and had replaced Letournerre in the directory by Barthélemy. The majority of the directory, relying on the support of Bonaparte, resolved to anticipate them. On the night of 4 September 1797, Augereau introduced 12,000 men into Paris, surrounded the halls of the councils and arrested the leaders of the reactionary party. The minorities of the two councils, assembled on the invitation of the directors, condemned 53 deputies to transportation; annulled the elections in 48 departments, and repealed the laws which had been passed in favor of priests and emigrants; and other violent measures were also taken. Moreau, who had betrayed the intrigues of Pichegru, was himself suspected, and deprived of his command.

Napoleon, who was named general of the army of England, persuaded the directory to abandon the project of a descent on England, and proposed, as a means of ruining her Indian empire, the conquest of Egypt. The army appointed for this expedition, consisting of 36,000 men, embarked at Toulon 10 May 1798. In passing, they took Malta from the knights. While Napoleon was occupied with the conquest of Egypt, Nelson, who had pursued the French fleet, found it moored in the Bay of Abukir, defeated, and nearly destroyed it. The French were thus already imprisoned in their conquest, the political value of which was confiscated in advance. After the battle of the Pyramids (21 July) the subjugation of Egypt was easily effected, and early in the following year Bonaparte proceeded to the conquest of Syria. After traversing the desert, and capturing Gaza and Jaffa, where he massacred the garrison, he laid siege to the city of Acre, which was defended by a Turkish garrison, assisted by the English commodore, Sir Sydney Smith. After 60 days' siege he was compelled to relinquish the attempt to capture this place and return to Egypt. On 22 August, in consequence of advices from Europe, he abandoned the command of the army to Kléber, and embarking in a frigate landed at Fréjus 9 October. A second coalition had by this time been formed against France, embracing England, Russia, Austria, and other German states, Naples, Portugal, and Turkey. To meet this danger the councils passed the law of the conscription (5 Sept. 1798), and ordered a levy of 200,000 men.

The campaign of 1799 was disastrous to the French. Jourdan, who had crossed the Black Forest, was defeated by the Archduke Charles on 25 March, and forced to retire beyond the Rhine. Schérer, who was intrusted with the command of the army of Italy, was defeated at Magnano on 5 April. Moreau, who superseded him, sustained further reverses; and MacDonald, who came to his assistance with the army of Naples, was totally defeated in the battle of the Trebbia, 17–19 June. Joubert, who succeeded Moreau, was defeated and killed at Novi 15 August. On the other hand, the Anglo-Russian campaign in Holland had failed; and Masséna, after a brilliant campaign in Switzerland, defeated the Russians and Austrians at Zurich on 25 September, which induced the Emperor Paul I. to make peace.

Napoleon, on his return, found the government in great embarrassment. Its credit was wholly gone. It was obliged to fund the interest of its debts or pay it in worthless paper money. It was ill-obeyed by its generals. A revolution had taken place in the government (18 June), but the new directors were as incompetent as the old. In these circumstances was accomplished the revolution of 9–10 Nov. 1799. The councils being alarmed with rumors of a Jacobin plot, the Ancients gave orders that both bodies of the legislature should be transferred to St. Cloud under the conduct of Bonaparte, who was entrusted with the command of the troops. Bonaparte had already secured the co-operation of Moreau and the other generals present in Paris. On the 10th Napoleon entered the Council of the Ancients assembled at St. Cloud, and insisted on the necessity of a new constitution. On proceeding to the Council of the Five Hundred he was received with cries of *à bas le dictateur*. Gen. Leclerc, by his orders, entered and dispersed the assembly. The members of the two councils who were favorable to Bonaparte then appointed a provisional government of three consuls — Bonaparte, Siéyès, and Roger Ducos, and a committee consisting of 25 members, of each council to draw up a new constitution, which was proclaimed on 15 December. The three consuls were appointed for 10 years, and re-eligible The first had all the executive powers, the others only a consultative voice. This constitution was submitted to the approbation of the people, and accepted by 3,011,107 suffrages against 1,567. The departments were put under prefects directly responsible to the minister of the interior. The prefects, sub-prefects, and maires of communes had all their councils, which were merely consultative, the whole executive power being in the hands of the officer responsible to government. Bonaparte chose Cambacérès and Le Brun as second and third consuls. He revoked the conscriptions, and made efforts to conciliate both Royalists and Jacobins. He wrote letters to the king of England and the emperor urging, in theatrical terms, the restoration of peace. Napoleon's overtures of peace being refused, his next business was to prepare for war. He gave Moreau the command of the army of the Rhine, and determined himself to proceed to Italy. Masséna, with the remains of the French army, was shut up in Genoa. He crossed the Alps, and defeated the Austrians at Marengo on 14 June 1800. By the Convention of Alessandria, signed on the 16th, Melas abandoned all Piedmont and Lombardy, to the Oglio. Napoleon then committed the command to Masséna and returned to Paris. Moreau defeated the Austrians in several engagements during May, and forced them to take refuge in Ulm. The rest of the year was divided between campaigning and negotiating; but the latter having proved fruitless, Moreau again defeated the Austrians under the Archduke John, on 3 December, in the decisive battle of Hohenlinden. Brune, who succeeded Masséna, extended the Italian conquests in Tuscany and Venetia. Negotiations were then entered on by Austria, and the Peace of Lunéville concluded 9 Feb. 1801. The Rhine was recognized as the boundary between France

and Germany. The Adige was to be the boundary of Austria in Italy. The independence of the Batavian, Helvetian, Cisalpine, and Ligurian republics was guaranteed. A treaty was also concluded with Spain at Madrid on 21 March; and by the Treaty of Florence, 28 March, Naples agreed to renounce the coalition, and received French garrisons. Russia, Prussia, Denmark, and Sweden, formed an armed neutrality in opposition to the naval privileges claimed by England, which now maintained the war single-handed. This led to a brief war between England and the northern powers, except Prussia, which was terminated by the death of Paul I. On 31 August, Gen. Menon, by a capitulation with the English, agreed to evacuate Egypt. Both England and France were now anxious for peace. Preliminaries were signed on 1 October, and the Peace of Amiens was concluded 27 March 1802. France retained her continental conquests. Ceylon was ceded to England by Holland, and Trinidad by Spain; all the other conquests of Great Britain were restored. Malta, which had been taken by the English, was to be restored to the Knights of St. John.

Napoleon exhibited his wonted vigor in home administration. By means of the senate he silenced the opposition of the tribunate and the corps législatif. He superintended the preparation of the Code Civil. He entered into a concordat with Cardinal Consalvi for the re-establishment of the Catholic religion. He undertook public works, constructed roads and bridges, encouraged agriculture, manufactures, and commerce. On 2 Aug. 1802, Napoleon and his colleagues were made consuls for life, and the constitution was amended.

The external policy of Napoleon was not calculated to conciliate the jealousies caused by the extension of French dominion. The independence of the new republics was merely nominal. The duchy of Parma and the island of Elba were occupied, and an armed intervention changed the government of Switzerland. By the Treaty of Lunéville the German princes dispossessed by the advance of the French boundary were to be indemnified beyond the Rhine. The process of compensation was not carried out with sufficient promptitude for Napoleon. By his interference, in conjunction with that of the emperor of Russia, the indemnification was effected by the extinction of the two electorates of Cologne and Trèves, and the secularization of the ecclesiastical estates. Napoleon occupied St. Domingo, and sold Louisiana to the United States for $15,000,000.

The discontent excited in England by this aggressive policy made it evident that the peace could not be maintained, and the government refused to evacuate Malta. On 16 May, two days before the declaration of war, an embargo was laid on all French and Dutch vessels in English harbors. Napoleon retaliated for this lawless proceeding by seizing as hostages all English travelers in France and Holland, and detaining them as prisoners till the peace, and Gen. Mortier took military possession of Hanover. Russia and Prussia attempted to intervene, but on terms unacceptable to France. Spain and Portugal had to purchase their neutrality from France; but as this purchased neutrality placed the former at the disposal of France, England declared war with Spain. Naples was occupied by French troops, and vast preparations were made ostensibly for the invasion of England.

A conspiracy for the overthrow of Bonaparte and the restoration of the Bourbons was discovered in 1804, in which the British government was implicated. The most distinguished of the conspirators were Cadoudal, Pichegru, and Moreau. Cadoudal was executed, Pichegru destroyed himself in prison, Moreau was pardoned, and retired to the United States.

The legislative bodies were now completely subservient to Napoleon, and the conspiracy of Cadoudal was made a pretext for offering him the empire, in order to assure the permanence of the government by giving it a hereditary head. The senate addressed him by a deputation, and on being invited to express their opinion voted the hereditary empire with four dissentient voices. In the council of state seven members supported the republic; in the tribunate there were only a few dissentients, among whom was Carnot. The *senatus-consultum* for the regulation of the empire, drawn up by Napoleon himself, was passed 18 May 1804. The empire was confirmed by a popular vote of 3,572,329 against 2,569. The empire was made hereditary in the male issue of Napoleon and his adopted sons, his brothers Joseph and Louis following in the order of succession. The emperor was to have absolute authority over the imperial family. A new aristocracy, not yet hereditary, was created. After the emperor came the grand dignitaries of the empire. The senate, besides 80 members elected by itself, was to comprise the six grand dignitaries of the empire, and the princes of the blood after 18 years of age. A high imperial court was constituted to take cognizance of crimes against the safety of the state, the person of the emperor, and of offenses committed by ministers or great persons of the state. On 4 July Napoleon distributed at the Hôtel des Invalides the grand decorations of the Legion of Honor, instituted two years before, to the chief personages of the empire. On 16 August he gave the crosses of the Legion to the soldiers in the camp of Boulogne, where in sight of the English fleet the preparations were going on for the invasion of England. The Pope was invited to the coronation of Napoleon, which took place at Notre Dame on 2 Dec. 1804. The emperor, after receiving the sacred unction from the Pope, crowned himself, and afterward the empress. On 26 May 1805 he was crowned king of Italy.

Pitt had in the meantime been organizing another coalition against France. A treaty was concluded between England and Sweden on 3 December. The Emperor Alexander, who had in the previous year strongly remonstrated against the usurpations of the French government, and withdrawn from diplomatic relations with it, joined the allies on 11 April 1805. Austria, which had long taken part in the consultations of the league, formally acceded to it on 9 August. Austria had delayed to the last her adhesion to the coalition, because on her the brunt of the war was certain to fall. Prussia remained neutral. Austria opened the campaign with a powerful army in Italy under the Archduke Charles, and a German army under Gen. Mack. A Russian and Swedish army was to operate in north Germany, and two Russian

armies of 60,000 each were to join Mack on the Danube. The Austrian army crossed the Inn and entered Bavaria, which was in alliance with France, on 9 September. Mack, who had about 80,000 men, without waiting for the Russians traversed Bavaria and took up a position on the Iller. Napoleon, who had resolved to deliver his principal attack in Germany, where the Austrians were weakest, turned Mack's right and crossed the Danube in his rear, and having cut off his communications shut him up in Ulm. Defeated in his attempts to escape the toils, particularly by Ney at Elchingen (14 October), Mack capitulated with all his forces on 19 October. On 13 November Napoleon entered Vienna, where he found himself between two armies. On the right that of the Tyrol and Italy, which the Archduke Charles had led back in consequence of Mack's disaster, followed by Masséna, on the left the Austro-Russian main army with the two emperors (Austria and Russia) in Moravia. He moved immediately against the latter, and arrived at Brünn on 20 November, encountered the Austro-Prussian army, which was superior in number, at Austerlitz on 2 December, and inflicted on it a decisive defeat. An armistice was immediately concluded, and the Peace of Presburg, between France and Austria, signed on 26 December. Austria surrendered Venetia, Istria, and Dalmatia to France, the Tyrol to Bavaria, and Suabia to Würtemberg and Baden. The title of king was assumed by the electors of Bavaria and Würtemberg, and of grand-duke by the elector of Baden. Napoleon was now able to carry out the plan he had contemplated of giving his empire a hereditary nobility. Joseph Bonaparte was created king of Naples and Sicily; Louis, king of Holland; Eliza, Duchess of Lucca; Pauline, Duchess of Guastalla; Talleyrand, Prince of Benevento; Bernadotte, of Pontecorvo; Berthier, of Neufchâtel; Murat, Grand-duke of Berg. Other territorial titles were bestowed upon his marshals and generals, and domains with hereditary succession set apart for their maintenance. While this great success was being achieved, Nelson in the battle of Trafalgar, 21 Oct. 1805, had almost annihilated the French and Spanish fleets. The Confederation of the Rhine, a league of German princes, under the protection of France, was signed at Paris on 12 July 1806. On 6 August Francis II. abdicated the title of emperor of Germany, the empire having been *de facto* dissolved.

Negotiations had been going on for peace with Russia; but the dissolution of the German empire determined Alexander to continue the war. The formation of the Confederation of the Rhine was also looked upon as an affront by Prussia, and when Napoleon offered to restore Hanover, which he had bestowed on Prussia as the price of peace to England, the king and people were filled with rage, and war was determined on regardless of the hazardous circumstances in which it was undertaken. War was declared on 8 October. Napoleon was already at Bamberg directing his troops which had not left Germany. On the 14th the two armies met at Jena and Auerstädt, when the Prussians were totally defeated. Napoleon entered Berlin on 27 October. Here he dictated on 21 November the celebrated decree declaring the British Isles in a state of blockade. All commerce in English articles was forbidden, all Englishmen on the Continent were rendered liable to arrest. A Russian army, about 90,000 strong, had already entered Prussian Poland. Napoleon arrived at Warsaw on 15 December, but nothing decisive occurred till the beginning of the year. The battle of Eylau, which was claimed as a victory on both sides, but which checked Napoleon's progress, was fought on 8 Feb. 1807. The surrender of Dantzig having relieved a large body of French troops engaged in besieging it, a new campaign was begun, and on 14 June a decisive victory was gained by the French at Friedland. Separate armistices were immediately entered into with Russia and Prussia, and the Peace of Tilsit was concluded 7–9 July. Prussia was compelled to cede nearly the half of her territory. The kingdom of Westphalia was formed for Jerome Bonaparte of Hesse Cassel and the Prussian provinces west of the Elbe; the grand-duchy of Warsaw for the king of Saxony of the Polish provinces of Prussia — some minor cessions were made in favor of Russia and other powers, and the Prussian army was restricted for 10 years to 42,000 men. Russia recognized the new kingdoms created by Napoleon, and the Ionian Republic, of which Russia had guaranteed the independence, was given up to France. To secure the connivance of Alexander in his ambitious designs, and especially his co-operation against England, Napoleon gave up Finland to Russia, and she was encouraged to hope for the Danubian provinces of Turkey. Napoleon's idea seems to have been that the two emperors should divide between them the dominion of the civilized world; but he soon showed that he could not admit a partner except as a dependent. In the meantime the mediation of Russia was formally accepted for the negotiation of a peace with England, and that of France for a peace betweeen Russia and Turkey; failing these, an offensive and defensive alliance was concluded, and a rigorous enforcement of the continental blockade was imposed both on Russia and Prussia.

The Peace of Tilsit led immediately to war between England and Denmark. Assured that the latter could not maintain her neutrality, the former insisted upon an alliance by which Denmark should be placed under the protection of Great Britain, her fleet carried to England for security, and her territory guaranteed. These extraordinary demands, which nothing but an extreme exigency could justify, were not complied with. Copenhagen was bombarded by the English fleet for three days, from 2 to 5 September, and the Danish fleet and naval stores carried to England. The war between England and Denmark continued till 1814. Russia offered her mediation to England, but declined, on the invitation of the English cabinet, to communicate the secret articles of the Treaty of Tilsit, and re-proclaimed the armed neutrality. War was consequently declared, and for five years Russia continued in the French alliance, and in hostility with England.

Portugal had generally joined the confederacies against France, and Napoleon now determined to occupy it, with the intention also of overthrowing the government of Spain, which he could not trust; but in the meantime he entered into an alliance with Spain for the partition of Portugal. Junot entered Lisbon

30 Nov. 1807, with the advance guard of the French army. The Pope being unwilling to carry out the continental blockade, and refusing to recognize Joseph as king of Naples, Rome was occupied, 2 Feb. 1808. The French troops had already entered Spain before the end of 1807; and in March 1808 Murat with 100,000 men marched upon Madrid, which was entered on the 23d. By the Treaty of Bayonne, signed 5 May, Charles IV. resigned the crown of Spain, which Napoleon gave to his brother Joseph. The sovereignty of Naples was bestowed upon Murat. The Spaniards, whose government had been disposed of without their consent, everywhere rose in insurrection, and the military occupation of all the provinces of Spain became a necessity. The French troops met with various reverses. At Baylen, on 22 July, Dupont was compelled to capitulate with 18,000 soldiers. A British force, under Sir Arthur Wellesley, landed at Mondego Bay, defeated Junot at Vimeira, 21 August, and compelled him to evacuate Portugal by the Convention of Cintra on the 30th. The progress of the Spanish insurrection brought Napoleon with fresh forces to Spain, and after successful engagements at Burgos, Espinosa, and Tudela, he entered Madrid on 2 December. He immediately decreed the abolition of the inquisition, the suppression of two thirds of the convents, the cessation of feudal rights, and the abolition of internal customs.

The occupation of Napoleon in Spain gave Austria the opportunity she awaited of breaking the Peace of Presburg. On 27 March 1809 a declaration of grievances suffered since the Peace was delivered to the French government, and on 10 April the Austrian army crossed the Inn and occupied Bavaria. Napoleon, who had returned from Spain to prepare for the encounter, defeated the Austrians at Eckmühl on 22 April, and immediately advanced to Vienna. The Archduke Charles after his defeat also marched toward Vienna on the opposite bank of the Danube, and took up a position a short distance to the north of the capital. The French seized the island of Lobau, and throwing a bridge across the Danube, encountered the Austrians in the bloody and indecisive battles of Aspern and Essling. The French were forced after great loss to return to the isle of Lobau, which Napoleon fortified, and awaited the approach of Eugène with the army of Italy. On 5 July he debouched with 150,000 men on the left bank, and on the 6th defeated the Austrians in the battle of Wagram. An armistice was signed at Znaim on 11 July, and on 14 Oct. 1809 was signed the Peace of Vienna (Schönbrunn), in which the cessions of the Treaty of Presburg were confirmed, and further cessions of territory made to France and her allies.

Napoleon was divorced from Josephine on 16 December, and married Maria Louisa of Austria by proxy, 11 March 1810. The "king of Rome" was born 20 March 1811.

The war continued in Spain throughout all the provinces. Saragossa had surrendered after a memorable siege on 20 Feb. 1809. The mutual jealousy of Napoleon's marshals, bound to the service of an ambitious master rather by the tie of self-interest than of patriotism, always interfered in his absence with the unity of their operations; but the force wielded by them was too great for the undisciplined and ill-organized bands of the Spanish junta. In Portugal a somewhat better organization prevailed. A forced levy was made, and 24 regiments were taken into British pay. Sir Arthur Wellesley landed at Oporto with an English force on 22 April 1809, and, uniting with the Portuguese under Beresford, compelled Soult to evacuate Portugal. He then formed a junction with the Spanish general Cuesta, and marched on Madrid. He met the forces of Joseph under Victor and Jourdan at Talavera de la Reina, 27–28 June, and defeated them; but the advance of Soult, Ney, and Mortier to the protection of the capital compelled him to retreat to Badajoz.

In 1810 Napoleon, freed from other wars, had concentrated an overwhelming force in the Peninsula, and Wellington defended himself in his famous lines of Torres Vedras, near Lisbon, into which he retired in October, after contesting every position on the way. He was followed by Masséna, who, in the beginning of March 1811, was compelled to retire by want of provisions. Wellington followed, and defeated him at Fuentes de Onoro on 3 and 5 May. On 16 May Soult was defeated by Beresford at Albuera. Suchet had in the meantime been carrying on a successful war in Catalonia, and earned his marshal's baton by the capture of Tarragona. Wellington captured Ciudad Rodrigo on 19 Jan. 1812, defeated Marmont at Salamanca on 22 July, and entered Madrid on 12 August. While these events were going on, war was preparing elsewhere on a larger scale. The continental system had been insisted on with such rigor that his brother Louis resigned the throne of Holland, 3 July 1810, rather than carry out his instructions, and Holland had been united to France. The Milan decrees (17 Dec. 1807) declared every vessel which had touched at an English port to have lost its nationality, and ordered all English merchandise found on the Continent to be burned. It now became more than ever an object with Napoleon to shut the ports of Russia, and he insisted upon this in as harsh and arbitrary a manner as if Alexander had been his vassal. So oppressive had the system become that Napoleon himself had been compelled to issue licenses for trade between France and England. From the close of 1810 Russia had partially departed from the blockade by admitting colonial produce in neutral vessels. Napoleon demanded that such vessels should be confiscated. Russia, he said, must return to the position of subordination in which it was placed by the Treaty of Tilsit. The czar on his part had entered into an alliance with Sweden, of which country Bernadotte had been elected crown-prince, and secured peace with Turkey; and on 8 April 1812 he demanded the evacuation of Old Prussia, the duchy of Warsaw, and Swedish Pomerania, and a relaxation of the continental system.

In the war now imminent Prussia and Austria entered on compulsion into the alliance of France, with the obvious intention of deserting her whenever she should meet with serious reverses. The alternative with Austria was alliance or disarmament, and she supported France with a portion of her forces in order that she might be able at the proper moment to turn against her with the whole.

On 16 May Napoleon arrived at Dresden, and took up his residence at the royal palace, where he was waited on by the emperor of Austria, the king of Prussia, and other German princes, who expressed the utmost devotion to him. Negotiation having proved fruitless, he made here his final arrangements for the campaign. The army he had organized for it has been estimated at from 640,000 to 680,000, including auxiliary forces. The principal army of the Russians, 130,000 strong, under Barclay de Tolly, was to cover the route to St. Petersburg, resting on the Dwina; another, under Bagration, to cover Moscow on the line of the Dnieper, and threaten the flank of the invading army.

Napoleon crossed the Niemen at Kovno on 24 June, and entered Vilna on the 28th, where he was detained 17 days arranging the commissariat of his army. He beat the rear-guard of Barclay's army at Ostrovno, 25 July, and occupied Vitebsk on the 28th. Smolensk, where Barclay had formed a junction with Bagration, was captured on 17 August. The army now advanced toward Moscow; and Kutusoff, who had superseded Barclay, gave battle at Borodino on 7 September, to defend the ancient capital of Russia, where he was defeated with a loss of nearly 30,000 to the victors, and almost double that number to the vanquished. After this fatal battle the French entered Moscow on the 15th, but during the night the city, which had been deserted by its inhabitants, was found to be in flames. The conflagration lasted five days, and destroyed a great part of the city. Napoleon now attempted to negotiate with Alexander, but without result. It was impossible to pursue the Russians further, and the capture of their capital had not produced the moral effect he anticipated. Nothing remained but to retreat. He left Moscow on 19 October with 80,000 men, leaving 10,000 behind as a garrison. At Malo-Jaroslavitz, on the 24th, he had a sanguinary conflict with the Russians. On 5 November, when the army had reached Dorogubush, intense cold set in, and from this point thousands perished on the way. On 9 November only 40,000 to 50,000 men reached Smolensk, and the arrangements which Napoleon had made for victualling the army had not been carried out. Three Russian armies threatened to cut off the passage to the Berezina, which was effected with heavy loss on the 27th. At Smorgoni Napoleon quitted the army to return to Paris, leaving Murat to conduct the retreat. The remains of the army recrossed the Niemen on 20 December. Ney, who commanded the rear-guard, was the last to cross the Bridge of Kovno.

The return of Napoleon to Paris was necessitated by the impending formation of another European coalition. Austria, Russia, and Prussia had successively looked on, while each in turn had sacrificed itself to the divided counsels inspired by dread of French ascendency and of the genius of Napoleon; but now, when Russia had set the example of a heroic defense, a really European combination was to be formed against the common oppressor.

A formal declaration of war was made by Prussia on 27 March. Napoleon, availing himself of the wonderful command which the French system of conscription gave him of the resources of the country, raised a new levy of 200,000 men, and was ready before the allies. He assumed the command of the army at Erfurt on 25 April. He had still 350,000 men in Germany, and Austria did not yet deem it prudent to join the coalition. He defeated the allies at Lützen, 2 May, forced them to cross the Elbe, and entered Dresden on the 8th. On 21 May he again defeated them at Bautzen, and reached Breslau on 1 June. On the 4th he concluded an armistice for six weeks at the village of Poischwitz, near Jauer, in Silesia. As his preparation were more forward than those of the confederates, and his allies could only be depended on in the event of success, this step was of fatal omen. By the Treaty of Töplitz, signed 9 September, a formal alliance was entered into between Austria, Russia, and Prussia; but on the reopening of the campaign, 16 August, they had already aranged a joint plan of operations, and appointed Prince Schwarzenberg commander-in-chief of their combined forces. The allies could now bring from 500,000 to 600,000 men into the field, while Napoleon commanded about 360,000. The whole operations, of course, were extended over a vast area, but the main army of the allies advanced upon Dresden. The battle of Dresden (q.v.) 26–27 August, was again a victory for Napoleon, but fatal mistakes were committed, and disastrous defeats of separate corps sustained after it. The surrender of Vandamme in particular, with the remains of a corps of 30,000 men, more than counterbalanced the victory. A large portion of the French armies was composed of German troops, who were daily deserting to the enemy. On 1 October Bavaria seceded. The allied armies were gathering near Leipsic. In these circumstances Napoleon abandoned Dresden, and concentrated his army about Leipsic (15 October). He held this city with 190,000 men, while the allies with about 330,000 formed a semicircle around him. After some preliminary fighting, not disadvantageous to the French, on the 16th, the great battle of the campaign was here delivered on the 18th and 19th. Early on the first day the Saxons and Würtembergers passed over to the allies on the field of battle. On the second day the French fought only to cover their retreat, which was made more disastrous by the want of bridges over the Elster. This victory of the allies led to the retreat of the French over the Rhine, which was not effected without further combats. The fortresses held by them in Germany and Poland, which occupied 100,000 men, were gradually reduced.

Wellington in the meantime had continued his successes in the Peninsula. He defeated Jourdan on 21 June 1813, and followed Soult, who succeeded him, after a series of successful engagements, to Bayonne, which he invested in December. The southern territory of France was thus actually invaded, when, in 1814, the allies prepared for its invasion from the north. Napoleon on his return had made vigorous preparations for the invasion, and had ordered a fresh levy of 300,000 conscripts. The allies crossed the frontier in two bodies — the army of Silesia, under Blücher, crossing the Rhine; the grand army, under Prince Schwarzenberg, passing through Switzerland. Both armies entered France in January. Napoleon's defense ranks among the most skilful of his many campaigns; but in spite of the desperate

combats delivered at Vitry-le-Français, St. Dizier, Brienne, Montmirail, Arcis-sur-Aube, etc., the allies steadily advanced, and after a combat sustained in its defense by Marmont and Mortier, Paris surrendered on 31 March. Napoleon abdicated in favor of his son (6 April), but the allies required an unconditional surrender, and assigned him the sovereignty of the Isle of Elba, to which he was conveyed in a British vessel (20 April–4 May). Louis XVIII. was now proclaimed king of France, and a constitution having been arranged, the Peace of Paris was signed 30 May, and the allies immediately evacuated France.

The successes of Napoleon had disorganized the whole of Europe, and a congress had assembled at Vienna to adjust the claims of the various powers, when it was announced that Napoleon had left Elba, returned to Paris (20 March 1815), and been reinstated without resistance in his former authority. Hereupon the allied sovereigns declared him an outlaw and a disturber of the peace of the world, and renewed their alliance against him.

Napoleon had proposed to remain at peace and govern constitutionally, but his past achievements afforded no guarantee for the safety of this experiment, and he was not allowed to make it. As it was evident the allies would bring a preponderating force into the field, his only chance was to anticipate them. On 15 June he crossed the Sambre with 130,000 men to attack the English and Prussians, who were preparing to invade France on the Belgian frontier while the Austrians attacked it on the Rhine. He encountered the Prussians under Blücher at Ligny, while Ney held the English in check at Quatre-Bras (16 June). Blücher was forced to retreat, and Napoleon marched against the English, who had taken position at Waterloo. Here, on the 18th, was fought the decisive battle which resulted in his final overthrow. The allies advanced without opposition to Paris. Napoleon again abdicated in favor of his son (22 June), but being threatened by Fouché, who had assumed the direction of the government, he surrendered to the British (5 July). He was sent by the decree of the allies to St. Helena, where he died 5 May 1821.

A convention was signed (3 July), by which the French army was to retire, and the allies entered Paris. Louis XVIII. was again proclaimed, and the allies continued in military occupation of France till 1818. By the first Treaty of Paris (30 May 1814) France was reduced to her limits of 1792, with the addition of a part of Savoy, and some cantons added to the departments of the Ardennes, Moselle, Bas-Rhin, and Ain. She recovered her colonies with the exception of Tobago, Sta. Lucia, and the Isle of France (Mauritius). By the second Treaty of Paris between France and the allies she lost Philippeville, Marienburg, the duchy of Bouillon, Saarlouis, Saarbrück, the two banks of the Sarre, the country north of the Lauter and part of the county of Gex; and the Holy Alliance entered into between Russia, Austria, and Prussia became for a time a guarantee against future aggressions.

Louis XVIII. at first governed with the support of a moderate Liberal party, but the assassination of the Duke of Berri, 13 Feb. 1820, threw him into the hands of the reactionary party. Secret societies began to spread in France, with ramifications in Germany and Italy, where despotic governments also prevailed. Several insurrections took place, and some of the leaders suffered capital punishment. This ministry also undertook an expedition to Spain, to repress the opposition of the Liberals of that country to Ferdinand VII. (1823).

Louis XVIII. died 16 Sept. 1824 and was succeeded by his brother Charles X., who had always been the head of the ultra-royalist party. In 1827 a joint expedition was undertaken by England, France, and Russia in favor of the Greeks, who had thrown off the yoke of Turkey. The elections of 1827 gave a majority to the Liberals, and a moderate government was formed under Martignac. It was displaced by the Polignac ministry, a reactionary government, in August 1829. An expedition was sent against Algiers under Count Bourmont, which captured the city 5 July 1830, and formed the beginning of the French colony of Algiers. An insurection in Paris during the three days 27–29 July overthrew the royalty of Charles X., and Louis Philippe was proclaimed king, 9 Aug. 1830.

It was the policy of Louis Philippe to amuse the populace and flatter the national vanity by active foreign intervention. In 1832 an expedition was sent to drive the Dutch garrison out of the citadel of Antwerp, which should have been given up to Belgium by Holland in accordance with the Treaty of London. After an obstinate siege the French gained possession of the citadel. In the same year France seized Ancona to counterbalance the influence of the Austrians in Italy, and in 1835 the Algerine war was successfully terminated by the costly acquisition of Algeria. But by degrees the policy of the citizen king, as he was called, was changed; the government proved reactionary at home and devoid of energy abroad; the material prosperity which had marked a great part of the reign was suddenly checked by the scarcity of the harvests and the high prices of 1847. In the middle of that year Guizot, the king's chief minister, declared himself as averse to all organic changes in the state while a strong opposition was insisting on reform. At last, on 24 Feb. 1848, another bloody revolution broke out by which the Orleans family was exiled. A republic was set up without consulting the voice of the country at large. The bourgeoisie would have undoubtedly preferred the continuation of a constitutional monarchy, but for a time sailed with the stream and professed their readiness to give the republican form of government a fair trial. A so-called republican constitution was adopted, and on 10 Dec. 1848 Louis Napoleon was elected president of the French republic for a term of four years by a majority of more than 4,000,000 over Gen. Cavaignac.

The president immediately set about gaining the favor of the army, in which he was completely successful, and when the dissensions in the legislative assembly became apparently dangerous to a continuance of his arbitrary power he dissolved it, 2 Dec. 1851, and appealed to the people, asking their sanction for what he had done. Various ill-concerted attempts at armed resistance were repressed by energetic and bloody measures, and the president, who had all the elective machinery of the nation completely under his control, was confirmed in

his office for a further term of 10 years by 7,839,216 votes; and a new constitution similar to that of the Napoleonic consulate of 1799 was promulgated. At length, on 7 Nov. 1852, a senatus consultum proposed the re-establishment of a hereditary empire, and another appeal was made to the nation under the same coercive system and with similar success. On 2 December, strengthened by the votes of 7,824,129 citizens, the empire was proclaimed and Louis Napoleon declared emperor under the title of Napoleon III. In 1853, Russia having invaded the provinces of Moldavia and Walachia under the pretext of securing protection for the adherents of the Greek Church against Turkish intolerance, France and England, having guaranteed the integrity of the Ottoman empire, declared war against Russia on 27 April 1854, and sent a combined fleet to the Black Sea. The Anglo-French armies were landed in the Crimea 14 Sept. 1854, and the battles of the Alma (20 September), of Inkermann (5 November), and, finally, the capture of Sebastopol (8 Sept. 1855), led to the Treaty of Paris (30 March 1856), which secured in a great measure the objects for which the allies had gone to war. The Austrian invasion of the Sardinian states, in 1859, brought France once more into the field, as an ally of the latter. The victories of the Franco-Piedmontese armies at Montebello (20 May), Magenta, Marignano, and Solferino (4, 8, and 24 June) deprived Austria of Lombardy, which was ceded to Piedmont. The French obtained, as a recognition of their powerful assistance, the territories of Savoie and Nice (10 March 1860). In 1860 the French sent out an expedition to China to act in concert with the British, who were determined to enforce the Treaty of Tien-Tsin, by which provision had been made for the permanent residence of their ambassadors in Peking. After some severe fighting the allies entered that city on 12 October, and the Chinese emperor submitted to the terms dictated by the conquerors. Another distant expedition undertaken by France was less fortunate in its ultimate results. For some years Mexico had been the theatre of civil war carried on by the so-called clerical party headed latterly by President Miramon, and by the liberal party headed by the rival President Juarez. A temporary suspension of the payment of indemnities due to France and England led to the intervention of the European powers. It was soon evident that France had ulterior objects in view; the extravagant demands of M. de Soligny and the presence of Miramon in the French camp rendered negotiation impossible, and England and Spain formally withdrew from further intervention. In 1862 war was declared by France against Juarez, who was driven across the frontier. The government of the country was handed over to Maximilian, Archduke of Austria, who assumed the title of emperor. Supported as this prince was by French troops he could not preserve tranquillity in his dominions, and Napoleon began to recognize the grave position in which he had placed himself. The United States, moreover, who had always favored Juarez, brought strong diplomatic pressure to bear on the French emperor, and in the autumn of 1866 he began to withdraw his troops from Mexico. On the conclusion of the Austro-Prussian war in 1866 Napoleon, alarmed at the growing power of Prussia, demanded a reconstruction of frontier, claiming by way of compensation for his neutrality on that occasion Prussian territory on the Saar. This was peremptorily refused by Prussia. The ill-feeling between that nation and France was further increased in 1867, when the king of Holland signified his intention to cede Luxembourg to France. It was now, however, evident that a rupture between France and Prussia was imminent, and in 1870, on the Spanish crown being offered to Prince Leopold of Hohenzollern, France demanded that the king of Prussia should compel him to refuse it. Notwithstanding the subsequent renunciation of the crown by the German prince, war was declared by France (19 July). The disastrous surrender of the emperor and his army at Sedan (2 September) was fatal to the Second Empire. On the following day the French republic was proclaimed and the government of national defense formed. After an almost uninterrupted series of victories the Germans became masters of the French capital (28 Jan. 1871). On 26 February the preliminaries of peace were signed, by which France renounced the fifth part of Lorraine, including Metz and Thionville, and Alsace, less Belfort, and agreed to pay a war indemnity of five milliards of francs ($1,000,000,000). A definite treaty of peace was signed at Frankfort on 10 May, and on the 18th was ratified by a French assembly elected for the purpose. Meanwhile civil war had broken out in Paris, and was suppressed with great difficulty. The assembly, whose authority ought to have expired with the ratification of the peace they were expressly called together to pronounce, should now have dissolved, but this was impossible during the war of the Commune, and it was impracticable to appeal to the confused voice of the country when the pressing need was to restore tranquillity and give the nation time to think over the situation. Therefore the deputies elected Thiers, a former minister of Louis Philippe, president of the republic. The Thiers administration, which lasted until 24 May 1873, set vigorously about wiping off the war debt, and thus freeing French soil from the invaders, which was eventually accomplished in the first half of the following September. Although throughout the whole period the nation had been singularly tranquil and prosperous, and was fast attaining her former place among the great powers, the conservative faction in the assembly, professing to be alarmed at the spread of radicalism and socialism, offered on various occasions violent opposition to the government, and at last effected its fall, Thiers being succeeded by Marshal MacMahon. Under his and the preceding régime intrigues of more or less importance were carried on in the interest of one or other of the competitors for the crown, the most nearly successful being that of the adherents of the Comte de Chambord, or, as he was called by the legitimists, Henry V. This prince, however, destroyed all his chances of success by his extravagant pretensions to all the prerogatives enjoyed by his ancestors, the Bourbons. The consequence of this failure was the prolongation of MacMahon's powers as president for seven years by a vote in the assembly, 19 Nov. 1873. France, after remaining for several years without any settled form of govern-

ment, at last, in 1875, had a republican constitution drawn up for it by the national assembly elected in 1871. Its principal provisions have already been given above. MacMahon held the post of president for nearly six years, but finding his position too unpleasant to retain, he resigned, 30 Jan. 1879. Jules Grévy was elected as his successor, and he in turn was succeeded by Sadi-Carnot in 1887. The following year witnessed the culminating point of a royalist agitation under Gen. Boulanger (q.v.), which for a time threatened to overthrow the Third Republic. In June 1894 President Carnot was assassinated by an anarchist while passing through the streets of Lyons. Casimir-Perier was chosen to the vacant office, but in January 1895 he resigned, and was succeeded by Félix Faure. During M. Faure's tenure of office, which ended with his death in 1899, an alliance was concluded with Russia. He was succeeded by Emile Loubet. In 1881 France invaded Tunis and established a protectorate there. In 1883-4 possession was taken of Tonquin and a protectorate established over Anam, proceedings which led to hostilities with China. The kingdom of Dahomey was, in 1893, proclaimed a French protectorate, and in the following year the dethroned king's disaffection was suppressed by a military expedition. France had long claimed a protectorate over Madagascar, but disputes with the Malagasy government ultimately led to war, and in 1895 to the total defeat and submission of the Hovas. During the last decade of the 19th century she largely increased her possessions in north and western Africa. An attempt to occupy Fashoda and the Bahr-el-Ghazal valley in 1898 nearly led to war with Great Britain, but by a convention concluded early in 1899 she resigned her claims to the disputed territory and to Darfur and Kordofan. From 1897 till 1899 France was profoundly agitated by the demonstrations and developments which took place in connection with the attempt to secure a revision of the trial of a Capt. Dreyfus, who had been banished in 1894 for alleged treason. Revelations damaging to the heads of the army were made, and at times revolution seemed imminent.

French Language.— At the time of the conquest of Gaul by Julius Cæsar, the principal dialects spoken by the inhabitants were the Celto-Teutonic of the Belgæ, the Celto-Iberic of the Aquitani, and the Celtic proper used in the centre of the country. The Roman language overwhelmed all these idioms. It would appear that in the 4th or 5th century, the whole of Gaul, from the Rhine to the Pyrenees, with the exception of Brittany, had adopted the language of the conqueror — not the *sermo urbanus* of the classic writers, but that form of Latin which, of course with dialectical variations, had become common to all the subjugated provinces of central Europe — the *lingua Romana rustica*. On the overthrow of the Western Empire this language was modified by the mixture of words and expressions originally Frankish, Burgundian, Ostrogothic, or Visigothic. The real French language began to be developed about the beginning of the 13th century. Its sway was increased in that century by the extension of the crownlands; in the 14th by the growing authority of the house of Capet, the organization of the royal courts of justice and the parliament of Paris; in the 15th by the establishment of a military and fiscal system, but above all, by the invention of printing; and in the 16th the formal ordonnances of François I. forbade the use of any other language than French in the courts, and in public and private documents. The Académie Française established by Richelieu in 1635 for the regulation of the national language, the influence of the court, the labors of the Port Royalists and the writers of the memorable era of Louis XIV. purified, augmented, and diffused it more and more. It was first used as a diplomatic language at the conferences of Nimwegen, in 1678. Owing to its admirable clearness and precision, and its wealth of happy colloquial phrases, together with the fame of its great writers, and the important part France has continued to play on the stage of Europe, this language has now generally become the first a man of the world learns to speak after he has mastered his mother tongue.

Literature.— The earliest monuments of French literature are the productions of the Troubadours, who flourished during the 11th and 12th centuries. Their poems consist for the most part of short lyrical effusions of an amatory cast. Thibaut, the king of Navarre, sang in the service of his lady-love as a troubadour. But we cannot help looking at the poetry of this epoch as a display of ingenuity and wit, rather than as the expression of passion and deep feeling. On the other hand, the trouvères, who flourished at a somewhat later period, treated in their narrative poems (the *chansons de geste*) of national subjects, and celebrated the deeds of renowned kings and knights. These romances or chansons de geste are numerous, and have been divided into three cycles. The first narrated the deeds of the great Frankish emperor Charlemagne, his descendants and vassals; one of the oldest and best of this category of romances being the Chanson de Roland. The Armorican or Arthurian cycle consists of the poetical forms of the legends connected with ancient Britain and the achievements of the Norman warriors; the Roman de Brut, or that of King Arthur; and the Roman de Rou, or that of the dukes of Normandy, are the double foundation on which all the poems of this series rest. The third or Alexandrine cycle consists of poems in which the recollections of Greece and Rome are strangely enough mixed up with chivalric notions and legends of fairyland. La Guerre de Troie, by Benoit de St. More; the Alexandre by Lambert li Cors and Alexandre of Paris; the Médée, and the Ulysse by Raymond du Bosquet, are fair examples of this class. Almost contemporaneous with the chansons de geste, and related to them as comedy or farce is to tragedy, sprung up the fabliaux, short, humorous, satirical, poetic tales, a species of literature which obtained its highest perfection and greatest popularity in France. One of the most celebrated of fabliaux writers is Rutebeuf, a contemporary of St. Louis. But by far the most notable production of this nature is the Roman de Renard, the composition of different hands and even of different ages. This satiric epopee throws an air of ridicule over all classes and institutions of the time, king and priest, knight and judge, court and cloister, tourney and pil-

grimage. The spirit of the poem is the negation of that of chivalry, the vital principle of the Middle Ages. The progress of prose was slower than that of poetry. The earliest specimens are furnished by the monkish chroniclers, the most noteworthy being the 'Chroniques de France selon qu'elles sont conservées à St. Dénis.' It was, however, the genius of a layman that made history the rival of poetry, and the 'Histoire de la Conquête de Constantinople' (1302), by Villehardouin, an eye-witness, may be regarded as the first example of genuine French historical literature. This was followed by the Mémoires, in which Joinville (1223-1317) tells with winning naïveté the heroic deeds and private virtues of the good king Louis IX.; by the Chroniques de Froissart (1337-1410), which present the most animated pictures of society and manners of that period of war and gallant enterprise. By the Mémoires of Philippe de Commines (1445-1509) we are introduced to Louis XI. and his contemporaries; and we have striking evidence that the chivalrous poetic spirit of the Middle Ages had now fairly given way to shameless trickery and deep cunning. The race of the trouvères may be said to have ended with Charles, Duke of Orleans (1391-1465), whose graceful gallantry finds a strong contrast in the easy, unblushing impudence of Villon (1431-1500). The revival of classic learning and the reformation of religion exercised a powerful influence on the French literature of the 16th century. Its principal characteristics being freedom of thought and variety of style, writers cannot be judged by a single standard. In originality Rabelais (1483-1553) and Montaigne (1533-92) hold the first rank. The former was a profound scholar, physician, and philosopher, yet contented himself with the renown of a profane humorist. His 'Vie de Gargantua et de Pantagruel' is filled with strange tales, wild notions, and gross buffooneries, good sense, sound philosophy, and keen reasoning. As learned, as witty, and as skeptical as Rabelais, but wanting his coarseness, Montaigne lived a quiet, easy life, while France was being torn by civil war; writing his charming Essais, ridiculing the bigotry of the Catholic and the Protestant, the enthusiasm of the soldier, the trickery and pedantry of the judge; inclined to laugh at human imperfections rather as weaknesses than to storm at them as vices. These essays are a series of free and familiar disquisitions on every subject, and are one of the standards of French literature. Meanwhile the Reformation had been defended by Calvin (1509-64) in his 'L'Institution de la Religion Chrétienne,' a production which afforded convincing evidence that French prose had now acquired strength and gravity to become a fit vehicle of religious expression. Later in the century the admirable pamphlet, the 'Satire Ménippée,' and the speeches of Chancellor L'Hôpital, proved it to be flexible enough for political purposes. Amyot (1513-93) had invested it with new graces by happily blending French and Grecian beauties in his translation of Plutarch's 'Lives'; its capacity for lighter themes had been previously demonstrated by the Heptameron of Queen Margaret of Navarre (1492-1549). In poetry this period was less successful. Clement Marot (1495-1544) had indeed exhibited grace, elegance, and wit in his epistles, epigrams, and elegies; Ronsard (1524-85) attempted to invest French verse with that dignity and variety which he admired in the Greek metres, but his violent introduction of foreign forms and elements into the vernacular obtained scant success. The Clèopatre of Jodelle (1532-73) may be considered as the first drama of importance placed on the French stage. In the beginning of the next century the simplicity and ease of the verse of Regnier (1573-1613), and the correct and pure but somewhat cold and formal style of Malherbe (1556-1628), paved the way for the masters of the succeeding generation. Balzac (1597-1654) devoted his attention to the improvement of prose, his epistles especially being valuable at the time as models of harmonious rhetoric. Such were also the letters of his friend Voiture (1598-1648), affected and frivolous as they often are. Both were great favorites at the Hôtel de Rambouillet, the headquarters of French euphuism and of the Précieuses. Out of another of these social reunions, which were more of the nature of literary clubs, Richelieu founded the French Academy (1635); but it was outside all such coteries that France was to find the great poet who was to usher in the glories of her Augustan age. The drama was represented by Racine (1639-99) and by Molière (1639-93). Under the absolute sway of the Grand Monarque philosophy became orthodox under the guidance of Malebranche (1631-1715), Bossuet (1627-1704), and Fénelon (1656-1715). By the two last-mentioned writers, and by Bourdaloue (1632-1704), Massillon (1663-1742), and the Protestant divines Claude (1618-97) and Saurin (1677-1730), sacred eloquence was carried to a high state of perfection. The more important didactic prose writings of the age are the cynical 'Maximes' of La Rochefoucauld (1613-80), the 'Caractères' of La Bruyère (1639-99), and the 'Lettres and Discours' of St. Evremond (1613-1703). In the inimitable letters of Madame de Sévigné (1627-96) to her daughter and friends we have a lively and complete picture of the age, the writers of which had generally conformed to the manners, taste, and religion professed by the court. Before we fairly reach the philosophic era we meet with the names of Le Sage (1668-1747), to whom we are indebted for the *chefs d'œuvre* in novel-writing, 'Gil Blas' and the 'Diable Boiteux.'

The 17th century may be said to be fully represented by one man, Francois Marie Arouet de Voltaire (1694-1778). He claims notice as an epic, lyrical, and comic poet, as a tragic and comic dramatist, as a historian, novelist, and philosopher. It cannot be said that he excelled in the highest walks of literature; France could no more boast of a great epic poem after the 'Henriade' was written than she could before it; his tragedies are cold and formal, abounding in philosophical disquisitions; his histories are brilliant, but inaccurate. But his fund of common sense, his keen wit, his persistency, and his appreciation of the tendency of the age, made him be looked upon as chief of the republic of letters for more than half a century. His more important works are: 'Zaïre'; 'Mérope'; 'Alzire'; and 'Tancrède' (tragedy); 'Henriade' (epic); 'Dictionnaire Philosophique'; 'Charles XII.'; 'Siècle de Louis XIV.' (histories); 'Candide' (novel), etc. Next to him in immediate influence on the age stands Jean Jacques Rousseau (1712-78), whose fiery eloquence has

never been surpassed. In his 'Emile' he draws a visionary plan of education; his 'Nouvelle Heloise' is a novel in which love and paradox are strangely blended together; while his 'Confessions' excite a mingled feeling of sympathy and disgust. These two great men had each his school of disciples, who were the foremost actors in the Revolution. Buffon (1707–88) occupied a less agitated sphere, devoting his powerful intellect to the study of nature; his great 'Histoire Naturelle' is a monument which time can scarcely injure. Montesquieu (1689–1755), a writer of unusual scope of mind, combining a masculine vigor with great brilliancy of style, commenced his career with his 'Lettres Persanes', a satire on French manners, government, and even religion. Some tragedies by Joseph Chénier (1784–1811), founded on the classic models, a few light comedies and novels of little note, are the only representatives of literay activity, until we come upon the names of Châteaubriand (1768–1848) and Madame de Staël (1766–1817). The former, in his 'Génie du Christianisme' and his 'Martyrs,' and the latter in her 'Allemagne,' 'Delphine,' and 'Corinne,' combated the skeptical spirit of the age of Voltaire; and its political creed was attacked by Joseph de Maistre (1754–1821), and De Bonald (1753–1840). A more moderate politician and philosophical writer on sociology and religion is found in Benjamin Constant (1767–1830). Later on in the 19th century the influence of Goethe, Schiller, Shakespeare, Scott, and Byron began to be felt. Such was part of the creed of many of the most gifted of the younger men of letters in France, and a new school, called the romantic, sprung up, headed by Victor Hugo (1802–85), who promulgated the new theories in the preface to his drama of 'Cromwell,' and carried them into practice in numerous poems and novels ('Notre Dame de Paris,' 'Les Misérables,' 'Les Travailleurs de la Mer,' etc.). The most notable of his associates were Alfred de Vigny (1779–1863), calm, elegant, and somewhat too refined, author of a volume of 'Poëmes antiques et modernes,' of a translation of 'Othello,' and of a novel, 'Cinq Mars,' by which he is best known to English readers; the capricious Alfred de Musset (1810–57), at once the Ariel and Caliban of modern French literature, equally at home in the domains of poetry, drama, and romance, and whose favorite hero is a French copy of Byron's 'Corsair,' 'Lara,' or 'Don Juan'; Sainte-Beuve (1804–69), who published several volumes of poetry ('Consolations,' 'Pensées d'Août,' etc.), but now chiefly famous for his 'Causeries du Lundi' and other works of a literary-historical nature, in which he has proved himself to the satisfaction of numerous authorities the best literary critic France has ever possessed, and Alexandre Dumas the elder, who opened his career with a historical drama, 'Henry III.,' which was quickly followed by 'Charles VII.,' 'Antony,' 'Teresa,' etc., but who is best known to the most of English readers by his novels, 'Monte Cristo,' 'Les Trois Mousquétaires,' 'Vingt Ans Après,' etc. A reactionary movement was attempted, led by Ponsard (1814–67) and Emile Augier (1820–89). Casimir Delavigne (1793–1843) has attempted to combine the classic and romantic schools; and Lamartine (1790–1869) is more than half a romanticist by sentiment and style. Béranger (1780–1857), the greatest of French song-writers, may be considered as belonging to neither of the two schools, though he was ranged on the classicist side. The 25 volumes of light, sparkling comedies and vaudevilles, by the indefatigable librettist Eugène Scribe, can scarcely be claimed by any of the rival parties. After the heat of the struggle was over, which was chiefly carried on in the region of the drama, the novels of George Sand (Madame Dudevant, 1804–76) began to attract attention. Her 'Indiana,' 'Lélia,' 'Jacques,' 'André,' 'Consuelo,' 'La Petite Fadette,' 'La Mare au Diable,' etc., have gained her the reputation of possessing the finest style of any writer of the age. Balzac (1799–1850), by several critics considered the greatest of French novelists, lays bare the vices of modern society in his 'Eugénie Grandet,' 'Le Père Goriot,' 'Scènes de la Vie Privée,' etc. Low life in Paris was vividly depicted by Eugène Sue (1804–57) in the 'Mystères de Paris,' 'Martin, 'L'Enfant trouvé,' etc. The charming and pure tales of 'Picciola,' by Saintine (1798–1865), and 'Colomba,' by Prosper Mérimée (1803–70), are especially worthy of notice. Equally healthy in tone are the novels of Emile Souvestre (1806–54), and the admirable stories of the two novelists, conjoined in work as in name,— Erckmann-Chatrian (1822–99; 1826–90). A new school, styled the realistic, has had among its representatives the younger Dumas (1824–95), novelist and dramatist; Victorien Sardou (b. 1831), dramatist; Octave Feuillet (1812–90), Ernest Feydeau (1821–73); Henri Murger (1822–61), Gustave Flaubert (1821–80), and Edmond About (1828–85). Some of the most delicate of social problems are treated in them with candor, if with little delicacy. Still more recently a group of writers has arisen who have striven to outdo the most realistic of their predecessors in depicting scenes of low life. The chiefs of this school are Emile Zola (1840–1902), Alphonse Daudet (1840–97), Emile Gaboriau (1835–73), Adolphe Belot (1829–90), Victor Cherbuliez (1829–99), Paul Bourget (b. 1852), the brothers Edmond and Jules de Goncourt (1822–96; 1830–70), Guy de Maupassant (1850–93), etc. Among recent poets we may mention Théophile Gautier (1811–72), also known as a novelist; Leconte de Lisle (1818–94); Charles Baudelaire (1821–67); Sully-Prudhomme (b. 1839); François Coppée (b. 1842); Paul Verlaine (1844–96); Anatole France (b. 1844), also a well-known critic; Paul Déroulède (b. 1846); and J. Richepin (b. 1849). Other novelists not mentioned above are the following: Jules Sandeau (1811–83); Theuriet (b. 1833); Jules Claretie (1840), also known as critic and poet; G. Ohnet (b. 1848); Gyp, the *nom de guerre* of Countess de Martel de Janville (b. 1850); Louis M. J. Viaud, better known as Pierre Loti (b. 1850); and Marcel Prévost (b. 1862). If the preceding century was the philosophic age *par excellence*, the 19th may be said to be the historical. The following are the chief writers in other departments and their principal works: Louis Blanc (1813–82), 'Histoire de Dix Ans,' 'Histoire de la Révolution Française'; Guizot (1787–1874), 'Mémoires relatifs à l'Histoire de France,' 'Histoire de la Révolution d'Angleterre'; Michaud (1767–1839), 'Histoire de Croisades'; Michelet (1791–1874), 'Histoire de France'; Mignet (1796–1884).

'Histoire de la Révolution Française'; Sismondi (1773–1842), 'Républiques Italiennes du Moyen Age'; Amédée Thierry (1787–1873), 'Histoire des Gaulois'; Augustin Thierry (1795–1856), 'Conquète de l'Angleterre par les Normands,' 'Le Tiers Etat'; Thiers (1797–1877), 'Histoire de la Révolution Française,' 'Histoire du Consulat et de l'Empire.' Literary historians: J. J. Ampère (1800–64), 'Histoire littéraire de France avant le XII. Siècle,' 'Littérature Française au Moyen Age'; Littré (1801–81), 'Histoire de la Langue Française,' 'Comte et la Philosophie positive'; Sainte-Beuve (1804–69), 'Causeries du Lundi,' 'Portraits Contemporains'; Taine (1828–93), 'Histoire de la Littérature Anglaise,' 'Les Philosophes Français du XIX. Siècle'; Vinet (1797–1847), 'Blaise Pascal,' 'Moralistes des XVI. et XVII. Siècles. Philosophy is represented by Auguste Comte (1798–1857), 'Cours de Philosophie positive'; Victor Cousin (1792–1867), 'Le Vrai, le Beau, et le Bien,' 'Histoire de la Philosophie'; Jouffroy (1796–1842), 'Cours de Droit Naturel,' 'Cours d'Esthétique'; Lamennais (1782–1854), 'Esquisse d'une Philosophie'; Montalembert (1810–70), 'Du Vandalisme et du Catholicisme dans l'Art'; Quinet (1803–75), 'Le Génie des Religions,' 'Le Christianisme et la Révolution'; Rémusat (1797–1875), 'Essais de Philosophie,' 'Philosophie Religieuse'; Renan (1823–92), 'Histoire des Langues Sémitiques,' 'Vie de Jésus.' Among the writers on political economy and sociology are Bastiat (1801–50), Chevalier (1806–79), Prévost Paradol (1829–70), Tocqueville (1805–59), Jules Simon (1814–96), etc. We can simply mention the names of the principal scientific writers: Etienne Geoffroy St. Hilaire and his son Isidore, Cuvier, Jussieu, in natural science; Gay-Lussac, Bichat, Magendie, in chemistry and medicine; and Lagrange, Laplace, and Arago in mathematics. Writers of travels, etc., are Burnouf, Champollion, Father Huc, and others. Of essayists and literary and art critics Alphonse Karr, Emile Girardin, Jules Janin, Fétis, Villemessant, Théophile Gautier, and J. Lemaitre are among the best known. See ACADEMY, FRENCH; DUMAS; HUGO, VICTOR; VOLTAIRE.

French Architecture.—The earliest specimens of architecture in France belong to the Gallo-Romanic period. The Maison Carrée, a Corinthian temple in Nimes, is one of the best preserved and most interesting structures of that age. It is evident from what is still preserved of the ecclesiastical and other buildings that the forms of Greek art adopted by the Romans were closely imitated; and even up till the 11th century the construction of all edifices of importance was entrusted to Italian architects trained in the classic schools. Then the Gothic style arose, and carried all before it. The architectural art was cultivated by the ecclesiastics, and many buildings of extraordinary merit owe their origin to some monks, so piously humble that they have left no trace of their names. Some names have, however, come down to us. Fulbert, of Chartres, planned the cathedral of that town, and directed for a time the construction (1020); the abbey church of St. Dénis was built from the plans of the minister Suger. The cathedral of Amiens was commenced in 1220 by Robert de Luzarche, and continued by Thomas and Renaud de Cormont. About the middle of the 13th century there were three architects of great fame in France,—Jean de Chelles, who built the lateral portico in the south side of the cathedral of Notre-Dame, at Paris; Pierre de Montereau, who planned the old Holy Chapel of Vincennes; and Eudes de Montreuil, to whom Paris was indebted for several imposing churches now destroyed. Covey and La Bergier rebuilt the ancient cathedral at Rheims, which had been destroyed by a fire. Jean Ravy, sculptor and architect, employed his double talent to complete the cathedral of Notre-Dame (1351). The Gothic style began to lose ground about the end of the 15th century; and under the influence of the southern artists introduced into France by Francis I. Italian architecture obtained firm footing. The most celebrated French architects of that period were Lescot, Delorme, and Jean Bullant. Under the regency of Marie de Medicis flourished Desbrosses, who planned the Luxembourg Palace. The age of Louis XIV. was favorable to this art, and we meet with notable names — Perrault, Bruant, and Mansard, who built the Hôtel des Invalides. The palace of Versailles is the work of Mansard alone. The principal architects of the 18th century are — Gabriel, who designed the square known as the Place de la Concorde; Oppenor, who designed the greater part of the Palais Royal; G. de Boffrand, De Wailly, Lemaire, D'Ivry, Soufflot, the architect of the Panthéon and the Ecole de Droit; Antoine, Moreau, Descoutures, and Desmaisons, the joint authors of the Palais de Justice; Rousseau, who planned the Palace of the Legion of Honor, now burned down; Louis, who built the Théâtre Français; Chalgrin, whose chief work is the Collège de France, etc. Under the first empire the Bourse was erected by Brongniart, the Madeleine by Vignon and Huvet, the Arc de Triomphe du Carrousel and one of the wings of the Louvre by Fontaine and Percier, the Corps Législatif by Poyet. Among the recent architects of most note are Garnier, who erected the new opera house; Visconti, who completed the Louvre; Baltard, who planned the Halles; Lefuel, who reconstructed the Tuileries; Espérandieu, Viollet-le-Duc, Gau, Blouet, Duc, the architect of the façade of the Palais de Justice, etc. See ARCHITECTURE.

Painting and Sculpture.— France, in the reign of Charlemagne, and subsequently, had numerous miniature and enamel painters, but can be hardly said to have had a school of painting of its own until the 16th century. With the exception of the Clouets (father, son, and grandson) and Jean Cousin, who owed little to foreign masters, the older French painters either studied in Italy or were mere imitators of Italian painters; while many Italians were either temporary or permanent residents in France. Among these were Leonardo da Vinci, Andrea del Sarto, Rosso, and Primaticcio, all of whom were invited by Francis I. The influence of Rosso and Primaticcio was considerable. Commissioned to decorate the Palace of Fontainebleau, they employed many Italian and French artists as assistants, on whom they imposed their ideas, manner, and style, and this created a distinct school known as that of Fontainebleau. An independent French style was formed by Simon Vouet (1582–1641), who was regarded as the master and model of the succeeding generation of French artists. Nicolas Poussin (1594–1665), stamped a character on

the art of his country which may be said to have lasted almost to our own days. Claude Gelée (1600–82), better known as Claude Lorraine, is of all landscape-painters the one best able to express the poetry of nature. The most celebrated of Vouet's disciples were Eustache Lesueur (1617–55), and Charles Lebrun (1619–90), court painter to Louis XIV., and one of the founders of the Academy of Painting and Sculpture at Paris, and the French Academy at Rome. Pierre Mignard (1610–95), another pupil in the same school, was justly esteemed for the nobleness of his style and the delicate grace of his execution. The *fêtes galantes* of the nobility under the regency of Philippe d'Orléans were represented with piquant grace by Antoine Watteau (1684–1721). His exquisite finish, the poetic charm with which he transferred to his canvas the follies of the regency, have gained for him a fame which suffers somewhat from the attack of the higher critics, who charge him and his imitators with having degraded French art to its lowest pitch. In opposition to this school rose another, inspired with purer and healthier ideals: Pierre and Vien, historical painters; Chardin; and greater than all, J. B. Greuze (1725–1805), who represented the scenes of everyday life; and Varnet, painter of landscape and sea pieces. It was, however, painfully evident that art was steadily deteriorating. It owes its resuscitation to the mental excitement of the Revolution; but the form which it assumed was due to the genius and energy of Jacques Louis David (1748–1825), who tried to inculcate elevated sentiments on his disciples, and gain the sympathy of the French school for what was truly noble, grand, and heroic. Among the most distinguished of his pupils are Gérard, Gros, Drouais, Granet, and Ingres. A reaction against this classic school, as it was called, was headed by Géricault, Delacroix, Delaroche, Scheffer, Vernet, and Descamps. Among the eminent French contemporary artists we may mention Rosa Bonheur, an animal painter; Courbet, the leader of a new school called the realistic; Gustave Doré, Cabanel, Yvon, Bin, historical painters; Gérôme, Comte, Hector Leroux, G. Boulanger, Lévey, Bréton, Millet, Hébert, as genre painters; Corot, Rousseau, D'Aubigny, André, Noël, and Barry as landscape and marine painters; and Chaplin, Henner, Mademoiselle Jacquemart, and Henriette Browne, as portraitists.

The first essays of the French sculptors were little else than imitations of the Byzantine school, and later of the Italian. It was not until Jean Goujon (1515–72) had produced his 'Diana' that France could boast of an original sculptor. His most remarkable work is the 'Fontaine des Innocents' at Paris. Germain Pilon (1516–90), Jean Cousin (about 1500–90), and Barthélemy Prieur (d. 1611) were the ablest of his contemporaries. Jean de Bologne (1524–1608), though a Frenchman by birth, may be looked upon as an Italian from his long residence in Italy and his training under Michelangelo. François Anguier (1604–69) executed the beautiful tomb of the Duke of Montmorency in the church of St. Mary at Moulins, and along with his brother Michel the statues and reliefs of the Porte St. Dénis. Girardon (1628–1715), pupil of the former, was the favorite sculptor of Louis XIV., and executed a great number of statues for Versailles, Trianon, and other royal residences. A much superior artist, however, was Pierre Puget (1622–94), who, unassisted by any master, gained for himself deservedly the title of the French Michelangelo. He is undoubtedly one of the greatest sculptors of modern times. The art was practised with more or less success down to the 18th century by Pierre Legros, the brothers Coustou, Bouchardon, L. Adam Lemoyne, Bosio, Stouf, and Pigalle. The revolution which took place in painting under the influence of David extended itself to sculpture, but the new school which arose, in their zeal for reform, soon fell into conventionality and affectation. The downward progress of the art was, however, arrested by David of Angers (1789–1856), Pradier (1792–1852), and Rude (1784–1858). Among the more distinguished of modern French sculptors may be mentioned Barye, Ramey, Jouffroy, Perraud, Carpeaux, Caïn, Guillaume, Gruyère, Leharivel-Durocher, Dubois, Falguier, Aizelin, Chapu, Rodin, etc. See ART; SCULPTURE.

France, Isle of. See MAURITIUS.

Francesca, Piero Della, pē-ā'rō dĕl lä frän-chĕs'kä, Italian painter: b. Borgo San Sepolcro, Italy, 1398; d. 1484. His early work has perished and Raphael painted out the frescoes he did for Nicolas V. in the Vatican. Some very fine work of his still remains in the pictures he executed, after his return from Rome, at Borgo San Sepolcro, Arezzo, and Loreto. Losing his eyesight at 60 he devoted himself to the study of mathematics, and his principal claim to fame lies in the fact that he was the first of the Italian school to formulate the principles of linear perspective, to study the anatomy of the nude, to employ lay figures, modeled in clay, and draped with costumes folded wet.

Francesca da Rimini. See DA RIMINI, FRANCESCA.

Francesco di Paula, frän-chĕs'kō dē pō'lä, or **Saint Francis of Paola,** Italian monk: b. Paula or Paola, Calabria, 1416; d. Plessis-les-Tours 2 April 1507. At the age of 13 he was the inmate of a Franciscan convent; and at 19 he retired to a cave where he inflicted on himself every species of self-mortification. The fame of his piety having attracted to his cell sev-

eral emulators of his austere life, he obtained permission to erect a convent, and the new community received from Pope Sixtus IV. the title of the Hermits of St. Francis of Assisi; but the title was changed by Alexander VI. to Minim-Hermits of St. Francis of Paola. The founder established numerous communities in Italy, Sicily, France, Spain, and Germany, but the Minims were never settled in Great Britain or Ireland. To the usual conventual vows, Francesco added one of the most rigorous abstinence — flesh, eggs, cheese, and milk being strictly forbidden the entire year, except in illness. Popular report having attributed to Francesco several wonderful cures, Louis XI. of France, being ill, summoned him to his presence. Francesco was received with the highest honor, and attended the king on his death bed. Charles VIII. and Louis XII. detained him, with his fraternity, in France. Charles consulted him on all affairs of importance, and other princes also gave the Minims proofs of their favor. In Spain they were called the Brothers of Victory, in commemoration of the deliverance of Malaga from the Moors, which had been predicted by Francis. Twelve years after his death he was canonized by Leo X., and the Roman Catholic Church celebrates his festival on 2 April.

Franchetti, frän-chĕt'tē, Baron **Alberto,** Italian composer: b. Turin 1860. He was a pupil of Coccon and Magi, studied at Dresden and Munich, and in 1888 produced his most successful opera 'Asraele.' Other operas and works of less importance prove him one of the best representatives of modern Italian music.

Fran'chise, in law, a right belonging to a subject of exercising a branch of the sovereign or government prerogative, either in virtue of a grant conferring such right, or by prescription, which always presupposes such a grant. The corporate franchise, that is, the right of being incorporated, and of holding fairs, ferries, etc., are among the most important franchises, which are, however, almost infinite. In politics it is the right of voting upon proposed legislative measures, where such measures are accepted or rejected by the people generally; or for representatives to a legislative assembly (the parliamentary franchise) or to a municipal body.

Francia, frän'chä, easel name of Francesco di Marco di Giacomo Raibolini, Italian painter: b. Bologna 1456; d. there 5 Jan. 1517. He assumed his name of Francia from that of the goldsmith under whom he began his art studies. He was a pupil in painting of the Ferrarese, Lorenzo Costa, and shows the influence of his master's style. He painted portraits and history, his greatest work being the Bentivoglis altarpiece, in the Church of San Giacomo Maggiore, Bologna.

Francia, José Gaspar Tomas Rodriguez da, hō-sā' gäs'pär tō'mäs rō-drē'gēs frän'-sē-ä, Paraguayan dictator: b. Asunçion 1756; d. there 20 Sept. 1840. He was sent to the University of Cordova, with a view to entering the Church; but his plans underwent a change, and on his return to his native town with the degree of doctor of laws, he began his public career as a barrister. His high reputation for learning, but still more for honesty and independence, procured him an extensive practice; and he devoted himself to legal pursuits for 30 years. In 1811, when Paraguay threw off the Spanish yoke, he became secretary of the junta appointed by congress. In 1814 he was appointed dictator for three years, and in 1817 he was continued in authority for life. No sooner had he reached the goal for which he had been striving than he began to display the utmost tryanny in his administration. He was kindly disposed toward foreigners, till they excited his jealousy by the culture of Paraguay tea, of which he made a state monopoly. After everything had been placed completely at his beck he seemed, in 1824, disposed to return to milder courses, but a new attack of his constitutional malady led him again to a renewal of his tryannical proceedings; but as Paraguay had improved under his government, and the inhabitants had become reconciled to his tyranny, he was able to continue his system till his death.

Franciabigio, frän-chä-bē'jō (the easel name of Francesco di Cristofano Bigi), Italian painter: b. Florence 1482; d. there 24 Jan. 1525. He was a pupil of Albertinelli, where he met and made a friend of Andrea del Sarto. The two artists painted in collaboration the frescoes in the Santa Annunziata Church at Florence. In these paintings the influence of del Sarto is very apparent, as well as in the 'Last Supper,' which Franciabigio painted in the refectory of San Giovanni, and the oil painting at Dresden, 'David and Bathsheba.' He has left many excellent portraits, one of which is in the Berlin Museum.

Fran'cillon, Robert Edward, English novelist: b. Gloucester, England, 25 March 1841. He was educated at Trinity Hall, Cambridge. He was admitted to the bar in 1864 and was on the staff of the London *Globe* 1872–94. His novels are: 'Earl's Dene'; 'Pearl and Emerald' (1872); 'Olympia'; 'Strange Waters'; 'Zelda's Fortune'; 'A Real Queen'; 'Queen Cophetua' (1880); 'Under Slieve-Ban' (1881); 'King or Knave' (1888); 'A Dog and his Shadow'; 'Jack Doyle's Daughter'; 'Ropes of Sand'; 'Gods and Heroes'; etc.

Francis I., king of France: b. Cognac, France, 12 Sept. 1494; d. Rambouillet 31 March 1547. He succeeded to the throne in 1515, on the death of Louis XII., who died without male issue. As grandson of Valentino of Milan, he put himself at the head of an army to assert his right over the Milanese. The Swiss, who opposed him in his entry into the duchy, were defeated at Marignano (or Melegnano), and Milan fell immediately after this victory. After a short war with England, the famous interview between Henry VIII. and Francis took place, in 1520, in Flanders, which, from the magnificence displayed on the occasion, was called The Field of the Cloth of Gold (q.v.). In the same year, Charles V. of Spain having inherited the empire after the death of Maximilian, Francis laid claim to the imperial dignity and declared war against his rival. In this struggle, however, he met with nothing but reverses. After the defeat of Marshal Lautrec at Bicoca, in 1522, the retreat of Bonnivet, and Bayard's death, Francis was himself, in 1525, beaten at Pavia, and taken prisoner. The fight had been a fierce one, and the king wrote to his mother, «All is lost, except honor.» Led captive into

Spain, he recovered his liberty only at the cost of an onerous treaty, signed at Madrid in 1526; but which Francis subsequently declared null and void. He immediately recommenced war in Italy, met with fresh defeats, and concluded a second treaty at Cambrai in 1529. He once more invaded Italy, in 1536, and, after various successes, consented to a definite arrangement at Crespi, in 1544, by which the French were excluded from Italy, though Milan was given to the Duke of Orleans, the second son of Francis. Francis was a friend to arts and literature, which flourished during his reign; and he was called the "Father of Letters." Justice, also, began to be better administered in his reign. He founded the Royal College of France, the Royal Library, and built several palaces. He was succeeded by his son, Henry II.

Francis II., king of France, son of Henry II. and Catharine of Medici: b. Fontainebleau 19 Jan. 1544; d. Orleans 5 Dec. 1560. He ascended the throne on the death of his father, 10 July 1559. The year previous he had married Mary Stuart, only child of James V., king of Scotland. During his short reign of 17 months were sown the seeds of those evils which afterward desolated France. The uncles of his wife, Francis, Duke of Guise, and the Cardinal of Lorraine, held the reins of government. The latter stood at the head of the clergy, and had charge of the finances. The former had the direction of military affairs; and both used their power solely as a means of gratifying their pride and avarice. Antony of Bourbon, king of Navarre, and his brother Louis, Prince of Condé, provoked that two strangers should govern the kingdom while the princes of the blood were removed from the administration, united with the Calvinists to overthrow the power of the Guises, the protectors of the Catholics. Ambition was the cause of the quarrel, religion the pretext, and the conspiracy of Amboise formed among the French nobility, especially the Calvinists, with the object of removing the king from the influence of the Guises, the first symptom of the civil war. The war broke out in March 1560. In December of the same year Francis died, leaving the kingdom loaded with debt, and a prey to all the miseries of civil war.

Francis I., emperor of Germany: b. 8 Dec. 1708; d. Innspruck 18 Aug. 1765. He was the son of Leopold, Duke of Lorraine. He inherited this duchy from his father in 1729, and six years afterward exchanged it for that of Tuscany, which the death of the last of the Medicis had rendered vacant. In 1736 he married Maria Theresa, the daughter of the Emperor Charles VI. On the death of the latter, he disputed the imperial dignity with the elector of Bavaria, whom France supported, and who took the name of Charles VII.; he was, however, defeated, and Francis reigned peaceably for 20 years. He had 16 children, among whom were Joseph II., who succeeded him, and the unfortunate Marie Antoinette. See MARIA THERESA.

Francis II., emperor of Germany, and **I.** of Austria: b. Florence, Italy, 12 Feb. 1768; d. Vienna 2 March 1835. He succeeded his father, Leopold II., in 1792, as emperor of Germany, king of Bohemia, Hungary, etc. At the very commencement of his reign, he had to sustain a war against France, in which he was defeated, and was, in 1797, obliged to sign the treaty of Campo Formio, which deprived him of the Netherlands and Lombardy. Another war taking place with the same power, he was not more fortunate than in the first, and was beaten at Marengo, and lost, by the Treaty of Lunéville, in 1801, all his possessions on the Rhine. In a third campaign, undertaken in 1805, the French were victorious over his armies at Elchingen, Ulm, and Austerlitz; and the Treaty of Presburg still further diminished his territory. Renouncing now the title of emperor of Germany, he took that of Austria, under the name of Francis I. He tried again the fate of battles in 1809; but the defeats of Eckmühl and Wagram led to the Peace of Schönbrunn, to cement which more strongly his daughter Maria Louisa was, in 1810, given to Napoleon I. Notwithstanding this alliance, however, he, in 1813, joined the coalition against his son-in-law and contributed considerably to his overthrow. The treaties of 1815 put him again in possession of the greater portion of his territory, and he reigned peaceably till his death.

Francis I., king of the Two Sicilies, son of Ferdinand I.: b. Naples 19 Aug. 1777; d. there 8 Dec. 1830. Twice during the lifetime of his father he carried on the government of the kingdom under the name of viceroy; first in 1812, when a constitution was granted to Sicily; and afterward in 1820, during the troubles which broke out in Naples and Palermo. He mounted the throne in 1825, and died 1830, without having achieved anything remarkable. He was succeeded by Ferdinand II.

Francis II. (Francesco d'Assisi Maria Leopold), king of the Two Sicilies: b. Naples 31 Jan. 1836; d. 27 Dec. 1894. He succeeded his father, Ferdinand II., in 1859, and attempted to carry out the monarch's policy. His dominions were invaded by Garibaldi in 1860 and Gaeta, his last stronghold, fell in 1861. Subsequently the deposed ruler lived in France in retirement, occasionally organizing abortive expeditions against the Italian kingdom.

Francis Joseph, Charles, emperor of Austria: b. Vienna 30 Aug. 1830. He became emperor 2 Dec. 1848, and found the empire shaken by internal dissensions; and his first step was to promise a free and constitutional government to the country. The course of events, however, compelled him to close the national assembly, and to assume absolute power. He centralized the governments of his heterogeneous nationalities at Vienna, and, aided by Herr Von Brück, inaugurated a series of fiscal and commercial reforms favorable to the interests of the middle classes. In 1853–4, the emperor endeavored, though in vain, to induce the Czar Nicholas to abandon his ambitious designs against Turkey, and further excited that autocrat's displeasure by refusing to assist Russia against the western powers, whose rulers also felt aggrieved because he resolved to remain neutral and declined to throw the weight of his name into their scale. The unwillingness of Austria to make common cause with the western powers has been severely punished, for had she joined the alliance against Russia in 1854, in all probability Louis Napoleon would not have crossed the Alps and dictated the Peace of Villafranca. It is, therefore, more than prob-

able that her reluctance to act against Russia in that war was the cause of her losing Lombardy three years later. At Solferino the emperor gave proof of bravery amounting almost to rashness. In April 1854 he married the Princess Elizabeth Amalie Eugenie, daughter of the Duke Maximilian Joseph, and cousin, on her mother's side, to the king of Bavaria. The plenipotentiaries of Austria, Prussia, and Denmark, assembled at Vienna to consider the terms of a peace, 26 July 1864, which was concluded 30 October. The convention of Gastein signed 14 Aug. 1865, transferring the government of Schleswig to Prussia, and that of Holstein to Austria, was a few days after confirmed by the emperor and the king of Prussia at Salzburg. The emperor issued an important manifesto to his people, 20 September, in which he expressed very conciliatory intentions toward the peoples of Hungary and Croatia. At the beginning of 1866, the armaments against Prussia commenced, and an imperial order was issued 6 May, placing the whole army on a war footing, and concentrating the army of the north on the frontiers of Bohemia. In 1867, the emperor put an end to the hostilities of Hungary by re-establishing the constitution of that country; and on 8 June, he was crowned at Budapest as king of Hungary, with extraordinary pomp. In December of the same year, a new constitution, one of the most liberal of continental Europe, framed by the Reichsrath, was approved by the emperor, and promulgated as the fundamental law of the empire. His only son, Rudolf, committed suicide in 1889, and the emperor's nephew, the Archduke Francis Ferdinand, is heir-presumptive. See AUSTRIA.

Francis, David Rowland, American politician: b. Richmond, Ky., 1 Oct. 1850. He was graduated from Washington University, St. Louis, 1870, entered business and in 1877 established the firm of of Francis Brothers, grain merchants, St. Louis. He was mayor of St. Louis 1885–9, governor of Missouri 1889–93, secretary of the interior under President Cleveland 1896–7, and became president of the Louisiana Purchase Centennial Exposition in 1901.

Francis, Joseph, American inventor: b. Boston, Mass., 12 March 1801; d. Cooperstown, N. Y., 10 May 1893. He was the inventor of a number of life-boats and life-cars which came into general use and by means of which 200 persons were saved when the British ship Ayrshire was wrecked on the New Jersey coast in 1850. It is estimated that in four years as many as 2,150 lives were saved.

Francis, M. E. See BLUNDELL, MRS. FRANCIS.

Francis, SIR **Philip,** British statesman: b. Dublin 22 Oct. 1740; d. London 23 Dec. 1818. He is the best accredited of the candidates for authorship of the 'Junius' letters. He entered the civil service, and was rapidly advanced, owing partly to his abilities and partly to personal influence curiously accordant with partialities shown in the 'Letters.' Suddenly raised to the lofty position of one of the resident India council appointed by Parliament to control those affairs, he went out to India; spent his time there in a furious contest for supremacy with Warren Hastings; was finally vanquished, but achieved a terrible revenge after his return to England, by inciting Hastings' impeachment and coaching Burke; entered Parliament, prepared many pamphlets and made many speeches of much ability and unfailing acrimony. The 'Letters' — savage assaults on the heads of the party in power, up to George III. himself — appeared in the 'Public Advertiser' of London from 1867 to 1772; ceasing with the dispersion of the party faction most liked by Francis, and a year before his great promotion and his departure from England. The case for his authorship is effectively put in Macaulay's 'Essay on Warren Hastings.' See JUNIUS.

Francis of Assisi, äs-se'ze, **Saint,** Italian founder of religious order: b. Assisi, Umbria, Italy, 1182; d. Assisi 4 Oct. 1226. St. Francis of Assisi is the founder of the Friars Minor, who are usually styled Franciscans (q.v.). His family name was Bernardone. At baptism he was called John. Whether it was because his father, who was a merchant, was at the time largely engaged in French trade, or because of the saint's own familiarity with the French language, the name Francis eventually superseded that of John. As a youth he was remarkable for his ardent piety and the spotless purity of his life, but is reproached with a worldly vanity in dress which his wealth enabled him to indulge in. A change of heart came over him in consequence of a year's confinement as a prisoner of war; a serious illness helping the transformation. He began to dispose of his property for the purpose of repairing dilapidated churches. Irritated by his extravagance his father treated him with the greatest cruelty; the trouble ending by the saint's abandonment of everything, even his worldly apparel, and he assumed the dress of a common laborer. His zeal for church restorations grew in intensity, and being no longer able to devote his own patrimony to the work he obtained the necessary means by begging; he himself laboring at the buildings with his own hands. His affection was lavished also on the poor and especially upon lepers. He lived in the extremest poverty, practised the greatest austerities, and for a time was looked upon as a madman. Distinguished and learned men, however, began to associate with him and follow his way of life. Though not a priest (and he never became one) he began to preach everywhere on the necessity of penance. As those were the days in which Barbarossa was raging against the Church, both religion and morality needed reformation, and the preacher was eagerly listened to by all classes. When the number of his followers increased, the desire to institute a new religious order developed, and for that purpose he betook himself to Rome, but Innocent III., then sovereign pontiff, treated the proposal with indignation. Francis persevered, and the request was granted. The new community, known first as the Preachers of Penance, increased with astonishing rapidity, and at the first general chapter more than 5,000 friars assembled; some from the humble classes of life, others already famous in Church and state. The foundation of the order coincided with the great Lateran Council, the spirit of which was against the formation of any new religious order. In spite of this, however, there seemed to be a tacit consent to allow the new movement to proceed. It was when Pope Honorius finally gave

the necessary authorization that Francis met the Spanish canon Dominic, who was in Rome to found his own Order of Preachers, commonly known as Dominicans (q.v.). The two saints met in church and instinctively recognized each other, becoming immediately most devoted friends. The visions and miracles reported of Francis are bewildering in their number and character. In the hope of martyrdom he made several attempts to preach the gospel to the Mohammedans. His prayer and austerities were continued, his ecstasies frequent, and while on Mt. Alverno he received on his person what are known as the *stigmata*, namely, bleeding wounds on the hands, feet, and side, corresponding to the marks on the crucified body of the Saviour. Wherever he went he was honored as a saint; and his preaching was irresistible in its pathetic and stirring appeals to repentance. The rule of life he laid down for his followers was based on the strictest poverty, that is, no property, and dependence on the alms of the faithful. This extreme rigor almost immediately brought dissension in the order. Parties were formed, and the Friar General Elias, who had been appointed by Francis, was its bitterest opponent, going so far as to leave the order and to side with Barbarossa, who was then in open warfare with the Church. Nevertheless, the friars continued to increase in number and to spread everywhere, preaching the gospel and carrying the faith into distant countries. Besides his order for men, he established another for women, commonly known as the Poor Clares, so called from Saint Clare, the first superior. There is still another section called the Third Order of Saint Francis, for men and women living in the world, who follow a mitigated and adapted form of the rule of the friars. All three have given a vast number of saints and scholars to the Church. Francis died at the age of 45, 19 years after the establishment of his order. The extreme beauty, simplicity, and amiability, and perhaps the poetry, of the saint's character, but especially his love of created nature, have had the effect in our own days of developing a singular cult for him on the part of many outside the Catholic Church. The movement was started by Paul Sabatier, a French Calvinist minister, and Franciscan societies for the study of the life of the saint and of everything connected with him have been established in several countries of Europe.

THOMAS J. CAMPBELL, S.J.

Francis de Sales, sālz, Fr. säl, **Saint,** French prelate, founder of the Order of Visitation: b. of a noble Savoyard family, in the château of Sales, near Geneva, 21 Aug. 1567; d. Lyons 28 Dec. 1622. He was educated by the Jesuits at Paris, studied law at Padua, and having a strong bent to theology and a religious life, entered the Church. Earnest and successful as a preacher, he was sent in 1594 with his kinsman, Louis de Sales, to preach in the duchy of Chablais, and bring back, if possible, to the Roman Catholic Church the followers of Calvin. He had a large measure of success. His conferences with Théodore de Bèze, Calvin's successor, at Geneva, were, however, without result. He went to Paris in 1602, preached there with great success, and steadily refused the offers of dignities made by the French king. The same year he was appointed bishop of Geneva, and taking St. Charles Borromeo as his model, applied himself zealously to the reform of the diocese and its monasteries. He was disinterested and free from worldly ambition, and declined the offer of a cardinal's hat and the renewed invitations of the king of France. In 1610 he founded the Order of the Visitation, of which the first directress was his friend, Madame de Chantal. His best known works are the 'Introduction to a Devout Life,' which has been translated into many languages, and 'A Treatise on the Love of God.' He was canonized by Pope Alexander VII. in 1665. See 'Life' by Camus.

Francis Xavier, zăv'ĭ-ėr, Fr. ksăv-ē-ā, **Saint,** Spanish Jesuit missionary: b. Castle of Xavier, Navarre, 7 April 1506; d. Island of Sancian 2 Dec. 1552. Saint Francis Xavier was born in Spain, of one of the noblest families of the kingdom of Navarre. After the usual collegiate studies in his own country, he went to Paris for a course of philosophy in the University. In spite of his extreme youth, his extraordinary ability secured for him a professorship in the affiliated College of Beauvais. It was in Paris that he met the man who shaped his destinies, Ignatius of Loyola (q.v.). Abandoning his professorship, he took up the study of theology, practised the rudest austerities, bound himself to a life of evangelical poverty, chastity, and obedience, and with Ignatius and five other companions established what is known as the Society of Jesus.

The original purpose of this organization was to evangelize Christians living in the Mohammedan countries of the East. Failing in that, they offered themselves to the Pope and were employed by him in most responsible trusts in various parts of Europe, which, however, they combined with labor in pest houses, prisons, and among the abandoned poor. A demand coming from John III. of Portugal for 10 missionaries to evangelize the new Portuguese possessions in India, Francis Xavier was chosen, but went alone, invested, however, with the dignity of Apostolic Nuncio, a dignity which he sedulously kept out of sight.

The day after the command was given to go he left Rome for Lisbon, making the journey on foot, preaching and teaching on the way. In Portugal his influence was so instantaneous and so great that the king purposed to keep him in his dominions. But nevertheless Xavier set sail for the East, 7 April 1541, having refused even to see his own relatives before leaving. The journey meant more than a year of great sufferings, and he reached Goa only on 6 May 1542. The ignorance and immorality which prevailed there were deplorable and a complete and immediate revolution in conditions followed his arrival.

Then began his series of amazing apostolic journeys. They can only be appreciated by recalling the methods of travel of those days; the perilous character of the seas through which he continually sailed, and the savage or barbarous nature of the people he had to evangelize. From Goa he went around Cape Comorin and Ceylon,

then back to Goa again, then through every principality of Hindustan, off through the scattered islands of the coasts, until he reached the distant Moluccas; establishing missions everywhere, and managing all the complicated and multiplied works which necessarily resulted. The story of his life is simply a series of surprising evangelical conquests, bringing thousands to Christianity by the efficacy of his preaching, the prodigies he wrought, and the extraordinary sanctity of his life.

On 15 Aug. 1549 he reached Japan. He remained there only two years and four months, but succeeded in penetrating almost all the little kingdoms into which the country was then divided; breaking down the opposition of the Bonzes who were the chief enemies of the Gospel, winning vast numbers to the faith, and establishing his followers in the favor of both rulers and people. The sway which he exerted over the Japanese mind may be inferred from the reverence with which he is still regarded there. The thoroughness with which he and his successors taught Christianity is evidenced by the fact that 25,000 Catholics were found in Japan after three centuries of persecution. They had handed down the faith from father to son without any ecclesiastical ministrations.

To obtain laborers for this new field he returned to Goa in 1551. We then find him venturing on a new project, attempting to win China to Christianity. Its conversion he thought essential for the maintenance of the faith both of India and Japan; for the corrupting influences in both those places he considered to be largely due to their relationship with China. He never reached that country but died on the Island of Sancian, about six leagues from Canton, being only 46 years of age. This last fatal voyage had lasted nine months.

His entire apostolate in the East extended over only 10 years, but he is said to have planted the faith in 52 kingdoms, preached the Gospel through 9,000 miles of territory, and baptized more than 1,000,000 persons. Fifty years after his death Pope Paul V. by a bull, dated 25 Oct. 1605, declared him blessed, and, 16 years subsequently, Gregory XV. canonized him, but on account of the pontiff's death, which occurred just at that time, the bull of canonization was issued by Urban VIII. on 6 Aug. 1623. He is honored in the Church on 3 December and is usually styled "the Apostle of the Indies." The devotion to him is universal and countless churches are erected under his invocation. His relics are still preserved in Goa, and in 1850 the body was found to be incorrupt.

THOMAS J. CAMPBELL, S.J.

Francis'cans, the designation borne by the members of the three great religious orders founded in the 13th century by St. Francis of Assisi. The first of these orders is that of the Friars Minor, known as the Greyfriars, and in France as the Cordeliers. The second order is that of the Poor Clares, called in Italian *Povere Donne* (Poor Ladies), and in France the Clarisses. The third order is that of Penance, or Tertiaries.

1. Francis, keenly alive to the evils which in his day seemed to threaten the very existence of the Church and society, strove to counteract their baneful influence by establishing an order, the members of which were to observe the most absolute poverty, and to be devoted to the service of the Church. The goal which he aimed at was to reproduce the ideal of the divine life on earth, therefore neither he nor his were to possess anything temporal, but were to go about doing good and preaching to all the world the kingdom of heaven. A little band of disciples to the number of seven, aglow with enthusiasm, gathered around the saint, and the little chapel of Sta. Maria degli Angeli, near Assisi, which he called Portiuncula, "the little portion, or inheritance," was the place where the order was first planned. It was truly a humble origin, an insignificant beginning, but Francis had a presentiment of the future world-wide extension of his order. In 1210 he obtained from Innocent III. a verbal approbation of the rule he had drawn up for it. Forthwith it appeared how accurately he had gauged the wants of his age, for his order sprang at a bound into popular favor. So rapid was its growth that 10 years afterward at a chapter held near Assisi, more than 5,000 of his religious assembled, and not half a century had elapsed when they counted missionaries in every known country, as may be learned from a bull of Alexander IV. in 1258. In 1260, when a chapter presided over by St. Bonaventure was held at Narbonne, the order had 1,400 houses. At the dissolution of the monasteries in England there were 65 houses of Franciscans, and even in 1680, in spite of severe losses in Protestant countries, the order numbered 100,000 members. The order is ruled by a general minister, who, with his council or *definitorium,* resides in Rome. It is divided into provinces to govern which provincials are elected. Each province is composed of a certain number of houses or convents, whose superiors are termed guardians.

Owing to the absolute nature of the poverty prescribed by the second rule drawn up for the first order and approved by Honorius III. in 1223, some of St. Francis' immediate followers showed tendencies inimical to it even in the saint's lifetime. After his death these tendencies became more marked, and were covertly connived at and effectively encouraged by the second minister-general, Elias of Cortona. This was the rift in the lute which widened as time went on. Some zealous upholders of the purity of the rule, such as St. Anthony of Padua, Adam de Marisco, Cæsar of Spires, protested against all innovations, and labored strenuously to maintain intact their sacred inheritance, receiving the distinctive name of Cesarines, but eventually returning to the body of the order in 1256. Other reforms were initiated, such as that of Peter of Macerata, 1294; that of Philip of Majorca, 1308; that of John of Vallées, 1336; and others. They met with varying success, until in 1415 a final split took place, one section of the order adopting the mitigations which had been introduced in the matter of poverty, this being the bone of contention all through. They became known as the Conventuals, while the members of the other section were called Observants, as observing faithfully the Franciscan traditions. These latter still adhere strictly to the original austerity

of their rule. St. Bernardine of Sienna, St. John Capistran, and St. James de la Marcha were mainly instrumental in promoting the interests of the Observance. In 1517 Leo X. issued his famous bull, *Ite et vos in vineam meam*, decreeing that a general minister of the whole order was to be chosen from among the Observants, and that the Conventuals were to elect a master-general. The Observants, however, did not satisfy the zeal of some, and thus we find certain groups, such as the Reformati, originating in Italy; the Alcantarines, or those who follow the reform of St. Peter of Alcantara, in Spain; and the Recollects.

There were now the two great families of the first order, the Observants and the Conventuals, these latter being governed, as said above, by a master-general, and notwithstanding their dispensations in regard to poverty, they have always rendered important services to the Church. The great Pope Sixtus V. was himself a Conventual.

In 1525 there arose a third family, known as the Capuchins (q.v.).

The Franciscans did not devote themselves exclusively to the apostolic life. From the first they took an active and leading part in the study of Holy Scripture and in all the branches of sacred and secular learning. They have filled with honor the first chairs in the most celebrated universities. Such great names occur among them as Alexander of Hales, St. Bonaventure ("the Seraphic Doctor"), Blessed John Duns Scotus, called "the Subtle Doctor," who as defender of the Immaculate Conception became the leader of the Franciscan school, Francis Mayronis, and Nicholas de Lyre. In England during the centuries immediately preceding the Reformation, there were 67 friars professors at Oxford and 73 at Cambridge, among them being Adam de Marisco, Duns Scotus, Roger Bacon, the pioneer of the modern discoveries in the physical sciences. Thomas de Celano, who wrote 'Dies Iræ,' and Jacopone da Todi, author of 'Stabat Mater,' were Franciscans. Nuncios, legates, archbishops, 50 cardinals, and 5 popes have been chosen from among the Franciscans.

The relations of the Franciscans with America began with its very discovery. Father Juan Perez, guardian of the Franciscan monastery at La Rabida, the adviser and personal friend of Columbus, with several companions, accompanied the discoverer in 1493. The first convent was erected for them at what is now the city of Santo Domingo, on Haiti; another arose at La Vega, on the same island. Connected with these convents were the first schools in the western hemisphere.

Owing to the enthusiasm among the religious in Spain, and to the docility of the Indians, the order spread so rapidly in the West Indies that King Ferdinand found it advisable to issue a decree forbidding the erection of a new convent except at a distance of at least five leagues from one already existing. In 1505, only 13 years after the discovery, there was a sufficient number of convents to form a province, under the name of Holy Cross. The first diocese to be erected was Santo Domingo, in 1504; its first bishop was Father Juan de Padilla, a Franciscan.

After the Spaniards had set foot on the mainland, the king, ever anxious for the spiritual welfare of the aborigines, sent over a great number of friars under the leadership of Father Juan de Quevedo, who was appointed bishop of Darien, the first bishop on the American continent. The Franciscans entered Venezuela in 1508, Brazil in 1519; in 1535 they were able to form a province in Peru, whence were founded the missions farther south in the Andes and Pampas. Saint Francis Solanus, called the Apostle of Peru on account of his extraordinary missionary labors, evangelized these regions; he died at Lima in 1610.

In 1521, if not before, the first Franciscans came to Mexico. Together with 12 friars known as the Twelve Apostles of Mexico, there labored here from 1533 to 1572 the famous Brother Gante. He wrote a catechism in the Aztec language, erected over 100 churches, and with one companion frequently baptized 8,000 Indians in one day. Many schools were erected, in which often as many as 600 and 800 boys received an elementary education. Owing to their stainless lives, abstinences, and contempt for gold, the friars obtained marvelous results among the natives. In 1535 the 70 convents in Mexico were organized into a province. At the end of the 16th century there were three provinces; others have been formed since then, besides several missionary colleges, whence zealous missionaries set out to convert the natives to the north, notably in Florida, New Mexico, Arizona, Texas, and California.

Florida was the first of the States that beheld the Franciscan garb. Five friars came with Narvaez in 1528; their superior, Father Juan Suarez, was the first bishop in the United States. In the course of time the missionaries succeeded, though not without heavy sacrifices of life and labor, in establishing flourishing missions all along the coast and in the interior as far west as Mississippi and as far north as Georgia. In 1634 there were 34 friars, who maintained 44 mission stations, where they attended to about 30,000 converts. These missions suffered greatly by invasions from Carolina and Georgia, and when Florida was ceded to the English in 1763 they ceased to exist.

Arizona and New Mexico were first visited by Franciscans in 1539; in the course of time a great many missions and churches were established, to most of which were attached schools for boys, as we learn from an official report of 1632. Beginning with 1689, about 160 friars labored in Texas up to the time of the Mexican independence, when the missions were ruined.

The Franciscans came to California in 1768 under the renowned Father Junipero Serra. The first mission founded was San Diego. Up to 1823, 21 missions were organized, forming a chain which extended a distance of over 700 miles. At the height of mission prosperity 30,000 Indians lived under the paternal guidance of the friars; they were fed, clothed, and educated, with no expense to the government, the missions supporting themselves by agriculture and stock-raising; everything was manufactured at these establishments by the Indians. In 1834 the Mexican government began to confiscate the missions and took them from the control of the friars; this work was finished by 1846 and brought about the complete destruction of the once so flourishing missions.

While the Spanish Franciscans were thus extending their labors in the south from the Atlantic to the Pacific, other bands of Friars Minor were emulating their example in the north. Champlain induced the French Franciscans, formerly called Recollects, to come to Canada as early as 1615. Thence they penetrated into Maine, New York, Pennsylvania, Michigan, Illinois, Minnesota, and Wisconsin. The best known of these missionaries is Father Louis Hennepin. He accompanied La Salle on his expeditions, and was the first to publish a description of the Niagara Falls. While a captive among the Sioux he saw and named the Falls of Saint Anthony. About this time we find the English Franciscans laboring in Maryland and adjoining colonies for full half a century. In the beginning of the 19th century the Rt. Rev. Michael Egan, a Franciscan and first bishop of Philadelphia, intended establishing a province of his order in Pennsylvania, but he died before accomplishing his design. In 1845 Franciscans from the Tyrol came to Cincinnati; in 1854 Italian friars formed a community in western New York, and in 1858 German friars settled in Illinois. The "Kulturkampf" was the cause of many more coming to the United States.

At present (1905) there are in the States 1,033 Franciscans, who are distributed as follows: The Custody of the Immaculate Conception (New York city) in the Eastern States has 8 houses, with 37 members; the Province of the Holy Name (Paterson, N. J.), also in the Eastern States, has 12 houses, with 132 members; the Province of Saint John the Baptist (Cincinnati, Ohio), chiefly in the Central States, has 33 houses, with 343 members; the Province of the Sacred Heart (Saint Louis, Mo.), in the Central and Northern States, has, including the houses in California and Arizona and the Polish communities in Wisconsin, 44 houses, with 521 members. Most of these friars are engaged in regular parish work; some preach missions throughout the States; others are on the Indian missions in Michigan, Wisconsin, California, Arizona, and New Mexico. They also conduct one seminary (Allegany, N. Y.) and six colleges (Allegany, N. Y., Cincinnati, Ohio, Teutopolis, Ill., Quincy, Ill., Pulaski, Wis, Santa Barbara, Cal.).

The Conventual Friars Minor came to the United States in 1851, and at present (1905) form a province in New York and New Jersey numbering 120 members. Besides these there are in the States 134 Franciscan Brothers and some 7,800 Sisters, all belonging to the third Order of Saint Francis. In 1897 the four abovementioned groups, namely, Observants, Reformati, Alcantarines, and Recollects, who had always been under the same minister-general, dropped their distinctive traits and are now known simply as Friars Minor or Franciscans. They number at present (1905) 16,801, are distributed into 77 provinces, and have 1,498 houses. In 1893 the Conventuals numbered 1,462, which number has since decreased, and had 172 houses.

Rev. P. Hugoline Storff, O.F.M.

Franck, César Auguste Jean Guillaume Hubert, sä'zar ō-güst zhŏṅ gē-yōm übār, fränk, French composer: b. Liège 1822: d. Paris 1890. He studied in the conservatory of his native town and at Paris, and in 1872 succeeded his master, Benoist, as teacher in the Metropolitan Conservatory. His talent as a composer was for a long time unrecognized, and in 1846 his oratorio 'Ruth' fell flat. Twenty years later it was revived and created a furore, and Franck found himself leader of a new school. The popularity which his works still enjoy at Paris has to some extent spread to the United States, where his oratorio 'Les Beatitudes' has been much appreciated.

Francke, August Hermann, ow'goost hĕr'män frän'kė, German Lutheran clergyman and philanthropist: b. Lübeck 22 March 1663; d. Halle 8 June 1727. In 1692 he obtained the professorship of Oriental languages at Halle, which in 1698 he exchanged for that of theology. A pupil of Spener and the teacher of Zinzendorf, Francke belonged to the ranks of those who carried forward the pietistic movement; his activity, however, took the practical direction of founding, endowing, and organizing various educational institutions at Halle. Among these were a school for the poor, a pædagogium, a burgher school, a Latin school, and a seminary for training teachers for these establishments, all founded in one year, 1695; and with them was associated an orphanage, which became in the course of time the most important of all Francke's institutions. At the time of his death his schools were frequented by more than 2,300 pupils. Francke's principal aim was religious instruction, but he founded also a printing-office, and an apothecary's shop, and taught natural science and physical exercises and manual trades. At the present time all Francke's foundations exist with but little alteration; in addition to those mentioned there are also a real-gymnasium, two schools for girls, and a free school. The number of pupils is more than 3,000 annually. See 'Lives' by Kramer (2d ed. 1885); Stein (2d ed. 1886).

Francke, Kuno, American educator: b. Schleswig, Germany, 27 Sept. 1855. Was educated at Kiel; came to the United States and has been professor of German literature in Harvard University for many years. His notable book 'Social Forces in German Literature' appeared in 1896; followed by 'Glimpses of Modern German Culture' (1898); 'History of German Literature' (1901); etc.

Francken, Frans, fräns fränk'ĕn (called The Younger), Flemish painter: b. Antwerp May 1581; d. there 6 May 1642. After a trip to Italy he was received into the Guild of St. Luke at Antwerp, where he worked at first in the brilliant colors of the old masters and later in the realistic style of Rubens. Most prominent European galleries have examples of his art.

Francken, Frans (called The Third), Flemish painter: b. Antwerp 1607; d. there 2 Sept. 1667. He was admitted to the Guild of Saint Luke in 1639. His works, patterned after Rubens, are unsigned and therefore difficult of identification. Specimens of his religious subjects are to be seen at Augsburg ('Moses Striking Water from the Rock') and Vienna,

Liechtenstein collection ('John the Baptist Preaching'). In later years he also conducted a linen-draper's shop. He was a son of Frans Francken called The Younger (q.v.).

Franco, Giovanni Battista, jō-vän'nē bät-tēs'tä frän'kō, Italian painter, called Il Semolei: b. Udine 1510; d. Venice 1580. He visited Rome, where his Venetian manner was much influenced by that of Michelangelo. He was a very busy and uneven artist, doing his best work in decorative lines. Upon the victorious entry of Charles V. of Spain into Rome in 1536 he embellished the triumphal arch with scenes descriptive of the city's history. His principal canvas is a 'Baptism of Christ' in the Venetian Church of San Francesco della Vigna. His etchings, including such plates as 'The Adoration of the Shepherds' and 'The Scourging of Christ' (after Titian), are by many preferred to his paintings, which are criticised for defects of color.

Franco-German or **Franco-Prussian War**, the stupendous conflict between France and Germany in 1870–1, which resulted in the total defeat of the French, the overthrow of the Napoleonic dynasty, the establishment of the Third Republic in France, and the consolidation of Germany into an empire under the leadership of Prussia.

The remote causes of this war are to be sought in the jealousy which had long existed between France and Prussia, and which was strengthened on the side of France by the Prussian defeat of Austria in 1866, which secured to her rival the unquestioned leadership in Germany. The immediate occasion of the war occurred in June 1870, when Gen. Prim, commanding in Spain after the deposition and abdication of Queen Isabella, offered the crown of that country to Leopold of Hohenzollern, a prince belonging to the reigning house of Prussia. It was thought in France that the acceptance of this offer would endanger the balance of power in Europe, and more particularly would threaten the safety of France, by putting Prussia in a position to attack it both in the east and in the south. Accordingly, the government of Napoleon III. demanded of the king of Prussia that he should forbid the candidature of the prince. The prince voluntarily retired from his candidature, but the French ambassador offensively insisted that this renunciation should be formally made by the king, and a guarantee given that the candidature would not be revived. This demand was refused, and a formal declaration of war by France against Prussia was received by Count Bismarck, the chancellor of the North German Confederation, on the 19th of July. The war was welcomed by both sides with equal enthusiasm. While the French were the first in getting their troops to the frontier it soon became manifest that instead of being in a complete state of readiness, as the minister of war had declared, the army was defective in almost everything essential to its equipment. Owing to the prevalence of the system of paying for substitutes who never appeared, and were yet registered as belonging to the army, it was also discovered that the numbers of the army did not reach anything like the amount at which they were represented in the official estimates.

In contrast to this the arrangements for mobilizing the Germany army, which had previously been tested in Prussia in 1864 and 1866, were again found to work admirably. Each section of the army was completely organized in the headquarters of the district which it occupied in time of peace, and was only sent to the frontiers after being furnished with everything it required. In addition to this, Prussia, against which country alone the war had been declared, was not only joined according to treaty by all the states of the North German Confederation, but also by those of the south, upon whose neutrality, perhaps even upon whose alliance, Napoleon and the French had counted. The whole of Germany north and south was thus in arms, and was able to muster forces far outnumbering those of the French. While the whole French army brought into the field at the commencement of the war numbered no more than 310,000 men, the troops of the Germans in the field amounted in all to 477,000, to which must be added strong reserves ready, with the exception of such as were necessary to protect the interior and to resist a threatened landing on the north coast by the French fleet, to be brought to the scene of war at any time, giving a total strength on the side of the Germans of more than 1,000,000 of men.

The German forces were divided into three armies; the First Army had its headquarters at Trèves under Gen. Steinmetz; the Second Army occupied the Bavarian Palatinate under Prince Frederick Charles; while the Third Army, under the Crown-prince of Prussia, was stationed in northern Baden. The cavalry of each army, instead of being attached in separate divisions to each of the corps d'armée composing the army, were in this way massed together into one body, and in this formation rendered very important services during the war. The commander-in-chief of the whole forces was King William of Prussia, who was supported by a staff of general officers, with Von Moltke at their head. The French army, under Napoleon himself, had its headquarters at Metz, and two advanced divisions were stationed on the borders of France and Germany, the one in the north on the Saar, under Gen. Frossard, the other farther south at Weissenburg, under Gen. Douay. The first overt act of war took place on 2 August, in which a part of the northern division of the French army, in the presence of Napoleon and the prince imperial, compelled a few Prussian troops belonging to the First Army, after some hours' firing, to evacuate Saarbrücken. After this Von Moltke assumed the offensive. His plan was to unite the three armies in the line of the Moselle in order to attack the enemy's centre with the view of obtaining the shortest line of operations in the direction of Paris, and in this he was completely successful. On 4 August the army under the crown prince defeated the advanced southern division of the French army at Weissenburg, and on 6 August MacMahon's army at Wörth; on the latter date also the first and second German armies had routed the northern division of the French army at Forbach, with terrible loss on both sides. In two separate armies, commanded respectively by Marshal Bazaine and Marshal MacMahon, the French retreated. To prevent their union Steinmetz and Frederick Charles pursued Bazaine, defeated him at Courcelles on 14 August, at Mars-la-Tour on the 16th, at Gravelotte with awful slaughter on the

18th, and shut him up in Metz. The crown prince and his army following MacMahon, advanced to Nancy; there reinforced by a newly formed army under the crown prince of Saxony, they advanced on Châlons, where MacMahon's army had been reorganized and strengthened, and was expected to retreat on Paris. Following instructions, however, MacMahon moved northward to make a descent upon Metz and relieve Bazaine. He was overtaken near Beaumont, and on 27 August and on the days immediately succeeding a number of engagements and strategic movements resulted in MacMahon's army being surrounded at Sedan on 1 September, by a force of overwhelming numbers. On the following day both army and fortress were forced to capitulate. Forty generals, 4,000 officers of all grades, and 84,000 soldiers became prisoners of war. Among the prisoners was Napoleon III., who was unexpectedly found to have been present with the army of MacMahon. On the day after the battle he had a personal interview with King William of Prussia, who assigned to him Wilhelmshöhe, near Cassel, as a place of residence during his captivity.

At the news of this disastrous defeat the Parisians in an outburst of rage demanded the dethronement of the Napoleon dynasty, and on 4 September a republic was proclaimed. A government of national defense presided over by Gen. Trochu, military governor of Paris, was formed, but before any effective measures could be adopted Paris was invested by the Germans on 19 September. A day or two before a delegation from the central government had escaped from Paris and established themselves at Tours, where they were joined on 9 October by Gambetta, who escaped from Paris by balloon. It was some time before the French were able to organize a new army, and in the meantime, 27 September, Strasburg fell into German hands and on 28 October Metz, which had been invested by the second German army under Prince Frederick Charles, capitulated. By the beginning of November war in the open field had been resumed at various points: in the north, in the southeast, and on the Loire in the neighborhood of Orleans. The army of the Loire, under Gen. Aurelle de Paladines, compelled the Germans to evacuate Orleans on 7 November, but was unable to follow up this temporary success, and on 4 December and on 12 January was severely defeated by Prince Frederick Charles. The army of the north, under Gen. Faidherbe, which had been hastily formed to attempt the relief of Paris, after many gallant attempts which were checked by the first German army under Gen. Manteuffel, was finally defeated at St. Quentin on 19 January. In the east and southeast the results were equally disastrous to the French. Gen. Werder defeated the French troops under Cambriels in the Vosges, the irregular forces under Garibaldi in Burgundy, and at Héricourt on the Lisaine on 15, 16 and 17 January kept in check the army of Bourbaki until the approach of Manteuffel compelled Bourbaki and 84,000 troops to escape into Switzerland, where they were disarmed and remained till the conclusion of the war. Meanwhile Paris had held out for a much longer period than even the most sanguine on the side of the French had expected. Desperate sallies were frequently made, but not in sufficient strength to have any decisive effect. On the failure of the last sally on 19 January, Gen. Trochu resigned and was succeeded by Leflô as head of the government of defense, and by Gen. Vinoy as commander of the troops of Paris. But by this time the city was at the point of starvation, and after a three weeks' bombardment was in such a desperate condition that the government could no longer help seeing that a capitulation was inevitable. The terms were settled on 28 January, the chief being that all the forts around Paris should be immediately handed over to the Germans, and that the city should pay a contribution of 200,000,000 francs ($40,000,000). An armistice of three weeks was at the same time concluded, to allow of the election and assembling of a National Assembly to decide upon war and peace. This armistice, however, was not to extend to the scene of war in the southeast until a separate arrangement had been made regarding it. Here the fortress of Belfort still held out, but at last, on 16 February, it agreed to capitulate. The garrison, on account of its gallant defense, was allowed to march out with full military honors. On the same day the armistice became general. The fortress of Bitsch in the department of Moselle, did not surrender till after the conclusion of the preliminaries of peace.

The elections for the assembly had taken place on the 8th; it met at Bordeaux, and on the 17th appointed M. Thiers head of the executive; and on the 21st he arrived at Versailles with a diplomatic commission to negotiate for peace. After the armistice had been thrice prolonged the preliminaries of peace were signed at Versailles on 26 February, and accepted by the assembly at Bordeaux on 1 March. On the same day the German troops entered Paris; on 18 January King William, who had taken up his residence at Versailles, had by acclamation been proclaimed Emperor of Germany. The principal terms of peace were: (1) That France should cede to Germany one fifth part of Lorraine, including Metz, together with the whole of Alsace except Belfort and the surrounding district. (2) That France should pay to Germany a war indemnity of 5,000,000,000 francs ($1,000,000,000). (3) That certain departments of France should remain in the occupation of the Germans, and should not be fully evacuated until after the payment of the whole indemnity. The definitive treaty of peace, which was signed at Frankfort on 10 May and ratified on the 21st, confirmed in all essential particulars the preliminaries of Versailles. The last instalment of the war indemnity was paid on 5 Sept. 1873, and France was completely evacuated by the Germans on the 13th of the same month.

François, Kurt von, koort fōn frän-swä, German explorer: b. Grand-duchy of Luxembourg 2 Oct. 1853. After active service in the Franco-Prussian war, he joined, with the rank of lieutenant, the Wissmann expedition to explore the river Kassai, a tributary of the Congo, and subsequently published his work 'In the Interior of Africa, the exploration of the Cassai, during 1883–5' (1891). He then explored with Grenfell two southern tributaries of the Congo and published his 'Exploration of the Tschuapa and Lulongo' (1888). He was on his return promoted to be leader of an expedition which

the government despatched to the German colony of Togo, and 1890–1 accompanied the military expedition into South Africa and in 1892 traversed the Kalahari Desert.

François, Luise von, German novelist: b. Herzburg, Saxony, 27 June 1817; d. Weissenfels 24 Sept. 1893. Her first considerable story, 'The Last Reckenburgerin' (1871), was very warmly praised by the critics for its power in character delineation; it was followed by: 'Frau Erdmuthen's Twin Boys' (1872); 'Climacteric Years of a Lucky Fellow' (1877); 'Judith the Housekeeper' (1868), a peasant counterpart to 'The Last Reckenburgerin,' and next after that her best story. She wrote a 'Popular History of the Prussian War of Liberation, 1813–15'; and a comedy, 'Woman's Station' (1882).

Fran'colins, a genus of small partridges of Africa and southern Asia, much resembling the American bobwhite in behavior. One species (*Francolinus vulgaris*) used to be common in the south of Europe, but has been exterminated.

Franco'nia, Germany, a district lying to the east of the Rhine, and traversed by the Main. After the dismemberment of the Carlovingian empire this district became attached to the German division, and ultimately formed one of the grand-duchies of Germany. Between 1024 and 1125 it furnished a series of emperors to Germany. (See GERMANY, *History*.) It was one of the ten circles into which the empire was divided by Maximilian I. in 1512. Its capital was Nuremberg. In 1806 it was partitioned among Würtemberg, Baden, Hesse-Cassel, the Saxon duchies, and Bavaria. The last received the largest share, and still retains the name in the three circles of Upper, Middle, and Lower Franconia. (1) Upper Franconia has an area of 2,702 square miles and pop. (1900) 607,903. Baireuth is the capital. (2) Middle Franconia has an area of 2,925 square miles and pop. (1900) 815,556. The capital is Anspach. (3) Lower Franconia has an area of 3,243 square miles and pop. (1900) 650,758. Würzburg is the capital. The name of Franconia has been rendered familiar to the traveler and the geologist by its picturesque scenery, which has procured for part of it the name of Franconian Switzerland, and by its caverns, filled with fossil bones, among the most remarkable of which is König Ludwig's Höhle (King Louis' Cave), between Baireuth and Muggendorf.

Franconia Mountains. See WHITE MOUNTAINS.

Fran'gula, the bark of *Rhamnus Frangula,* used in medicine as a purgative.

Fran'gulin ($C_{20}H_{20}O_{10}$), a dyestuff extracted from the root, bark, fruit, and seed of the alder buckthorn (*Rhamnus frangula*). It is a bright yellow, silky, crystalline mass, without taste or smell, which fuses on heating, and can be sublimed in golden needles. It is not soluble in water, and though soluble in hot alcohol separates very completely on cooling. It dissolves in alkalies with a purple color, and is decomposed by sulphuric acid with a succession of colors. It forms lakes with metallic hydrates, and dyes silk, wool, and cotton. In its chemical constitution it is a glucoside, and it is probably the same as *cascara sagrada.*

Frank, Jakob, yä'kōb fränk (properly **Lebowicz**), Jewish pseudo-Messiah: b. Galicia 1720; d. 10 Dec. 1791. The name Frank was obtained during travel in the east from the Turks, who employed the word as a generic term for an European. Originally a distiller, he settled, after his eastern journey, in Podolia, where he professed himself a second Messiah, basing his teachings, in opposition to the Talmud, on the Sohar, the source of the Cabbala. He finally removed to Offenbach, where he lived regally on the gifts of adherents, and finally became a Roman Catholic. His death by apoplexy broke down popular belief in his immortality. The sect of Frankists persists in Poland, Turkey, and Moldavia, its tenets being a Judaized form of the Roman Catholic faith.

Frank, Royal Thaxter, American military officer: b. Gray, Maine, 6 May 1836. He was graduated at the United States Military Academy in 1864, and during the Civil War was brevetted major and lieutenant-colonel for bravery at Fredericksburg, 13 Dec. 1862. He was in command of the Artillery School at Fortress Monroe 1888–98, and was promoted brigadier-general in 1898.

Frank'enstein, or the Modern Prometheus, a psychological romance, by Mary Wollstonecraft Shelley (daughter of Mary Wollstonecraft Godwin and wife of the poet Shelley), published in 1817. It has a morbid power which makes it one of the most remarkable books of its kind in English. Frankenstein conceives the idea of creating by mechanical means a living being, who, independent of the ills of the flesh, shall be immortal. Like Prometheus of old, he hopes to bring down a vital spark from heaven to animate the human frame. After a long series of laboratory experiments, in which he sees himself gradually approaching his goal, he succeeds. But his creation turns out to be not a blessing but a curse. He has made a soulless monster, who will implacably pursue Frankenstein and all his loved ones to the dire end. In vain the unhappy scientist flees from land to land, and from sea to sea. The fiend he has brought into existence is ever on his track, and is the evil genius of his whole family. Finally, in an ice-bound sea, worn out by his hideous experiences, he dies, and over his dead body hovers the horrid shape of the man-machine. The monster then leaps over the ship's side, and disappears in the ice and mist.

Frankfort, Ind., city, county-seat of Clinton County; on the Louisville, N. A. & C., the L. E. & W., the St. L. & K. C., and the Vandalia R.R.'s; about 40 miles northwest of Indianapolis, and 91 miles southwest of Fort Wayne. It is in an agricultural section, and its chief manufactures are flour, crackers, lumber, tiles, bricks, agricultural implements, and some furniture. Natural gas is used extensively for light and heat. The trade is chiefly in the manufactured articles and grain, fruits, and vegetables. The city has a fine public library and a well organized system of public schools. The electric-light plant is owned by the city. Pop. (1900) 7,100.

Frankfort, Ky., city, capital of the State of Kentucky, county-seat of Franklin County; on the Kentucky River, the Chesapeake & O., and the L. & N. R.R.'s; about 50 miles east of Louisville and 65 miles southwest of Cincinnati. The city was founded by Gen. James Wilkinson (q.v.) in 1786, and for a time it was

made the seat of his intrigues when he was trying to detach Kentucky from the Union and affiliate it with Spain. When Kentucky was admitted as a State in 1792, Frankfort was made the capital. During the Civil War it was for a time the headquarters of the Confederate forces under Braxton Bragg (q.v.). On 4 Oct. 1862 Richard Harves was inaugurated here as the Confederate governor of Kentucky. In 1900 there was great excitement in Frankfort as to who was elected governor of the State. It was decided that William Goebel was the governor-elect. In the midst of the agitation Goebel was assassinated. Frankfort owes much of its present prosperity to its location in the "Blue Grass" section of the State. Its chief manufactures are flour, whiskey, lumber, carriages, twine, shoes, furniture. The city is the trade centre for an extensive region; the river is navigable and by artificial means it is made to furnish a large amount of water power. The city contains the State arsenal, a State Home for Feeble-Minded Children, the State penitentiary, the State Normal School for colored pupils, and Saint Joseph's Academy. The State government buildings and the State library with over 100,000 volumes add to the interests of the city. Franklin cemetery contains the grave of Daniel Boone (q.v.) and other noted men connected with the history of Kentucky. Pop. (1900) 9,487.

Frank'fort-on-the-Main, mān, Prussia, the capital of a district of same name, on the Main, 20 miles above its conflux with the Rhine. It is divided by the river into two unequal parts; the one on the north bank, called Frankfort proper, being considerably larger than the other, which is called Sachsenhausen; and the two communicate by a stone bridge. Frankfort was formerly fortified; but most of its outworks are now converted into gardens and promenades, and it is entered by nine gates. The principal streets are wide; there are also many squares and a number of large buildings; among which may be named the Rœmerberg, or old palace, in which the emperors of Germany were elected, and place of the assembling of the Diet; the Taxis palace, a place of residence of the emperors; the Sallhof, a modern imperial palace; an academy of painting, and the Senkenberg Museum. Its manufactures include carpets, table-covers, oil-cloths, cotton and silk fabrics, woolen stuffs, jewelry, tobacco and printer's black. It has also large printing, lithographic and stereotyping establishments. Frankfort was founded by the Franks in the 5th century. Charlemagne, who had a palace in this city, summoned a council in 794, and it was surrounded with walls by Louis I. in 838. It was the capital of the Eastern Franks from 843 to 889, when Ratisbon was selected. Frederick I. was elected at Frankfort in 1152. From that time it became the place of election of the emperors. Frankfort was made a free city in 1257. The bridge over the Main was built in 1342. Frederick of Prussia signed a treaty known as the Union of Frankfort, with the empire, France, and Sweden, at this city 13 May 1744. The French captured it 2 Jan. 1750, and again in 1792; but the Prussians wrested it from them 2 Dec. 1792. It was bombarded by the French 12 July, and surrendered 19 July 1796. It formed part of the Confederation of the Rhine in 1806. Napoleon I. erected Frankfort into a duchy in 1810. The Declaration of the Allied Powers was issued at Frankfort 1 Dec. 1813. By the Congress of Vienna, in 1815, it was made one of the four free cities of Germany, and the seat of the Germanic Diet. It was made a free port in 1831. The constituent assembly, elected in 1848, held its sittings at Frankfort. It was occupied by the Prussians 16 July 1866, and is now incorporated with Prussia. Pop. (1900) 288,489.

Frankfort-on-the-Oder, Prussia, the capital of a district of the same name, province of Brandenburg, 48 miles from Berlin. Its university, founded in 1506, was in 1811 transferred to Breslau. Manufactures are woolens, silks, leather, earthen-ware, tobacco, mustard, etc. Near it is Kunersdorf, the scene of the victory of the Austrians and Russians over Frederick the Great (q.v.) in 1759. Pop. (1900) 61,835. The district has an area of 8,000 square miles, with a population of 1,000,000.

Frankfort Black, a fine black pigment used in copper plate engraving. It is said to be made by burning, in the manner of ivory black, the lees of wine from which the tartar has been washed.

Frankfort Land Company, 1686. Francis Daniel Pastorius, an able young German lawyer, had joined the sect of Pietists (q.v.), and to escape from the atmosphere of Lutheranism, concerted with his co-religionists an emigration to America. A number of wealthy and distinguished Germans and Dutchmen were induced to join; but they soon gave up the idea of emigrating themselves, and wished Pastorius instead to head a colony of German and Dutch Mennonites and Quakers to a land where they need not be harried. Pastorius had made Penn's acquaintance in England, had become a Quaker, and wished to be near Penn; some Crefeld merchants bought from Penn 15,000 acres near Philadelphia, and in 1683 Pastorius conducted a colony thither, and at once laid out Germantown (q.v.). In 1686 the Frankfort Land Company was organized, and bought 25,000 acres more.

Frankincense, frank'ĭn-sĕns (O. F. *franc encens;* Mod. Lat. *francum incensum*), a name given to various oleo-resinous substances. The frankincense employed in religious ceremonies (called also *incense* and *olibanum*) is a gum resin obtained from *Boswellia thurifera* (or *serrata*), a tree somewhat resembling the sumach, belonging to the *Amyridaceæ*, and inhabiting the mountains of India. The frankincense so highly prized by the Greeks, Romans and Jews was probably chiefly of this variety. Substances derived from other trees, such as Croton and Protium, are frequently employed as substitutes for *olibanum.* American turpentine, from which Burgundy pitch is obtained by melting and straining through a cloth, is frequently called frankincense. The frankincense familiar to pharmacy is procured from the European silver fir.

Franking Privilege, that of sending postal matter gratis. In England peers and members of the House of Commons had it till 1840, and till 1837 could also frank their friends' letters wholesale, and even leave franks with them to use at will. In the United States it was first accorded to Revolutionary soldiers in actual service; then to the executive body, chiefs of departments and bureaus, and some special clerks;

and all public documents were franked. Senators and Congressmen, postmasters for official correspondence, also had it; likewise newspaper exchanges and petitions to Congress; and later, exchanges of the Smithsonian institutions, and medals and testimonials to soldiers. The first four presidents had it for life, and it has been granted to the widows of ex-presidents. It was totally abolished from 30 June 1873, an allowance of stamps being made to the departments; but restored a few years later for public documents, seeds to constituents, etc. There is a penalty of $300 for unlawful use of envelopes marked "official business."

Frankl, Ludwig August, lood'vĭg ow'goost fränkl, Chevalier von Hochwart, Austrian poet: b. Chrast, Bohemia, 3 Feb. 1810; d. Vienna 14 March 1894. His literary début was made with 'A Lay of Hapsburg' (1832), a series of historical ballads, followed (1836) by the romantic epic 'Christopher Columbus'; the biblical romantic poem 'Rachel' (1842); a poem 'The University' (1848), the first publication in Austria not subjected to the official censorship; 'Don John of Austria,' a heroic poem (1846); 'Lyric Poems,' and 'Epic and Lyric Poetry.'

Frank'land, Sir **Edward,** English chemist: b. Churchtown, England, 18 Jan. 1825; d. Norway 11 Aug. 1899. He made the discovery of the union of organic radicles with metals, announcing in 1850 the preparation of compounds of zinc with methyl and ethyl. From this he deduced the conclusion that an atom of the metal could only attach itself to a definite number of the atoms of other elements, which discovery led to the theory of "equivalents." He was appointed professor of chemistry at Owens College, Manchester, in 1851, and there developed the process of making water gas. Becoming professor of chemistry in the Royal School of Mines in 1865 he turned his attention to water analysis, the purification of sewage and the means of preventing pollution. Subsequently he proved that compressed gases are capable of giving out a flame of constant spectrum, from which he concluded that the photosphere of the sun was atmospheric. He also investigated the chemistry of foods. He published 'Experimental Researches on Pure, Applied and Physical Chemistry' (1878); 'Water Analysis for Sanitary Purposes' (1880).

Frankland, Percy Faraday, English chemist: b. London 3 Oct. 1858. He is a son of E. Frankland (q.v.). In 1880 he became demonstrator and lecturer on chemistry at the School of Mines, a post which he held till his appointment in 1888 as professor of chemistry in University College, Dundee. In 1894 he became professor of chemistry in Mason College, Birmingham. His published works, which deal mostly with micro-chemistry, the chemistry of fermentation and bacteriology, include 'Agricultural Chemical Analysis' (1883); 'Our Secret Friends and Foes' (1894, on micro-organisms); 'Micro-organisms in Water' (1894); 'Life of Pasteur' (1897); and many lectures and papers in the transactions of various societies. In several of his works he has been assisted by his wife, the sister of the philanthropist Arnold Toynbee (q.v.).

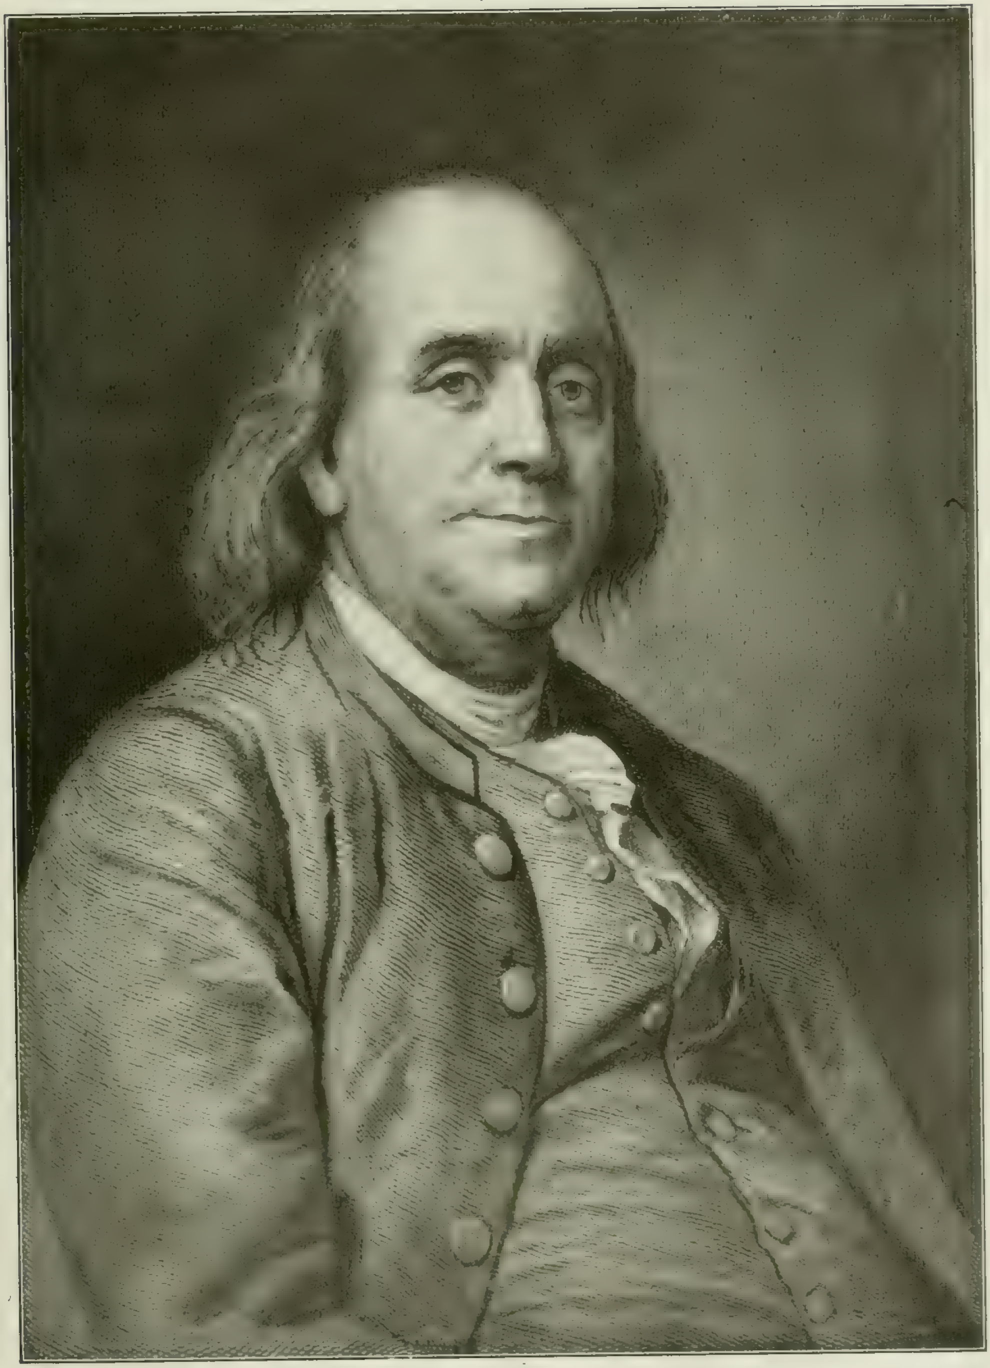
Franklin, Benjamin, American statesman and philosopher: b. Boston, Mass., 17 Jan. 1706; d. Philadelphia, Pa., 17 April 1790. The youngest son of the 17 children of a Boston tallow-chandler named Franklin was born a subject of Queen Anne of England, and on the same day received the baptismal name of Benjamin at the Old South Church in that city. He continued for more than 70 of the 84 years of his life a subject of four successive British monarchs. During that period, neither Anne nor either of the three Georges who succeeded her had a subject of whom they had more reason to be proud, nor one whom at his death their people generally supposed they had more reason to detest. No Englishman of his generation can now be said to have established a more enduring fame, in any way, than Franklin established in many ways. As a printer, as a journalist, as a diplomatist, as a statesman, as a philosopher, he was easily first among his peers.

On the other hand, it is no disparagement of the services of any of his contemporaries on either side of the Atlantic, to say that no one of his generation contributed more effectually to the dissolution of the bonds which united the principal British-American colonies to the mother country, and toward conferring upon them independence and a popular government.

As a practical printer Franklin was reported to have had no superiors; as a journalist he exerted an influence not only unrivaled in his day, but more potent, on this continent at least, than either of his sovereigns or their parliaments. The organization of a police, and later of the militia, for Philadelphia; of companies for extinguishing fires; making the sweeping and paving of the streets a municipal function; the formation of the first public library for Philadelphia, and the establishment of an academy which has matured into the now famous University of Pennsylvania, were among the conspicuous reforms which he planted and watered in the columns of the Philadelphia *Gazette*. This journal he founded; upon the earnings of it he mainly subsisted during a long life, and any sheet of it to-day would bring a larger price in the open market probably than a single sheet of any other periodical ever published.

Franklin's Almanack, his crowning work in the sphere of journalism, published under the pseudonym of "Richard Saunders,"— better known since as Poor Richard,— is still one of the marvels of modern literature. Under one or another of many titles the contents of this publication, exclusive of its calendars, have been translated into every tongue having any pretensions to a literature; and have had more readers, probably, than any other publication in the English or indeed in any other language, with the single exception of the Bible. It was the first issue from an American press that found a popular welcome in foreign lands, and it still enjoys the special distinction of being the only almanac ever published that owed its extraordinary popularity entirely to its literary merit.

What adds to the surprise with which we contemplate the fame and fortunes of this unpretentious publication, is the fact that its reputation was established by its first number, and when its author was only 26 years of age. For a period of 26 years, and until Franklin ceased to edit it, this annual was looked forward to by a larger portion of the colonial population and with more impatience than now awaits a President's annual message to Congress.



BENJAMIN FRANKLIN.

Franklin graduated from journalism into diplomacy as naturally as winter glides into spring. This was simply because he was by common acclaim the fittest man for any kind of public service the colony possessed, and especially for any duty requiring talents for persuasion, in which he proved himself to be unquestionably past master among the diplomatists of his time.

The question of taxing the Penn proprietary estates in Pennsylvania, for the defense of the province from the French and Indians, had assumed such an acute stage in 1757 that the Assembly decided to petition the king upon the subject; and selected Franklin, then in the 41st year of his age, to visit London and present their petition. The next 41 years of his life were practically all spent in the diplomatic service. He was five years absent on this his first mission. Every interest in London was against him. He finally surmounted all obstacles by a compromise, which pledged the Assembly to pass an act exempting from taxation the unsurveyed lands of the Penn estate,— the surveyed waste lands, however, to be assessed at the usual rate. For his success the Penns and their partisans never forgave him, and his fellow colonists never forgot him.

Franklin returned to Philadelphia in 1762, but not to remain. The question of taxing the colonies without representation was soon thrust upon them in the shape of a stamp duty, and Franklin was sent out again to urge its repeal. He reached London in November 1764, where he remained the next 11 years and until it became apparent that the surrender of the right to arbitrarily tax the colonies would never be made by England during the life of the reigning sovereign, George III. Satisfied that his usefulness in England was at an end, he sailed for Philadelphia 21 March 1775; and on the morning of his arrival was elected by the Assembly of Pennsylvania a delegate to the Continental Congress which consolidated the armies of the colonies, placed Gen. George Washington in command of them, issued the first Continental currency, and assumed the responsibility of resisting the imperial government; his last hope of maintaining the integrity of the empire having been dissipated by recent collisions between the people and the royalist troops at Concord and Lexington. Franklin served on 10 committees in this Congress. He was one of the five who drew up the Declaration of Independence in July 1776, and in September following was chosen unanimously as one of the three commissioners to be sent out to solicit for the infant republic the aid of France and the sympathies of continental Europe. In this mission, the importance of which to his country can hardly be exaggerated, he was greatly favored by the reputation which had preceded him as a man of science. While yet a journalist he had made some experiments in electricity, which established its identity with lightning. The publication by an English correspondent of the letters in which he gave an account of these experiments, secured his election as an honorary member of the Royal Society of London and undisputed rank among the most eminent natural philosophers of his time. When he arrived in Paris, therefore, he was already a member of every important learned society in Europe, one of the managers of the Royal Society of London, and one of the eight foreign members of the Royal Academy in Paris, where three editions of his scientific writings had already been printed. To these advantages must be added another of even greater weight: his errand there was to assist in dismembering the British empire, than which nothing of a political nature was at this time much nearer every Frenchman's heart.

The history of this mission, and how Franklin succeeded in procuring from the French king financial aid to the amount of 26,000,000 francs, at times when the very existence of the republic depended upon them, and finally a treaty of peace more favorable to his country than either England or France wished to concede, has been often told; and there is no chapter in the chronicles of this republic with which the world is more familiar.

Franklin's reputation grew with his success. «It was,» wrote his colleague John Adams, «more universal than that of Leibnitz or Newton, Frederick the Great or Voltaire, and his character more beloved and esteemed than all of them. . . . If a collection could be made of all the gazettes of Europe for the latter half of the 18th century, a greater number of panegyrical paragraphs upon *le grand Franklin* would appear, it is believed, than upon any other man that ever lived.»

A few weeks after signing the definitive treaty of peace in 1783, Franklin renewed an application which he had previously made just after signing the preliminary treaty, to be relieved of his mission, but it was not until 7 March 1785 that Congress adopted a resolution permitting «the Honorable Benjamin Franklin to return to America as soon as convenient.» Three days later, Thomas Jefferson was appointed to succeed him. On 13 Sept. 1785, and after a sojourn of nearly nine years in the French capital, first in the capacity of commissioner and subsequently of minister plenipotentiary, Franklin once more landed in Philadelphia, on the same wharf on which, 62 years before, he had stepped, a friendless and practically penniless runaway apprentice of 17. Though now in his 79th year, and a prey to infirmities not the necessary incidents of old age, he had scarcely unpacked his trunks after his return when he was chosen a member of the municipal council of Philadelphia, and its chairman. Shortly after, he was elected president of Pennsylvania, his own vote only lacking to make the vote unanimous. «I have not firmness,» he wrote to a friend, «to resist the unanimous desire of my country folks; and I find myself harnessed again into their service another year. They engrossed the prime of my life; they have eaten my flesh, and seem resolved now to pick my bones.»

He was unanimously re-elected to this dignity for the two succeeding years, and while holding that office was chosen a member of the convention which met in May 1787 to frame the Constitution under which the people of the United States are still living. With the adoption of that instrument, to which he probably contributed as much as any other individual, he retired from official life; though not from the service of the public, to which for the remaining years of his stay on earth his genius and his talents were faithfully consecrated. Among the fruits of that unfamiliar leisure, always to be remembered among the noblest achievements of his illustrious career, was the part he had in

organizing the first anti-slavery society in the world; and as its president, writing and signing the first remonstrance against slavery ever addressed to the Congress of the United States.

In surveying the life of Dr. Franklin as a whole, the thing that most impresses one is his constant study and singleness of purpose to promote the welfare of human society. It was his daily theme as a journalist, and his yearly theme as an almanac-maker. It is that which first occurs to us when we recall his career as a member of the Colonial Assembly; as an agent of the provinces in England; as a diplomatist in France; and as a member of the conventions which crowned the consistent labors of his long life. Nor are there any now so bold as to affirm that there was any other person who could have been depended upon to accomplish for his country or the world what Franklin did in any of the several stages of his versatile career.

Though holding office for more than half of his life, the office always sought Franklin, not Franklin the office. When sent to England as the agent of the colony, he withdrew from business with a modest competence judiciously invested mostly in real estate. He never seems to have given a thought to its increase. Frugal in his habits, simple in his tastes, wise in his indulgences, he died with a fortune neither too large nor too small for his fame as a citizen or a patriot. For teaching frugality and economy to the colonists, when frugality and economy were indispensable to the conservation of their independence and manhood, he has been sneered at as the teacher of a "candle-end-saving philosophy," and his 'Poor Richard' as a "collection of receipts for laying up treasures on earth rather than in heaven." Franklin never taught, either by precept or example, to lay up treasures on earth. He taught the virtues of industry, thrift, and economy, as the virtues supremely important in his time, to keep people out of debt and to provide the means of educating and dignifying society. He never countenanced the accumulation of wealth for its own sake, but for its uses,— its prompt convertibility into social comforts and refinements. It would be difficult to name another man of any age to whom an ambition to accumulate wealth as an end could be imputed with less propriety. Though probably the most inventive genius of his age, and thus indirectly the founder of many fortunes, he never asked a patent for any of his inventions or discoveries. Though one of the best writers of the English language that his country has yet produced, he never wrote a line for money after he withdrew from the calling by which he made a modest provision for his family.

For the remaining half of his life both at home and abroad, though constantly operating upon public opinion by his pen, he never availed himself of a copyright or received a penny from any publisher or patron for any of these labors. In none of the public positions which he held, even when minister plenipotentiary, did his pay equal his expenditures. He was three years president of Pennsylvania after his return from France, and for his services declined to appropriate to his own use anything beyond his necessary expenditures for stationery, postage, and transportation. It is not by such methods that men justly incur the implied reproach of "laying up treasures on earth," or of teaching a candle-end-saving philosophy.

Franklin courted fame no more than fortune. The best of his writings, after his retirement from journalism, he never gave to the press at all; not even his incomparable autobiography, which is still republished more frequently than any of the writings of Dickens or of Thackeray. He always wrote for a larger purpose than mere personal gratification of any kind. Even his bagatelles and *jeux d'esprit* read in the salons of Paris, though apparently intended for the eyes of a small circle, were inspired by a desire to make friends and create respect for the struggling people and the great cause he represented. Few if any of them got into print until many years after his decease. Franklin was from his youth up a leader, a lion in whatever circle he entered, whether in the printing-house, the provincial assemblies, as agent in England, or as a courtier in France. There was no one too eminent in science or literature, on either side of the Atlantic, not to esteem his acquaintance a privilege. He was an honorary member of every important scientific association in the world, and in friendly correspondence with most of those who conferred upon those bodies any distinction; and all this by force of a personal, not to say planetary, attraction that no one brought within his sphere could long resist.

Pretty much all of importance that we know of Franklin we gather from his private correspondence. His contemporaries wrote or at least printed very little about him; scarcely one of the multitude whose names he embalmed in his 'Autobiography' ever printed a line about him. All that we know of the later half of his life not covered by his autobiography, we owe almost exclusively to his private and official correspondence. Though reckoning among his warm friends and correspondents such men as David Hume, Dr. Joseph Priestley, Dr. Price, Lord Kames, Lord Chatham, Dr. Fothergill, Peter Collinson, Edmund Burke, the bishop of St. Asaph and his gifted daughters, Voltaire, the habitués of the Helvétius salon, the Marquis de Ségus, the Count de Vergennes, his near neighbors De Chaumont and Le Veillard, the *maire* of Passy,— all that we learn of his achievements, of his conversation, of his daily life, from these or many other associates of only less prominence in the Old World, might be written on a single foolscap sheet. Nor are we under much greater obligations to his American friends. It is to his own letters (and except his 'Autobiography,' he can hardly be said to have written anything in any other than the epistolary form; and that was written in the form of a letter to his son William, and most of it only began to be published a quarter of a century after his death) that we must turn to learn how full of interest and importance to mankind was this last half-century of his life. Beyond keeping copies of his correspondence, which his official character made a duty as well as a necessity, he appears to have taken no precautions to insure the posthumous fame to which his correspondence during that period was destined to contribute so much. Hence, all the biographies — and they are numberless — owe almost their entire interest and value to his own pen. All, so far as they are biographies,

are autobiographies; and for that reason it may be fairly said that all of them are interesting.

It is also quite remarkable that though Franklin's life was a continuous warfare, he had no personal enemies. His extraordinary and even intimate experience of every phase of human life, from the very lowest to the very highest, had made him so tolerant that he regarded differences of opinions and of habits much as he regarded the changes of the weather,—as good or bad for his purposes, but which, though he might sometimes deplore, he had no right to quarrel with or assume personal responsibility for. Hence he never said or did things personally offensive. The causes that he represented had enemies, for he was all his life a reformer. All men who are good for anything have such enemies. "I have, as you observe," wrote Franklin to John Jay the year that he retired from the French mission, "some enemies in England, but they are my enemies as an American; I have also two or three in America who are my enemies as a minister; but I thank God there are not in the whole world any who are my enemies as a man: for by his grace, through a long life, I have been enabled so to conduct myself that there does not exist a human being who can justly say, 'Ben Franklin has wronged me.' This, my friend, is in old age a comfortable reflection. You, too, have or may have your enemies; but let not that render you unhappy. If you make a right use of them, they will do you more good than harm. They point out to us our faults; they put us upon our guard and help us to live more correctly."

Franklin's place in literature as a writer has not been generally appreciated, probably because with him writing was only a means, never an end, and his ends always dwarfed his means, however effective. He wrote to persuade others, never to parade his literary skill. He never wrote a dull line, and was never *nimious*. The longest production of his pen was his autobiography, written during the closing years of his life. Nearly all that he wrote besides was in the form of letters, which would hardly average three octavo pages in length. And yet whatever the subject he touched upon, he never left the impression of incompleteness or of inconclusiveness. Of him may be said, perhaps with as much propriety as of any other man, that he never said a word too soon, nor a word too late, nor a word too much.

The Doric simplicity of his style; his incomparable facility of condensing a great principle into an apologue or an anecdote, many of which, as he applied them, have become the folk-lore of all nations; his habitual moderation of statement, his aversion to exaggeration, his inflexible logic, and his perfect truthfulness,—made him one of the most persuasive men of his time, and his writings a model which no one can study without profit. A judicious selection from Franklin's writings should constitute a part of the curriculum of every college and high school that aspires to cultivate in its pupils a pure style and correct literary taste.

There was one incident in Franklin's life, which, though more frequently referred to in terms of reproach than any other, will probably count for more in his favor in the Great Assize than any other of his whole life. While yet in his teens he became a father before he was a husband. He never did what men of the loftiest moral pretensions not unfrequently do,—shirk as far as possible any personal responsibility for his indiscretion. On the contrary, he took the fruit of it to his home; gave him the best education the schools of the country then afforded. When he went abroad, this son accompanied him, was presented as his son wherever he went, was presented in all the great houses in which he himself was received; he entered him at the Inns of Court, and in due time had him admitted to the English bar; made him his private secretary, and at an early age caused him to be appointed by the Crown governor of New Jersey. The father not only did everything to repair the wrong he had done his son, but at a time when he was at the zenith of his fame and official importance, publicly proclaimed it as one of the great errors of his life. The world has always abounded with bastards, but with the exception of crowned heads claiming to hold their sceptres by divine right, and therefore beyond the reach of popular criticism or reproach, it would be difficult to name another parent of his generation of anything like corresponding eminence with Franklin, who had the courage and the magnanimity to expiate such a wrong to his offspring so fully and effectively.

Franklin was not a member of the visible Church, nor did he ever become the adherent of any sect. With the Unitarian creed Dr. Franklin had more in common than with any other, though he was much too wise a man to suppose that there was but one gate of admission to the Holy City.

Franklin made a somewhat more definite statement of his views on the subject of religion, in reply to an inquiry from President Styles of Yale College, who expressed a desire to know his opinion of Jesus of Nazareth. Franklin's reply was written the last year of his life, and in the 84th of his age:

"You desire to know something of my religion. It is the first time I have been questioned upon it. But I cannot take your curiosity amiss, and shall endeavor in a few words to gratify it. Here is my creed. I believe in one God, the creator of the universe. That he governs it by his providence. That he ought to be worshipped. That the most acceptable service we render to him is doing good to his other children. That the soul of man is immortal, and will be treated with justice in another life respecting its conduct in this. These I take to be the fundamental points in all sound religion, and I regard them as you do in whatever sect I meet with them.

"As to Jesus of Nazareth, my opinion of whom you particularly desire, I think his system of morals and his religion, as he left them to us, the best the world ever saw or is like to see; but I apprehend it has received various corrupting changes, and I have, with most of the present Dissenters in England, some doubts as to his divinity; though it is a question I do not dogmatize upon, having never studied it, and think it needless to busy myself with it now, when I expect soon an opportunity of knowing the truth with less trouble. I see no harm, however, in its being believed, if that belief has the good consequence, as probably it has, of making his doctrines more respected and more observed; especially as I do not per-

ceive that the Supreme takes it amiss, by distinguishing the unbelievers in his government of the world with any peculiar marks of his displeasure.

"I shall only add, respecting myself, that, having experienced the goodness of that Being in conducting me prosperously through a long life, I have no doubt of its continuance in the next, though without the smallest conceit of meriting such goodness. My sentiments on this head you will see in the copy of an old letter enclosed, which I wrote in answer to one from an old religionist whom I had relieved in a paralytic case by electricity, and who, being afraid I should grow proud upon it, sent me his serious though rather impertinent caution."

JOHN BIGELOW.

Franklin, Fabian, American mathematician and editor: b. Eger, Hungary, 18 Jan. 1853. After his graduation from Columbian University, Washington, in 1869, he engaged in civil engineering and surveying. In 1877 he became a fellow at Johns Hopkins University, and his advance to the associate and then full professorship of mathematics quickly followed. During his connection with Johns Hopkins, which lasted until 1895, he was a frequent contributor to mathematical and other journals. In 1895 he became editor of the Baltimore 'News.'

Franklin, SIR **John,** English navigator: b. Spilsby, Lincolnshire, 16 April 1786; d. Lancaster Sound 11 June 1847. When only a boy he went to sea, and later entered the English navy. In 1806 he was present at the battle of Trafalgar, in 1814 at that of New Orleans, and in 1819 was appointed to head an overland expedition from Hudson Bay to the Arctic Ocean. After suffering many hardships and being frequently on the verge of death from hunger and fatigue, he reached home in 1822. In the following year he married a Miss Purden, the daughter of an architect, and the author of several poetical effusions. In 1825 he submitted to Lord Bathurst a plan "for an expedition overland to the mouth of the Mackenzie River, and thence by sea to the northwest extremity of America, with the combined object also of surveying the coast between the Mackenzie and Coppermine rivers." This proposition was accepted, and six days after he left Liverpool, in the same year, his wife died. In 1827 Capt. Franklin arrived at Liverpool, where he was married a second time, and in 1829 had the honor of knighthood conferred upon him. In 1845, Sir John set out on a third expedition with two ships, called the Erebus and Terror, and spent his first winter in a cove between Cape Riley and Beechey Island. After that period many expeditions were dispatched, both from England and America, in search of Sir John, of whom there were no tidings, and not till 1854 did the intelligence reach England that the navigator and his companions had, in all probability, perished in the winter of 1850-1. This intelligence, however, wanted confirmation, and Lady Franklin, who deserves all praise for the intelligent persistency of her efforts, resolved to have the mystery cleared up. Accordingly, a last expedition was fitted out, and the news was, in 1859, at length confirmed by the return of Capt. McClintock, in the yacht Fox, after a persevering search for the lost adventurers. This officer brought with him indisputable proofs of the death of Sir John and the loss of his crew. Several articles belonging to the unfortunate explorers were found at Ross Cairn and Point Victory. At the latter place a record was discovered, wherein it was stated that Sir John Franklin had died 11 June 1847. Other traces were found on the west coast of King William's Island, as the various survivors of the expedition had strayed from each other, perhaps in search of food, or the means of escaping from their dreary and desolate situations. C. F. Hall, the eminent Arctic explorer, returned in September 1869 from a five-years' search for the remains of Sir John Franklin's companions, and brought back about 150 relics of the expedition, purchased from the natives of King William's Land. It remained, however, for Lieut. Schwatka to find the bodies of the Franklin party in his expedition of 1879–80. Franklin was the author of 'Narrative of a Journey to the Shores of the Polar Sea in the Years 1819–22' (1823); 'Narrative of a Second Expedition to the Shores of the Polar Sea in 1825–27' (1828). Consult: McClintock, 'Narrative of the Fate of Sir John Franklin' (1860); Osborn, 'Career, Last Voyage and Fate of Sir John Franklin' (1860); Beesly, 'Sir John Franklin' (1881); Markham, 'Life of Sir John Franklin and the Northwest Passage' (1891); Traik, 'Life of Sir John Franklin' (1896).

Franklin, Samuel Rhoades, American naval officer: b. York, Pa., 25 Aug. 1825. In 1841 he entered the navy as acting midshipman, in 1862 became lieutenant-commander, served in the western gulf blockading squadron (1863), and as assistant to Palmer at New Orleans (1863–4), and was hydrographer to the Bureau of Navigation 1877–80. From 1884 to 1885, when he attained rear-admiral's rank, he was superintendent of the Naval Observatory, and from 1885 until his retirement in 1887 was in command of the European station. He was president of the Washington International Marine Conference (1889), and wrote 'Memoirs of a Rear-Admiral' (1898).

Franklin, William, American colonial governor: b. Philadelphia 1729; d. England 17 Nov. 1813. He was a natural son of Benjamin Franklin (q.v.). He served with the Pennsylvania forces on the Canada frontier, obtained a captain's commission before 1750, in 1754–6 was comptroller of the general post-office, and during a portion of that time clerk of the provincial assembly. He studied law in London and was admitted to the English bar in 1758. In 1762 he became governor of New Jersey. During the Revolution he was a Loyalist, and kept under guard by the patriots from January 1776. In June 1776 he called a meeting of the Colonial

Assembly, then abrogated, for which he was kept prisoner in Connecticut till 1778, when he was exchanged, and later went to England.

Franklin, William Buel, American military officer: b. York, Pa., 27 Feb. 1823; d. Hartford, Conn., 8 March 1903. He was graduated at the United States Military Academy in 1843. In the Mexican war he served on the staff of Gen. Taylor as a topographical engineer; and carried Taylor's orders at the battle of Buena Vista. At the outbreak of the Civil War he was assigned to the command of a brigade in Heintzelman's division. He took part in the battle of Bull Run, served with distinction in the Peninsular campaign and was promoted major-general in 1862. Subsequently he served under McClellan in Maryland and under Burnside at Fredericksburg, was assigned to the Department of the Gulf, under Banks, in 1863; and in 1865 was brevetted major-general in the regular army, but resigned a year later to engage in manufacturing. He was appointed United States commissioner-general to the Paris Exposition in 1899.

Franklin, William Suddards, American physicist and electrical engineer: b. Geary City, Kan., 27 Oct. 1863. He graduated from the University of Kansas in 1887, and the same year was appointed assistant professor of physics there. After studying at Harvard and Cornell and the University of Berlin, Germany, he was appointed in 1892 to the chair of physics and electrical engineering in Iowa State College, remaining there till 1897, when he received his appointment to the same chair in Lehigh University. In 1901 he was a member of the jury of awards of the Pan-American Exposition. He has written 'Elements of Physics' and 'The Elements of Alternating Currents.'

Franklin, a title bestowed upon the English landholders previous to the Norman conquest, who held their lands of the crown free from any feudal servitude. They were bound together by the Frank-pledge, by which the members of each decennary or tithing, which was comprised of 10 families, were held responsible for each other and forced to make reparation if any member committed an offense. In later years they lost their power and dignity, which was usurped by the Normans and became simply wealthy yeomen.

Franklin, Ind., city, county-seat of Johnson County; on the Pittsburg, C. C. & St. L., and the C., C., C. & St. L. R.R.'s; about 75 miles east of Terra Haute, and 16 miles south of Indianapolis. It is in an agricultural section and its chief manufactures are agricultural implements, flour and lumber. Its trade is principally in grain, flour, and boards. It is the seat of Franklin College, founded in 1834 by the Baptist Church. Pop. (1900) 4,005.

Franklin, Ky., city, county-seat of Simpson County; on the Louisville & N. R.R.; about 145 miles southwest of Lexington, and 5 miles from the boundary line between Kentucky and Tennessee. The manufactures are woolen goods, flour, bricks, and lumber. The trade is in the agricultural products of the surrounding country, and the manufactures of the town. It is the seat of the Franklin Military Institute and the Franklin Female College. Pop. (1900) 2,166.

Franklin, La., a town and parish-seat of Saint Mary Parish, 100 miles southwest of New Orleans and 30 miles west of Morgan City, on Teche Bayou, and on the Southern Pacific R.R. It is in the centre of a very fertile district, and as the bayou is navigable for steamers, the town deals in a considerable quantity of cotton, sugar, fruits, etc. There are also several saw-mills located in the town. Pop. (1900) 2,166.

Franklin, Mass., town in Norfolk County, 27 miles southwest of Boston, on the New England R.R. The town also includes the village of Unionville. Dean Academy, an endowed coeducational school, is located here, and the town also has an almshouse, a public library, and six churches. There are manufactories of pianos, straw, woolen, felt and cotton goods, an iron foundry and a canning factory. It was originally a part of the town of Wrentham, but in 1778 was separated and incorporated. The affairs of the community are administered by town meetings. Pop. (1900) 5,017.

Franklin, N. H., a city in Merrimac County, situated at the junction of the Pemigewasset and Winnepesauke rivers, which here unite to form the Merrimac, and on the Boston & M. R.R., 95 miles northwest of Boston. Owing to the abundant water power, numerous mills have located here, among which are paper and pulp mills, machine shops, wood-working shops, hosiery and knitting machine mills, woolen mills and one of the largest needle factories in the world. It is famous as the birthplace of Daniel Webster, and on the farm once owned by him now stands the New Hampshire Orphans' Home. The city owns and operates its waterworks. It was incorporated as a town in 1828 and as a city in 1895. A mayor and council administer public affairs. Pop. (1900) 5,846.

Franklin, Ohio, village in Warren County, on the Great Miami River, and the Miami and Erie Canal, 40 miles northeast of Cincinnati. There are six churches, one high and one primary schools, five paper mills, two wood pulp mills, and three large tobacco warehouses. It was founded by Gen. William Schenck in 1796. Pop. (1900) 2,724.

Franklin, Pa., a city and county-seat of Venango County, 123 miles north of Pittsburg, on the Allegheny River, at the mouth of French Creek, and on the Allegheny V., the Erie, the W. N. Y. & P, and Lake S. & M. S. R.R.'s. The chief business is in oil, as the city is in the heart of the great oil region, but there are also flour mills, planing mills, machine shops, carriage factories, brick works. The city has two beautiful parks and a public library; the streets are provided with sewers and paved with brick. Franklin was first settled in 1753, and was incorporated in 1795. The government is vested in a mayor and council elected annually. Pop. (1900) 7,317.

Franklin, Tenn., town and county-seat of Williamson County, 20 miles south of Nashville, on the Harpeth River, and on the Louisville & N. R.R. The Tennessee Female College, which was established in 1856, and the Harpeth Male Academy are located here, and there are also several public schools and a Masonic Temple. It has flour mills, a furniture

factory and a planing mill, several steam cotton gins, and carriage manufactories. It was the scene of two battles during the Civil War, the first on 10 April 1863, between the Federal forces under Gen. Granger and the Confederate forces under Gen. Van Dorn, the latter being defeated; the second on 30 Nov. 1864, between the forces of Gen. Hood and those of Gen. Schofield, and which is famous as the Battle of Franklin (q.v.). Pop. (1900) 2,180.

Franklin, State of, now Tennessee (q.v.). Fifteen years after the Watauga Association was formed (1769), and when four counties west of the present North Carolina had been organized, with some 10,000 people, that State on request of Congress ceded the district to the United States, giving it two years to accept. The inhabitants, already aggrieved at having no supreme court or militia protection, and being left to fight the Indians and keep public order without help, and now, feeling abandoned to at least two years' anarchy, decided to revolt, set up a State, and ask Congress for admission. On 23 Aug. 1784 deputies from three counties met at Jonesboro, resolved on measures, and issued an address to the people. Each county chose five representatives, which met in convention at Jonesboro in November, but were unable to agree, and adjourned to 14 December. Meantime the alarmed North Carolina legislature established a supreme court and proper officers, and formed the Watauga militia into a brigade, commanded by the leader of the revolt, John Sevier. He advised the convention to accept this redress of their grievances; they refused and made him president, drew up a constitution to be ratified by another convention the following November, and named the new State perhaps at first Frankland; if so, they soon changed it to Franklin, after the philosopher. A governor — Sevier — and a legislature were elected; courts established, sheriffs and justices appointed, etc. For the next three years there were two conflicting governments, each levying taxes, disallowing each other's official acts, and making war on each other. The North Carolina militia invaded the Franklin court-house at Jonesboro, seized the papers, and turned the judge and counsel outdoors; a Franklin mob did the same service to a North Carolina court; the North Carolina commander took the papers by force from Sevier's house, and Sevier gathered a force and recaptured them from his opponent's house. At last, in 1788, the North Carolina party prevailed and put an end to Franklin; Sevier was carried off and tried for high treason; a great Watauga militia gathering attacked the town, rescued him from jail, and carried him back home. Finally the North Carolina legislature sensibly passed an act of oblivion and made Sevier a senator, and in 1790 the lands were ceded to the United States. See U. S.— Westward Movement.

Franklin and Marshall College, located at Lancaster, Pa., was formed in 1852 by the consolidation of Franklin College, founded at Lancaster in 1787, and Marshall College, founded at Mercersburg, Pa., in 1836. Franklin College was organized with a view to meet the needs of higher education in the interior of the State, especially among the Germans, who formed so large a part of the population. Dr. Benjamin Franklin, after whom the college was named, took a deep interest in its welfare, contributed liberally to its endowment, and in his old age made the journey from Philadelphia to Lancaster to be present at its formal opening. Although the college had in its faculty men like Henry E. Muhlenberg, the distinguished botanist, and Frederick V. Melsheimer, the entomologist, and on its board of trustees some of the most prominent men of the commonwealth, its work was that of a first class high school.

Marshall College was founded by the Reformed Church in the United States, when its theological seminary was removed from New York to Mercersburg, to meet the educational requirements of her own communion, and with limited resources accomplished a wonderful work. Among the eminent men in its faculty were its first presidents, Drs. Frederick Augustus Rauch and John Williamson Nevin, and later on Dr. Philip Schaff, all of whom took high rank as philosophers and theologians. The college had a brilliant career, but declined for lack of endowment and pecuniary resources.

When the two colleges were united, James Buchanan became president of the new board of trustees, and the institution entered upon a prosperous career, although it had to make its way in the face of many obstacles and limitations. Its growth was checked by the Civil War, from the effects of which it but slowly recovered. During the last fifteen or twenty years, however, its growth has been rapid, and it now compares favorably in point of equipment, grade of scholarship, and number of students with its sister colleges in the State of Pennsylvania.

Franklin and Marshall College makes no pretense to be a university. It lays stress upon the college course as a means of liberal education, with sufficient elasticity in the way of electives to make first class preparation for technical or professional study. It confers the degrees of A.B. and Ph.B. for undergraduate work, and A.M. for graduate work, after the completion of the prescribed courses and satisfactory examinations.

The site of the college is exceptionally fine. The principal buildings are: the main building, the halls of the literary societies, the Daniel Scholl Observatory, the gymnasium, the Academy building, the De Peyster Library, and the new Science building, with admirable equipment for physics, chemistry, and biology. The libraries contain altogether about 42,000 volumes. The students in the college proper and the academy number 357, and the faculty 21. This account does not include the Theological Seminary of the Reformed Church, which, although in close proximity to the college, is a separate institution.

John S. Stahr,
President.

Franklin, Battle of. On 12 Nov. 1864 Gen. Sherman turned back from his pursuit of Hood to begin his march from Atlanta to the sea, leaving Gen. Thomas to act on the defensive in Tennessee or to take the offensive in Alabama. Hood was at Florence and Tuscumbia, on the Tennessee River, threatening Nashville, with an army of 44,000 men. Thomas' command, much smaller, was widely distributed from Chattanooga to Nashville. Gen. Schofield was at Pulaski, Tenn., 80 miles south of Nashville. With the Fourth corps under Gen. Stan-

ley, a part of the Twenty-third corps, under Gen. Cox, and a division of cavalry. Thomas instructed Schofield to delay Hood, should he advance, until the army could be concentrated and Nashville reinforced. On the 21st Hood moved on Schofield's right. Schofield withdrew from Pulaski on the 22d, reached Columbia on the 24th, and remained there until the 27th, when Hood forced him to withdraw to the north bank of the river. On the 28th Schofield learned that Forrest's Confederate cavalry threatened his line of withdrawal through Spring Hill, 11 miles in his rear, and early on the morning of the 29th all his trains and three divisions of infantry were put in motion for Spring Hill. Stanley led, and arrived at Spring Hill just as Forrest reached it. Stanley checked Forrest and took defensive positions. Hood followed Forrest, and during the night Schofield's entire army passed through Spring Hill, in sight of Hood's bivouac fires, for Franklin, 12 miles distant, which the advance reached before daylight of the 30th. Being unable at once to cross to the north bank of the Harpeth River, Schofield, who was closely followed by Hood, had to fight to save his trains, with a river at his back. He threw up a line of entrenchments, and a division of the Fourth corps under Stanley crossed to the north bank of the river, all those remaining in the works south of it being under command of Gen. Cox. By noon the trains were in, and most of them crossed to the north bank. Not anticipating a general attack, Schofield gave orders for the withdrawal of the troops at sunset. He was mistaken as to the intention of Hood, who had closely followed his rear with Forrest's cavalry, and when Wagner's division, acting as Schofield's rear-guard, had halted and thrown up barricades about 280 yards beyond the main line, Hood rapidly advanced his infantry and ordered a desperate assault to drive the Union forces into the river. Two of Wagner's brigades were on either side of the Columbia road; Opdycke's brigade had come into the main line and was massed 200 yards in rear of the entrenchments. Wagner's orders were "to develop the enemy, but not to attempt to fight if threatened by too strong a force." Hood formed his lines with celerity on either side of the Columbia pike, Cleburne's and Brown's divisions of Cheatham's corps on the east and west sides of the road respectively, in two lines of battle. When within 400 yards of Wagner's line, at 3.30 P.M., the charge was ordered and, with a wild shout, they rushed forward. Wagner was enveloped on both flanks and fiercely attacked in front, the Confederates rushed over his barricades, and his men gave way in the greatest disorder, closely pursued by the exultant enemy. When within 100 yards of the main line the Union artillery and infantry opened fire. Cleburne, who was leading his division, was shot dead, great gaps were made in the ranks, but the line pressed on, carried the centre of the Twenty-third corps' line for the length of a brigade, went over the works, captured two batteries and many prisoners, reached an inner line of intrenchments, 68 yards in rear of the main line, and here they were checked. Col. Opdycke, who had massed his brigade in rear, when he saw Wagner's men falling back in disorder, and that the works in front had been captured, ordered his men forward. Deploying as they advanced, they rushed upon the Confederates, and a desperate hand-to-hand encounter took place, resulting in the retreat of the enemy to the outer line of works, the capture by Opdycke of nearly 400 prisoners and 9 battle-flags, and the recovery of the captured batteries. Gen. Thomas says Opdycke's prompt action "saved the day." Meanwhile the battle had extended to the right and left, involving all of the Twenty-third corps and the left brigade of Kimball's division. The Confederates reached the works in many places, but were unable to carry them. On both sides the fighting was most gallant. At midnight the Union army crossed to the north bank of the river and marched to Nashville.

The Union army engaged at Franklin, not including cavalry, numbered about 23,000 men, of whom 189 were killed, 1,033 wounded, and 1,104 missing. Of this loss 1,241 were in Wagner's division. The Confederates engaged numbered about 22,000. There are no official reports of Hood's losses, but Schofield reports that 1,750 were buried on the field, 3,800 were disabled and placed in hospital, and 702 captured, an aggregate of 6,252, to which must be added the slightly wounded, probably 2,000. Consult: 'Official Records,' Vol. XLV.; Cox, 'Battle of Franklin' 'The March to the Sea, Franklin and Nashville'; The Century Company's 'Battles and Leaders of the Civil War,' Vol IV.

E. A. CARMAN.

Franklin College, a coeducational institution in Franklin, Ind.; founded in 1834 under the auspices of the Baptist Church; reported in 1902: Professors and instructors, 10; students, 200; volumes in the library, 12,300; productive funds, $207,000; grounds and buildings valued at $75,000; income, $14,500; number of graduates, 305; president, Rev. W. T. Stott, D.D.

Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts. A famous school in Philadelphia, established in 1824, which now embraces schools in mechanical and architectural drawing, machine design, naval architecture, etc. The objects of the institute are obtained by means of a journal (begun in 1826), lectures, libraries, reports, exhibitions and school instruction. The library now contains 55,000 volumes and 38,500 pamphlets. The institute grants medals, premiums and certificates for mechanical inventions. The Institute building is located at 15 South 7th Street, Philadelphia.

Franklinism. See ELECTRICITY.

Frank'linite, a native oxide of zinc, manganese and iron, containing these metals in rather widely varying proportions. It crystallizes in the isometric system with octahedral habit, and also occurs in massive and granular forms. It is opaque, slightly magnetic, and iron-black in color, commonly with a metallic lustre. Its hardness varies from 5.5 to 6.5, and its specific gravity from 5.1 to 5.25. In the United States it occurs in considerable quantity in the neighborhood of Franklin Furnace, N. J., taking its name from the locality, where it is mined as an ore of zinc, its manganese and iron being melted into "spiegeleisen," an alloy used in the manufacture of Bessemer steel.

Franks, SIR **Augustus Wollaston,** English archæologist: b. Geneva, Switzerland, 1826; d. London 22 May 1897. He was graduated at Cambridge University in 1849; became an as-

sistant in the British Museum in 1851; and served as keeper of the Department of British and Mediæval Antiquities for many years. He was knighted in 1888; and was president of the Society of Antiquities from 1892 till his death. His publications include 'Recent Excavations and Discoveries on the Site of Ancient Carthage' (1860); 'Guide to the Christy Collection of Prehistoric Antiquities and Ethnography' (1868); 'Catalogue of a Collection of Oriental Porcelain and Pottery' (1876); etc.

Franks ("Spearmen"), **The.** In the 3d century A.D. (the name first appears in 240, under the Emperor Gordian), the scattered Teutonic tribes north and east of the middle and lower Rhine, in the present Westphalia, Hesse, Gelderland, etc., united in a loose confederacy; very probably compacted by the ancestor of the Meroving family, to whom the Franks clung so loyally and even stupidly for centuries. The tribes themselves were known from the early empire: Ampsivarii, Attuarii, Batavi, Bructeri, Chamavii or Gambrivii, Chatti, Cherusci, Sali, Sigambri, Usipetes, etc. In 253 under Valerian they raided Belgic Gaul, and half a century later had permanently settled south of the lower Meuse in Brabant. They are early distinguished as Salian and Ripuarian Franks: the former (from their chief tribe, perhaps originally on the Isala or Yssel) on the lower Rhine; the latter (*ripa*, bank) on both banks of the middle Rhine. The Salians, after heavy defeats by the Romans, became their allies and wardens of the marches; but when the pretender Constantine withdrew the Roman garrisons in 406 for his attempt on Italy, they flooded central Belgium, and Colonia Agrippina (Cologne) shortly fell into their hands. By 450 they had reached the Moselle and the Somme, or Luxemburg and northwest France; but still acknowledged Roman sovereignty. They sent forces to help the Romans against Attila at Châlons; but when the Huns had retreated from the fortresses whence they had expelled the Romans,— Trier, Mainz, Metz, etc.,— the Franks occupied them and the lands on the Rhine and Moselle instead of the Romans. The Salians now held the territory from the Scheldt to the Somme and Meuse, or most of Belgium and a little of France; the Ripuarians from the Meuse to the Rhine, and the lands along that river from the Lippe to the Lahn. They were still pagans; backward in the arts of war; had no political union or common head, though their chiefs all claimed Meroving descent; and were credited with being treacherous and perfidious even beyond barbarian wont, which their history makes probable.

When the Western Empire fell, the Rhone and Saône valleys were occupied by a Burgundian kingdom; central and northern France by a Roman province with no one to obey; below which was the great Visigothic kingdom of Euric, taking in south France and nearly all the Spanish peninsula. Five years later (481) a Salian prince of the upper Scheldt named Chlodovech (Latinized Clovis) acceded, and in 485 fell on the Roman province in alliance with other princelings. In three years he had conquered it, making Gaul to the Loire and Brittany a Frankish possession; refusing to share the spoil with his allies, he attacked and subjugated all the Ripuarians, slaying every Merovingian prince he could seize, to exterminate all rivals. In 492 he married Clotilda, the Catholic niece of the Burgundian king. In 496 he subdued the Alemanni, and Frankish settlers founded Franconia. On returning from this campaign he was baptized a Christian, in the Athanasian creed; and in a single generation the entire Frankish body, now consolidated into one, renounced paganism. He then conquered nearly all Visigothic Gaul. But Burgundy was too strong for him. He died in 511. The chance of Chlodovech becoming an Athanasian instead of an Arian had the most important consequences: alone of all the barbarian conquerers of Rome, his subjects were in religious sympathy with him, and his work endured, while the Arian kingdoms crumbled to pieces. This also began the career of the Frankish monarchy, for centuries, as the champion of the Church, helping it and helped by it.

Chlodovech began the practice of dividing the kingdom among his sons, which his successors followed; again and again death or the strong hand united the realms, again a legacy would divide them; and the records of the ferocious, half decrepit, perfidious Merovingians are the blackest in all European history for unredeemed wickedness and unprogressive anarchy. Scarce one of them for a century lived to be 40, and scarce one showed any gleam of statesmanship to justify his atrocities or his even worse weakness. At last in 613 the dominions — which had generally followed the fourfold divisions of Austrasia, Neustria, Burgundy, and Aquitaine — were united for a seeming finality, but the Merovingian kings ceased to have any but a nominal sovereignty. The great provincial governors, in the anarchy, had made their offices hereditary; the officers of state likewise — chamberlain, keeper of the seal, etc. Of these the mayors of the palace became the *de facto* rulers; keeping the kings as puppets, but making them live as country gentlemen, only attending court functions annually, in a farm-cart and with long hair. This mayoralty in Austrasia fell into the hands of one of the most wonderful families of the world, the Karlings or Carlovingians, who mostly held possession of it for a century, till one of them became king; and later the mightiest of them, Charlemagne, became emperor of the Romans in a revived empire. Pepin, or Pippin of Landen, "the Elder," was the first, dying 639; then his son Grimwald, murdered 656; the latter's sister married the son of Arnulf Bishop of Metz; and their son was Pepin the Younger or Pepin of Heristal, who, after 30 years of anarchy and partition and reunion following Grimwald's death, finally and forever reunited the Frankish realms by a crushing defeat of the allied forces of Neustria and Burgundy at the battle of Testry, 687. His son, Charles Martel (Hammer), who held power 717–41, carried civilization at the sword's point among the Germans, and in 732 routed a great Saracen army at Poitiers, saving France from the Mussulman. His son Pepin the Short, after 10 years of mayoralty, deposed the last driveling Meroving and ascended the throne. Pepin's son Charles (Carolus Magnus, Charlemagne, perhaps with a confusion of the title with the name Carloman), acceded in 768. As warrior, statesman, and lawgiver, he stands among the foremost of all time. The Frankish realm as such attained by far its greatest extension under him — though it is incorrect to say, as is usual, that his work

perished with him, for the pieces of his realm never went back to their old anarchy. He ruled a vast congeries of races, from north Spain to north Germany, and from the Hungarian plains to the English Channel; and he brought them all under the reign of law and Christianity, inheritors of the memories and civilization of Rome. In 800 he crowned the career of the Franks begun by Clovis, becoming secular head of a Holy Roman Empire, of which the Pope was the spiritual head. Whether it was well judged or beneficial to the world, historians are still divided. The history of Charlemagne's successors is not the history of the Franks: after this they have become merged in a wider aggregation.

The Frankish dominion was the conduit through which the treasures of Rome, political, social, and ecclesiastical, were given to the world. Roman law, Roman literature, and the Christian religion were forced on the barbarians through the Franks: that Europe is what it is, we have to thank them first of all. The best modern compendium is Oman's 'History of the Dark Ages' (1901).

Franz, fränts, **Robert,** German composer: b. Halle 28 June 1815; d. Berlin 24 Oct. 1892. He studied under Schneider at Dessau 1835–7, and in 1843 published his first set of 12 songs, which won the warm praises of Schumann, Mendelssohn, Liszt, and other masters. From then till 1868 he held various appointments at Halle. He published over 250 songs with pianoforte accompaniments, a Kyrie, and several chorales and four-part songs, besides arrangements of the vocal masterpieces of Bach and Handel. Franz's best songs rank with those of Schubert and Schumann.

Franz-Josef Land, fränts'-yō'zĕf-länt, an Arctic archipelago, north of Nova Zembla, extending, so far as it has yet been explored, between lat. 80° and 83° N. It consists of two large masses of land, Wilczek Land to the east, and Zichy Land to the west, separated by Austria Sound, and Rawlinson Sound. Between these two sounds lies Crown Prince Rudolf Land, while to the north of this again comes Petermann Land, and to the northwest King Oscar Land. The southern shores are deeply indented with fjords; and the whole archipelago, which rises into isolated flat-topped or dome-shaped mountains of basalt, 5,000 feet high, is sheeted with ice. Owing to the open water round its shores in summer, and the comparative abundance of its animal life — bears, walruses, foxes, and numerous birds occurring — Franz-Josef Land is regarded by many experienced Arctic explorers as the most favorable base whence to make an attempt to reach the North Pole. The archipelago was discovered and partly explored by Payer and Weyprecht in 1873–4; its southern shores were explored by Leigh Smith in 1880–2, and much of it by the Jackson-Harmsworth expedition in 1895–6. See POLAR EXPLORATION.

Franzensbad, fränt'sĕns-bät, **Egerbrunnen,** ā'gĕrbroon-nĕn, or **Kaiser-franzensbad,** Bohemia, a celebrated Austrian watering-place, about three miles north of Eger, with which it is connected by a fine avenue. It is situated amid low bare hills, and consists of four rectangular streets lined with trees. The mineral springs here were known in the 16th century, and even at that time the waters were made up in bottles to be sent to a distance. It was selected as a watering-place in 1793 by the Emperor Francis II., from whom it received its present name. The bathing establishment consists of an irregular building erected over the springs with a long colonnade extending to the Kurhaus, where the visitors assemble, and the balls and concerts are given. The springs, 12 in number, are alkaline, taline, chalybeate, and are very efficacious in cases of anæmia, dyspepsia, catarrh of the bowels, uterine disorders, etc. The mud baths of Franzensbad are much used by those suffering from gout, rheumatism, skin diseases, etc. Pop. (1890) 2,330.

Fra'ser, Agnes, («FRANCES MAC NAB»), English traveler and writer: b. Halstead, Essex, 7 Dec. 1859. She studied art in London 1882–4, and has since traveled extensively in Algiers, Norway, British Columbia, Morocco, and South Africa. She has published: 'No Reply' (1888); 'Relics: Fragments of a Life' (1893); 'On Veldt and Farm in Bechuanaland, Cape Colony, the Transvaal, and Natal' (1897); 'British Columbia for Settlers' (1898); 'A Ride in Morocco among Believers and Traders' (1902).

Fraser, Alexander Campbell, Scottish philosophical writer: b. Ardchattan, Argyleshire, 3 Sept. 1819. He was a lecturer on mental philosophy in the New College, Edinburgh, 1846; editor of the 'North British Review' (1850–7); professor of logic in Edinburgh University 1856–91. His principal productions are: 'Essays in Philosophy' (1856); 'Rational Philosophy' (1858); a memoir of Bishop Berkeley, with a collected edition of his works (1871–90); an annoted edition of Locke's 'Essay on Human Understanding' (1894); 'Philosophy of Theism' (1898), etc.

Fraser, Augusta Zelia Webb («ALICE SPINNER»), Scottish novelist. She was married to Affleck Fraser 1889. She has published over the pseudonym «ALICE SPINNER,» 'A Study in Color'; 'Lucilla'; 'A Reluctant Evangelist.'

Fraser, Charles, American painter; b. Charleston, S. C., 20 Aug. 1872; d. there 5 Oct. 1860. He studied law, was admitted to the bar in 1807, but withdrew from practice in 1818, and acquired, particularly in the South, a considerable reputation as a miniature-painter. His sitters included Lafayette (1825) and most prominent South Carolinians for 50 years. He also painted interiors, landscapes, genre, and still-life scenes, and historic subjects. An exhibition of his works at Charleston in 1857 comprised 313 miniatures and 139 other canvases in oils. Publication: 'Reminiscences of Charleston' (1854).

Fraser, MRS. **Hugh.** See FRASER, MARY CRAWFORD.

Fraser, James, English prelate: b. Prestbury, Gloucestershire, 18 Aug. 1818; d. Manchester 22 Oct. 1885. He was educated at Lincoln College, Oxford, took orders in the English Church and was rector at Cholderton, Wiltshire, 1847–60; and of Ufton Newet, Berkshire, 1860–70. In the year last named he became bishop of Manchester, in which position he gained the approbation of churchmen and nonconformists alike. Under his administration the diocese made a most remarkable advance.

Bishop Fraser was greatly interested in educational matters and visited the United States and Canada in 1865 as a commissioner of education, subsequently publishing a 'Report on the Common School System of the United States and of Upper and Lower Canada' (1866). A bronze statue of Bishop Fraser stands in the square before the Town Hall of Manchester, and in the Fraser Chapel of the Cathedral of Manchester is a recumbent statue in marble of the much beloved prelate. See Hughes, 'Memoir of Bishop Fraser' (1887).

Fraser, Mary Crawford (MRS. HUGH FRASER), English novelist: b. Rome. She is a sister of F. M. Crawford (q.v.), the novelist, and was married to Hugh Fraser, English minister to Japan, who died in 1894. She is the author of 'The Brown Ambassador' (1895); 'Palladia' (1896); 'A Chapter of Accidents' (1897); 'The Looms of Time' (1898); 'A Diplomatist's Wife in Japan' (1899); 'The Customs of the Country: or Tales of New Japan' (1899); 'The Splendid Porsenna' (1899), etc.

Fraser, Simon. See LOVAT, TWELFTH LORD.

Fraser, William Alexander. Canadian author: b. Pictou County, N. S., 24 March 1859. He traveled widely and became a mining engineer, but subsequently turned his attention to writing. He has contributed much to English and American magazines; published an interesting collection of animal stories, 'Mooswa and Others of the Boundaries' (1900), and also 'The American Animal Book,' and 'The Outcast' (1901).

Fraser River, the principal river in British Columbia, rising in the Rocky Mountains, in lat. 53° 42'.; lon. 119° W. It flows northwest for about 270 miles, then turns south, and after a total course of over 700 miles falls into the Gulf of Georgia, in lat. 49° N. Gold is found both on the Fraser and its affluents. Its principal affluents are the Thomson, Quesnelle, and Stuart rivers.

Fraserville, or **Reviere du Loup,** rē-vē-ār dü loo, Canada, a town and county-seat of Temiscouata County, Quebec, on the south shore of the St. Lawrence at the confluence of the Reviére du Loup, 116 miles below Quebec. It is on the Intercolonial Railway and is the terminus of the Temiscouata Railway. Its permanent population is almost entirely French Canadian. It has a good trade and manufactories of pulp, leather, lumber, furniture, iron products and woollens. There are three churches (2 Angelican and 1 Catholic), a convent, hospital, and collegiate institute. It has a creamery, banks, and newspapers (French), and is a popular summer resort. Pop. (1901) 4,569.

Fraternal Insurance. See INSURANCE, FRATERNAL.

Fraternal Societies in America. A fraternal society is defined as a corporation or voluntary association organized and carried on for the sole benefit of its members and their beneficiaries. It has no capital stock and is not operated for profit. Every such society must have a representative form of government, and is supposed to operate on the lodge system, with a ritualistic form of work for the meetings of the lodges or other designated subordinate bodies. It has power to adopt its own constitution, by-laws, rules and regulations for the orderly conduct of its affairs, and in general terms may manage its internal interests as it may deem best. Although the American fraternities have the same basis as the friendly societies (q.v.) of England and Scotland, they are a purely American institution, organized without reference to, and at the outset of their career, in entire ignorance of the fact that the same system was in successful operation elsewhere. At the present time the laws governing the fraternal system are in a state of transition, and as the fraternal societies are the creatures of, and governed by the laws of the different States, any change in those laws will necessarily change or modify the system as at present operated.

There are two representative bodies, claiming to act for, and represent a large constituency among the fraternal associations. The National Fraternal Congress, organized in 1886, represents the larger number of leading societies. From its official reports it appears to aim at eventually securing the adoption of a uniform law throughout the United States and Canada, defining as fraternal society, as above expressed, with the addition, that every society shall pay a death benefit on the death of a member, and may pay disability payments, resulting from accident, disease, or old age. During the years 1900 and 1901 the Congress made a vigorous effort to secure the passage of a uniform bill in the legislatures of all the leading States, restricting the benefits, coupled with a provision requiring all the newer organizations to charge adequate rates, but allowing the older societies to continue their low rate assessment system. This action was bitterly opposed by the minority of the Congress and by a still larger number of other associations, that were not affiliated with the Congress. The result of this opposition was the defeat of the proposed law in every State where a contest was made.

The outside societies that participated in this contest, feeling the need of a union, for mutual protection thereafter, immediately after the contest was ended met together and in March 1901, organized the Associated Fraternities of America, with the avowed object of opposing any further changes in the laws of the different States until public sentiment was ripe for the adoption of a uniform law on the basis of the largest liberty to each society in the matter of benefits, provided adequate rates are charged therefor. This dissension among the fraternal societies induced the convention of the insurance commissioners of the different States to formulate a proposed law for the government of fraternal societies, containing many new and startling features.

All the early fraternal associations collected their contributions from their members by means of assessments, the rate of which, except in two instances, was graded according to age at entry, and each member was required to pay such a number of assessments each month as might be needed to meet the death losses. As these older organizations advanced in years, their death losses necessarily increased in number, and with increased death losses the number of assessments each month also increased. During this period many new societies were organized on the same system and while young, naturally had a low death rate, and a low mortality cost per member. Being much cheaper they naturally attracted members from their

predecessors until they were displaced in popular favor by other new creations on the same plan. Whatever differences of opinion may now exist among fraternalists as to the need of the systems at the present time, they all agree that the old assessment system has been a failure, and should be superseded by rates based on the recognized mortality tables. The newer organizations profited by the experience of the older societies, and generally started with higher rates, and this fact has made it much easier for them to provide for their deficiencies. A large number of the younger organizations are, and for some years have been, charging adequate rates, and the protection they furnish is as safe as the insurance supplied by any insurance company.

The real basis of the fraternal system in America is the fraternal bond of union, uniting the members together in a common cause for mutual beneficial and protective purposes. The lodge system requires meetings of the members at least once a month, and therefore directly tends to draw the members closer together. Every member thus participates in the work of the organization and the emulations aroused among the different lodges naturally produces the best results at the least outlay. Bread cast upon the waters will return, and it is the act of casting that produces that wonderful change in the human heart, which constitutes the return. A mother is fonder of her offspring than the father, and both parents love a crippled child more than the sturdy members of the flock, and the reason is the same. The mother suffers more and bears more than the father, and both do more for the cripple than for the healthy child. No one ever did a good deed, or thought to do a good act without feeling the better for it, and thus no person ever did or can participate in the good work that the various lodges of the fraternities are engaged in without growing to love the work and the organization which does the work. This ennobling influence upon the membership is not by any means the least of the many blessings conferred upon the American people by the fraternal system. This same influence naturally impels the members to labor without compensation for the growth and prosperity of the organization and thus at a low cost produce results beyond the dreams of avarice to the insurance companies.

Every society is required to have a representative form of government and is governed by its constitution and laws, as enacted, or from time to time amended, by the constituted authorities. Its constitution and laws therefore constitute the contract between the members in their relations to the society. The protection furnished by such societies is not insurance in the ordinary sense, in which that word is understood and used. No society can issue a certificate in favor of a creditor of the member and the benefits furnished under the certificate cannot be attached for the debt of the member. The beneficiaries are limited to husband or wife, affianced husband, or affianced wife, or, some heir, blood relative, or dependent of the member. In insurance anyone having an insurable interest in the life of the policy holder may be named as beneficiary while under a fraternal certificate the beneficiary is limited by the bonds of affection and duty. In the one case a beneficiary has a vested interest in the policy and it cannot be changed without her consent, while in the other the beneficiary has no vested rights whatever until the claim matures; and the member may have his certificate changed in favor of another beneficiary without her knowledge or consent.

Among the prominent large fraternal societies in the United States are the Odd Fellows, founded in 1819; Knights of Honor 1873; Knights of Pythias 1877; and Royal Arcanum 1877. The insurance paid by these varies from $500 to $3,000. There are numerous other societies conducted on the same principle. According to the reports of the supreme bodies of these organizations for 1904, the membership of the principal fraternal organizations in the United States and Canada was as follows:

Odd Fellows	1,341,375
Freemasons	1,011,655
Modern Woodmen of America	700,359
Knights of Pythias	594,883
Ancient Order of United Workmen	423,015
Knights of the Maccabees	375,000
Improved Order of Red Men	355,662
Royal Arcanum	303,597
Foresters of America	299,081
Independent Order of Foresters	224,000
Woodmen of the World	217,128
Ancient Order of Hibernians	193,832
Benevolent and Protective Order of Elks	190,000
Order of Eagles	165,000
Junior Order of United American Mechanics	130,977
Ladies of the Maccabees	149,060
Knights of the Modern Maccabees	127,000
Knights of Columbus	122,645
Ladies Catholic Benevolent Association	87,400
Tribe of Ben Hur	85,267
Knights and Ladies of Honor	76,761
Court of Honor	70,426
Knights of the Golden Eagle	69,385
National Union	69,000
Improved Order of Heptasophs	62,860
Catholic Mutual Benefit Association	58,035
Protected Home Circle	56,000
Knights of Honor	52,600
Brotherhood of American Yeomen	47,025
Order of B'rith Abraham	46,234
Order of Gleaners	46,000
United Order of American Mechanics	42,691
New England Order of Protection	39,098
Ancient Order of Foresters	38,898
Sons of Temperance	34,789
Independent Order of B'nai B'rith	31,500
Catholic Benevolent Legion	28,000
Knights of Malta	28,000
Smaller organizations	284,541
Total	8,278,779

All the older associations operate on what is known as grand jurisdictions, consisting of representatives elected by the subordinate lodges within the limits of the grand jurisdiction. It in turn sends delegates to the supreme body, which is the highest authority in the organization. As a general rule the supreme body assumes all liability for death or disability payments that are permanent in their nature, and the subordinate lodges assume and pay the sick or other temporary disability benefits. Each member pays his share of all benefits through the local lodge, of which he is a member, the dues going to the supreme office, being remitted direct, and not through the grand jurisdiction. As a rule the grand jurisdiction covers a State, and has supervision over the growth and general management of all the lodges within its territory. Of late years the tendency has been to do away with the plan of grand jurisdictions and have the supreme body composed of delegates elected either directly by the lodges or by districts composed of a number of lodges. The officers are usually elected by the supreme body, but in some cases are elected by a direct vote of the members.

To sum up in a word: a fraternal society is a brotherhood of members, bound together by its fraternal bond of union. It is organized and carried on for the sole benefit of its members and their beneficiaries. It operates on the lodge system, and uses a ritual in the meetings of its lodges and the initiation of its new members. It has a representative form of government, in which the management is responsible to the members for the faithful performance of their duties. It is governed by a constitution and laws enacted by the representatives of its members, and it furnishes its members, in all the States, with protection in case of death, and in many of the States with protection in case of disability resulting from illness, accident and old age, after the expectancy of life, and in some of the States with still more liberal benefits. See INSURANCE, FRATERNAL, and the articles on the different fraternal organizations.

FREDERICK GASTON,
President the Grand Fraternity.

Frater'nities, religious societies for pious practices and benevolent objects. They were often formed during the Middle Ages, from a desire of imitating the holy orders. From the 12th to the 15th century nothing was considered more meritorious than to form and belong to such orders. The laity, who did not wish to pronounce the monastic vows, entered into associations in order to gain some of the advantages of the religious even in their worldly life. These societies were at first formed without any ecclesiastical interference, and on this account many of them, which did not obtain or did not seek the acknowledgment of the Church, had the appearance of separatists, which subjected them to the charge of heresy. The pious fraternities which were formed under the direction of the Church, or were acknowledged by it, were either required by their rules to afford assistance to travelers, to the unfortunate, the distressed, the sick, and the deserted, on account of the inefficiency of the police, and the want of institutions for the poor, or to perform certain acts of penitence and devotion. Of this description were the Fratres Pontifices, a brotherhood that originated in Tuscany in the 12th century, where they maintained establishments on the banks of the Arno, to enable travelers to cross the river, and to succor them in case of distress. A similar society was afterward formed in France, where they built bridges and hospitals, maintained ferries, kept the roads in repair, and provided for the security of the highways. A bridge of 18 arches over the Rhône at Avignon, built by St. Bénézet in 1177, and another of 22 arches over the same river at Pont St. Esprit, built between 1265 and 1309, were among their greatest achievements in bridge-building. They gradually amassed great wealth by alms and gifts. In 1519 they were secularized on account of the abuses that had crept into the order.

Similar to these were the Knights and Companions of the Santa Hermandad in Spain; the Familiars and Cross-bearers in the service of the Spanish Inquisition; the Calender Brothers in Germany; the Alexians in Germany, Poland, and the Netherlands, etc. The professed object of the Alexians was to visit the sick and imprisoned; to collect alms for distribution; to console criminals, and accompany them to the place of execution; to bury the dead, and to cause masses to be said for those who had been executed, or for persons found dead. They derived their name from Alexius, their patron saint, and were at first principally composed of persons from the lower classes of the people in the Netherlands. They were afterward increased by the addition of the female branch, the Black Sisters. Although lay brothers they had houses, and formed their order into two provinces under an ecclesiastical government. They still exist, in the societies for burying dead bodies, in Antwerp, Utrecht, and Cologne. The Brothers of Death, of the order of St. Paul, were dressed in black, like the Alexians, and were distinguished by a death's head on their scapulary. They were suppressed by Pope Urban VIII.

There were also Gray Penitents (an old fraternity of an order existing as early as 1264 in Rome, and introduced into France under Henry III.), the black fraternities of Mercy and of Death; the Red, the Blue, the Green, and the Violet Penitents, so called from the color of their cowl; the divisions of each were known by the colors of the girdle or mantle. The fraternity of the Holy Trinity was founded at Rome in 1548 by Philip de' Neri for the relief of pilgrims and the cured dismissed from the hospitals. The Brothers of the Christian Schools are a fraternity founded near the end of the 17th century, the statutes of which were approved by Benedict XIII. Their labors have been of great service in the cause of elementary and secondary education in France, though their work is not confined to France but extends over a large part of the world, including Belgium, North and South America, and England. They take religious vows, wear a suit of clerical dress, and always work in pairs. In Ireland there is a body of Christian Brothers modeled on the French one, the first of its schools having been opened at Waterford in 1804. Their schools have spread over Ireland, and their system of education has received the approval of various Royal Commissions.

The Brothers of Common Life, founded at Deventer in Holland by the celebrated theologian, Gerald Groot, toward the end of the 14th century, and formally approved by Gregory XI. in 1376, were a fraternity which performed great services to learning, especially theological learning. From Holland they spread rapidly over Germany, and increased so greatly in numbers that 500 houses belonged to the order in 1460. The Roman Catholic Church is indebted to it for a text of the Latin version of the Bible by St. Jerome, most carefully prepared by a collation of the most ancient manuscripts. This text was consulted as an authority by the editors of the Bible prepared at the command of Sixtus V. The same order prepared some texts of the Christian fathers.

The Brothers of Charity are another fraternity whose hospitals are found in the principal cities. It was founded by St. John de Dieu in Spain in 1540. Much better known in Great Britain are the Sisters of Charity (called also Gray Sisters, Daughters of Charity, Sisters of St. Vincent de Paul), a Roman Catholic order founded in 1634 at Paris by St. Vincent de Paul for the purpose of nursing the sick in hospitals. The sisters take vows of poverty, chastity, and obedience, besides a vow binding themselves to serve the sick. Besides conducting hospitals and nursing, they sometimes undertake the manage-

ment of poor schools. They attend the sick of every nation and religion. There is also a body of Irish Sisters of Charity, separate from the one just mentioned. See ORDERS, RELIGIOUS.

Fraternities, College. See GREEK-LETTER SOCIETIES.

Fraticelli, frăt-ĭ-sĕl'ĭ, a name applied to several heretic sects in the Middle Ages. They were generally opposed to existing ecclesiastical and social order and were similar to the Brethren of the Free Spirit, Beghards and other sects. They had no fixed place of residence. In 1260 to 1300 the Fraticelli made considerable progress and attracted more or less attention in northern Italy. They declared the existing Church as in a state of apostasy and looked upon poverty as an absolutely essential condition.

Fratricellians. See FRATICELLI.

Fraud, in law, all deceitful practices in defrauding or endeavoring to defraud, another of his known right, by means of some artful device, contrary to the plain rules of common honesty. It is condemned by the common law, and punishable according to the offense. All frauds and deceits for which there is no remedy by the ordinary course of law are properly cognizable in equity. Where a fraud can be clearly established, courts of law exercise a concurrent jurisdiction with courts of equity. Wherever fraud or surprise can be imputed to, or collected from, the circumstances, equity will interpose and grant relief against it. Where a person is party to a fraud, all that followed by reason of that fraud shall be said to be done by him. A party prejudiced by a fraud may file a bill in equity for a discovery of all its circumstances. Mere inadequacy of price alone is not a ground for a court to annul an agreement; but if there be such inadequacy as to show that the person did not understand the bargain he made, or was so oppressed that he was glad to make it, knowing its inadequacy, it will show a command over him which may amount to a fraud. If a person be fraudulently prevented from doing an act, equity will consider the act as done; and equity also relieves against bargains made under misconception of rights. In treaties, concealment of a material fact by one of the parties, in order to keep the other in ignorance, whereby to profit, is a gross fraud, and the contract will be set aside in equity. Constructive or legal fraud is applied to such acts or contracts as, though not originating in any actual evil design or contrivance to perpetrate a positive fraud or injury upon other persons, yet by their tendency to deceive or mislead other persons, or to violate public or private confidence, or to impair or injure the public interest, are deemed equally reprehensible with actual fraud, and are prohibited by law, as within the same reason and mischief as acts and contracts done *malo animo*. Gross criminal frauds are punishable by way of indictment or information. Frauds are not indictable at common law unless they be such as affect the public — as vending unwholesome provisions, or using false weights or measures; or by way of conspiracy; or unless they affect the crown or the administration of justice. See FRAUD, STATUTE OF; FRAUDULENT CONVEYANCES.

Consult: Browne, 'Construction of the Statute of Frauds' (1895).

Frauds, Statute of. Perhaps one of the most important statutes ever enacted in England or the United States was the Statute of Frauds (29 Charles II. ch. 3). It was passed in the year 1673. Its object is stated to be the "prevention of frauds and perjuries," and its effect is to make writing essential to the validity of many contracts or transactions. The most important sections are those relating to contracts; namely, the 4th and the 17th, almost every word of which has been the subject of numerous decisions. It is provided by the 4th section that no action shall be brought on the contracts therein mentioned unless the agreement or some note or memorandum thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. The contracts referred to are the following: (1) Any special promise by an executor or administrator to answer damages out of his own estate; (2) any special promise to answer for the debt, default, or miscarriage of another person; (3) any agreement made upon consideration of marriage; (4) any contract or sale of lands, tenements, and hereditaments, or any interest in or concerning them; and (5) any agreement that is not to be performed within the space of one year from the making thereof. This section, however, does not make the contract null and void, but only unactionable. The 17th section has reference to sales of goods for the price (or value) of £10 and upward, which are "not allowed to be good" unless some memorandum of the bargain has been made in writing, or unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment. In the statutes of the American States the principal alteration made in these terms is by the specification of a different sum of money. The sum usually established is $50, but in some of the States it is $30, or $40. The importance of this statute has been so fully recognized in this country that it has been substantially re-enacted in every State in the Union, and in some of them its provisions have been made still more comprehensive and stringent. See FRAUD.

Fraudulent Conveyances, in law, a fraudulent conveyance is a conveyance the object, tendency, or effect of which is to defraud another not a party to such a conveyance, or the intent of which is to avoid some debt or duty due by or incumbent on the party making it. Conveyances of this character are declared invalid by two celebrated English statutes which have been substantially re-enacted throughout the United States with the same provisions. The first of these statutes was passed in the 13th year of the reign of Queen Elizabeth (1571), and commonly referred to as the statute 13 Eliz. ch. 5, and by it all fraudulent conveyances, gifts, or alienations of lands or goods whereby creditors might be in anywise disturbed, hindered, delayed, or defrauded of their just rights, are rendered utterly void; but the statute does not extend to any estate or interest in lands on good consideration, and *bona fide* conveyed to any person not having notice of such fraud. The second statute against fraudulent conveyances is the statute 27 Eliz. ch. 4, which was passed in 1585. It provides that the conveyance of any interest in lands for the intent and purpose to

defraud and deceive subsequent *bona fide* purchasers of the lands for a good and sufficient consideration shall be utterly void. This statute differs from the one first mentioned in applying solely to lands, and in protecting the interests of purchasers instead of creditors; but it contains similar provisions declaring the validity of any previous conveyance if it be upon valuable consideration and to a *bona fide* purchaser. It has been held in England, in the interpretation of this statute, that if the previous conveyance be voluntary it is void as to a subsequent purchaser, even if he had notice before he received his deed that such a conveyance had been made. This doctrine has been generally rejected by the courts throughout the United States as unjust, and the principle adopted that the receipt of notice gives a person intending to purchase sufficient opportunity to protect his own interests, and if he is guilty of imprudence in accepting the conveyance he should receive no assistance from the courts. This appears to be the more unobjectionable doctrine. Voluntary conveyances are never set aside under either statute, as between the immediate parties, but only in favor of purchasers or creditors. See FRAUD.

Fraunhofer, Joseph von, yō'sĕf fòn frown'-hō-fĕr, German mathematician: b. Straubing, Bavaria, 6 March 1787; d. Munich 7 June 1826. In 1799 he was placed with a looking-glass maker and glass-grinder at Munich. After various vicissitudes he received an appointment as optician in the mathematical and mechanical institute of Reichenbach at Benedictbeurn, and in 1809 the mechanical part of the optical institute was chiefly under his direction. Ultimately he became one of the members of the firm under which the business was conducted. One of the most difficult operations of practical optics was to polish the spherical surfaces of large object-glasses accurately. Fraunhofer invented a machine which obviated this difficulty, and rendered the surface more accurate than it was left by the grinding. He invented also other grinding and polishing machines, and introduced many improvements into the manufacture of the different kinds of glass used for optical instruments, and which he found to be always injured by flaws and irregularities of various sorts. In 1811 he constructed a new kind of furnace, and on the second occasion when he melted a large quantity found that he could produce flint-glass, which, taken from the bottom of a vessel containing two hundredweight of glass, had the same refractive power as glass taken from the surface. He found that the English crown-glass and the German table-glass both contained defects occasioning irregular refraction. In the thicker and larger glasses there would be more of such defects, so that in larger telescopes this kind of glass would not be fit for object-glasses. Fraunhofer therefore made his own crown-glass. The cause which had hitherto prevented the accurate determination of the power of a given medium to refract the rays of light and separate the different colors which they contain was chiefly the circumstance that the colors of the spectrum have no precise limits, and that the transition from one to another is gradual and not immediate; hence, the angle of refraction cannot in the case of large spectra be measured within 10′ or 15′. To obviate this, Fraunhofer made a series of experiments for the purpose of producing homogeneous light artificially, and unable to effect his object in a direct way, he did so by means of lamps and prisms. In the course of these experiments he discovered that bright fixed line which appears in the orange color of the spectrum when it is produced by the light of fire. This line enabled him afterward to determine the absolute power of refraction in different substances. Experiments to ascertain whether the solar spectrum contains the same bright line in the orange as that produced by the light of fire led him to the discovery of the innumerable dark fixed lines in the solar spectrum, consisting of perfectly homogeneous colors. The importance of this discovery can scarcely be overestimated. It led to the invention and use of the spectroscope, to the science of spectroscopy, and to all our present knowledge of solar and stellar chemistry. Fraunhofer also made a variety of other important discoveries and inventions.

Fraunhofer Lines. See SPECTROSCOPE.

Fraxinus, frăk'sĭ-nŭs. See ASH.

Frazee, Lawrence Fisher, American inventor: b. New Brunswick, N. J., 22 May 1813; d. Jersey City, N. J., 10 Oct. 1896. He became connected with the New Brunswick Steamboat and Transportation Company about 1835; and continued with its successors, the Camden and Amboy, and the Pennsylvania railroad companies till his death. During the Civil War he had command of the transport Massachusetts. He was the inventor of numerous useful appliances.

Frazer, John Fries, American scientist: b. Philadelphia, 8 July 1812; d. there 12 Oct. 1872. Grandson Gen. Persifor Frazer of Revolution. Was graduated with highest honors at the University of Pennsylvania in 1829, and afterward completed courses in both law and medicine. With Professor A. D. Bache he made the first researches on magnetics in the United States. In 1836 he became one of the two assistants on the First Geological Survey of Pennsylvania. After filling for some time a professorship in the Philadelphia High School, in 1844 he succeeded Professor Bache, as professor of natural philosophy and chemistry in the University of Pennsylvania, serving until his death; and from 1855–68 also as vice provost. In 1857 he received the degree of LL.D. from Harvard. He was an active member of the American Philosophical Society (its vice-president in 1855), the Academy of Natural Sciences, and the Franklin Institute (the editor of its journal from 1850 to 1866), and one of the charter members of the National Academy of Sciences.

Frazer, Persifor, American geologist, son of preceding: b. Philadelphia, 24 July 1844. After graduation (1862) from the University of Pennsylvania, served during Civil War in the South Atlantic squadron (1862–63) as aide, United States coast survey; in the cavalry during Gettysburg campaign, and as ensign in the navy to the end. Was mineralogist and metallurgist to the United States geological survey (1869–70), professor of chemistry in the University of Pennsylvania (1870–74), assistant geologist second geological survey of Pennsylvania, 1874–82. He was the first foreigner to receive the degree of Docteur ès-Sciences Naturelles from France, which also gave him the decoration of the golden palms of the Academy. He served as vice-president, representing the

United States in the International Geological Congress of 1888 (London), and of 1897 (St. Petersburg). He has written extensively for scientific periodicals, published five volumes of Reports of the Geological Survey of Pennsylvania; ‘Tables for the Determination of Minerals’ (1874); and ‘Bibliotics, or the Study of Documents’ (1894).

Fraziers Farm, Battle of. See GLENDALE, BATTLE OF.

Frear, Walter Francis, American jurist: b. Grass Valley, Cal., 29 Oct. 1863. He was graduated at Yale University in 1885, and at the Yale Law School in 1890; was made second judge of the first circuit court of Hawaii, in January 1893, first associate justice in the supreme court of the Republic of Hawaii in January 1896. He was a member of the commission to recommend to Congress legislation for Hawaii, in August, 1898, and became chief-justice of the Supreme Court of Hawaii in July 1900. He is the author of ‘Evolution of the Hawaiian Judiciary’; etc.

Frechette, Louis Honoré, loo-ē ō-nō-rā frā-shĕt, French Canadian poet: b. Levis, Quebec, 16 Nov. 1839. He has edited several French Canadian journals and in 1889 became clerk of the Legislative Council of Quebec. His lyrics have been much admired both for their form, and sincerity of passion. His published books include: ‘Mes Loisirs’ (1863); ‘La Voix d'un Exilé’ (1869); ‘Pèle Mele’ (1877); ‘Les Fleurs Boreales,’ crowned by the French Academy (1880); ‘Les Oiseaux de Niège’ (1880); ‘La Legende d'un Peuple’ (1887); ‘Les Feuilles Volonte’ (1891); ‘Veronica,’ a drama; and in prose ‘Lettres à Bastile’ (1872); ‘Histoire Critique des Rois de France’ (1881); ‘Originaux et Detraques’ (1893); ‘Lettres sur l'Education’ (1893); ‘La Noël au Canada’ (1900).

Freckles, brownish-yellow spots of a circular form on the human skin. They are due to excess of pigmentary matter in the cells of the cuticle, immediately above the true skin, and only appear on those exposed surfaces, as the neck, face, hands, and arms. They are sometimes congregated in thick clusters which give to the features an unsightly appearance. Sometimes freckles are hereditary, appearing soon after birth, and continuing through life, or subsiding or vanishing altogether. This affection is most common as well as most persistent in persons of fair complexion and hair, and especially so in those with red hair. There can be no doubt that exposure to the sun increases the disfigurement.

Frederic, Harold, American journalist and novelist: b. Utica, N. Y., 19 Aug. 1856; d. London, England, 19 Oct. 1898. He was for many years London correspondent of the New York *Times*. His writings include: ‘Seth's Brother's Wife’ (1887); ‘The Lawton Girl’ (1890); ‘In the Valley’ (1890); ‘The Return of the O'Mahoney’ (1892); ‘The New Exodus’ (1892); ‘The Copperhead,’ a tale of the Civil War (1895); ‘Marsena’ (1895); ‘The Damnation of Theron Ware’ (1896); ‘March Hares,’ a study of contemporary social life (1896); ‘Gloria Mundi’ (1898); ‘In the Market Place’ (1899).

Fredericia, frĕd-ĕ-rĭsh'ē-ä, Denmark, seaport, on the coast of Jutland. It was at one time well fortified, but the forts have not been kept in repair. The chief exports are eggs, meat, fish, cheese, and butter; the chief imports are cotton and woolen goods, fruit, salt, and petroleum. Pop. (1900) 12,700.

Frederick I., king of Denmark and Norway: b. 3 Sept. 1471; d. 10 April 1533. He succeeded his nephew Christiern (or Christian) II., on the deposition of the latter, in 1523, and entered into an alliance with Gustavus I., king of Sweden. After taking Copenhagen, he gained over all the nobility, and introduced Lutheranism into his dominions.

Frederick II., king of Denmark, the son and successor of Christian III.: b. 1534; d. 1588. He ascended the throne in 1559. He was a great friend of learning, and was a patron of Tycho Brahe and other men of science. He waged a long war with Sweden, which ended in 1570.

Frederick III., king of Denmark: b. Hadersleben, Schleswig, 18 March 1609; d. Copenhagen 9 Feb. 1670. He succeeded his father Christian IV., in 1648. The most remarkable event of his reign was his changing of the constitution from an elective to an hereditary monarchy.

Frederick IV., king of Denmark: b. Copenhagen 11 Oct. 1671; d. there 12 Oct. 1730. He ascended the throne on the death of Christian V. in 1699. He leagued against Charles XII. of Sweden, who forced him to make peace; but when Charles fled to Turkey, Frederick drove the Swedes out of Norway, and concluded a favorable peace; retaining possession of the duchy of Schleswig.

Frederick V., king of Denmark: b. Copenhagen 31 March 1723; d. 14 Jan. 1766. He came to the throne in 1746. The character of his reign may be inferred from the following remark, which, on his deathbed, he made to his successor, Christian VII.: "It is a great consolation to me, my son, that I have not injured any person, and that my hands are not stained with one drop of blood."

Frederick VI., king of Denmark: b. Copenhagen 28 Jan. 1768; d. there 3 Dec. 1839. He ascended the throne in 1808, though, from 1784, he was associated in the government with his father, who had lost his reason. On his accession he had to repair the damages done by the English in their bombardment of Copenhagen in 1807, and to wage a war with the Swedes, who attempted to possess themselves of Norway. He succeeded in defeating them, and peace was signed at Jon Kœping, in 1899. Allying himself with Napoleon, Norway was, in 1814, given to Sweden, under Bernadotte; Pomerania and the isle of Rügen falling to Denmark. More tranquil times now arriving, Frederick devoted himself to the extension of the internal resources of his kingdom.

Frederick VII., king of Denmark: b. Copenhagen 6 Oct. 1808; d. Glücksburg 15 Nov. 1863. He ascended the throne in 1848. He was well known as an archæologist, publishing numerous works on the subject. On his death, the elder line of the house of Oldenburg became extinct.

Frederick I., surnamed **Barbarossa,** emperor of the Holy Roman Empire, son of Fred-

erick, Duke of Suabia: b. 1121; d. June 1190. He was chosen to succeed his uncle Conrad III. in 1152. He was crowned at Aix-la-Chapelle a few days after his election. His great ambition was to secure the independence of the empire, and, above all, to be master of Italy. His first expedition to Italy was made in 1154, when, after subduing several towns in Lombardy, he went to Rome, and, after some delays, had himself crowned emperor by Adrian IV. He marched again into Italy in 1158, took Brescia and Milan, and at the celebrated Diet at Roncaglia assumed the sovereignty of the towns and received the homage of the lords. On his return to Germany he triumphed over Bohemia, and made Poland tributary to the empire. After the death of Pope Adrian, Frederick had three anti-popes in succession elected in opposition to Alexander III., who excommunicated him and his pope, Victor. The same year, 1160, he besieged and took Crema, after a most courageous defense. In 1162 he conquered Milan, and had many of the public buildings destroyed, as well as parts of the fortifications; after which the other towns of Lombardy submitted to him. In 1166, he traversed the Romagna, levied contributions on the towns, besieged Ancona, and had himself crowned a second time at Rome by the anti-pope, Pascal. A fresh league being formed against him, he put its members under the ban of the empire and returned to Germany. In 1174 he besieged unsuccessfully the newly founded town of Alessandria, and in the following year was totally defeated by the Milanese at Como. Soon after he made peace with the Pope and the towns of Lombardy. In 1188 he assumed the cross, set out in the following year on the third crusade, was opposed on the march by the Greek emperor and the sultan, arrived in Asia, and was drowned while crossing a river. Frederick was great, not only as a soldier, but as a ruler. His administration was marked by justice, his subordinate officers were chosen for their capacity and probity, he was himself an educated man and promoted education and literature. His memory is still cherished among the peasants of Germany, who dream of the return of Fritz Redbeard, as the Welsh did of King Arthur. Consult: Prutz, 'Kaiser Friedrich I.' (1871–3); Fischer, 'Kreuzzug Friedrichs I.' (1870).

Frederick I., first king of Prussia (FREDERICK III. as elector of Brandenburg): b. Königsberg 22 July 1657; d. Berlin 25 Feb. 1713. He succeeded his father in 1688, entered into the alliance against France, and seized Bonn and other towns, sent auxiliaries to the emperor against the Turks, and, after a dispute of some years, sold to the emperor the circle Schwiebus, which the Great Elector had acquired in exchange for the principalities of Liegnitz, Brieg, and Wohlau. He supported the emperor in the war of the Spanish Succession, and in 1701 obtained from him the title of king, which he had long coveted. Frederick gratified his love of pomp in the ceremony of his coronation at Königsberg, the cost of which exhausted his treasury for a time. He placed the crown on his head with his own hands. In 1694 he founded the University of Halle; two years later the Berlin Academy of Painting; and, in 1707, he established the Academy of Sciences, Berlin, and made Leibnitz first president.

Frederick I., William Charles, duke (1797–1803), elector (1803–6), and king (1806–16) of Würtemberg: b. Treptow, Pomerania, 6 Nov. 1754; d. 30 Oct. 1816. He was a son of Sophia Dorothea, niece of Frederick the Great. In 1797 he became duke. His title of king, with a large accession of territory, he gained through an alliance with Napoleon. In 1806 he joined the Confederation of the Rhine; in 1809, 1812, and 1813 fought for Napoleon, but in 1813 took side with the allies.

Frederick I., William Louis, grand-duke of Baden: b. Karlsruhe 9 Sept. 1826. He was the second son of the Grand-duke Leopold. In 1856 he assumed the grand-ducal power. He restored the constitution in its full effect; and devoted himself to the promotion of art and science and the spiritual and material interests of his realm. Though he took side with Austria in 1866, he later worked for the admission of Baden to the North German Confederation.

Frederick II., emperor of the Holy Roman Empire: b. Jesi 26 Dec. 1194; d. Viorenzuoli 13 Dec. 1250. He was elected king of the Romans in 1196, again after the death of his father, Henry VI., and a third time on the excommunication of Otho IV., in 1211. He was already king of Sicily and duke of Suabia, under the joint regency of his mother and Pope Innocent II. He made a league with Philip Augustus, king of France, and after the defeat of Otho by the latter at the battle of Bouvines, was crowned at Aix-la-Chapelle in 1215. He received the imperial crown at Rome in 1220, on which occasion he had to renew a vow previously extorted from him to take the cross. In 1225 he married Yolande, daughter of John of Brienne, king of Jerusalem, and in 1227 embarked for the Holy Land. Illness compelled him in a few days to land again, and for this he was excommunicated by Pope Gregory IX. He set out again in 1228, and the Pope exciting opposition to him, and invading his hereditary states, he at once concluded a truce with Kameel, the sultan of Egypt, by which he became master of Jerusalem. He entered the city, crowned himself (no priest daring to do it), and returned to Europe. He recovered his states, made peace with the Pope, and suppressed the revolt of his son Henry, who was then imprisoned for life. In 1235 Frederick began the war with the cities of Lombardy, having for his ally Eccelino, tyrant of Verona. After his victory of Cortenuova, he took Ravenna, Faenza, and Benevento; and, in 1241, his fleet defeated that of the Genoese, and captured the cardinals and bishops who were on their way to attend a council against him. Frederick promoted the election of Innocent IV., who had been his friend, and made a treaty with him; but soon found Innocent a most determined enemy. A new anathema and sentence of deposition, and release of his subjects from their allegiance to him, was published in 1245. The mediation of St. Louis utterly failed to bend the Pope to reconciliation. Rival emperors were set up, the war in Italy continued, Parma was lost in 1248, his son Enzio was defeated and made prisoner in the following year. Frederick was the most accomplished sovereign of the Middle Ages; but his strong sympathies with his Italian motherland, and his unremitting endeavors to establish a compact and all supreme empire in Italy,

were the causes not only of his own misfortunes but of the miseries which he brought on the German empire by embroiling him in costly wars abroad, and leading him to neglect the welfare and sacrifice the interests of his German subjects.

Frederick II., landgrave of Hesse-Homburg, called "Prince of Homburg": b. 9 June 1633; d. 24 Jan. 1708. He fought bravely at Copenhagen (January 1659), where his leg was shot away and its silver substitute gained him the sobriquet "mit dem silbernen Bein." In 1670–8 he was a general of cavalry in the army of Frederick William, the great elector of Brandenburg, to whose victory over the Swedes at Fehrbellin (1675) he contributed the chief part. Having succeeded to power in 1681, he renovated the saline springs of Homburg, beautified the city, and made it prominent as a watering-place.

Frederick II., best known as **Frederick the Great,** king of Prussia: b. 21 Jan. 1712; d. Sans Souci 17 Aug. 1786. He was the son of Frederick William I., and the Princess Sophia Dorothea of Hanover. Though, by the direction of his father, he was instructed only in the details of military exercises and service, his taste for poetry and music was early developed by the influence of his first instructress, Madame de Rocoules, and his early teacher, Duhan, who, countenanced by the queen, formed a secret opposition to his father's system of education. The prince's inclination led him to adopt entirely the views of his mother. This gave rise to a coolness between him and his father. Indignant at the oppression and hatred which he experienced from his father, Frederick determined to flee to the court of George II., king of England, his mother's brother. His sister Frederica and his friends, Lieuts. Katt and Keith, were the only persons entrusted with the secret of his flight. He was, however, overtaken, was barbarously treated by his father, and obliged to be an eye-witness of the execution of his friend Katt.

While the prince remained in the closest confinement in Küstrin, the king sent a proposal to him to renounce the succession in favor of his younger brother Augustus William, on condition that he should have the liberty of pursuing his own inclinations in regard to his studies, traveling, etc. "I accept the proposal," said the prince, "if my father declares that I am not really his son." On this answer the king, who looked on conjugal fidelity with religious respect, relinquished his plan. That the king was inclined to sentence his son to death is certain. But the provosts Reinbeck and Seckendorf, who had before intrigued against the prince, now saved his life; the latter, in particular, by availing himself of the interference of the emperor.

The prince was not admitted to court till on the occasion of the nuptials of his sister Frederica, and was obliged by his father in 1733 to marry the Princess Elizabeth Christina, daughter of Ferdinand Albert, duke of Brunswick-Bevern. Frederick William gave the castle of Schönhausen to her, and to the prince the county of Ruppin, and in 1734 the town of Rheinsberg, where he lived devoted to study till he ascended the throne. Among his daily visitors were literati, musicians, and painters. He corresponded with foreign scholars, particularly with Voltaire, whom he greatly admired. Several of his writings, in particular his 'Antimacchiavel,' had their origin in the rural tranquillity of Rheinsberg.

The death of his father raised him to the throne 31 May 1740. Frederick on his accession found in his states a population of only 2,240,000. At his decease he left 6,000,000. He raised Prussia to this pitch of greatness by his talents as a legislator and general, assisted in the field and in the cabinet during a reign of 46 years by many distinguished men. Frederick II., who had already excited great expectations, retained for the most part the institutions and laws of his father, but gave to the latter more extent and vigor. The death of the Emperor Charles VI. was a favorable moment, of which Frederick II. took advantage, to revive the claims of the house of Brandenburg with regard to the Silesian principalities, so far as to ask from the queen, Maria Theresa, the duchies of Glogau and Sagan, in return for which he promised her assistance against all her enemies, his vote for the election of her husband as emperor, and 2,000,000 Prussian dollars. These proposals being rejected, he occupied Lower Silesia in December 1740, and defeated the Austrians 10 April 1741, near Molwitz. This victory which was almost decisive of the fate of Silesia, raised new enemies against Austria. France and Bavaria united with Prussia, and the war of the Austrian Succession commenced. The only ally of the queen of Hungary and Bohemia, George II. of England, advised her to make peace with Prussia, because Frederick II. was her most active and formidable enemy. After the victory of Czaslau (Chotusitz), gained by Frederick 17 May 1742, the first Silesian war was terminated by the preliminaries signed at Breslau under British mediation (11 June), and by the peace signed at Berlin 28 July 1742. Frederick obtained Lower and Upper Silesia, and the larger part of the county of Glatz, with full sovereignty. On the other hand he renounced all claims to the other Austrian territories, assumed a debt of 1,700,000 Prussian dollars charged on Silesia, and promised to respect the rights of the Catholics in Silesia. Saxony acceded to this peace, of which England and Russia were the guarantees.

Frederick II. seized the opportunity of a peace to introduce useful institutions into the conquered territories, and to render his army more formidable. In 1743 on the death of the last Count of East Friesland, he took possession of that country, the reversion of which had been granted to his family in 1644 by the emperor. The war of the Austrian Succession continued; the Emperor Charles VII. was driven from his hereditary estates of Bavaria, and the Austrians were everywhere victorious. Frederick, apprehensive that an attempt would be made to recover Silesia, entered into a secret alliance with France (April 1744), and with the emperor, the palatinate, and Hesse-Cassel, in Frankfort (22 May 1744). He promised to support the cause of the emperor by the invasion of Bohemia, on condition that he should receive the circle of Königgrätz. He entered Bohemia suddenly, 10 Aug. 1744, and captured Prague; but the Austrians and Saxons compelled him to evacuate Bohemia before the close of the year. The death of the emperor (18 Jan. 1745), and the defeat of the Bavarians at Pfaffenhofen, obliged Maximilian Joseph, the young elector

of Bavaria, to conclude the Peace of Fuessen with Maria Theresa, and occasioned the dissolution of the Alliance of Frankfort, after Hesse-Cassel had already declared itself neutral. The victory of the Prussians over the Saxons at Kesselsdorf, 15 Dec. 1745, led to the Peace of Dresden (25 December). Frederick retained Silesia, acknowledged the husband of Maria Theresa, Francis I., as emperor, and Saxony promised to pay 1,000,000 Saxon dollars to Prussia.

During the 11 following years of peace Frederick devoted himself with the greatest activity to the domestic administration, to the improvement of the army, and at the same time to the Muses. It was at this time that he wrote his 'Mémoires pour servir à l'Histoire de Brandenbourg,' his poem, 'L'Art de la Guerre,' and other works in prose and verse. He encouraged agriculture, the arts, manufactures, and commerce, reformed the laws, increased the revenues of the state, perfected the organization of his army which was increased to 160,000 men, and thus improved the condition of the state.

Secret information of an alliance between Austria, Russia, and Saxony gave him reason to fear an attack and the loss of Silesia. He hastened to anticipate his enemies by the invasion of Saxony, with which the Seven Years' War, or third Silesian war, commenced. The Peace of Hubertsburg (15 Feb. 1763), terminated this war, without any foreign interference, on the principle that the contracting parties should remain in *statu quo*. Frederick came out of the Seven Years' War with a reputation which promised him in the future a decisive influence in the affairs of Germany and Europe. His next care was the relief of his kingdom, drained and exhausted by the contest. He opened his magazines to furnish his subjects corn for food and for sowing. To the peasants he distributed horses for plowing, rebuilt at his own expense the houses destroyed by fire, established new settlements, built manufactories, and laid out canals. In 1764 Frederick founded the Bank of Berlin, with a capital of 8,000,000 Prussian dollars.

A treaty was concluded with Russia (31 March 1764), in consequence of which Frederick supported the election of the new king of Poland, Stanislaus Poniatowski, and the cause of the oppressed Dissidents in Poland. For the purpose of connecting Prussia with Pomerania and the Mark, and of enlarging and consolidating his territories, Frederick consented to the first partition of Poland proposed at St. Petersburg and concluded 5 Aug. 1772. Frederick received the whole of Polish Prussia (which had been ceded to Poland by the Teutonic Order in 1466) with the part of Great Poland to the river Netz, excepting Dantzic and Thorn. From this time the kingdom of Prussia was divided into East and West Prussia. He declared against the possession of a large part of Bavaria by Austria in 1778, after the death of Maximilian Joseph, elector of Bavaria, without issue, but Austria was not to be diverted from her designs by negotiations. Saxony, therefore, formed an alliance with Prussia and Frederick invaded Bohemia with two armies (July 1778). The Emperor Joseph, in a strongly fortified camp behind the Elbe, could not be induced to give battle. The aged Empress Maria Theresa wished for peace. But Catharine II. having declared her intention of assisting Prussia with 60,000 men, this war of the Bavarian Succession was terminated without a battle by the Peace of Teschen (13 May 1779). Austria consented to the union of the principalities of Franconia with Prussia, and renounced the feudal claims of Bohemia to those countries. In the evening of his active life Frederick concluded, in connection with Saxony and Hanover, the confederation of the German princes, 23 July 1785.

Frederick left to his nephew, Frederick William II., a kingdom increased by 29,000 square miles, more than 70,000,000 Prussian dollars in the treasury, an army of 200,000 men, great credit with all the European powers, and a state distinguished for population, industry, wealth, and science. Improved by severe experience before he ascended the throne, and possessed of rare talents, Frederick shook the political system of Europe when he conceived and established, in accordance with the wants of his time, the confederation of princes, the master-work of his policy. One of his great merits is that in the most difficult circumstances he contracted no public debts, but on the contrary, though he distributed a considerable part of his revenues in different ways among his subjects, he had a richer treasury than any monarch in Europe ever possessed. His contempt for ecclesiastical establishments, which was considered by his contemporaries as a contempt of religion, has been censured, and his writings show that his heart was a stranger to the highest sentiments of piety. Entirely unacquainted with the literature and mental cultivation of Germany, he underrated it, and contributed nothing to its improvement.

Some of Frederick's writings were published during his lifetime, but most of them appeared first in the 'Œuvres Posthumes' (1788–9). In 1846–57 the Berlin Academy published a critical edition of the whole, together with his literary and private correspondence, under the title 'Œuvres de Frédéric le Grand' (31 vols.).

Consult Loryman, 'Frederick the Great and the Seven Years' War' (1881); Carlyle, 'History of Frederick II.' (1858–65); Tuttle, 'History of Prussia under Frederick the Great' (1888); Lavisse, 'La jeunesse du grand Frédéric' (1891); Lavisse, 'Le grand Frédéric avant l'événement' (1893); Koser, 'Friederich der Grosse als Kronprinz' (1901).

Frederick II., landgrave of Hesse-Cassel: b. 14 Aug. 1720; d. Castle Weissenstein, Wilhelmshöhe, 31 Oct. 1785. He ascended the throne in 1760. By the aid of his architect, Du Ruy, he greatly beautified his capital, in which he founded the Collegium Carolinum, the museum, the library, and an academy of painting and sculpture. He sold a corps of 12,000 troops to England for service in America during the Revolution; whence, in the patriot mind, a stigma attached to the name "Hessian."

Frederick III., emperor of the Holy Roman Empire: b. Innsbruck 21 Dec. 1415; d. Linz 19 Aug. 1493. He was elected emperor in 1440 and ruled for 53 years, the longest German reign. His sobriquet was "the Pacific," owing to his plans for the pacification of the empire.

He left it to his son Maximilian to carry out the device inscribed upon his palaces and books, A, E, I, O, U; which characters are

FREDERICK THE GREAT,

ONE OF THE STATUES PRESENTED TO HARVARD UNIVERSITY BY EMPEROR WILLIAM II.

generally supposed to represent the motto, *Austriæ est Imperare Orbi Universo* («Austria is to rule the world»).

Frederick III. (the Wise), elector of Saxony: b. Torgau 17 Jan. 1463; d. 5 May 1525. He succeeded his father, Ernest, and is known chiefly as founder of the University of Wittenberg, and as the friend and very cautious protector of Luther, one of the first professors of the new university. It was by his arrangement that Luther, after the Diet of Worms, was seized and carried off to Wartburg. He did not, however, establish the reformed faith in his dominions. He became administrator of the empire in 1519, and was offered the imperial crown, but declined it.

Frederick III., king of Prussia, second emperor of modern Germany: b. Potsdam 8 Oct. 1831; d. 15 June 1888. He married in 1858 the Princess Royal of England, the eldest daughter of Queen Victoria. He early entered the army of Prussia, and when the latter declared war against Austria in 1866 the crown prince, as he was called, became commander of the army of the Oder. By a series of rapid marches from Silesia through the Sudetic mountain passes into Bohemia his army arrived just in time to aid Prince Frederick Charles and snatch the decisive victory of Sadowa. At the outbreak of the Franco-German war he commanded the third German army, which numbered 200,000 men, and with these he advanced to attack the French under MacMahon. The first assault was made at Weissenburg (4 August), and two days later he successfully turned the French defense at Woerth, causing the disorderly retreat of MacMahon's army. He pressed northward closely after MacMahon, and the passage of the Meuse by the Germans under his command greatly contributed to the successful turning of the French advance, and the final surrender at Sedan. This accomplished, he pushed on to Paris, and after surrounding the city established his headquarters at Versailles, where he remained until the capitulation in January 1871. In 1887 he was attacked by a throat disease, and while undergoing treatment for this his father died, and he became emperor in March 1888. The announcement of his own death three months later was received with wide regret, for his renown as a military commander, his liberal views, his large-heartedness, and his resignation under suffering, had touched his personality with the rarest heroic qualities.

Frederick III., elector of Brandenburg. See FREDERICK I. OF PRUSSIA.

Frederick V., elector-palatine and king of Bohemia: b. Amberg 1596; d. Mentz, Germany, 19 Nov. 1632. He succeeded his father, Frederick IV., in 1610. In 1618 he married the Princess Elizabeth, daughter of James I. of England, and in the following year accepted the crown of Bohemia. He made a triumphal entry into Prague, followed in 1620 by his total defeat by the Imperial forces at the battle of Prague, and the loss of his kingdom and hereditary states. He then took refuge in Holland.

Frederick Augustus II., elector of Saxony and king of Poland. See AUGUSTUS II.

Frederick Augustus III., elector of Saxony and king of Poland. See AUGUSTUS III.

Frederick Charles, Prince of Prussia: b. Berlin 20 March 1828; d. Castle of Klein-Ghericke, near Potsdam, 15 June 1885. He was a son of Frederick Charles Alexander and nephew of William I. He was in command of the first Prussian army which made so vigorous a resistance, and, aided by the second army, which arrived opportunely, finally defeated the Austrians at the battle of Sadowa (Königgrätz). In the Franco-German war he commanded the second army, directed the siege-operations against Metz, and 28 Nov. 1870 defeated the army of the Loire.

Frederick, Christian August, duke of Schleswig - Holstein - Sonderburg - Augustenburg: b. Castle Augustenburg, island of Alsen, 6 July 1829; d. Wiesbaden 14 Jan. 1880. He was banished by Denmark in 1851, after having taken part in the insurrection as an officer of the general staff. Upon the conclusion, however, of the war between Denmark and Germany, he was proclaimed duke by a popular assembly at Elmshorn in 1864, and received allegiance at Kiel. But he was not destined to rule. The duchy, by the terms of the Treaty of Vienna, fell to Austria and Prussia for disposal, and Prussia, through Bismarck, imposed upon Frederick conditions which he rejected. After the war with Austria, his domains were incorporated with Prussia. He took part in the Franco-German war as a Bavarian general on the general staff of the Prussian crown prince. His daughter, Augusta Victoria, was married to Prince William of Prussia, later William II., emperor of Germany.

Frederick Louis, Prince of Wales: b. Hanover, Germany, 6 Jan. 1707; d. Leicester House, London, 20 March 1751. He was the eldest son of George II. He became the leader of the Opposition, which was strongly against Walpole and styled itself the Patriot party. In the contest between Handel and Buononcini he was a partisan of the latter. At the outbreak of the rebellion of 1745 he sought, but did not obtain, the command of the royal army. His eldest son became King George III.

Frederick William I., king of Prussia: b. Berlin 15 Aug. 1688; d. Potsdam 31 May 1740. He commenced his reign in 1713, after having married the daughter of the elector of Hanover, afterward George I. of England. In 1715 he declared war against Charles XII. of Sweden, and in conjunction with Denmark took Stralsund; but on the death of Charles, in 1718, he made peace. The habits of this sovereign were entirely military, and he labored unweariedly to promote the discipline of his troops. One of his strongest peculiarities was an extraordinary love for tall soldiers; and in order to procure them had agents employed in all parts of Europe. He held science and literature in profound contempt; but money he worshipped, and men of a military character after his own ideal he respected and encouraged. The consequence was that he left an abundant treasury and a well-appointed army of 66,000 men. He was succeeded by his son Frederick the Great.

Frederick William I., last elector of Hesse: b. Philippsruhe 20 Aug. 1802; d. Prague 6 Jan. 1875. He succeeded to the throne in 1847. His reign was disturbed by conflicts with his people due to his efforts to disregard the constitution of 1831 and to limit popular representa-

tion. In 1866 he took sides with Austria in the war with Prussia, was deposed, and for a time imprisoned. In the same year Hesse was annexed to Prussia, in which the larger portion of it is now incorporated with the province of Hesse-Nassau.

Frederick William II., king of Prussia: b. 25 Sept. 1744; d. 16 Nov. 1797. He was the eldest son of Prince August William, brother of Frederick the Great, and ruled from 1786 to 1797. As the result of an interview at Pilnitz in 1791, he arranged with the emperor of Austria to interfere in aid of Louis XVI. of France. The ensuing campaign was an inglorious one, concluded by a retreat to the Rhine in the autumn of 1792. The war was ended in 1795, and Frederick William ceded to France Prussian territory west of the Rhine. From the second (1793) and third (1795) partitions of Poland he acquired large territory.

Frederick William III., king of Prussia: b. 3 Aug. 1770; d. 7 June 1840. He commenced his reign in 1797 by maintaining a strict neutrality in the various alliances with and against France, which resulted from the ambitious designs of Napoleon I. In 1805, however, he yielded to the solicitations of Russia, allying himself with the czar against the French emperor. The rapid campaign of 1806, and the defeat of the Prussians at Jena, opened the gates of Berlin to the enemy, in whose hands it remained till 1809. In 1807 the battle of Friedland led to the humiliating peace of Tilsit. Restored to his capital, the king diligently endeavored to repair the evils of war; but new disasters overtook him, and his kingdom suffered greatly during the struggle from 1812 to 1814. He subsequently joined his troops with those of Russia. The allies having triumphed over the French at Leipsic, Frederick William in 1814, entered Paris with Czar Alexander. On the return of Napoleon from Elba, he once more joined the allies. After the victory of Waterloo, in which the Prussians, under Blücher (q.v.) played an important part, Prussia, once more at peace, gradually recovered the losses she had sustained, under the wise and paternal sway of Frederick, whose constant efforts and moderation contributed greatly to the maintenance of peace. Throughout his life, he was a warm defender of the Protestant religion, and a patron of education. He never redeemed his promise, however, to bestow a representative constitution on his people. The establishment of the provincial estates only affected very slightly the absolute power, which, it is true, he wielded with ability, and with a kind of paternal affection for his people. It may finally be said of him, that, a waverer between the Absolutist party and the Liberal party, he secured, as is the lot of most undecided men, the respect and adherence of neither.

Frederick William IV., king of Prussia: b. 15 Oct. 1795; d. near Potsdam 2 Jan. 1861. On the death of his father Frederick William III. succeeded to the throne in 1840. He evinced, at an early period of his life, a very great love for the arts, which he preserved throughout his career. During the first years of his reign his subjects anxiously demanded the reform of the government, requiring the liberal constitution which had been promised them in 1815, in return for the great sacrifices they had made during the continental war. In 1847, at a general diet of the Prussian states, many of these reforms were granted, and it was thought that the kingdom might escape the troubles of the next year's revolution. In March 1848, however, the king was obliged to change the ministry, to issue a general amnesty, and commence a war in favor of Schleswig against Denmark. In the war between the western powers and Russia, the king preserved a strict neutrality, though earnestly solicited by each party to espouse its side in the conflict. In 1856, in consequence of an attack on Neufchâtel by some Prussian partisans, war was in danger of breaking out between Switzerland and Prussia; but this was avoided, and a treaty concluded, in May 1857, in reference to the king's claims on that place. In the complication relative to the Danubian principalities, Prussia followed the lead of France and Russia as opposed to England and Austria. Toward the end of 1857, a severe illness, resulting in the loss of some of his faculties, caused his brother William to be nominated regent, who succeeded him as king.

Frederick William, duke of Brunswick: b. Brunswick 9 Oct. 1771; d. at Quatre-Bras 16 June 1815. He entered the Prussian military service in 1788, and in 1800 was commissioned major-general. With a Bohemian volunteer corps he invaded Saxony, and with Austrian reinforcements took Dresden and Leipsic. After the armistice of Znaim, he defeated Reubel's corps, 6,000 strong, at Oelger, near Brunswick, finally arrived at Elsfleth and Brake, seized all available shipping, and embarked for England, where he was received with demonstrations of enthusiasm. He participated in the Peninsular war, and returned only after the battle of Leipsic (1813). He was shot while leading an attack at Quatre-Bras.

Frederick William, elector of Brandenburg, called the Great Elector: b. 16 Feb. 1620; d. Potsdam 29 April 1688. He succeeded his father when the unhappy Thirty Years' war was still raging in Germany, and his conduct toward both parties was prudent. In 1641 he concluded a treaty of neutrality with Sweden, notwithstanding the earnest remonstrances of Austria. In 1644 he concluded an armistice with Hesse-Cassel, by which Cleves and the county of Mark were restored to him, and by the Peace of Westphalia in 1648 received Madgeburg, Halberstadt, and Kammin. In the war between Poland and Sweden (in 1655) he was obliged to take part, on account of the duchy of Prussia. He supported both parties in turn, and obtained an acknowledgment of the independence of the duchy of Prussia from Poland, upon whom it was formerly dependent. In 1672 he concluded a treaty with the Dutch Republic, when this state was threatened by Louis XIV. On June 6, 1673, he concluded a treaty with France at Vossem, by which France promised to evacuate Westphalia, and to pay 800,000 livres to the elector, who, in return, broke off his treaty with Holland, and promised not to render any aid to the enemies of France. In 1674 the German empire declared war against France. In the following December a Swedish army, at the instigation of France, entered Pomerania and the Mark. The elector defeated them, 18 June 1675, at Fehrbellin. In 1678 he concluded a separate peace with France, at Nimwegen, as did also Holland and

Spain. France demanded the restoration of all the conquered territories to Sweden. The elector, having refused compliance, formed an alliance with Denmark, and waged a new war against Sweden, but was obliged to submit, by the Peace of St. Germain, 29 June 1679. Louis XIV. having occupied several circles of Alsace by his famous *chambres de réunion,* Frederick William effected an armistice of 20 years between France and Germany (in 1684). But when he renewed (1685) his treaty with Holland, and received into his dominions about 14,000 Protestant refugees from France, new difficulties arose between him and France, which brought him into a closer connection with Austria. He received the circle of Schwiebus in 1686, and in the same year sent 8,000 men to assist the Austrians against Turkey.

The elector paid great attention to the promotion of agriculture and horticulture, and, by affording protection to the French refugees, gained 20,000 industrious manufacturers. A colossal statue of Frederick William in bronze, at Berlin, was cast by Jacobi, in 1700, and is still one of the greatest ornaments of that city. Consult: Hitl, 'Der grosse Kurfürst und seine Zeit' (1893); Philippson, 'Der grosse Kurfürst' (1897–1902).

Frederick, Md., city, county-seat of Frederick County; on Carroll's Creek, and on the Pennsylvania, and the Baltimore & O. R.R.'s; 62 miles northwest of Baltimore. Here are Frederick College, Woman's College of Frederick, and the State institution for the deaf and dumb. The city has manufactories of coaches, leather, shoes, knit goods, shirt-waists, palmetto, fibre brushes, tobacco, etc., and an assessed property valuation of nearly $4,000,000. During the Civil War it was twice occupied by the Confederates, the second time, in 1864, by Gen. Early, who forced the citizens to pay a ransom of $200,000. In 1862 Federal troops under Gen. McClellan occupied the place. Pop. (1900) 9,296.

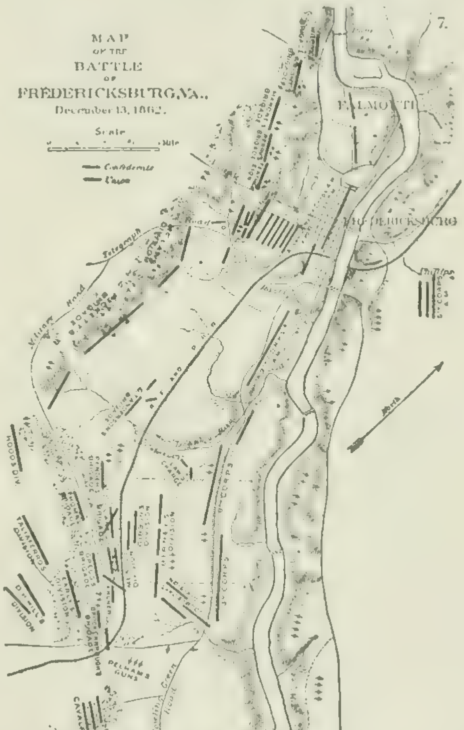
Fredericksburg, Tex., town, county-seat of Gillespie County; on the San Antonio & A. P. R.R.; 80 miles west of Austin. It was founded by a German colony in 1846. Pop. (1900) 1,532.

Fredericksburg, Va., city in Spottsylvania County; on the Rappahannock River, and the Richmond, F. & P., and the Potomac, F. & P. R.R.'s; 61 miles north of Richmond. It has tanneries, iron works, cigars, ice, and shoe factories, and an assessed property valuation of nearly $2,000,000. It was the scene of several battles during the Civil War and 15,300 graves of Confederate dead are in the National cemetery here. Pop. (1900) 5,068.

Fredericksburg, Battle of. At the beginning of December 1862 the Army of the Potomac, under command of Gen. Burnside, held the north bank of the Rappahannock River at Falmouth, Va., while the Confederate army, under Gen. Lee, held the south bank at and below Fredericksburg. The Army of the Potomac "present and equipped for duty" numbered 120,281 men, with 312 guns. Gen. Lee's army, strongly entrenched on a broken range of hills back of Fredericksburg, numbered (10 December) "present for duty" 78,513 men, with 270 guns.

The Army of the Potomac was organized into three grand divisions: The right, under Gen. Sumner, consisted of the Second corps, Gen Couch, the Ninth corps, Gen. Willcox, and Pleasonton's cavalry division; the centre, under Gen. Hooker, of the Third corps, Gen. Stoneman, Fifth corps, Gen. Butterfield, and Gen. Averell's cavalry division; the left, under Gen. Franklin, of the First corps, Gen. Reynolds, Sixth corps, Gen. Smith, and Gen. Bayard's cavalry brigade. Gen. Lee's army was divided into two wings, Gen. Longstreet commanding the left, and Gen. Jackson the right.

Burnside concluded to cross the river at and below Fredericksburg by pontoon-bridges. Under great difficulties, with annoyance from the enemy, the bridges were completed 11 December, troops



From original in the possession of the Southern Historical Society. SERIES I VOL. XXI.

rushed over, and by night of the 12th Sumner and Franklin had crossed and taken position. Franklin, who was to open the battle by an attack upon the Confederate right, reinforced by Birney's and Sickles' divisions of the Third corps, and Burns' of the Ninth, had about 60,000 men. At 7.30 A.M. on the 13th, Burnside gave him orders to seize the heights at Hamilton's crossing. One of Franklin's smallest divisions, Meade's, led the attack, moving out at 9 o'clock; but owing to flank attacks and lack of immediate support, it was 1.15 P.M. before Meade drove the Confederates from the Richmond Railroad and, crossing it, charged up a ridge and into the woods, piercing the centre of A. P. Hill's first line; but when he had crossed the road that ran in rear of the crest he was attacked, front and flank, by Hill's second line and the reserves, and was driven back with a loss of over 40 per

cent in killed, wounded, and captured. Gibbon, who had been thrown forward to support Meade's right, shared the same fate, being forced back, with a loss of 1,267 men. The Confederates then advanced beyond the railroad but were checked. Franklin made no further attempt to carry the ridge, but directed his attention to protecting his left, which he thought was seriously threatened. At 2.30 P.M., when Sumner was heavily engaged in front of Marye's Heights, Franklin received Burnside's order to attack with his whole force, but the order was not carried out. Franklin put but a small part of his command into the fight.

Sumner was held in position until after 11 A.M. in the expectation that Franklin would make such an impression upon Lee's right as would enable him to carry the line near the Telegraph and Plank roads. Feeling the importance of haste, Burnside now directed Sumner to begin his movement. In rear of the town, and between it and the heights that Sumner was to carry, was a broken plain, traversed about midway by a canal or ditch, running from right to left. Two roads cut the plain nearly at right angles with the canal; the Plank road on the right, the Telegraph road on the left, leading to Richmond. The advance was to be made on and between these two roads, over ground completely covered by artillery on the heights. McLaws' division held the heights to be assaulted, Cobb's and Kershaw's brigades being placed in the sunken Telegraph road, that ran at the base of the hill. On the side of the road next to the town was a stone wall, shoulder high, behind which Cobb's and Kershaw's men were well protected. The Second corps led in the attack. French's division moved out of the town by parallel streets, and at noon, under a severe artillery and musketry fire, had driven in the Confederate skirmishers and gained a rise of ground, within about 120 yards of the stone wall, from which and the top of the hill it received a most deadly fire. Hancock's division followed in support. At 1 P.M. Couch ordered French and Hancock to carry Marye's Heights. French sent in his three brigades in succession, but they were bloodily repulsed by the deadly fire from behind the stone wall. Hancock now ordered in Zook's brigade. It sprang forward, was joined by some shattered regiments of French's division, and when within 25 paces of the stone wall was repulsed with great loss. The Irish brigade and Caldwell's followed in succession, but failed to carry the position and, after losing one-half, fell back, and both French and Hancock continued, with parts of their commands, to hold the rise of ground near the stone wall. While Hancock's men were falling by hundreds, Howard was ordered to move his division to the right of the Telegraph road and turn the Confederate left, but as French and Hancock needed help, Howard was recalled and ordered in on the Telegraph road, and two divisions of the Ninth corps went in on Couch's left. All fought gallantly, but made no impression upon the Confederate line. French's loss was 1,160; Hancock's 2,032; Howard's 900; Sturgis' division of the Ninth corps lost 1,000, and Getty's division 290.

It was 2 P.M. when Hooker, riding in advance of the Fifth corps, came on the ground. After an examination of the position and conference with Couch and other general officers, he concluded that it would be a useless waste of life to make a further attempt and sent an aide to Burnside, giving his opinion. Burnside ordered him to attack. Hooker then rode to Burnside, across the river, and sought to impress upon him the hopelessness of the attempt, but Burnside reiterated the order to attack. Every available battery opened fire upon the Confederate position, and near sunset Humphreys led his division of the Fifth corps against Marye's Heights, Sykes' division moving on his right. Twice Humphreys led his men forward; some of them were killed within 20 yards of the stone wall; but he was repulsed with a loss of 1,000 men. Sykes, on his right, lost over 200, while Griffin's division, on the left, supporting the Ninth corps, lost over 800 men. Night came with the Union army everywhere repulsed. Burnside directed preparations for a renewal of the battle on the morning of the 14th, when he proposed to lead the Ninth corps, his old command, in an assault where the 2d and 5th Corps had failed, but he was dissuaded from the attempt. From the night of the 13th until the night of the 15th the two armies confronted each other, engaged in artillery-firing and angry skirmishing. On the night of the 15th the Army of the Potomac recrossed the river, after one of its most bloody and humiliating defeats. Its loss was 1,284 killed, 9,600 wounded, and 1,769 missing, an aggregate of 12,653. The Confederate loss was 595 killed, 4,061 wounded, and 653 missing. The loss of the Confederate troops defending Marye's Heights was less than 1,000; that of the attacking and supporting Union troops was over 7,300. Consult: 'Official Records,' Vol. XXI.; Allan, 'Army of Northern Virginia'; Swinton, 'History of the Army of the Potomac'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. Carman.

Fredericton, Canada, county-seat of York County and capital of New Brunswick, is beautifully situated on the west side of the river St. John, 60 miles north-northwest of St. John. It is on the Canadian P. and Canadian East. Rys., and is the terminus of the Fredericton Ry. It is a port of entry and the seat of a United States consular agent. It has handsome public buildings, and is the seat of New Brunswick University and of the provincial normal school. Fredericton has manufactories of iron castings, machinery, leather, boots and shoes, woolen ware, etc., but its chief trade is in lumber and timber products. The city was founded in 1740, first called Saint Anne, and given its present name by Governor-General Sir Guy Carleton in 1785, two years later becoming the capital of the province. Pop. (1901) 7,117.

Fredonia, N. Y., village, in Chautauqua County; on the Dunkirk, A. V. & P. R.R.; about four miles south of Dunkirk, and about 50 miles southwest of Buffalo. It was settled in 1803 and incorporated as a village in 1829. It was early noted for its good schools, including its free academy. It is a residential village with not a large amount of manufactories. It is situated in an agricultural region, in the Lake Erie grape section, and its chief manufactures are canned and dried fruits, grape baskets, and boxes, and patent medicines. Natural gas was discovered here in the early part of the 19th

century and was in use for lighting the village in 1821. The trade is chiefly in fruits, wine, and patent medicines. It has the D. R. Barker free library and one of the State Normal schools. It was for some years the home of William Barker Cushing (q.v.), a United States naval officer. The village owns and operates the waterworks and electric light plant. Pop. (1900) 4,127.

Fredro, frā'drō, Count **Alexander,** Polish dramatist, called "the Molière of Poland": b. Suchorow, Galicia, 1793; d. Lemberg 15 July 1876. He was the founder of Polish comedy, those who preceded him having worked over French plays. 'Mr. Moneybags' (his first piece, 1821); 'Ladies and Hussars'; 'Man and Wife'; and 'Revenge,' are his titles. The scenes are taken from real life.

Free Banking System, the predecessor of and essentially the same as our present national banking system, and on the same principles as the general railroad and corporation laws. Up to 1838 all banks required special charters, with the attendant evils of collusive "blanket" powers, corruption, and an insecurity which was not only a private evil, but seriously affected the state credit and finance. In that year New York State passed a "free" or open banking law, under which anyone could start a bank by depositing with the State an amount of securities equal to its circulating notes. The other States soon followed the precedent.

Free Church, the term applied by British non-conformists to the Christian denominations throughout the British empire, free from state patronage and control. The Free Church of England, a distinct evangelical Protestant denomination founded on the basis of recognizing only two orders, presbyters and deacons, although the first order also comprises bishops, maintains the ecclesiastical parity of presbyters, whether episcopally or otherwise ordained. The governing body is the convocation consisting of all the clergy and laity in the several churches. The denomination originated in the creation of "free churches" in the west of England, as a protest against the Tractarian (q.v.) movement of 1832. The Shore controversy (1843–9), and the Gorham case (1849–50), promoted its development. It was enrolled in chancery by a deed poll in 1863. The bishops are in the Canterbury line of episcopal succession. See Reformed Episcopal Church.

The Free Church of Scotland was the name assumed by the large body of ministers and their adherents who separated from the Established Church of Scotland at the Disruption (q.v.) of 18 May 1843. They seceded in vindication of what they called the "Headship of Christ," that is, to gain liberty to obey what they deemed the will of their Divine Lord in all church arrangements, without the control of the civil power. No new article of faith was adopted, all the forms and rights of the national Church being retained in their integrity. The Church prospered in the face of formidable financial difficulties which were largely overcome by the institution of a sustenation fund, and by the excellent arrangements made for its distribution and employment. After 1867 there was a movement in favor of the union of the Free and United Presbyterian Churches of Scotland, and on 31 Oct. 1900 the union was formally completed by the constitution at Edinburgh of the first assembly of the United Free Church of Scotland. See Presbyterian Church.

The Free Church Association founded in 1866, in English ecclesiology, is a society which has for its main object the abolishment in the Established Church of pew rents and pew ownership, maintaining the equal right of all parishioners to the free use of seats in churches. It has a long list of distinguished patrons, and aids churches with pecuniary grants if "free" and in need. See Institutional Church.

Free Cities, the name applied to various cities of Germany which in the 12th century assisted the emperors in repressing the arrogance of the nobles, and, in return for their services or contributions, received various privileges and immunities and became imperial cities. Free cities existed in Germany from the time of the Romans; they had little in common with the free cities of later times, and in the beginning of the 16th century lost their most essential privileges, and even the name of free cities, through the ignorance and carelessness of their magistrates. The most important of those privileges, as shown in the case of Ratisbon, were, that they should enjoy an independent government; should never swear allegiance to any emperor or king, nor be obliged either to engage in any expedition against the Romans, or to pay for the privilege of exemption; nor to pay any contributions whatsoever to the empire; nor be in any way reckoned among the cities of the empire. Virtually they were independent republics. Commerce and manufactures gradually increased the importance of the imperial cities and they often ventured to resist their masters, the emperors, and could not be reduced to obedience without great difficulty. In the middle of the 13th century two important confederacies were established for common objects — the Hanseatic League (1241), comprising the cities of Frankfort-on-the-Main, Hamburg, Bremen, and Lübeck, and the league of the Rhenish cities (1246), comprising Cologne, Worms, Mainz, Strasburg, Basel and Spires, which are now incorporated in their respective political divisions. The powerful Hanseatic League lasted nearly four centuries, until its dissolution was effected by several causes in 1630. The remnant of this league and of the former *collegium* of cities, which had its representatives in the German Diet, namely the free cities of Hamburg, Bremen, and Lübeck, was incorporated with the French empire in 1810. As these cities co-operated vigorously in the recovery of German independence, they were acknowledged, together with Frankfort-on-the-Main, as free cities by the Congress of Vienna (1814–15). They joined the German Confederacy, and obtained the right of a vote each in the Diet, and one among the four in the narrower council. In conformity with the 12th article of the Constitution of the German Confederacy, they established a common supreme court of appeal in 1830. Frankfort in 1866 was annexed to Prussia. The only free cities now existing are Hamburg, Lübeck, and Bremen, each sending a member to the Bundesrath, and Hamburg three deputies to the Reichstag, the others one each.

Free Congregations (Ger. *Freie Gemeinden*), sometimes called "Protestant Friends," a sect of German Rationalists, who at first pro-

fessed to be Christians, but now reject the doctrines of miraculous revelation and a personal deity. There are upwards of 120 congregations of them in Germany, and a few in the United States.

Free Negroes, in the United States. At the formation of the Union these numbered about 60,000, nearly half of them in the South; but while there were few slaves in New England, and those dwindling, and less than 50 per cent more than the free colored population north of Maryland, the South had more than 20 times as many slaves as freedmen, and the system was extending. Hence this section began early to dread the free negroes, as an element always making their slaves discontented, and possibly stirring them to revolt; a sentiment deepened into terror after the Santo Domingo massacres. State laws and constitutions were framed or amended to drive them from the States or reenslave them; one method being to forbid emancipation by will, and provide that free negroes must choose masters or leave the State; and another to punish all penitentiary offenses of negroes with reduction to slavery. The Colonization Society (q.v.) derived its first impetus from this feeling, till it was seen to be a mere reinforcement of slavery. The laws for refusing to allow negro merchant sailors to land, or even imprisoning them if they did, also caused much bad blood with the North. The "Black Laws" reached their acme just before the War, as did the personal-liberty laws in the free States. By the Dred-Scott decision, free negroes were not citizens of the United States; which became law and remained so until repealed by the Fourteenth Amendment, though the Thirteenth had abolished slavery.

Free Port, a harbor where ships of all nations may enter and load or unload on payment of harbor dues or charges for accommodation. Goods may be stored at free ports, and may then be either re-shipped for export, or they may be admitted for home consumption on payment of the usual full customs of the country. The bonded warehouse system effects the same end as free ports. See TREATY PORT.

Free Ships, Free Goods. That is, that in time of war, belligerents shall have no right to inquire into anything regarding a vessel and her cargo but whether the former belongs to a neutral, and if so, her cargo must be as free as herself; unless the cargo is agreed contraband of war. This is the doctrine of international law which the countries of predominantly industrial interests have always struggled to have accepted; while those by nature constantly or frequently at war have refused to admit it. In the great wars of France with England, in the Revolutionary and Napoleonic era, the United States was the great champion of this doctrine, while England refused to admit it, claiming the right to confiscate her enemy's goods wherever she found them, and search every neutral for them. The War of 1812 arose partly from this, and did nothing toward settling it; but the close of the war period left it of little practical importance for many years. The Declaration of Paris (q.v.) went farther than this, and proclaimed neutral goods safe even in an enemy's vessels.

Free-soil Party (1848-55). This was the old Liberty party (q.v.) of direct abolition (Birney, Chase, etc.), plus the "Conscience Whigs" of Massachusetts (Sumner, C. F. Adams, etc.), who supported the Wilmot Proviso (q.v.), and the "Barnburners," or Van Buren section of the New York Democrats. The latter as a body adopted their principle of restricting the extension of slavery into the Territories, to punish the Polk administration, ultrasouthern, for attempting to build up its own "machine" in New York at the expense of the Albany Regency (q.v.); but a small element of it was really in sympathy with their less extreme purposes. Van Buren had lost the nomination in 1844 by refusing to approve the annexation of Texas; and his co-operation was more than a mere party move. The Liberty party in 1847 nominated John P. Hale of New Hampshire and Leicester King of Ohio for President and Vice-President; but seeing a chance of larger success through the promising split in the Democracy, dropped them and waited. The Barnburners, offered only an even share of the State vote with their rivals the Hunkers in the Baltimore Democratic convention of 1848, withdrew, and after nominating Van Buren at a bolting convention to keep the party together, agreed to join in a fusion "Free-Soil" party. A convention of this at Buffalo in August nominated Van Buren and Adams. The platform declared for "Free Soil, Free Speech, Free Labor, and Free Men"; and that slavery in the States was beyond the control of Congress, but that as Congress could not make slaves it was bound to refuse it admission to the Territories (see WILMOT PROVISO). The party cast 291,263 votes, turned Maine and six western States over to the Democrats (Cass), and would have defeated the Whigs (Taylor) but that the New York defection (120,510) was mainly from the Democrats and gave that State to the Whigs. The New York Democratic delegation to Congress was annihilated all but one; and the two factions at once struck a bargain, which left Van Buren permanently out of public life. The Free-Soilers in the 31st Congress (1849–51) had 2 United States senators (Chase and Hale), and 14 representatives, including J. R. Giddings, George W. Julian, and Horace Mann. Sumner in the Senate and 3 more representatives reinforced them in 1851, and in the 33d Congress (1853–5) they had 5 senators and 17 representatives. Having been abandoned by their casual allies, in 1852 they nominated Hale and Julian; with a platform denouncing the Compromise of 1850 (q.v.), both the great parties for accepting it, and slavery as "a sin against God and a crime against man," and demanding the repeal of the fugitive-slave law. They polled 156,149 votes, of which 25,329 were in New York. They maintained their organization in Congress till the Kansas-Nebraska Bill (q.v.) had created the Republican party, into which they were at once fused.

Free Sons of Israel, Independent Order of, a Jewish fraternal and benevolent society founded 10 Jan. 1849. It has 3 grand lodges and 103 subordinate lodges in the United States. In 1902 it had a total membership of 11,000, and a reserve fund of $860,000.

Free Spirit, Brethren of the, a sect of heretics which originated in Alsace in the 13th century, and quickly became disseminated over Italy, France, and Germany. They claimed

"freedom of spirit," and based their claims on Rom. viii. 2–14. Thence they deduced that they could not sin.

Free Stone. See BUILDING STONE; SANDSTONE.

Free Trade, in current use restricted to mean the interchange of commodities between countries politically independent, without obstacles specifically intended to restrict the trade. All taxes on imports, which form a large part of the revenue of most civilized governments to that extent impede the freedom of trade; but the essence of the free-trade system is, that they shall not be arranged to "protect" the correspondent home production, or, as free-traders would put it, to divert capital into otherwise unprofitable channels at the expense of the consumer. This is accomplished by selecting articles not possible to produce at home (as tropical products in a temperate country); by forbidding their production at home (as tobacco in England), foregoing certain new home industries for the sake of sparing existent ones; or by laying corresponding internal taxes.

That free trade was never even formulated as a theory till a few generations ago, nor adopted as a policy till within two generations, that it is even now practised in its fulness by only one country, and nearly so by only two more, and that the former, its chief exponent, is at this moment rent by a fierce struggle to resume its old protective system, indicates something more back of this question than the mere state of economic enlightenment. The truth is, free trade is a matter of business, and all states have prior interests which business only subserves, and to which it is sometimes partially antagonistic. National existence always comes first, national prestige usually, national rivalry and jealousy frequently. In the Middle Ages war was the normal condition of most countries and the constant liability of the rest; hence everything had to be subordinated to diversified resources in war, whence a nation's supplies might be suddenly shut off. As the age of neutrality and the localization of wars has supervened, this danger has practically passed; but masses of capital and of labor in each country, which its rulers cannot politically disregard, can still be injured by the hostile tariffs which are the modern substitutes for fleets and armies of conquest. The problem at issue is, whether these injure the target as much as the marksman; free-traders have one answer, protectionists another. But the protectionist interest is always much more concentrated and effective than the free-trade: it is that of masses of capital embarked in certain enterprises and fighting for life, with all the masses of people behind it whom it maintains, and who would be temporarily injured by a readjustment. Protection is led by those who are interested in terms of millions, free trade mostly by those who are interested relatively in terms of pennies. The contest is so unequal that it is only wonderful that any circumstances have ever given the latter even a temporary victory.

In Europe till the 17th century, and in most parts of that till the 18th, the only way the bounds of free trade were extended was by conquest; and even that did not always effect it, old provinces and feudalities retaining their rights to separate custom-houses — primarily an octroi, but used for "protection." Most countries were cut up by dozens of these vexatious boundary lines, crippling all internal trade, and making each little district a special and self-subsistent world. Under Louis XIV. Colbert (1665–83) swept away many of these old provincial barriers, to the enormous development of French industry and trade, and consequently revenue; but he could not touch the chief portion. Already in 1623 De la Croix had propounded the theory of free trade; and in England it was urged in 1696 by Nicholas Barbon, one of the founders of the life-insurance system. But about the middle of the 18th century it sprung into life at once in two quarters, the lesser influence at the time having been vastly more potent in the end: with the French "Physiocrats" and Adam Smith. The theory of the former — whose founder was Cantillon and the chief heads Quesnay and De Gournay — was enthusiastically taken up by a group of able thinkers and men of affairs, and in 1774 put partially in practice by Turgot, in free trade for grain throughout France. Their method of approach was curious: they held that as commerce does nothing but transfer from hand to hand wealth already existing, without creating new, the gains of the trading class are at the expense of the only real wealth, the products of the earth; it is therefore to the community's interest that they should be as small as possible, and to this end commerce should take the shortest and most natural channels, as this leaves the "net product" of society the highest. Meantime in 1752–63, Adam Smith, a professor of moral philosophy at the University of Glasgow, had been working out a theory of the social progress of nations; and, as one branch of it, he investigated the causes of their material well-being. He was anything but a man of business, but he had a Scotch intellect which reasoned truly, and his society included many keen and able merchants and importers of the day. From them and his own mind he produced and fortified the theory that dams in a stream could never create water, but only force it into other channels. He visited France and met the Physiocrat leaders, and received doubtless new arguments and fresh facts. In 1775 he published his 'Wealth of Nations,' perhaps the most epoch-making single book of all time; for it created political economy as a science and free trade as a practical system. He took separately each kind of protective duty in use or advocated, and proved that each did harm in the very line it was supposed to do good. But he saw no hope of free trade ever coming about in England, so dominating was the influence of invested capital and of "furious and disappointed monopolists." But a curious change in industrial affairs inverted the position of his friends and enemies. His views had been favored by the landed interest and disfavored by the manufacturers; but the course of business made the agriculturists eager to keep up the duties on grain, which gave them immense profits; while the manufacturers began to be irked by the duties on raw material, which checked their coming dominance of the textile market under the splendid English inventions. The ablest statesmen were on the same side: Shelburne and the younger Pitt were convinced free-traders,

and the latter tried to put Irish free trade into the act of Union in 1800. Two decades later the adherents were numerous: Ricardo's 'Political Economy' had reinforced Smith's, with greater weight because he was a successful Jewish banker; and London merchants were petitioning to have the shackles taken off trade. The first great success was making William Huskisson president of the board of trade in 1823: he was ignominiously driven from the Cabinet by the Duke of Wellington, but had induced Parliament to free some articles and lighten the duty on others. Thrust aside by more pressing politics, the reform stood still till 1836, when a failure of crops made it once more a burning question. Never was an issue so sharply marked out: the people were sacking the towns for bread while grain was taxed to enrich the landlords. Meantime manufacturers, increasingly the chief reliance of the national revenues, were kept out of foreign markets by having to pay higher for raw materials and more for wages. Local Anti-Corn-Law Associations from 1837 on were fused into the National Anti-Corn-Law League in 1839; at its head were Richard Cobden and John Bright, both partners in Manchester calico-printing works; whence the term "Manchester School" for supposed believers in various doctrines mistakenly attributed to Cobden. The struggle convulsed England, and almost broke the bonds of social order; but the final blow to the old system was the Irish potato famine in 1845. This shortage made food still higher; and Sir Robert Peel, who had taken office expressly to resist the repeal of the Corn Laws, remained in it to repeal them himself, 26 June 1846 — most of the duty at once, the rest by a sliding scale within three years.

The full free-trade policy was not introduced for many years, however: it was Mr. Gladstone in 1869 who framed the present system of absolute freedom from protection, though as Palmerston's chancellor of the exchequer in 1861 he had taken a long step toward it. In 1841 more than 1,000 articles were on the customs list, over half of them large staples; in 1849 they were reduced to 515, and in 1855 to 414, but still 153 main articles of consumption; while in 1861 they were reduced at a blow to 142, of which only 19 were of great importance, and in 1876 to 42, of which 10 were important. They have since been reduced to 12 altogether, in as few classes as possible — seven kinds of drinks, three of sweets, one narcotic and one food; namely, spirits, wine, and beer; tea, coffee, chicory, and cocoa; sugar, molasses, and glucose; tobacco; and dried fruits.

The progress of Great Britain under this system is the very point now in fierce issue, and soon to be passed upon by a fresh election. It may be said here that in the last 30 years of protection, the total increase of British imports and exports was $340,000,000; in the first 30 of free trade it was $2,400,000,000, between seven and eight times as much. In 1816–40 the total increase in British shipping was 80,000 tons; from 1848 to 1858 it was 1,257,000, and thence to 1880 1,917,000 more. The experience of Belgium was even more striking. Under Napoleon prohibitory duties were imposed, and the country became largely depopulated; with the return of the Dutch and low duties, great manufactures at once sprang up; with their expulsion in 1830 high protective duties were again imposed, and in 1851 the prime minister declared that if they were not removed all domestic industry would be ruined; the whole system was swept away in 1855, and Belgium rapidly became, size for size, the foremost industrial and commercial state of the world, the richest per capita, and the manufactory of Europe. Only a few per cent of its revenue is from imports, the rest being from internal duties.

The arguments for free trade cannot be stated without those against protection, being the same. They are not alone industrial, but political and social. Broadly, it is asserted that protection cannot increase the total industrial product to be divided up, and can only enable one class of the community to force the remainder to buy one costly article instead of two cheap ones, thus lessening the volume of trade and production; that its claim, to redistribute the amount in wages is false, as but for the system the same capital would have been employed in other industries and paid as much wages, with lower prices to the consumers; that its claim to ultimately reduce prices is false, because as soon as that object has been achieved, it applies to the government on that very ground to save it from ruin by increasing the duty; that its claim to found industries is false by demonstration; and that it narrows instead of diversifying them; that it extorts high prices from home consumers by squeezing the market of which it is given a monopoly, and then sells its surplus to foreigners at a low price — which Adam Smith sets down as inevitable with a protective system; that it produces trusts, to prevent competition through which the public might secure its alleged benefits; that it produces alternate "feast or famine," inflation and panic, instead of equable business; that it makes orderly public finance impossible, by creating huge random revenues to be spent at random, in place of a calculable budget; that it corrupts politics deeply and hopelessly, by making masses of capital dependent on legislation for its profit, and consequently influencing that legislation for its own ends, stripping the treasury to prevent repeal of duties, inventing extravagant schemes to spend an unnecessary revenue, and buying votes in its favor by enormous permanent burdens on the people, through pensions and the like; that the low tone of American public life, wherein men can remain and be honored after exposures which would drive them into permanent obscurity in any European country, is mainly due to this money power created by legislation. For the opposite side, see PROTECTION.

Free Will. This question is properly divided into two sections, that of the metaphysical basis and the doctrinal application; but the latter has so deeply affected the reasonings on the former, that it is almost impossible to separate them.

The metaphysical problem is unique, from its presenting at the outset an irreconcilable contradiction between the phenomena of consciousness and the operations of reason. In this respect it is different from the insoluble problems of time and space, where the conflict is between opposing conclusions of the reason with regard to the materials furnished by consciousness;

here there is a denial, by reason, of the validity of those materials. Consciousness appears to show us at every moment that we can dictate our actions mostly and our thoughts very largely; reason tells us that each follows on other phenomena, from whose invariable relation of precedence we characterize them as cause and the former as effect. Consciousness tells us that our will is the active agent in producing the phenomena which immediately succeed it; reason tells us that this fancied agency is an illusion and itself a part of the chain of sequences, and that the apparent relation is because, as Hobbes says, the so-called will is the last wish of the mind before determining. But what causes the determination? This involves the problem of the nature of the will as before, as well as of the «coupling-pin» by which, if a reality, it acts on matter; if not a reality, the reason why a mental resolve is invariably followed by a physical movement or mental conception. Of the coupling-pin no acceptable theory has ever been framed; the best explanation of the association of will and act, supposing the former an illusion, is still Spinoza's, that they are twin phases of the same ultimate reality, and of necessity change coincidently. But this leaves it still unexplained why our consciousness makes the will not coincident with the act, but invariably its predecessor: we do not will and act simultaneously, but in succession. The overwhelming weight of reason, however, for 2,500 years, from the Greek predecessors of Aristotle to Jonathan Edwards, has won reluctant acceptance to the doctrine of universal determinism, or in theological phrase, of necessitarianism: a chain of causation extending to all things and back to infinity, since no uncaused first act or idea can be fancied except as part of the First Cause of the universe. It is of course never claimed that all acts are volitional or all volitions deliberate, but only that the mind at will can interject uncaused determinations among the caused. It is evident, however, that to assume the possibility of uncaused acts is to consign the universe to chaos and abolish the reign of law; that only on the theory of strict and unbroken causation (or «invariable sequence») can we reason at all concerning phenomena; that the mind must follow the same law as other entities, and has no power, nor could even be endowed with such by omnipotence, of willing without motive — that is, without a cause itself the resultant of an endless series of other causes. Indeed, as Prof. Huxley puts it, for the mind to cause itself implies that it has anteceded itself, which is absurd: the first mental action must have been part of the chain of causation, which surrenders the whole case, as there is no spot where it can be imagined that it was able to throw down the ladder by which it had climbed, and cut loose from causes into a region of caprice.

To avoid this conclusion, a curious dilemma — usually known as «Buridan's Ass,» though Buridan did not devise it — was invented by the mediæval schoolmen. Suppose an ass between two bundles of hay, exactly alike, and with no motive for choosing which to bite first: it is absurd to suppose he would starve in the midst of food, and he must therefore act from free will. To this, however, it was answered that if motiveless he would so starve; and the question remained as before.

Involved with this is the question of God's foreknowledge. It is obvious that this involves his pre-determination of events, as otherwise he would foreknow what was never to happen, or was to happen outside his will; and there can be no change in the predestined order, since any change in a sequence must itself be part of the predestination and foreknowledge.

Alone of all metaphysical questions not incident to the claims of religious founders, this has always been a fierce battle-ground, the dividing line of great religious sects. The reason is that the possibility of sanctions for moral law, and consequently of a decent basis for human society, is believed to depend upon it. Determinism seems to cut the roots of moral obligation, by removing the possibility of obedience to it. If we are without will except as a consciousness of preference resulting from causes outside our control, we are automata; and preaching obligation of any sort to us seems as irrational as preaching it to a doll, for our action will not be influenced by it, nor are we responsible for disobedience. In this extreme form, the fallacy is easily apparent. The will, as Edwards has put it, always follows the greatest seeming good: but its estimate of good is not an unvarying thing, but constantly changing with experience and reason. Now moral rules, apprehended and accepted by the mind, form a part of this good, and therefore become new causes which determine the will: and whatever may have been the causation which has determined the evolving and enforcing of the moral law, it is nevertheless a portion of the environment which acts on the mind. As to responsibility, the question is irrelevant. An automaton which runs into a fire or the sea perishes none the less than if the act were a conscious volition. Punishment waits not on responsibility, but on violation of the laws of its being, and blame as excuse are alike impertinent to the result. We do not blame a child who burns its fingers, but the fingers are in the same condition as if we did.

Back of this, however, lies a contradiction of fact. So far from determinism making moral law impossible, free will makes it impossible. If volition can perpetually nullify the action of motive, there is a fatal breach in the continuity of cause and effect; there can be no calculable sequence of action and therefore no law. The most perverse defiance of natural order is no more independent of cause than the steadiest obedience, for that perversity is itself due to causes precedent. Whence then come the invariable consciousness of freedom to act, its universal recognition, its embodiment into the framework of society, the obvious fact that there can be no society except on this basis? Why, here again, do consciousness and practice oppose themselves unalterably to invincible argument? Edwards explains that though we have not liberty of willing, we have liberty of action; which taken literally would imply that the will has no necessary connection with the act, and that we may voluntarily do a thing we have involuntarily willed not to do. Of course Edwards does not in fact maintain this, but only that God has given a choice of action by furnishing experience and reason and illumination by which to frame correct determinations. Waiving discussion of the difference between

these determinations and will, the real explanation probably lies in the confusion between the abstract and concrete will, between its dependence on causes and, as above said, our own power to determine or change those causes. Instruction, example, appeals to self-interest or fear, or vanity, or affection, or honor, etc., produce an evironment and modify the view taken by each of the supreme immediate good, calculably enough to base coherent society upon; where their effect is grossly miscalculated the society goes to pieces. Metaphysics and the general consciousness are both right, each in its own sphere: the will must have motives, but those motives are furnished in great measure externally. Furthermore, subject to the inexorable limitation, it can furnish by its own action motives to change itself; and constantly does so, attributing to its independent action what is really due to the influence of the new causes it has made to operate in altering its estimate of relative good. For the purposes of human life, volition is absolute and there is no injustice in enforcing responsibility.

Freedman. See FREEMAN.

Freedmen's Bank, a savings bank chartered by Congress in the District of Columbia in 1865, at the special instance of Charles Sumner and Charles R. Buckalew, as a means of encouraging thrift among the newly emancipated negroes. It was in fact intended as part of the Freedmen's Bureau work, and had among its corporators Gen. Howard, the chief commissioner, and a host of the most eminent and upright public men and philanthropists; and its investments were restricted to government securities. It started branches in some 30 Southern cities, with doubtful legality, but covered by the elastic ægis of the bureau's power and every one's good will, the South's most of all; and did a large business. But the corporators appointed successors much less disinterested; the restriction on investments was removed in 1870, ostensibly to benefit depositors by a higher rate of interest, against the protest of Simon Cameron in the Senate; the securities were rapidly replaced by "wildcat" stocks, all speculative and mostly worthless, and by mortgages on valueless property; and in 1874 the bank was pronounced insolvent, with practically no assets. The blow to incipient negro thrift was very great; and the scandal discredited the entire system of which the bank was an outcome, and was one cause of the political overturn in 1874.

Freedmen's Bureau, 1865-9. The supervision, temporary maintenance, and employment of the mass of homeless, penniless, and untaught freedmen created by emancipation, was an obvious duty of the government, urged upon it at once after the proclamation of 1 Jan. 1863; and in 1863-4 officials were appointed to lease abandoned lands to them for not exceeding a year. The military officers left much of the care and provision for freedmen in their hands; but a more comprehensive plan was needed, and after various abortive efforts at an acceptable measure, a "Bureau of Refugees, Freedmen, and Abandoned Lands" was established in the War Department 3 March 1865, to continue for a year after the war. It was to be headed by a commissioner, with assistant commissioners in all the seceded States; to issue supplies to destitute freedmen, have charge of abandoned lands to lease and ultimately sell in 40-acre plots, and have "control of all subjects relating to refugees and freedmen"— an elastic provision construed in the most elastic way. Its commissioners — the head being Gen. O. O. Howard (q.v.), a noble-minded and laborious philanthropist — acted as courts of law where there were none, or where negroes were not recognized as free; established the institution of marriage, and kept records; assured the freedmen the right to choose employers, and made fair contracts for them. The "abandoned lands" disappeared under the amnesty acts; but the bureau did excellent work by inaugurating free schools on a large scale. On 6 Feb. 1866 Congress passed a bill to enlarge its powers and make it permanent; Johnson successfully vetoed it, but on 16 July another was passed over his veto, extending the bureau to July 1868, later extended a year in unreconstructed States. Under this its sweeping powers made it largely the government of the South under Reconstruction, especially as the department military commanders were usually made assistant commissioners; and the demoralizing and disastrous struggle of the North to secure negro independence, and of the South to reassert white mastery, is a history of part of the bureau's action — through executive and legislative powers scarcely pretended to be constitutional, and to transfer which to the regular courts the Fifteenth Amendment was passed. Better features of its work were the foundation of the free public schools in the South, and of Fisk, Howard, and Atlanta universities, and Hampton Institute; of the system of negro peasant proprietorship; and the winning of equal rights for all men in the courts. That it failed in its larger hopes, and that its harmful results were so great that many hold them far in excess of its benefits, are facts attributed by the fairest judges to the inevitable conditions of the problem. (See a very lucid and singularly just summary by W. E. B. DuBois — colored — in the 'Atlantic Monthly,' Vol. LXXXVII., p. 354.) The bureau ended its main work in 1869: its educational work continued till 1872, and bounty payments some years longer. It had about 900 agents in 1868; and expended in all some $20,000,000, over $10,000,000 on objects unconnected with soldiers' bounties. Gen. Howard published a report of its work in the House Executive Documents, 41st Congress, 2d session.

Freedom, or **Freedom of the City,** an English custom occasionally revived in America. The freedom of a city or borough is the right of enjoying the privileges and immunities that belong to the burgesses or freemen, such as electing the council or the parliamentary representative. In certain boroughs there were at one time freemen by birth or marriage not on quite the same footing as burgesses.

Freehold, N. J., town, county-seat of Monmouth County; on the Central R.R. of New Jersey, and the Pennsylvania R.R.; about 32 miles southwest of Jersey City. It was settled in 1734, and for some time it was called Monmouth Court House, because of the county court being held in the village. In 1869 it was incorporated. It is the trade centre for a large agricultural section. Its chief manufactures are bicycles, foundry, and machine-shop products,

underwear, and shirts. One of the attractions of the town is the granite monument in memory of the battle of Monmouth (q.v.) which took place here 28 June 1778. Pop. (1900) 2,934.

Freehold, in English and American law, an estate or real property held in fee simple in America, or in England either in fee simple or fee tail; the tenure by which such an estate is held. (See FEE.) Anciently it was one of the two chief tenures known as tenure in free socage, and was the only free method for laymen to hold property. A freehold estate must possess immobility, in other words, must consist either of land or of some interest arising out of land annexed to it. Secondly, it must be of indeterminate duration.

Freeland, Pa., borough in Luzerne County; on the Lehigh Valley R.R.; about 30 miles southwest of Scranton. It is situated in the anthracite coal region, but it is surrounded by a large section of good farming land. The chief manufactures are lumber, mining and farm implements, and foundry products. During the last decade the place has increased rapidly in population and manufacturing. Pop. (1890) 1,730; (1900) 5,254.

Freeman, Alice Elvira. See PALMER, ALICE FREEMAN.

Freeman, Edward Augustus, English historian: b. Harborne, near Birmingham, 1823; d. Alicante, Spain, 16 March 1892. He was educated at Trinity College, Oxford, where he obtained a scholarship in 1841, and after his marriage in 1847 he retired to a small estate at Somerleaze, in Somerset, where he devoted himself to literature. His first publication (1849) was a 'History of Architecture,' a subject in which he maintained interest throughout his life. This work was more especially devoted to Gothic architecture. His architectural researches helped to turn his attention to history, but his earliest historical works were the product of his interest in contemporary burning questions. His 'History and Conquests of the Saracens' (1856) was partly due to the Crimean war; and the American Civil War brought forth his 'History of Federal Government' (1863), which, however, remained a fragment in one volume. Between 1867 and 1879 appeared his *magnum opus*, the 'History of the Norman Conquest of England,' in six volumes, followed in 1882 by two supplementary volumes dealing with 'The Reign of William Rufus and the Accession of Henry I.' In 1884 he was appointed regius professor of modern history at Oxford, and this post he occupied till his death. His last great work was a 'History of Sicily,' which he left unfinished, though three volumes of the work were published. He died in Spain, where he was traveling for the purposes of recreation and research. Other works of his beside those mentioned were: 'Church Restoration' (1849); 'Essay on Window Tracery'; 'The Architecture of Landaff Cathedral'; 'History of Wells Cathedral' (1870); 'Old English History' (1869); 'Growth of the English Constitution' (1872); 'Historical Essays' (three series, 1872-79); 'The Ottoman Power in Europe' (1877); 'Historical Geography of Europe' (1881); 'Sketches from the Subject and Neighbor Lands of Venice' (1881); 'Lectures to American Audiences' (1882); 'English Towns and Districts' (1883); 'Some Impressions of the United States' (1883); 'Exeter' (1887); 'Methods of Historical Study' (1886); 'The Chief Periods of European History' (1887); 'William the Conqueror' (1888). He was a man of strong partisan feeling, with a firm belief in the superiority of the Teuton which sometimes interfered with a judicial weighing of evidence. But he took great pains to verify his facts, indeed was devoted to truth, and had a wide and deep knowledge of history. In spite of his pugnacity and the obstinacy with which he maintained his side in a controversy he was a man of generous and kindly nature. Consult 'Life and Letters,' by Stephen (1895).

Freeman, James, American Unitarian clergyman: the first in the United States to assume the name Unitarian: b. Charlestown, Mass., 22 April 1759; d. Newton, Mass., 14 Nov. 1835. He was graduated from Harvard in 1777, in 1782 became lay-reader in King's Chapel, Boston, later proclaimed himself an Unitarian, and, supported by his congregation secured corresponding changes in the Prayer-book. In 1787, his bishop having refused him ordination, he was ordained by his wardens and congregation. Until his death he was rector of the chapel. He published: 'Sermons and Charges' (1832).

Freeman, James Edward, American artist: b. Nova Scotia 1808; d. Rome, Italy, 21 Nov. 1884. He was a pupil of the National Academy of Design, and was elected national academician in 1833. From 1836 his studio was in Rome. His works, largely portraits and genre subjects, are skilful in color and display attention to technical detail. They include: 'Young Italy'; 'Peasants on the Sands of the Sezchio'; 'The Beggars.'

Freeman, James Midwinter, American Methodist clergyman: b. New York 29 Jan. 1827; d. 1900. He was educated at Wesleyan University, and ordained to the ministry of the Methodist Episcopal Church, of whose Sunday-school Union and Tract Society he became secretary and editor in 1872. He was the author of 'Use of Illustration in Sunday-school Teaching' (1867); 'Hand-book of Bible Manners and Customs' (1874); 'Short History of the English Bible' (1879).

Freeman, Mary Eleanor Wilkins, American novelist: b. Randolph, Mass., 1862. She was educated at Mount Holyoke Seminary and after some years spent in Brattleboro, Vt., returned in 1883 to Randolph, which remained her home till her marriage to Charles Freeman in January 1902, when she removed to his home in Metuchen, N. J. She came first into notice about 1886 by her extremely faithful delineations of certain phases of New England life in her short stories contributed to the magazines. After some years she attempted more sustained work, and within the last ten years has published several novels, displaying the same characteristics as her short stories, as well as skill in the handling of plot, and dramatic vigor. Her work has steadily gained in popularity and has been greatly admired by English as well as American critics. A fondness for very short sentences gives her work almost a staccato character at times, and it must be said that while the accuracy of her studies of New England village existence cannot be called into question, her insistence upon the bareness of the life to the

exclusion, or almost entire subordination of its happier phases, conveys a not wholly correct impression of the life in its entirety. Her published works include: 'The Adventures of Ann' (1886); 'A Humble Romance and Other Stories' (1887); 'A New England Nun, and Other Stories' (1891); 'Young Lucretia' (1892); 'Giles Corey, Yeoman,' a drama (1893); 'Jane Field,' her first novel (1893); 'Pembroke' (1894); 'The Long Arm,' with J. E. Chamberlin (1895); 'Jerome, a Poor Man'; 'Silence and Other Stories'; 'The People of Our Neighborhood'; 'Understudies'; 'Madelon'; 'The Love of Parson Lord'; 'Evelina's Garden'; 'The Wind in the Rose-Bush'; a series of ghost stories (1903); etc.

Freeman, Nathaniel, American jurist: b. Dennis, Mass., 1741; d. 1827. In 1763 he became resident at Sandwich. He fought in the Revolution, and was brigadier-general of militia forces in 1781–91. In 1795–99 he was a member of the United States Congress, and he also sat in the Massachusetts legislature, and was for many years judge of the court of common pleas. He was also a medical practitioner, and an orator of some distinction.

Freeman, or **Freedman,** is one who has inherited the full privileges and immunities of citizenship; one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. In old Rome, the equivalent for freeman comprehended all classes of those who were not slaves. As the organization of Roman society survived the convulsions of the Middle Ages to a far greater extent in the towns than in the landward districts, where the institutions of feudalism (q.v.) almost entirely superseded it, it is in the borough and other municipal corporations of Europe that we still find freemen, or persons inheriting or acquiring by adoption, purchase, or apprenticeship the rights of citizenship. In the United States the term freemen was used of the colored people emancipated by the Civil War. The duty of caring for those people, finding them work, and preparing them for the privileges of freedom was thrown on the War Department; and in 1865 an act of Congress created in that department the bureau commonly known as the "Freedmen's Bureau" (q.v.), whose duties practically ceased in 1870. The founding of several institutions for colored persons, such as Howard University and Fisk University (q.v.), was a permanent result of its work, out of which have grown other educational achievements of great importance in the advancement of the colored people.

Freemasonry. See MASONIC FRATERNITY.

Freemasons. See MASONIC FRATERNITY.

Freeport, Ill., city, county-seat of Stephenson County, on the Pecatonica River, the Illinois C., the C. & N., and the C., M. & St. P. R.R.'s; about 105 miles northwest of Chicago, and 55 miles southeast of Dubuque. It was settled in 1835 and received its charter in 1855. The "Freeport heresy," a political doctrine much discussed before the Civil War, was that regardless of the Dred Scott case (q.v.) any Territory had the right to reject the slave system by the means of police laws which would be "unfriendly," and would in time stamp out the existence of slavery. This "doctrine" or "heresy" was advanced by Douglas in the famous debate with Lincoln which took place in Freeport in 1858. The chief manufactures are wind-mills, bicycles, organs, wagons, and toys. It has coffee-mills and railroad shops. It contains a free library, St. Francis Hospital, a good system of public and parish schools, and several fine public buildings. Pop. (1900) 13,258.

Freer, Paul Caspar, American chemist: b. Chicago, Ill., 27 March 1862. He was graduated in 1882 at the Rush Medical College of Chicago; at the University of Munich, Germany, in 1887; was assistant in Owens College, Manchester, England, in 1887; and an assistant and instructor in Tufts College in 1887–9. In 1889 he became professor of general chemistry in the University of Michigan. He has published: 'A General Inorganic Descriptive Chemistry' (1895); 'The Elements of Chemistry' (1896); and numerous pamphlets.

Freethinker, a name assumed by those who, disbelieving in revelation, feel themselves free to adopt any opinion in religious or other matters which may result from their own independent thinking. The name was specially claimed by those who in the 17th century took part on the anti-Christian side in the deistic controversy. Voltaire (q.v.) was a well-known French freethinker.

Freetown, Africa, a seaport of West Africa, capital of the British colony of Sierra Leone, on the south side of the river of Sierra Leone. Its principal streets are broad and straight, and have, more especially in the part occupied by Europeans, a very attractive appearance, the houses being generally detached and surrounded by trees. Freetown is a strongly fortified imperial coaling-station. A railway runs from Freetown some distance into the interior. Pop. (1901) 34,463.

Freezing, Congelation, or **Solidification,** the transformation of a liquid into a solid under the influence of cold. Each liquid always solidifies at the same temperature, which is called its freezing point, and the solid also melts again at the same temperature. Thus the freezing point and the melting point, or point of fusion, are the same, and the point is always the same for the same substance. The freezing point of water, or the melting point of ice (32° F.), is taken for one of the fixed points in thermometry. The freezing point of mercury is 39° below zero, of sulphuric ether 46° below zero, of alcohol 203° below zero F. It has been shown that the increase of pressure on water, and on all substances which expand in freezing, will lower the freezing point; and that such substances as wax, spermaceti, sulphur, and paraffin, which contract in freezing, have the freezing point raised by pressure. See MELTING-POINT.

Freezing-mixture, a mixture for the production of artificial cold. For this purpose two substances are mixed, of which one is usually solid, and which tend to form a liquid mixture. In liquefying any solid a certain amount of heat is made latent, and owing to this the temperature of the mixture at the end of the liquefaction is often very low indeed.

Thus on mixing snow and salt together the salt converts the snow into water, or rather tends to form brine; but snow cannot melt without making latent a considerable quantity of heat. Hence the temperature of the brine which is the result of the mixture is very much below that of either the salt or snow. The fact is that salt and water mixed cannot be in the solid condition, except at a temperature very much below that of ordinary snow. The following is a list of freezing-mixtures, and of the lowering temperature obtained by means of them. The substances, with the exception of the ice, mentioned in the second, are supposed to be mixed together at 10° C. (50° F.). Such mixtures are often employed in the making of ice-cream or water-ices, for cooling wine, etc. See ICE, ARTIFICIAL; REFRIGERATING MACHINES.

Substances	Parts by Weight	Reduction of Temperature
Sulphate of sodium..	8	+ 10° C. (+ 50° Fah.) to − 17° C. (+1° Fah.)
Hydrochloric acid....	5	
Powdered ice or snow	2	+ 10° C. to − 18° C. (0° Fah.)
Common salt........	1	
Sulphate of sodium..	3	+ 10° C. to − 19° C. (− 2° Fah.)
Dilute nitric acid....	2	
Sulphate of sodium..	6	+ 10° C. to − 26° C. (− 15° Fah.)
Nitrate of ammonium	5	
Dilute nitric acid....	4	
Phosphate of sodium.	9	+ 10° C. to − 29° C. (− 20° Fah.)
Dilute nitric acid....	4	

Freezing Point, that temperature at which the solid and fluid states of a substance can co-exist in a state of permanent equilibrium. For water, this temperature is 32° F., or 0° C. For the freezing points of other substances, consult the articles in which their general properties are described. See also HEAT; MELTING POINT; SOLUTIONS; THERMODYNAMICS; THERMOMETRY.

Freiberg, frī'bĕrg, Saxony, a mining town 19 miles from Dresden. It is the capital of the mining district of Saxony, and contains a mining academy founded in 1765, with 13 professors, fine scientific collections, among which is the celebrated collection of precious stones amassed by Werner, and a large library. There is a fine relic called the Golden Portal belonging to the ancient Church, which stood on the site of the Gothic cathedral. It is an ancient imperial city, and is still surrounded by the old walls and ditch. The town owes its origin to the discovery of silver mines in the 12th century. Here, on 29 Oct. 1762, Prince Henry of Prussia defeated the allied Austrian and Saxon army. Pop. (1900) 30,175.

Freiburg, frī'boorg, or **Freyburg,** or **Freiburg im Breisgau,** Baden, a town in the circle of the upper Rhine, on the Dreisam, and on the railway from Carlsruhe, in one of the most beautiful and fertile districts of south Germany, at the west foot of the Black Forest. It consists of the town proper, the fortifications of which have now been converted into pleasure-grounds, and of two suburbs, and is the seat of a superior civil and criminal court, and of several public offices. The buildings most deserving of notice are the münster or cathedral, a large and beautiful Gothic structure built of red sandstone, admired for its delicate symmetry and tasteful decorations, with a magnificent portal richly sculptured, and surmounted by a tower, partly of exquisite open work, 380 feet high; the university, founded in 1456; the merchant house, now the chief tax office, a quaint Gothic structure, resting on pointed arches, and decorated externally with fresco portraits of the Emperor Maximilian, his son Philip I., Charles V., and Ferdinand I.; and the grand-ducal palace and government buildings. Freiburg is the see of an archbishop, and the seat of the courts and offices for the circle of the upper Rhine. Pop. (1900) 61,506.

Freiburg. See FRIBOURG.

Freight, formerly a charge paid to the owner of a ship for the carriage and safe delivery of goods; but the term now extends to transportation by land, especially on railroads. In cases of maritime freight, a person chartering a ship pays freight for the goods sent by it, and dead freight in respect of any deficiency of cargo; the terms of the agreement are fixed by the charter party. A person sending goods by a general ship pays freight for them; and the contract takes the form of a bill of lading. So far as the rights of parties are not made the subjects of positive stipulation in the contract of affreightment, they are ascertained with reference to the usage of trade. The carrier's duty is to have the ship ready to start at the time appointed, and to receive the goods and carry them to their destination; having performed these duties, he has a lien on the goods and a right of action in case of non-payment of freight. The shipper's duty is to have his goods forward in time. Freight is not usually payable unless the voyage is completed; but it is sometimes prepaid, in whole or in part, at the risk of the shipper. See BILL OF LADING; CARRIER, COMMON; CHARTER; TRANSPORTATION.

Freiligrath, frī'lig-rät, **Ferdinand,** German poet: b. Detmold 17 June 1810; d. Cannstadt, Würtemberg, 17 March 1876. In 1838 he published at Mainz a volume of his collected poems, and as it proved successful he determined to devote himself entirely to literature. In 1842 he received a small pension from the king of Prussia; but this he retained for only two years, for having embraced views in politics of an advanced liberal stamp which placed him in opposition to the government, he felt bound to resign the benefits of royal favor. At the same time (1844) he published a poem entitled a 'Confession of Faith' (Glaubensbekenntnis), in which he became the champion of the political creed he had adopted. In 1848 other three political poems by him: 'Die Revolution'; 'Februarklänge'; and 'Die Todten an die Lebenden,' saw the light; and the last of these led to his being put on trial for treason. This trial, in which he was acquitted, is memorable for another reason, being the first jury trial ever held in Prussia. From 1851 till 1867 Freiligrath resided in England as manager of the London branch of a Swiss banking establishment. On the failure of the bank a national subscription was got up in his behalf in Germany, and the proceeds of it enabled him to return to private life. The early poems of Freiligrath are distinguished by a wealth of glowing and highly-colored imagery, and by the prevalence of Oriental scenes and subjects. His political poems are too full of the tones of party warfare to live as poetry; but many of his lyrics seem destined to hold an

abiding place in German literature. Germany is also indebted to him for many admirable translations from foreign languages, as from Burns, Tannahill, Moore, Hemans, Shakespeare, Longfellow, and Victor Hugo.

Freire, frā'rĕ, **Ramon**, Chilean general: b. Santiago 29 Nov. 1787; d. there 9 Dec. 1851. He was a grandson of Freire de Andrada (q.v.). He fought in the patriot army in the war for independence (1811–20), and defeated Benevides at Concepcion 27 Nov. 1820. He became the leader of the Liberals, and upon the deposition of O'Higgins in 1823, supreme director, with dictatorial powers. In 1826 he ended Spanish rule in Chile by expelling the remaining Spanish forces from Chiloé in 1826. He was re-elected supreme director in 1827, but resigned not long after. The Conservatives having gained control, he led an insurrection against them, was defeated at Lircai (1831), and banished to Peru, whence return was not permitted him until 1842.

Freire de Andrada, dā än-drä'dä, **Gomes**, Portuguese colonial administrator: b. Coimbra 1684; d. Rio de Janeiro 3 Jan. 1763. He served in the Portuguese army, and became governor and captain-general of Rio de Janeiro in 1733, his authority extending over most of southern Brazil. His administration of almost 30 years was the most successful and prosperous, as well as the longest, in the colonial annals of Brazil. The gold mines were effectively worked, and colonization was greatly furthered. Freire de Andrada was made Count of Bobadilla in 1758.

Frejes, **Francisco**, frän-sēs'kō frā'hĕs, Mexican historian: b. Guadalajara, Mexico; d. 1845. He was trained for priestly and monastic life, became known as a Franciscan of remarkable eloquence, but retired from publicity in 1838, and eventually became superior of the monastery of Guadaloupe, near Zacatecas, Mexico. His object in his retirement was the prosecution of historical study, and his work: 'Historia Breve de la Conquista de los Estados Independientes del Imperio Mejicana,' is a valuable authority on the subject it treats.

Frelinghuysen, frē'lĭng-hī-zĕn, **Frederick**, American lawyer: b. Somerset County, N. J., 13 April 1753; d. 13 April 1804. He was graduated at the College of New Jersey in 1770; studied law, and was admitted to the bar in 1773. Two years later he was chosen a member of the Provincial Congress of New Jersey. He was a member of the Continental Congress much of the time during the Revolutionary War; served as a captain in the army; filled various State and county offices; led an expedition against the western Indians in 1790; and was United States senator 1793–6.

Frelinghuysen, Frederick Theodore, American statesman: b. Millstone, N. J., 4 Aug. 1817; d. Newark, N. J., 20 May 1885. He was a nephew and adopted son of T. Frelinghuysen (q.v.). He was graduated at Rutgers College in 1836, and became an eminent lawyer. He was attorney-general of New Jersey 1861–6; United States senator in 1868–77; and secretary of state under President Arthur in 1881–5.

Frelinghuysen, Theodore, American lawyer: b. Millstone, N. J., 28 March 1787; d. New Brunswick, N. J., 12 April 1862. He was a son of F. Frelinghuysen (q.v.). He was graduated at the College of New Jersey in 1804; and admitted to the bar in 1808. In the War of 1812 he commanded a company of volunteers, and in 1817 became attorney-general of New Jersey, which office he held till 1829 when elected United States senator. He was chosen chancellor of the University of New York in 1838; was nominated for vice-president of the United States in 1844; and in 1850 became president of Rutgers College.

Fremantle, Australia, the chief seaport of Western Australia, at the mouth of the Swan River, 12 miles from Perth. The manufactures include aërated waters, boots, soap, furniture, confectionery, etc. Pop. of town and suburbs (1901) about 22,200.

Frémont, Jessie Benton, American author: b. Virginia 1824; d. Los Angeles, Cal., Jan. 1903. She was a daughter of Thomas H. Benton (q.v.), and married John C. Frémont (q.v.) in 1841. She published: 'Story of the Guard: a Chronicle of the War,' with a German translation (1863); 'A Year of American Travel'; 'Far West Sketches'; a sketch of her father prefixed to her husband's memoirs (1886); 'Souvenirs of My Time' (1887); 'The Will and the Way Stories.'

Frémont, John Charles, American soldier and politician: b. Savannah, Ga., 31 Jan. 1813; d. New York 13 July 1890. He was of mixed French and Virginian parentage. In 1833 he was appointed teacher of mathematics on board the United States sloop of war Natchez, with which he proceeded on a cruise to South America. On his return he turned his attention to civil engineering, and in 1838–9 undertook the exploration of the country between the Missouri River and the British frontier. Shortly afterward, he proposed to the government to undertake the exploration of the Rocky Mountains — at that day a terra incognita. His plan being approved, he, in 1842, started with a handful of picked men, and reached and explored the South Pass. Not only did he fix the locality of that great defile but he defined the astronomy, geography, botany, geology, and meteorology of that region, described the route since followed, and designated the points upon which a line of United States forts were subsequently erected. In 1845 he cleared the north part of California of Mexican troops, and then, seeking a broader field of activity, planned an expedition to the distant Territory of Oregon. He approached the Rocky Mountains by a new line, scaled the summit south of the South Pass, deflected to the Great Salt Lake, pushed investigations right and left his entire course, and at the same time connected his survey with that of Commodore Wilkes' exploring expedition. Later in the winter, without adequate supplies, or a guide, he traversed the wilderness to the Rocky Mountains. In this daring expedition he crossed 3,500 miles of country in sight of eternal snows, discovering the grand features of Alta California, its great basin, the Sierra Nevada, the valleys of San Joaquin and Sacramento, and determined the geographical position of the west portion of the North American continent. In 1846 he was promoted military commandant and civil governor of the Territory of California, in which capacity he in 1847 concluded those

articles of capitulation by which Mexico conceded exclusive possession of that territory to the United States. In 1853 he undertook a fifth expedition across the continent, made new discoveries, and reached California after enduring almost incredible hardships. In 1856 he was the first candidate of the Republican party for the presidency; and in 1861, on the outbreak of the Civil War, was appointed a major-general of volunteers. He then, as commander of the Western Union army, marched into Missouri with the view of encountering Gen. Price's Confederate force then in possession of that State, but an unfortunate dispute with a subordinate officer caused the War Department to relieve him of his command. He was governor of Arizona 1878–81. His publications include: 'Report of the Exploring Expedition to the Rocky Mountains in 1842, and to Oregon and North California in 1843–44'; 'Col. J. C. Frémont's Explorations'; and 'Memoirs of My Life.'

Fremont, Neb., a city and the county-seat of Dodge County, in the central eastern part of the State, on the Fremont, E. & M. V., the Union P., and the Sioux C. & P. R.R.'s, 37 miles northwest of Omaha. The town was settled in 1857 and was incorporated in 1871; it has a telephone system, gas works, and a municipal water supply and electric lighting plant. It is an important market for horses, cattle, sheep, and swine, and has pork-packing establishments, flouring mills, and planing mills. The educational institutions include a normal school and a business college. Pop. (1900) 7,241.

Fremont, Ohio, city, county-seat of Sandusky County; on the Lake Erie & W., the Lake Shore & M. S., and other railroads, and at the head of navigation on the Sandusky River, 30 miles east of Toledo. It occupies the site of a trading post established in 1785, and of Fort Stephenson built in 1812. In 1813 it witnessed the defeat of a body of British and Indian troops under Gen. Proctor, who were repulsed by Maj. George Groghan with 150 men, the British having 94 killed and wounded, and the Americans 1 killed and 7 wounded. In 1850 its former name of Lower Sandusky was changed in honor of J. C. Frémont. It is a busy agricultural and industrial centre with neighboring oil and natural-gas fields, and manufactures machinery, cutlery, agricultural implements, electro-carbons, woolens, beet-sugar, doors, sashes, etc. Steamers connect the city with the principal ports of Lake Erie and carry on a considerable trade. The city has street railways, gas and electric lighting, municipal waterworks and maintains several public parks. The educational institutions include normal and business schools, and the Birchard Public Library, founded by an uncle of ex-President Hayes, whose home here — Spiegel Grove — is occupied by members of the family. Pop. (1900) 8,439.

French, Alice («Octave Thanet»), American novelist: b. Andover, Mass., 19 March 1850. She was educated at Abbot Academy in her native town and has since lived in Iowa and Arkansas, her works reflecting the local color of both States. She has published: 'Knitters in the Sun: Short Stories' (1877); 'Otto the Knight and Other Trans-Mississippi Stories' (1891); 'Stories of a Western Town' (1893); 'An Adventure in Photography'; 'Expiation' (1890); 'We All' (1891); 'A Book of True Lovers' (1893); 'The Heart of Toil'; 'Man and His Neighbors'; etc.

French, Daniel Chester, American sculptor: b. Exeter, N. H., 20 April 1850. He was educated in Boston and in Florence, Italy; had studios in Boston and Concord, N. H., 1878–87, and in New York city 1887–1900. His principal works include: 'The Minute Man of Concord'; statues of Gen. Cass, Rufus Choate, John Harvard, and Thomas Starr King; 'Dr. Gallaudet and His First Deaf Mute Pupil'; 'Statue of the Republic'; and the Milmore Memorial. He was placed in charge of the sculpture department of the St. Louis exhibition.

French, Henry Willard, American journalist and author: b. Hartford, Conn., 1854. He is known as a war correspondent and lecturer and among his writings may be mentioned: 'Nuna, The Brahmin Girl'; 'Desmonde, M.D.'; 'Art and Artists'; 'Our Boys in China'; 'Our Boys in India'; 'Our Boys in Ireland.'

French, John Denton Pinkstone, English soldier: b. Ripple, Kent, England, 28 Sept. 1852. He served in the navy 1866–7, entered the army 1874 and fought in the Sudan campaign of 1884. In the Boer war in South Africa (1900) he commanded the cavalry division, directed the operations about Colesberg from 10 Nov. 1899 to 31 Jan. 1900, and commanded the cavalry in the movements that led to the relief of Kimberley in February 1900, and the capture of Bloemfontein and Pretoria. His services in South Africa were recognized by his promotion to the command of the First Army Corps at Aldershot, in which he ranks as major-general.

French, L. Virginia (Smith), American poet: b. Maryland 1830; d. McMinnville, Tenn., 31 March 1881. She was associate editor of the 'Southern Lady's Book,' a fashion magazine, published in New Orleans (1852). Her collected works are: 'Wind Whispers,' poems (1856); 'Iztalilxo,' a tragedy (1859); and 'Legends of the South' (1867).

French, Mansfield, American educator: b. Manchester, Vt., 1810; d. 1876. He was educated at Kenyon College, Ohio, and from 1845 to 1848 was president of the Female College, Xenia, Ohio. He was active in the founding of Wilberforce University, the first college for the colored race, as he had been one of the founders of Marietta College. An ardent abolitionist, he laid before President Lincoln his plans for the education of the negroes as preliminary to their emancipation. The National Freedman's Relief Association was the realization of his views, as he had stated them at a mass meeting held in Cooper Union, New York, February 1862.

French, William Henry, American soldier: b. Baltimore, Md., 13 Jan. 1815; d. 20 May 1881. He was graduated from West Point in 1837, served in the Seminole and Mexican wars, was commissioned brigadier-general of volunteers and major of United States artillery, and was mustered out of the volunteer service in 1864 after having for a time commanded the 3d Army Corps. He commanded the 2d Artillery 1865–72, and was retired with rank of colonel in 1880. He commanded the forces which suppressed the Baltimore & Ohio Railroad riots (1887).

French Alliance, The, in American history, an alliance, offensive and defensive, between France and the American colonies, signed in 1778. Three American commissioners, Benjamin Franklin, Silas Deane, and Arthur Lee, sent to the court of France at Versailles, obtained recognition of the independence of the United States, and effected an alliance between the greatest European rival of Great Britain and her revolting colonies in America. The treaty stipulated that should war ensue between France and England it should be made a common cause, that neither France nor America would make peace without the consent of the other, nor should either lay down its arms until the independence of the colonies should be established. The news of the alliance provoked great enthusiasm in the American colonies. See UNITED STATES — AMERICAN REVOLUTION.

French and Indian War. See COLONIAL WARS IN AMERICA.

French Broad River, a river of North Carolina and Tennessee, rising in Henderson County, of the former State, near the foot of the Blue Ridge, flowing northwest into Tennessee, and discharging into Holston River, four miles above Knoxville. It is about 200 miles long. From Asheville to the Tennessee line it is remarkable for its beautiful scenery, flowing through deep mountain gorges, or overhung by high cliffs. In Buncombe County, N. C., are precipices known as the Chimneys and the Painted Rocks. The latter, which are between 200 and 300 feet high, derive their name from some Indian pictures still to be seen on them.

French Chalk, a variety of steatite or talc (q.v.) occurring in fine-granular or scaly masses of milky-white color and pearly lustre. It is extensively used by tailors as a crayon for marking cloth, also as an absorbent in removing grease spots.

French Congo, Africa, a large French territory on the west coast between the Lower Congo and the German Kamerun country, and stretching inland to Lake Chad; total area, about 500,000 square miles. The chief rivers are the Muni, Gabun, Ogowe, and Kuilu, and the stations already founded include Libreville, the capital (pop. 3,000), Brazzaville, Njola, Philippeville, Bonga, Loango, Franceville, and about 20 others. The district is under a commissioner-general, assisted by two lieutenant-governors. Though it is unhealthy even in the more elevated districts for Europeans, considerable trade is carried on, the exports comprising caoutchouc, cocoa, coffee, ivory, ebony, mahogany, palm-oil, gum-copal, etc. Pop. 8,000,000 to 12,000,000, of whom 1,200 are Europeans.

French Creek, N. Y., in the War of 1812. In the course of Wilkinson's invasion of Canada late in 1813 (see CHRYSTLER'S FARM), Gen. Jacob Brown posted himself on the St. Lawrence near the present Clayton, N. Y. On 1 November the British sent two brigs, two schooners, and eight gunboats to dislodge him; but his three-gun battery on a hill at the mouth of French Creek drove them off. They returned the next morning and were again repulsed, with severe loss. The Americans lost two killed, four wounded.

French East India Company. See EAST INDIA COMPANIES.

French Guiana. See GUIANA.

French Guinea, gĭn'ĭ, West Africa, a French colonial possession, between Sierra Leone, Liberia, Senegal, and Portuguese Guinea. The area is about 95,000 square miles and the population (1901) 2,200,000. The centres of population are Konakry, the capital, on the Isle of Tombo, and Boké, Ubrèka, and Timbo. The products are rice, millet, earth-nuts, gum, and rubber. A railroad of 80 miles has been built from Konakry to the Niger. There are 1,060 miles of telegraph line in the colony. In 1900 the imports were $2,755,250, and the exports $1,887,600. The colony is under the administration of a governor, who is under the governor-general of French West Africa. The French colonized the section as early as 1685.

French Indo-China, generally, the French possessions in southeast Asia, which include Cochin-China and the protectorates of Tongking, Laos, Annam, and Cambodia. French Indo-China is bounded by the China Sea, the Gulf of Siam, and the Mekong River. The area and population are given (1901) as follows:

PROTECTORATE	Area Sq. m.	Population
Annam	52,100	6,124,000
Cambodia	37,400	1,103,000
Cochin-China	22,000	2,968,529
Laos	98,000	605,000
Tongking	46,400	7,036,900
	255,900	17,837,429

The military forces of Indo-China consist of 10,901 European troops and 15,000 native soldiers. Over 1,000 miles of railroad were in operation in 1902. Indo-China is under the administration of a governor-general, and lieutenant-governor or resident superiors. The local revenue of the possessions equal the expenditure. See ANNAM; CAMBODIA; COCHIN-CHINA; LAOS; TONGKING.

French Language. See FRANCE.

French Literature. See FRANCE.

French Polishing, a process, generally employed for giving a smooth surface-coating to furniture and cabinet-work. The surface of the wood being finished off with glass-paper and placed opposite the light, the rubber (a ball of wool covered with rag), dipped in the varnish (or polish), is passed quickly and lightly over the surface in the direction of the grain of the wood, and rubbed till dry. This operation must be repeated several times. The most common of the varnishes known under the name of French polish are prepared as follows: Pale shellac, 5½ ounces; finest wood-naphtha, 1 pint; dissolve. Before applying any of these varnishes the rubber must be first slightly moistened with raw linseed oil. See VARNISH.

French Revolution. See FRANCE, *History of.*

French River, Canada, a stream in Ontario. It empties into Lake Huron after a course of 55 miles. For 150 years it was the regular route to the upper lakes.

French Shore. See NEWFOUNDLAND.

French Somaliland, sō-mä'lē-lănd, Africa, a French colonial possession on the west shore of the Gulf of Aden, adjoining Abyssinia. The area is about 46,000 square miles and the population about 200,000. It is administered by a governor and general council. The sea fisheries and interior trade are the only commercial industries. In 1900 the imports were $1,200,000 and the exports $800,000. Among the exports are coffee, ivory, gold, and sheepskins. French and English vessels visit the coast regularly and there are 100 miles of railroad in operation. The principal towns are Jibutil, the capital, Obok, Tagurah, Ambado, Gobad, and Sagallo.

French Spoliation Claims. During the great European wars from 1793 on, French privateers assailed neutral commerce, of which the American was chief, under various pretexts or without any; one was that the United States had violated the treaty of 1778. In the virtual French-American war of 1798–9, their privateers about the West Indies and elsewhere made prize of a great quantity of American shipping, for which our commissioners vainly endeavored to obtain indemnification. Finally, in the treaty of 30 Sept. 1800, as there was no hope of getting the money from Napoleon, the United States for other considerations waived the claim; and in the Louisiana Purchase Treaty of 30 April 1803 a part of the consideration was the assumption by the United States of its citizens' claims against France, then amounting to $3,750,000. Thence till 1885, when the cases were referred to the court of claims, nearly every year saw a bill before Congress to pay these claims, and twice a vote for it was obtained, which was vetoed by the President in each case — Polk and Pierce. The court finally adjudicated several thousand claims, and awarded some $4,800,000.

French Sudan', Africa, the name officially given to a large tract of country in the western Sudan, including the upper basin of the Senegal and the countries watered by the Upper and Middle Niger. It is bounded on the west by Senegal, on the south partly by the French territory of Rivières du Sud, and on the east by independent tribes and by British territory. Officially it is divided into "annexed territories," mostly in the western part, and protectorates. The former have an area of 54,000 square miles and a population of 360,000, while the latter have an extent of 300,000 square miles with a population of about 2,500,000. The control of this region is entrusted to a military commandant subject to the governor of Senegal and residing at Kayes on the Senegal River. A railway has been opened between Kayes and Bafoulabe at the junction of the head-streams of the Senegal.

Frenchman's Bay, Maine, an ocean inlet in Hancock County, extending inland 25 miles with a width of 10 miles. It contains a number of islands, among them Mount Desert, whereon is situated Bar Harbor (q.v.).

Frenchtown, Md., in the War of 1812. As part of the British operations on Chesapeake Bay in 1813, Sir George Cockburn was sent to close its head. Establishing himself first at the mouth of the Susquehanna, then on Elk River, on 28 April he sent 150 marines to destroy the stores at Frenchtown, a small village much used in the land transport between Baltimore and Philadelphia since the closure of the Bay. They drove off the Americans, and burned the stores and five vessels lying near.

Frenchtown, Mich., a township in Monroe County; 22 miles southwest of Detroit. In this vicinity 14 Jan. 1813 an American force of 650 defeated 500 British and Indians. On 20 Jan. the American forces were defeated and taken prisoners. On the 23d the wounded were massacred in what is known as "the massacre of the River Raisin." See WAR OF 1812, THE.

Freneau, Philip, American poet: b. New York 2 Jan. 1752; d. near Freehold, N. J., 18 Dec. 1832. Graduated from Princeton in 1771, he was captured in 1780, during a voyage to the West Indies, by an English cruiser, and his experiences while under detention he later recorded in 'The British Prison-Ship.' Having regained his liberty, he wrote much for the 'Freeman's Journal' of Philadelphia. In 1790 he became editor of the *Daily Advertiser* (New York), and in 1791 of the *National Gazette* (Philadelphia). After an interval at sea he permanently settled in New Jersey. Freneau was the first national poet of America, and a lyrist of real though uneven gifts. His elegy, 'The Battle of Eutaw Springs,' was praised by Scott, who called it "as fine a thing of the kind as there is in the language." During the Revolution he was active in satirical verse. His work attests his extensive culture; and though it conforms in the main to the conventions of the 18th century, it does not lack distinction. He wrote also several volumes of prose, published under the pseudonym "Robert Slender" and of small merit. Until recently his poetry has been strangely neglected; but in 1901 appeared a biography by Austin, and in 1903 an edition of the poems, with a 'Life,' prepared by F. L. Pattee. During Freneau's life there were editions in 1786, 1788, 1809, and 1815. There were reprints of the 1786 edition in 1861 and 1865. Consult further: Tyler, 'Literary History of the American Revolution' (1897); and Wendell, 'Literary History of America' (1900).

Frère, Charles Théodore, shärl tā-ō-dōr frār, French painter: b. Paris 24 June 1815; d. there 25 March 1888. He was a pupil of Cogniet and Roquelan, and made his first exhibit in 1834. He was present at the fall of Constantine, Algeria, in 1837, and from that time chose scenes from eastern life. His pictures illustrating Constantine (1840–8) are among the best he painted.

Frere, frēr, SIR **Henry Bartle Edward,** English statesman and administrator: b. Clydach, Brecknockshire, Wales, 29 March 1815; d. Wimbledon, Surrey, 29 May 1884. He was educated at Haileybury College; entered the East India Company's Civil Service in 1833; introduced improvements into the system of tax collection, and distinguished himself as an administrator. At the outbreak of the Mutiny in 1857 he promptly seized the fortress of Multan, retained command over his own province, and was enabled to assist the neighboring provinces. In 1862 he became governor of Bombay, and in 1867 he was knighted. In 1872, as British commissioner, he negotiated a treaty with the sultan of Zanzibar abolishing the traffic in slaves. In

1877 he was appointed governor of the Cape, and high commissioner in South Africa to settle native and colonial affairs, but the war which he provoked with the Zulus gave so much dissatisfaction to the government that in 1880 he was recalled. See 'Life,' by J. Martineau (1895).

Frere, John Hookham, English poet, translator, and diplomatist: b. London 21 May 1769; d. Malta 7 Jan. 1846. After a career in the diplomatic service, he produced his original 'Prospectus and Specimen of an Intended National Work . . . Relating to King Arthur and His Round Table' (1817), better known as 'The Monks and the Giants'; a literary burlesque, full of charming verse and of excellent character-drawing. It naturalized in English the *ottava rima* afterward used by Byron in 'Beppo' and 'Don Juan.' A version of a large part of Aristophanes succeeded this effort.

Frère, Pierre Edouard, pē-ār ā-doo-är frār, brother of Charles Théodore Frère (q.v.), French painter: b. Paris 10 Jan. 1819; d. Anvers-sur-Oise June 1886. He studied under Paul Delaroche, and chose sentimental genre as his specialty; many of his delineations of home- and child-life are full of true and simple feeling and have been frequently reproduced. In technique he was remarkable as a colorist, and his 'Little Gourmand'; 'Curiosity'; 'Repose'; 'The Little Cook'; 'First Steps'; 'Going to School' have long been favorites in the print-shop windows.

Fresco, in art, a term applied, originally by the Italian artists, to pictures executed in water-colors upon a freshly-plastered wall. Mineral or earthy pigments are employed which resist the chemical action of lime, and in drying the colors become permanent. On the revival of the arts in Europe it became customary to decorate the walls of churches, palaces, cloisters, and convents with fresco paintings. The Romans found plaster paintings on brick walls at Sparta, cut them out, packed them in wooden cases, and transported them to Rome. Fresco painting was first made of real importance by the Italians in the 16th century. It is a very common error in this country with antiquarians and writers in general to term the ancient paintings frequently found on church walls, etc., frescos; but there is scarcely an instance of a genuine fresco among them. They are distemper paintings on plaster, and quite distinct in their style, durability, and mode of manipulation. The art is very ancient and widely spread, frescos of early date being found in India, Egypt, Mexico, etc., as also in Pompeii and other places. The example of Michelangelo and Raphael shows how worthy it is of the greatest artists. The painter cannot seduce the senses by soft tints and tender harmony of colors; he is, therefore, reduced to depend solely on form, character, expression.

The methods employed in painting frescos is described as follows in a treatise upon painting by the monk known as Theophilus, a work certainly written before the close of the 12th century: «When figures or other objects are drawn on a dry wall, the surface should be first sprinkled with water till it is quite moist. While the wall is in this state, the colors are to be applied, all the tints being mixed with lime, and drying as the wall dries, in order that they may adhere.» The method is still in general use in Italy and in Munich, for the production of both exterior and interior decoration. In modern practice lime and fine sand are used for the final coating of plaster, which is allowed to dry thoroughly, and then smoothed by the application of pumice-stone. On the evening before the painter is to begin his work the surface is thoroughly damped with water in which a little lime has been dissolved, and the process is again repeated next morning. The colors are the same as those used in true fresco-painting, which we next describe; but *fresco secco* possesses this advantage over true fresco, that the artist can leave his work at any point, and, having simply redamped the wall, again resume it. The *secco* process is excellently adapted for rough decorative work, and is as durable as true fresco; but it is less suited for delicate and refined artistic productions.

Fresco-painting was accordingly the chosen method by which the greatest Italian masters expressed, upon the walls of cathedral and council-room, their deepest conceptions of religion and polity. Giotto employed it in the Arena Chapel of Padua and the Church of St. Francis at Assisi; Orcagna in the Church of Sta. Maria Novella; Fra Angelico in the Convent of St. Mark; Masaccio in the Brancacci Chapel of the Carmine, Gozzoli in the Riccardi Chapel, at Florence; Perugino in the Sala del Cambio of his native city; Luini in the churches of Milan, Lugano, and Saronno; Pinturicchio in the cathedral library of Siena; Correggio in the Cathedral of Parma; Raphael in the Vatican; and when Michelangelo was directed by Pope Paul III. to paint his 'Last Judgment' in the Sistine Chapel in oils, instead of in fresco as at first agreed on, he protested that oil-painting was an art for women and indolent persons, that fresco was the art for men and painters, and was allowed to have his way. The celebrated 'Last Supper' of Leonardo at Milan is a mural painting in oils, not fresco; and the method used, combined with the fact that the production of the work extended over a period of years, and that the faulty masonry of the wall afforded insufficient protection against damp, accounts for the ruined state in which the subject now exists.

Germany has produced the most distinguished fresco painters in modern times, and Cornelius has established his fame by his grand fresco pictures in the Glyptotheca in Munich. Schnorr is also distinguished in this line, and the Villa Massimi, near Rome, is a fine monument of contemporary German art, as Overbeck, Schnorr, and Feith painted the three rooms in fresco. Fresco painting was long disregarded, when all noble and grand conceptions seemed to have fled from the art; and it is only in recent times that it has been taken up again, chiefly by the Germans. Several works of this kind have been executed in the British Houses of Parliament. See ART; MURAL DECORATION; PAINTING.

Frescos, Boscoreale. See METROPOLITAN MUSEUM OF ART.

Fresh-air Work, a form of benevolence or helpfulness; in this particular the taking of poor children from the tenements and slums of large cities to the country or seashore for recreation. It is said to have originated in 1840, when William A. Muhlenberg of New York sent a large number of poor children and invalids to the country for short vacations. The first general fresh-air societies were organized in

1874, and since then a number of newpapers have inaugurated fresh-air funds. There are now societies in 38 cities and 14 fresh-air organizations in New York. In Europe, Switzerland was the first to take up the movement in 1876. In 1895 there were 73 fresh-air colonies in that country. Nearly all European countries and Argentina in South America have taken up the work. Consult, 'Fresh Air Charity in the United States' (1897).

Fresh-water Insects. Insects are essentially creatures of the air and the land; yet a considerable number pass the whole or the greater part of their lives in rivers, lakes, and ponds. Among insects aquatic in all stages we can distinguish between those which glide or skate over the surface of the water, diving not at all, or only exceptionally, and those which habitually dive and swim through the water after the manner of fishes. The most typical of the surface-dwellers are the bugs of the family Hydrometridæ. See Pond-skaters.

Among the Coleoptera the whirligig beetles (*Gyrinidæ*) frequent the surface of ponds and brooks where they may be seen in small companies, performing a whirling, mazy dance over the surface-film. These insects, when they dive, carry down with them a small air-bubble; enclosed in a film between the tip of the wing-covers to the hinder end of the abdomen. They are not, like the pond-skaters, completely enveloped in air while under water. The beetles of a nearly related family (*Dyticidæ*), well called "diving-beetles," belong to the group of insects which live habitually submerged. Their contours are admirably adapted for motion through the water, but there is no dense hairy covering to ensure the formation of an air-bubble and the breathing is provided for in quite another way. The abdominal spiracles open on the upper surface of the segments, which are completely covered by the wing-cases when the wings are shut. The wing-cases being convex and the upper surface of the abdomen depressed, a considerable amount of air is enclosed, allowing the insect to remain submerged for some time.

Another mode of adaptation to life in the water is shown by the water-scorpions (*Nepidæ*). They are provided with a pair of long-grooved appendages at the tail-end of the body; these can be closely pressed together and form a tube, the tip of which pierces the surface-film and conveys a supply of air to the spiracles. These insects, like the allied "water-boatmen" (*Notonectidæ*), have well-developed wings, and make excursions by night to new watery dwelling-places.

Many insects lead an aquatic life only during their larval stage. Naturally enough, however, such insects when adult are to be found flying chiefly in the neighborhood of water in which they will lay their eggs — the May-flies and midges for example. The contrast between the conditions of the larval and the imaginal life in such cases is most striking, and can only have been brought about by slow degrees. A certain amount of moisture in the earth is necessary to the well-being of many burrowing larvæ, while some are found in semi-liquid mud, in decaying refuse, or in animal excrement. In such surroundings breathing through the lateral spiracles becomes impossible, and we find that access to the air-tubes takes place only by one or two pairs of spiracles near the head or tail-end of the body, sometimes opening through "respiratory trumpets" whose expanded mouths can be thrust out of the clogging surroundings of the mud or refuse into the fresh air, while the grub remains concealed and continues to feed. A similar suppression of most of the spiracles, with the development of a tubular process at the tail end of the body in connection with the tracheal system, is the adaptation by which many aquatic larvæ breathe — for example, the grub of the mosquito. The families of insects nearly related to these have larvæ which live in mud and damp earth, and this suggests that it was from the shores that the waters were invaded by these insect-hosts.

But there is another division of aquatic larvæ still more perfectly adapted to life in the water. The grub of the gnat or the drone-fly needs to rise to the surface at intervals and pierce the film with its air-tube in order to get a fresh supply of oxygen. But the pupa of the sand-midge, with its tubular gill-filaments, or the larva of a May-fly with its tracheal gill-plates, can remain in the water throughout its life, drawing, as do the fishes, sufficient oxygen from the dissolved air. It is interesting to notice that within the limits of a single and restricted order — the dragon-flies — we find some larvæ breathing by means of tracheal gill-plates, and others taking supplies of water into the hind-gut over whose walls run branching air-tubes; while in the final nymph stage the thoracic spiracles are open, and the insect raising the front part of its body above the surface, breathes through them after the manner of an imago. These various adaptations to an aquatic life within a single group indicate clearly that the habit of living in water is not primitive among insects, but that it has become acquired by different races at different times in the course of the development. It may be presumed that larvæ with the more perfect adaptations for breathing when submerged — leaf-like or thread-like gills — are older inhabitants of the water than those which have to rise periodically to the surface to take in a supply of air.

Fresh-water Mussels, bivalved mollusks that dwell in lakes and rivers; river-mussels, or river-clams. They belong to the family *Unionidæ,* allied to the cockles, which has a large and thick foot, no byssus, siphon short (when present), and a parasitic embryonic growth. The shells are equivalve, varying according from thin and smooth to very thick, rugose and knobbed; the hinge variable (in *Anodonta* having no hinge-teeth); and the interior always thickly nacreous, making it useful in the arts as "mother of pearl," and often producing fine pearls. The family is world-wide in its distribution and includes about a dozen genera, two of which (*Unio* and *Anodonta*) occur in most parts of the world. These mollusks dwell in rivers and ponds, and vary greatly according to the character of their home, whereby a great number of supposed species have been named that are now known to be merely varieties of the same stock resulting from different environment. They stand upright in the sand on the blades of the shell, so that the heavy hinge margin receives any blow from drifting stones, or other harm; and slowly move about, sucking

in the minute animal and vegetable organisms upon which they feed. (See PELECYPODA.) The development of their young is most unusual. The eggs when ejected from the ovaries are caught in the gills of the mother and are sustained by a nutritive mucuslike secretion, until they reach a certain degree of age, when they become "glochidia."

They then have a larval shell, provided with strong hooks, and possess a long filament. After a period they are expelled through the exhalent siphon into the water, and this ejection may be timed to the passing of a small fish, to whose body if they touch it the glochidia at once cling by means of the hooks. Should they miss striking against a fish when thrown out the embryos sink and lie upon the bottom with their shells gaping and the filament floating upward. There they remain until a "host" comes within reach; but this must soon happen or they will perish. The glochidia of *Unio* usually become attached to the gills; those of *Anodonta* to the skin or the fins. In this position they become overgrown by the skin or mucous membrane of their host, and are nourished by his juices. This goes on for about 10 weeks, during which time the glochidium has been metamorphosed into a young normal mussel, drops off and begins the ordinary course of life. Their life is probably long.

Mussels abound in all the rivers of the United States and were extremely numerous and varied in those of the Mississippi; and they entered very largely into the fare of the native red men, as is attested by the large refuse-heaps of their shells to be found in all the river courses. It was long ago discovered, however, that these shells yielded pearls of great beauty and price (see PEARL), while the mother-of-pearl of many species was marketable for the manufacture of buttons and similar articles. The result has been a serious depletion of the mussels of many parts of the Middle West, and nearly an extinction of some species.

Fresnel, frā-nĕl, **Augustin Jean,** French physicist: b. Broglie, France, 10 May 1788; d. Ville d'Avray, near Paris, 14 July 1827. He was educated at the Ecole Polytechnique, and early devoted himself to the practice of civil engineering. In 1815 he became distinguished as the discoverer of the polarization of light, and in 1823 was elected a member of the Academy. He made important researches respecting the wave theory of light. The result of his great discovery is shown in the system of lens lighting apparatus, which has changed the mode of lighthouse illumination over the whole world, and is universally known as the "Fresnel system." In 1825 Fresnel was elected F. R. S. of London, and in 1827 received the Rumford medal of the society.

Fresnel's Surface. See LIGHT.

Fresnillo, frĕs-nēl'yō, Mexico, a city in the State of Zacatecas. It has a spacious square, with a costly fountain in the centre, and contains several large churches. In its vicinity are the celebrated mines of Fresnillo, reckoned among the most productive in Mexico. Pop. 13,000.

Fresno, Cal., a city and county-seat of Fresno County, situated on the San Francisco & S. J. V., the Southern P., and Atchison, T. & S. F. R.R.'s. The city is an important fruit-growing centre, the raisin trade alone being valued at $3,000,000 annually. Other important industries are the cultivation and exporting of oranges, grapes, and olives, besides a large livestock trade.

Fresno was settled in 1872, became the county-seat in 1874, and received a charter as a city in 1885. The government is controlled by a mayor, chosen every four years, a municipal council, and other administrative officials. The assessed property valuation is about $6,000,000. Pop. (1900) 12,470.

Freund, froint, **Herman Ernst,** Danish sculptor: b. Uthlede 15 Oct. 1786; d. 30 June 1840. At first a blacksmith, he studied at the Copenhagen Academy of Fine Arts, won the Academy's large gold medal with allowance for foreign study, and resided in Rome, where he was greatly assisted in artistic progress by Thorwaldsen and executed his 'Mercury' and 'Luke.' His conspicuous successes were produced in the domain of Norse mythology, to which field belongs his Ragnarök frieze, done in 1827 for the Christianborg Palace, where it was nearly destroyed by fire in 1884, and later restored by Ginding. Further works by him are 'Eurydice,' 'Thor,' and 'Mimer and Bolder Consulting the Norns.' See Life by Victor Freund (1883).

Frey, frī, **Albert Romer,** American author: b. N. Y. 17 Feb. 1858. He is secretary of the Shakespeare Society of New York and has written in refutation of Ignatius Donnelly's 'cipher' theory of Shakespearian authorship. Among his other writings are 'William Shakespeare and alleged Spanish Prototypes' (1885); 'Soubriquets and Nicknames' (1887).

Frey, Emil, Swiss president: b. Arlesheim, near Basel, 24 Oct. 1838. While in the United States in 1861 he enlisted as a sergeant in the Federal army, was taken captive at Gettysburg and confined in Libby prison. He returned to Switzerland in 1865, there becoming prominent as a journalist, and was minister from Switzerland to the United States 1882–7. He was elected president of the Swiss Confederation 14 Dec. 1893. He is a noted advocate of educational progress and reform and has been prominent in the furtherance of public works and of army improvement.

Frey, Heinrich, German anatomist and zoologist: b. Frankfort-on-the-Main 15 June 1822; d. Zürich 17 Jan. 1890. He began his studies at Bonn in 1840, and continued them up to 1845 at Berlin and Göttingen, when he took the degree of Doctor in medicine and at the last named university became assistant professor of physiology. In 1848 he was appointed professor of histology and comparative anatomy at Zürich. He was considered one of the first microlepidopterologists of Germany. The range of his published works is wide. He wrote a 'Text-Book of Zootomy' (1847); 'An Introduction to the Study of Invertebrates' (1847); several works on histology, a book on the microscope, and an elaborate account of the lepidoptera of Switzerland.

Freyberg, frī'berg, **Konrad,** German painter: b. Stettin 14 May 1842. He studied at the Art Academy of Berlin and entered the studio of Steffecks, applying himself to the delineation of military subjects, especially cavalry

scenes. His canvases are small, but his portraits of the mounted troops are finished and elegant. He has painted in this style many of the principal figures in the Franco-Prussian War. Among his works may be mentioned 'Prince Karl of Prussia with his Staff' (1872); 'Group of Officers of the Guard' (1875); 'Royal Hunt at Letzlingen' (1881); 'Prince Frederick of Hohenzollern at the head of the Second Regiment of Dragoon Guards' (1885).

Freyburg. See FREIBURG.

Freycinet, Charles Louis de Saulces de, shärl loo-ē dė soos dė frā-sē-nā, French statesman: b. Foix (Ariège) 14 Nov. 1828. He was trained as an engineer, and held several important appointments, being associated with Gambetta in the war department in 1871. He was elected to the senate in 1876, and became minister of public works in the following year. He was minister of foreign affairs and president of the council 1879–80, and these posts he held on several subsequent occasions. In 1888 he became minister for war, and continued to hold that office for five years, during two of which (1890–2) he was also premier. In 1893 he had to resign owing to the Panama scandals. As head of the war department he did much to strengthen and develop the French army. He is the author of several important works on engineering and sanitation, and of 'La Guerre en Province pendant le Siège de Paris' (1871). In 1890 he was elected to the French Academy.

Freytag, Gustav, goos'täf frī'täg, German author: b. Kreuzburg, Prussia, 13 July 1816; d. Wiesbaden 30 April 1895. His first dramatic composition was 'The Bridal Tour,' a comedy (1844); it was followed by a little one-act tragedy, 'The Savant' (1844), and by a small volume of poems, 'In Breslau' (1845); after which he produced 'The Valentine' (1846); 'Count Valdemar' (1847), and 'The Journalist' (1853). Among his works outside of the drama may be mentioned his great novel of social life, 'Debit and Credit' (1855; 40th ed. 1893); 'Pictures from the German Past' (1859); 'The Lost MS.' (1864; 23d ed. 1893); 'Die Ahnen' ('Ancestors'), a cycle of six stories portraying the German civilization from the beginning of historic times; and 'Charlemagne' (1894).

Fri'ar, from the French *frère*, Latin *frater*, signifying brother, is a name common to the male members of any religious order. Thus the Capuchins were originally called Friars Hermits Minor, and the Observants Friars Observants. The term, however, is more exclusively applied to those of the mendicant orders: of which the four chief were the Dominicans (Black Friars), Franciscans (Gray), Carmelites (White), and Augustinians.

Friar-bird, a familiar woodland bird of Australia, of moderate size, with brownish-drab plumage, head and neck bare of feathers and a cowl-like neck-ruff. It is an aberrant form of honey-eater (*Meliphagidæ*), some 16 species, all of the Malayan and Australian regions are grouped in the genus *Philemon*, of which the present species is named *P. corniculatus*, in reference to a horny excrescence upon the base of the culmen of the beak. Its loud cries and other peculiarities have given it many local names, such as 'monk,' 'leatherhead,' 'poor soldier,' 'pimlico,' and 'four o'clock.'

Fribourg, or **Freiburg,** Switzerland, a town picturesquely situated on the Saane, which is here crossed by a magnificent suspension bridge, 905 feet long. It is partly surrounded with walls and towers, and among the chief buildings are the Church of St. Nicholas, a handsome Gothic structure, with a spire 240 feet high, and one of the finest organs in Europe; a town-house with a lime-tree near it, which was planted in 1476, on the day of the battle of Morat (Murten), the cantonal university, founded in 1889, and a Jesuit college. A gorge close to the town is crossed by a second suspension bridge, 689 feet in length and 317 feet high. Pop. (1900) 15,794.

Frick, Henry Clay, American manufacturer: b. West Overton, Pa., 19 Dec. 1849. He began commercial life in a small coke business, which grew to be the largest in the country, and is now president of the H. C. Frick Coke Co. He was prominent as instrumental in putting an end to the Homestead Strike (1892) and has been president of the Carnegie Steel Co.

Friction, the resistance which opposes the sliding or slipping of one body relatively to another body with which it is in contact. It is doubtless chiefly due to the minute irregularities that exist upon the surfaces in contact, the motion being opposed by the interlocking of these irregularities. Two kinds of friction may be recognized: (1) "Static friction," between bodies that are relatively at rest, and (2) "Kinetic friction," between bodies that are actually slipping over each other. Static friction is measured by the force that is required to just cause one body to move upon the other, when the two are pressed together by a certain definite pressure; and the ratio of this force to the pressure with which the bodies are held in contact is called the "coefficient of statical friction." Kinetic friction is measured by the force that is required to maintain one of the bodies that are in contact, in a state of uniform motion with respect to the other one; and the ratio of this force to the force with which the bodies are pressed together is called the "coefficient of kinetic friction." The coefficient of static friction between two given substances may be determined by causing a weight composed of one of the substances to rest upon a smooth plane composed of the other substance. If the plane is nearly horizontal, the weight will not slip upon it; but by increasing the angle of inclination, a position will be found for the plane, such that the weight is just on the point of sliding. The angle that the plane then makes with the horizontal is called the "angle of repose" of the pair of substances of which the plane and the weight are composed; and it may be shown by the elementary principles of mechanics that the coefficient of statical friction for these substances is numerically equal to the natural tangent of the angle of repose. Following are a few coefficients of statical friction, as given by Rankine: Wood upon wood, dry, 0.25 to 0.50; leather on metals, dry, 0.56; leather on metals, greasy, 0.23; metals on metals, dry, 0.15 to 0.20. Rennie found somewhat larger values for the coefficient between metals. Thus for statical friction between dry surfaces, he found: Steel on cast iron, 0.33 for ordinary loads; and for similar loads he found 0.22 for brass upon cast iron. Coefficients of kinetic friction are smaller than

the coefficients of statical friction between the same substances, and all friction is greatly diminished by introducing oils or other lubricants between the rubbing surfaces. In kinetic friction between surfaces that are smooth and well lubricated, the results depend far more upon the nature of the lubricant than they do upon the nature of the rubbing surfaces; and they are also greatly dependent upon the method by which the lubricant is applied. When a journal is lubricated by means of a pad placed underneath it, the friction may be more than six times as great as when the same journal is run in a bath of the same oil. Speed also has a great influence upon the amount of friction developed. Morin's "laws of friction," given in 1831, are as follows: (1) The coefficient of kinetic friction is independent of the pressure with which the rubbing surfaces are pressed together; (2) the coefficient of friction, and the total friction, are independent of the areas in contact, so long as the total pressure between the two rubbing bodies is constant; and (3) the coefficient of friction is independent of the velocity, although static friction is greater than kinetic friction. These laws, which are often given in text-books and elsewhere as reliable presentations of the known facts, are now known to be exceedingly imperfect. Morin gave them for ordinary conditions of shafting and journals, where no special care has been taken with the journals, and no artificial means have been provided for the free supply of oil. It is now certain that they cannot be assumed to apply under other conditions, and it has been pointed out that "there are many conditions under which they lead to the wildest kind of error." The phenomena of friction are in reality quite complicated, and a thorough study of the subject is necessary before the friction that may be expected in any given case can be calculated with even a rough degree of approximation. Consult: Thurston, 'Friction and Lost Work'; Kent, 'Mechanical Engineer's Pocket-Book.'

"Rolling friction," so called, is not true friction, in the sense in which the word has here been defined. It is due mainly to the fact that a wheel when rolling upon a smooth track or other surface, creates a slight depression by its weight, and is also slightly deformed itself at the same time. The energy which is absorbed in producing these slight deformations is in considerable measure dissipated as heat; but the retardation of the moving body from this cause is seldom comparable with that due to sliding friction. For the internal friction of fluids, see VISCOSITY.

Friday, the sixth day of the week, so named from the Anglo-Saxon *Frigedag*, the day of Friga, the wife of Odin and the Teutonic goddess of love. The Anglo-Saxon is a translation of the Lat. *Veneris dies*, day of Venus, whence the French *Vendredi*, Friday. Its religious associations are varied. According to the Mohammedans it was the day when Adam was created, entered Paradise, was expelled therefrom, the day of his repentance, of his death, and is to be the day of resurrection. It is the Moslem "day of assembly" or sabbath. As the day of Christ's crucifixion it is generally observed in the Greek, Latin, and other Christian episcopal churches as a fast day, and is especially observed on Good Friday (q.v.). From the same cause, also, it is regarded among the superstitious as an unlucky day, and was long associated in the public mind with the execution of criminals sentenced to death, which usually took place on Friday and was commonly called hangman's day.

Friedel, frē'dĕl, **Charles,** French chemist: b. Strasburg 1832; d. 1899. He studied under Pasteur in his native town and continued his scientific education at Paris, entering the laboratory of Wurtz. In 1869 he was graduated with two remarkable theses and in 1876 became professor of mineralogy in the Sorbonne. He eventually succeeded Wurtz (1884) as professor of organic chemistry and director of the research laboratory in the Sorbonne, a position he maintained till his death. His researches are record by him in 254 original memoirs and entitle him to a place among the foremost scientific men of the 19th century. His name is especially connected in association with James Mason Crafts (q.v.) with the synthetic method known as the 'Friedel and Crafts reaction' (q.v.). He published, in addition to text-books on mineralogy and crystallography, 'Cours de Chimie Organique Professé a la Faculté des Sciences de Paris' (1887).

Friedel and Craft's Reaction, in chemistry, a synthetic method discovered by the French chemist, Charles Friedel, in conjunction with James Mason Craft. This discovery revealed the action of various chlorinated compounds on hydrocarbons in the presence of aluminum chloride. A vast number of varying organic compounds may thus be produced in any ordinary quantity, for example, triphenyl methane is a commercial compound, necessary to the production of valuable dyes; by Friedel and Craft's Reaction process it can be produced rapidly and cheaply in any quantity required.

Fried'elite, an acid silicate of manganese, containing some chlorine, and crystallizing in the rhombohedral system, but also occurring massive. It is rose-red in color, and is found in a manganese mine at Aderville, France.

Friedericia, frē-dā-rē'sē-ä, **Julius Albert,** Danish historian: b. Copenhagen 1849. He became assistant librarian of the library of the University of Copenhagen in 1891. He has published 'Danmarks ydre politiske Historie i Tiden fra Freden i Lybek til Freden i Brömsebro' (1876–81); 'Adelsvoeldens sidste Dage Danmarks Historie fra Christians IV.'s Dod til Enevoeldens Indforelse' (1894).

Friedland, frēd'länt, **Valentin,** surnamed Trotzendorf, German educator: b. Trotzendorf, Upper Lusatia, Germany, 14 Feb. 1490; d. Liegnitz, 26 April 1556. He became a teacher at Görlitz in 1515. He was for many years at the head of the gymnasium in Goldberg where the students, at times over 1,000 in number, were organized like a Roman republic, with senate, consuls, censors, and the like, with Friedland as perpetual dictator. See Pinzger, 'Valentin Friedland, gennant Trotzendorf' (1825); Lösche, 'Valentin Trotzendorf' (1856).

Friedland, Prussia, a small town 28 miles southeast of Königsberg, on the river Alle. The Russians under Benningsen were here defeated on 14 June 1807 by the French under Napoleon (q.v.) Pop. (1900) 2,824.

Friedländer, Friedrich, frēd'rĭh frēd'lĕn-dėr, Austrian painter: b. Kohljanowitz, Bohemia, 10 Jan. 1825; d. 1901. Among his works, which are confined to historical or genre themes are 'The Death of Tasso' (1852); 'The War Veterans' (1875); 'News' (1883); 'Distribution of Wine' (1884).

Friedländer, Ludwig, lood'vĭg, German classical scholar: b. Königsberg, Prussia, 24 July 1824. His most representative work is 'Typical Studies in the History of Roman Manners and Morals' (6th ed. 1889), written in popular style. 'The Remains of Nicanor's Emendations of the Punctuation of the Iliad' (1850), and like theses, constitute him an authority in Homeric criticism.

Friedman, frēd'man, **Isaac Kahn,** American journalist and novelist: b. Chicago, Ill., 3 Nov. 1870. He was graduated from the University of Michigan in 1893 and has since been engaged in newspaper work in Chicago. He has published 'The Lucky Number,' a collection of short stories of the Chicago slums (1896); 'Poor People,' a novel (1900).

Friedmann, frēd'män, **Alfred,** German poet and novelist: b. Frankfort-on-the-Main, Prussia, 26 Oct. 1845. Among his poems are: 'Merlin,' 'Orpheus' (1874), two ballads; 'Biblical Stars' (1875), comprising three idylls; 'Love's Fire Test, Angioletta'; 'Lays of the Heart' (1888). He is the author of many novels, including: 'Two Marriages'; 'Suddenly Rich' (1891); 'The Wild Rose' (1893).

Friedrich, Johannes, frēd'rĭh yō-hän'nĕs, German Old Catholic theologian: b. Poxdorf, Bavaria, 5 May 1836. After studying at the universities of Bamberg and Munich he entered the Roman Catholic priesthood in 1859. In 1865 he became professor of theology in the University of Munich. At the Vatican Council, 1869–70, he united with his colleague Döllinger (q.v.) in opposing the dogma of papal infallibility, and when acceptance of the dogma was demanded by the archbishop of Munich of the faculty of the Munich University, he with Döllinger declined and was excommunicated. In 1882, however, he was given another professorship, and in 1882 was transferred to the philosophical faculty. He was one of the leaders in founding the Old Catholic Church, but withdrew from active leadership in 1878 when the Old Catholic Synod voted to allow its priests to marry. Among his many writings are 'Tagebuch während des vaticanischen Concils' (1871); 'Zur Verteidigung meines Tagebuchs' (1872); 'Geschichte des Vaticanischen Concils' (1877–87), and 'Life of Döllinger' (1899–1901).

Friedrich, John, American violin-maker: b. Cassel, Germany, 1858. Having studied violin making under Oswald Möckel, he came to the United States in 1883, and shortly took prominent rank in his calling. In 1893 he obtained the highest award for violins, violas, and violoncellos at the World's Columbian Exposition. He has also made bows of very excellent workmanship, and came to be recognized as an expert in identifying and appraising rare specimens.

Friedrich, Kaspar David, German painter: b. Greifswald 5 Sept. 1774; d. Dresden 7 May 1840. He obtained his training in the Copenhagen Academy of Fine Arts, and in 1795 settled at Dresden, where he became member and professor of the Academy. He excelled in depicting nature as seen through the psychologic medium of transitory human moods. Favorite motifs are the gloom of the forest, night scenes with moonlight, or storms at sea. The Castle of Berlin contains two fine examples: 'Abbey in an Oak Forest on a Winter's Evening,' and 'Pilgrim on the Shore.'

Friedrich, Woldemar, vŏl'dė-mär, German painter: b. Gnadau, Saxony, 20 Aug. 1846. He accompanied the German troops in the Franco-German War, and thence gained material for his illustrations in Daheim and in Hiltl's 'Der französische Krieg von 1870–71' (6th ed. 1891). In 1881 he became professor in the art school at Weimar and in 1885 in the Berlin Academy. He executed decorative paintings in Castle Hummelshain, Weimar; the Weimar gymnasium; and the booksellers' exchange at Leipsic. He also painted a series of aquarelles and numerous genre-works in oils.

Friedrichs, frēd'rĭhs, **Hermann,** German author: b. St. Goar, on the Rhine, Germany, 14 June 1854. He distinguished himself in periodical journalism, and also wrote: 'The Revenge of the Bayadere' (1880), a lyric; 'Love Ordeals' (1888), a volume of stories; and 'Forms and Passions' (1889), a book of poems.

Friendly Islands. See TONGA.

Friendly Societies in America. See FRATERNAL SOCIETIES IN AMERICA.

Friendly Sons of Saint Patrick, Philadelphia, Pa., organized in 1790 as the Hibernian Society. The first president was Hon. Thomas McKean, a signer of the Declaration of Independence. Among other prominent members of the society have been Gen. Walter Stewart, Commodore John Barry, Gen. Edward Hand, Col. Francis Nichols, Col. Thomas Proctor, Hon. Thomas Fitz Simons, and Gen. Andrew Jackson. The organization still exists, has a membership of over 600, and has in its treasury $75,000 or $80,000. In December 1897 the name Hibernian Society was dropped and that of the Friendly Sons of Saint Patrick adopted. The latter name had been borne by a Philadelphia society which was organized in 1771 and went out of existence sometime after 1805.

Friendly Sons of Saint Patrick, Society of the, New York city: founded in 1784. To-day, as at all times during its long existence, it numbers in its membership a great many of the most eminent merchants and professional men of New York. Among its presidents have been Hon. Richard O'Gorman, Chief Justice Charles P. Daly, Hon. James T. Brady, Eugene Kelly, Hon. Hugh J. Hastings, Joseph J. O'Donohue, David McClure, Samuel Sloan, John D. Crimmins, Hon. Morgan J. O'Brien, Hon. James A. O'Gorman, and Hon. James Fitzgerald. There are no creed or political tests for membership in the organization.

Friends, The Religious Society of. The Religious Society of Friends, commonly called Quakers, had its origin in England about the middle of the 17th century, and was largely the result of the ministry of George Fox, who is often called its founder.

Early History.— George Fox, the son of a weaver, was born at Drayton, in Leicestershire, 1624, and began his public preaching about the year 1648. His spiritual views and practical application of Christian doctrines met a ready

response in many pious persons (both Churchmen and Dissenters), and bitter opposition from others whose practices they condemned. His followers increased rapidly, and were known as "Children of Light," "Children of Truth," and "Friends of Truth"; finally adopting the name "Religious Society of Friends." Among them were many itinerant preachers; Fox in his journal (1654) says, above 60 in number. From the first imprisonment of Fox in 1649 to 1687 Friends were the objects of almost continuous persecution. In 1656 Fox computed there were seldom less than 1,000 in prison. Between the years 1661 and 1697, over 13,000 Friends were imprisoned in England, 198 were transported as slaves, and 338 died in prison or of wounds received in assaults while attending meetings. These persecutions were upon various pretexts, as, the refusal to pay tithes, to swear, or to remove the hat; for preaching in public places; as disturbers of public worship, for speaking in "churches" (a practice then not uncommon); and as Sabbath breakers, for traveling to their meetings on the day called the Sabbath. Many were apprehended for keeping an unlawful assembly under the Conventicle Act. Scotland, Ireland, the Continent, and America were early visited by their ministers.

The first to arrive in New England were two women, Ann Austin and Mary Fisher, who came to Massachusetts from Barbadoes in 1656. After five weeks' imprisonment and much cruel treatment they were sent back. Stringent laws were promptly enacted by that colony to prevent others from coming and owners of vessels from bringing them. Regardless of the cruel penalties of these laws, the Quakers continued to arrive and suffer their infliction. In numerous instances delicate women were "stripped naked from the middle up, tied to a cart's tail and whipped through the town" and thence through other towns. Four — one a woman — were hanged on Boston Common. Nevertheless they increased in numbers and spread to adjoining colonies.

The first Friends in New Jersey settled along the Raritan River in 1663. In 1677 over 200 came to this province and founded Burlington. William Penn joined the society in 1667. In 1681 he and several other Friends purchased East New Jersey, and in the same year Penn obtained from the crown the grant of Pennsylvania. A few Friends were in the province before Penn acquired it, and two shiploads came in the fall of 1681. The next year Penn himself came with others, and in less than three years the colony had a population of 7,000. For a period of 70 years, and so long as the influence of Friends predominated, there were no conflicts with the Indians. At an early date the society cleared itself of human slavery. Friends began to protest against it as early as 1688, and for nearly 100 years the agitation was continued, until "in the year 1787 there was not a slave in the possession of an acknowledged Quaker." This was largely due to the labors of John Woolman, a minister in New Jersey, whose journal has a literary reputation.

Organization and Discipline.— Fox and his co-laborers did not have an outward organization as an object. The organization and discipline were progressively developed. The first disciplinary meetings established were held monthly and were in a sense congregational. Some were held as early as 1656, but the practice does not appear to have become general before 1666. The first yearly meeting appears to have been held in 1656, the first in London in 1668, but it was not held there regularly until 1672. The first yearly meeting in America was held in Rhode Island in 1661. Monthly, quarterly and yearly meetings have geographical boundaries; and monthly meetings are subordinate to quarterly, and these to the yearly meeting, which is the source of discipline, and final judge of all questions. At stated periods monthly meetings appoint a few of their number as "Overseers," whose duty it is to have a loving oversight of the members. Men and women hold separate meetings for business, although some subjects are jointly considered. Of late years the practice of separate meetings has largely been discontinued. Elders are men and women chosen out of the body as "Friends of solid judgment, prudence, and experience," to sit with the ministers and to advise, encourage or caution them as seems needful. Persons — men or women — who speak and pray in public to the satisfaction of the members are, in due time, publicly acknowledged as ministers, or those in whom the body recognizes the "true gift." Such recognition does not confer upon them any new powers or authority. All members are embraced in a set of "Queries" which are answered, some quarterly — others annually, by meetings for discipline. These have reference to love and unity; attendance upon meetings; consistency in speech, behavior, and apparel; oaths, military service and fraudulent business; moderation in trade and living, and just payment of debts; encouragement of a stated or paid ministry; care of the poor and education of children; and keeping records of births, deaths and marriages. (The answering of "Queries" has been discontinued in many meetings.) Meetings have no presiding officer. In those for business a clerk is appointed, whose duty is to gather and record the sense or judgment of the meeting as expressed. No question is settled by a majority and no vote is taken. Christ is recognized as "the head over all things to the church."

Distinguishing Views.— In the essential doctrines of the Christian religion Friends were in accord with their fellow Christians. The principal points in which they differed were:

1. Immediate Divine Revelation. Barclay ('Apology') says: "Nothing is less minded and more rejected by all sorts of Christians than immediate divine revelation; insomuch that once to lay claim to it is matter of reproach." Again, "He that affirms himself so led (by the spirit of God) is, by the pretended orthodox of this age, presently proclaimed an heretic." Fox (Journal) says: "I saw that Christ had died for all men, and had enlightened all men and women with his divine and saving light. I was commanded to turn people to that inward light, spirit and grace, by which all might know their salvation and their way to God." Friends believed that this inward saving light of Christ was universal and came to both heathen and Christian.

2. Worship and Ministry. Barclay ('Apology') says: "All true and acceptable worship to God is offered in the inward and immediate moving and drawing of his own spirit. All other worship, praises, prayers, and preachings, which man sets about in his own

will, at his own appointment, and can begin and end at his pleasure are but superstitious will-worship." Again, "As our worship consisteth not in words, so neither in silence as silence; but in an holy dependence of the mind upon God: from which dependence silence necessarily follows in the first place, until words can be brought forth which are from God's spirit." Hence silence is the basis of meetings for worship, which can be, and often are, held without a minister or any vocal service. Neither ministers, nor others, are supposed to break this silence without an immediate opening of a subject, and a sense that the Lord requires the delivery of the message revealed. No special training or educational qualifications are considered necessary for the ministry, and no consistent "Quaker" minister accepts pecuniary compensation for services in that capacity. Accepting literally the command of Christ to his apostles, "Freely ye have received, freely give," Friends refuse to pay tithes or in other ways to contribute to the support of a paid ministry.

3. Sacraments. Sacraments require the services of a priest or minister. Friends denied this necessity, rejecting all types and outward ordinances. They taught that the only saving baptism was that of the Holy Spirit, and that the true communion was not partaking of bread and wine, but the spiritual "eating of the flesh and drinking of the blood" of Christ. They held that marriage was the Lord's joining of man and woman, and therefore was not performed by man — men were but witnesses.

4. War, Oaths, etc. Friends have always maintained that war and oaths were inconsistent with Christianity, being forbidden by Christ and his apostles in the New Testament. Consistent members refuse to perform military service or partake in war-like preparations. They refuse oaths in civil courts or elsewhere as forbidden by Christ's language, "Swear not at all." In their early history they suffered much on this account. They decline the use of complimentary titles and language, believing they proceed from pride and tend to foster it. They refuse the complimentary use of the plural pronoun to a single person, although the "thou" and "thee" to judges and magistrates has often resulted in suffering. They use the numerical language of Scripture instead of the names of months and days in honor of heathen deities. Their plainness of dress is a testimony against pride, and any uniformity the result of a refusal to change its style at the dictates of fashion.

Present Condition and Membership.— With some unimportant exceptions the society maintained a practical unity until the year 1827. At that time a separation occurred in Philadelphia Yearly Meeting and later in others. Since then two distinct bodies have claimed the title "Religious Society of Friends," commonly distinguished by the names "Hicksite" and "Orthodox," although not recognized or officially used by either body. The name "Hicksite" came from Elias Hicks, a talented and popular minister of Long Island, whose ministry was the immediate cause of the schism. The Orthodox party hold that unsound doctrines caused the separations. The followers of Hicks, admitting differences in doctrines, contend that the real cause was not so much these differences, as an arbitrary exercise of authority by the Orthodox party. Quotations from Hicks establish the contention that the divinity of Jesus Christ, the doctrine of atonement, and the inspiration and authority of the Bible were denied or questioned. There were probably some grounds for the charge of an arbitrary spirit on the part of the Orthodox. In the separations, two thirds of Philadelphia and New York Yearly Meetings were of the "Hicksite" party, and in Baltimore four fifths; in Ohio they were about evenly divided, while in Indiana Hicks had comparatively few sympathizers. No separations occurred in New England or North Carolina meetings, they continuing to be identified with the Orthodox bodies, which were officially recognized by London Yearly Meeting.

There are (1903) seven yearly meetings of "Hicksite" Friends: Philadelphia, Baltimore, New York, Genesee (Canada), Ohio, Indiana, and Illinois, numbering about 21,000 members. They are connected by epistolary correspondence. Their principal schools are Swarthmore College, and the George School in Pennsylvania, Friends Central in Philadelphia, and similar schools in New York and Baltimore. 'The Friends Intelligencer,' an ably conducted weekly paper, is published in Philadelphia.

Several of the Orthodox yearly meetings have experienced separations. Joseph John Gurney of England, a wealthy and educated minister and voluminous writer, expressed views which many in England and America regarded as subversive of some always held by the society. Prominent among those in America who opposed his views was John Wilbur, a minister in New England. This resulted in a division in that Yearly Meeting in 1845, which was followed by one in Ohio in 1854. These, and later separations in others, resulted in two distinct bodies of Orthodox Friends within the limits of six yearly meetings, including Canada. They have been distinguished by the respective names, "Gurney" and "Wilbur," and the terms "Progressive" and "Conservative." In Ohio the "Conservative" body was the larger, and in each of the others the smaller. London gave its official recognition to the "Progressive" bodies. There are now 13 of these, connected with each other and with London and Dublin Yearly Meetings by correspondence: New England, New York, Canada, Baltimore, North Carolina, Ohio, Wilmington (Ohio), Western, Indiana, Iowa, Kansas, Oregon, and California. Total membership in America about 88,500.

The six "Conservative" yearly meetings are: New England, Ohio, Canada, Western (Ind.), Iowa, and Kansas. These annually exchange epistles. Their membership is about 4,500.

Philadelphia occupies a unique position, not being connected with either of these groups of related yearly meetings. That its sympathies were with Wilbur against the views of Gurney was shown by the recognition of the "Wilbur" Friends in Ohio. Later, in the interest of peace, Philadelphia ceased correspondence with all yearly meetings, and has never regularly resumed it. The membership is about 4,500. Within most "Progressive" yearly meetings paid pastors, prescribed services, singing, instrumental music and revival methods have been introduced; until, in many localities, the so-called "Friends Churches" more nearly resemble "Methodists" than "Quakers." These yearly meetings have organized "The Five Years Meeting," held periodically as the name indicates, having advisory rather than legislative powers.

Most of them have recently adopted a «Uniform Discipline.» The principal schools of Orthodox Friends in America are: Haverford College, Pennsylvania; Earlham College, Iowa; Guilford College, North Carolina; Pacific College, Oregon; Westtown Boarding School, Pennsylvania; Friends Select School, Philadelphia; Friends Boarding School, Providence, R. I.; Friends Boarding School, Barnesville, Ohio. Their principal periodicals are: 'The Friend,' Philadelphia (weekly), in its 77th year of continuous publication of uniform size and style; 'The American Friend,' Philadelphia (weekly), organ of the Progressive Yearly Meetings.

STATISTICS.

London Yearly Meeting	17,476	
Dublin Yearly Meeting	2,528	
Australasia	550	
Continental: Norway, Denmark, Germany, France, Turkey	247	
Total abroad	20,801	
In America:		
Hicksite Friends	20,773	
Progressive Friends	88,401	
Conservative Friends, about	4,500	
Philadelphia Yearly Meeting, about	4,500	
Primitive Friends, about	225	
Total in America		118,399
Total in foreign countries		20,801
Total in the world		139,200

EDWIN P. SELLEW,
Publisher of 'The Friend,' Philadelphia.

Fries, frēs, **Elias Magnus,** Swedish botanist: b. Smaland, Sweden, 15 Aug. 1794; d. Upsala 8 Feb. 1878. In 1834 he was called to the chair of practical economics at Upsala, with which in 1851 that of botany was conjoined. Fries introduced into Sweden the morphological theory in his 'Systems of the Vegetable World' (1825). His work on 'Mycology' (1820–32) was long the standard work on the classification of fungi, of which he gave a relatively complete catalogue in 'Scandinavian Flora' (1846–9). He wrote a series of useful books on the *Hymenomycetæ,* on lichens, and on the flora of Scandinavia, more particularly of Sweden. Among his monographs is one on the 'Hieracieæ' (1848). In 1851 Fries was appointed director of the botanical museum and garden at Upsala, and in 1853 rector of the university.

Fries, Jakob Friedrich, yä'kōb frēd'rĭн, German philosopher: b. Barby, Prussia, 23 Aug. 1773; d. Wartburg, Germany, 10 Aug. 1843. He is a link between Kant's system and the so-called historical school. 'The New or Anthropological Critique of Reason' (1807) is his most important book. He wrote 'Handbook to Psychical Anthropology' (1820); 'System of Metaphysics' (1824), etc.

Fries, John, American insurgent: b. 1764; d. 1825. When in July 1798, Congress voted a direct tax of $2,000,000 the federal officers who were sent to Pennsylvania to collect the State quota of $237,000, were resisted by a party of opposition which Fries had rallied from among the Germans of Montgomery, Lehigh, Bucks and Berks counties. At Bethlehem, 7 March 1799, the United States marshal was compelled by this party to release 30 prisoners who had been arrested for refusing to obey the law. The «rebellion» was at length put down by the militia which President Adams ordered out, and among those captured was Fries, who was subsequently twice tried and on each occasion sentenced to death. In April 1800 he was pardoned by President Adams, who at the same time proclaimed an amnesty to all concerned in the «rebellion.»

Friese, frē'zė, **Richard,** German painter: b. Gumbinnen, East Prussia, 15 Dec. 1854. He studied at Berlin, and traveled in the East, as well as northward within the Arctic Circle. He is now considered one of the best of German animal painters, and is equally successful in depicting the lion in the desert and the deer in a German forest. In 1886 he was awarded a gold medal by the Berlin Academy, of which body he was elected a member in 1892. His most famous works are: 'Lions Surprising a Sleeping Caravan' (1884), in the Dresden Gallery; 'On the Bredszell Moor' (1895), in the Königsberg Museum.

Friesland, frēz'lănd, or **Vriesland,** frēs'länt, a province in the Netherlands, bounded partly by the German Ocean and the Zuyder Zee. It is generally flat, and parts of it are below sea-level, being protected by dykes. Excellent horses, the best in Holland, cattle, and sheep are reared, and cattle and other agricultural produce are sent to England. It is sometimes called West Friesland, to distinguish it from East Friesland, now the district of Aurich in Hanover. It is divided into three districts — Leeuwarden, containing the capital of same name, Sneek, and Heerenveen. Area, 1,281 square miles. Pop. (1901) 345,004. See NETHERLANDS.

Frieze, Henry Simmons, American educator: b. Boston 15 Sept. 1817; d. Ann Arbor, Mich., 7 Dec. 1889. He was graduated from Brown University in 1841, was instructor there from 1841–5, and in the grammar-school connected with the university 1845–54, and from 1854 professor of the Latin language and literature in the University of Michigan, of which in 1869–71 and 1880–1 he was the acting president. He did much to promote the interests of the university, obtaining for it a State appropriation of $75,000 and an important library in political science. He published: an edition (1860) of the 'Æneid,' and (1867) of the 'Ars Rhetorica'; and 'The Story of Giovanni Dupré' (1886).

Frieze, (1) the architectural term for that part of an entablature between architrave and cornice or any similar position, in a work of structural decoration. It is often enriched with figures of animals, etc., in relief, and is sometimes divided into triglyphs and metopes. One of the best known examples is the Panathenaic, frieze around the cella of the Parthenon. (See ARCHITECTURE.) (2) The name of a thick woolen stuff or cloth with a nap on one side, in use since the 14th century for heavy outer garments. Frieze is largely made in Ireland, whence considerable quantities are exported.

Frigate, the designation in the days of wooden war vessels of a full-rigged ship with two decks, and so distinguished from a ship of the line which had three. Frigates were usually fast sailers, mounted with 28 to 60 guns, and were employed as scouts and as cruisers, to convoy merchantmen, etc. With the introduction of armor-clad war vessels the term frigate has been superseded by that of cruiser, but a large full-rigged merchantman is still sometimes so called. The name originally was used in the Mediterranean to designate a long, swift vessel propelled by oars and sails.

Frigate-bird, or **Frigate Pelican.** See MAN-OF-WAR HAWK.

Frill-lizard, a large Australian lizard (*Chlamydosaurus kingi*) of the family Agamidæ, so called in allusion to the erectile collar or ruff about its neck. This broad membrane is supported on each side of the neck by slender rods from the hyoid bone which extend to its margin like the sticks of a fan; and like a fan it may be folded close against the shoulders or spread until it stands up all around the back part of the head; but this erection can be accomplished only by opening the mouth widely, and always accompanies a stretching apart of the jaws. The exterior of the frill is of the general grayish-brown of the animal's body, but its interior or front is scarlet; and when it is suddenly spread in the face of an enemy behind the open hissing mouth, it is calculated to astonish and frighten the attacker in no small degree, as seems to be the purpose of the structure. These lizards are 6 to 8 inches long plus a long, lash-like tail. They spend their time on trees and logs, searching for the beetles which constitute their principal food; and have an extraordinary manner, when in haste, of rising and running upon their hind legs alone. The species has been extensively described and illustrated by Saville Kent in his books on the natural history of tropical Australia.

Fringe-tree (*Chionanthus virginica*), a beautiful tree of 10 or 20 feet in height, with somewhat oval, smooth, entire leaves, white narrow-petaled flowers in drooping racemes, and oval, purple drupes. Its blossoms are not only suggestive of its English name, but of the generic title of *Chionanthus*, "blossoms of the snow." It is found in the United States from latitude 39° to the Gulf of Mexico, and forms an attractive feature in garden shrubbery. In the southern States it is known as old-man's-beard.

Fringed Dragon, one of the names of the Australian lizards of the genus *Chlamydosaurus*, characterized by an erectile neck-ruff. See FRILL-LIZARD.

Fringillidæ, frĭn-jĭl'ĭ-dē, the finch and sparrow family, an extensive group of oscine birds, regarded as the most highly organized of all birds. The old name *Fringilla*, applied by Linnæus to the whole group, is retained only for the typical genus, represented by the chaffinch (q.v.). All the fringillines are small, compact and active, without eccentricity of form or plumage, and with organs adapted to an omnivorous diet, although seeds form the principal part of the fare. The bill is usually stout and cone-shaped, varying from a greatly swollen size in some of the grosbeaks to the slenderness of that of the goldfinch. The legs are short, and scutellate; the feet strong; and the wings and tail do not vary much from normal, but the wing has a minute outer primary. The plumage is varied, and in many genera the sexes are unlike. These birds mainly frequent fields, roadsides, and woodlands; and build their nests (often elaborate structures) in trees, in bushes or on the ground — never in burrows, or tree-holes, or composed of mud. Their eggs are usually five in number, and usually are spotted. The family includes extremely good singers, and furnishes us not only the canary but many other of the most popular cage-birds; also many whose flesh is considered a delicacy. The group is divided into scores of genera and contains hundreds of species, which predominate in the northern latitudes of the Old World, where many are resident throughout the year; but they also abound in all other parts of the world except Australia. See Evans 'Birds' (1900), and for America the exhaustive monograph by Ridgway in his 'Birds of North and Middle America,' Part I. (1901). See BUNTING, FINCH, GROSBEAK, LINNET, REDPOLL, SPARROW, and names of various species.

Frisian, or **Friesian**, the term applied to a native and to the language of Friesland. The Frisians are descended from a German tribe, who, at the beginning of the Christian era, occupied the territory between the mouths of the Rhine and the Ems, in the modern provinces of Groningen and Friesland. They became tributaries of Rome under Drusus, and lived for some time on friendly terms with their conquerors, but were driven to hostilities by oppression. They were partially subdued in 47 A.D., and rebelled again with the Batavians under Civilis. In the 5th century a host of Frisians joined the Angles and Saxons in invading Britain. About the end of the 7th century the Frisians in the southwest were subdued by the Franks under Pépin d'Héristal, who compelled them to accept Christianity. A century later the eastern branch of the tribe was conquered and Christianized by Charlemagne. Their country was divided into three districts, two of which were annexed on the division of the Carlovingian Empire to the possessions of Louis the German, and the other to those of Charles the Bald. The latter part was called West Frisia (West Friesland), and the two former East Friesia (East Friesland). The distinctive national features were gradually lost by assimilation with their neighbors, and their modern history is chiefly connected with Holland and Hanover.

The *Frisian Language*, a Low German dialect, holds in some respects an intermediate position between Anglo-Saxon and Old Norse. Of all the Teutonic dialects it is the most nearly related to English. Its ancient form exists in some remarkable collections of laws, of which each Gau or district had its own set written in its own language. The Asegabuch (dating from 1200) was a series of laws valid for all Friesland. An almost complete collection of those laws is to be found in Richthofen's 'Friesische Rechtsquellen' (1840). The modern Frisian is mostly confined to the peasantry. It is broken up into three dialects; the North Frisian on the west coast of Schleswig, its islands, and Helgoland; the Batavian comprising the common West Frisian, and those of Mulkweren and of Hindelopen; and the Westphalian, whose vari-

etics are the East Frisian and those of Rustringen, Wursten, and Saterland, each of which is more or less unintelligible beyond the narrow district in which it is spoken. Among specimens of Frisian literature are, 'Waatze Gribberts Brilloft,' a comedy (1712); 'It Libben fen Aagtje Ysbrants,' a novel (1779); the writings of Japicx, Althuysen, the brothers Halbertsma, Dijkstra, Troelstra, and others. Consult: Grimm's 'Deutsche Grammatik'; the 'Altfries'; 'Wörterbuch' of Richthofen; Doornkaat Koolman's 'Wörterbuch der Ostfriesischen Sprache'; Van Helten's 'Altostfriesische Grammatik'; Hewett's 'Frisian Language and Literature.'

Frit. See FRITTING FURNACE; GLASS.

Frith, William Powell, English painter: b. Studley, near Ripon, 9 Jan. 1819. Since 1840, when he exhibited 'Malvolio before Olivia' at the Royal Academy, he has produced a great number of scenes from Shakespeare, Molière, Dickens, Sterne, Goldsmith, etc., besides his immensely popular pictures, 'Coming of Age in the Olden Time' (1849); 'Life at the Sea-Side' (1854); 'The Derby Day' (1858); 'The Railway Station' (1862); 'Before Dinner at Boswell's Lodgings' (1868 — sold in 1875 for £4,567); 'The Private View at the Royal Academy' (1881), etc. He was commissioned by the queen to paint the marriage of the Prince of Wales. He was elected R.A. in 1852, and is a member of several foreign academies. His works do not exhibit the highest qualities of art, but, possibly in part because of this, they have been extremely popular. Large engravings have been produced from a number of his pictures. In 1887–8 he published his autobiography.

Fritillary, in botany, a plant of the genus *Fritillaria,* of the lily family, found in the North Temperate and Arctic zones. The plants are herbaceous, the leaves simple, alternate, though sometimes appearing opposite or verticillate; the flowers terminal and pendent; the perianth campanulate, of six petals; the stamens six; the style trifid. About a dozen species are known, several of which are cultivated in gardens, being hardy and highly ornamental plants. The *F. imperialis,* or crown imperial, supposed to be a native of Persia, has large orange or yellow flowers nodding beneath a terminal tuft of leaves. The bulb is poisonous, as is that of *F. meleagris,* though in a less degree.

Fritting Furnace, in glass-making, a reverberatory furnace in which the materials for making glass are calcined (fritted) as a process preliminary to melting. The object is to effect a partial union of the salicylic acid and alkali, to avoid volatilization in the latter in the subsequent vitrification. The materials (sand, chalk, soda-ash, and cullet) being introduced into the furnace, the temperature is gradually raised for three hours. The pasty mixture is stirred, and the temperature increased to incipient fusion. The frit is then raked out and transferred to the melting pot, or is placed in cast-iron trays, cut into blocks with a spade, and stored away as frit bricks. See GLASS.

Fritz, John, American iron and steel expert: b. Londonderry, Pa., 1822. He was at first a machinist in shops at Parkersburg and Norristown, and subsequently was a constructor of rolling-mills, acquiring in the latter capacity an authoritative knowledge of iron and steel manufacture. He equipped the Bethlehem iron and steel works, and was for many years manager of that well-known establishment. Many methods of manufacture now in general use were employed by Fritz among the first in this country, including the Bessemer process. Several manufacturers and scientists established in 1902 the award of the Fritz medal to be given for discovery in the fields of science.

Friuli, frē'oo-lē, **Italy,** a formerly independent duchy, consisting, in its widest extent, of the modern Italian province of Udine, the Austrian county of Görz and Gradiska, and the circle of Idria. It was one of the most important duchies of the Longobard Kingdom, and after the overthrow of that monarchy by Charlemagne, and even up to the 15th century, when it was conquered by Venice and its territories dismembered, it retained a considerable degree of independence. The inhabitants, called Furlani, are Italian for the most part, but speak a peculiar dialect, into which a strong Celtic element has been introduced. See ITALY.

Frobisher Bay, an Arctic inlet opening westward near the mouth of Davis Strait, at the southern end of Baffin Land. It is about 200 miles long by above 20 wide, with rugged mountainous shores. It was till Hall's voyage called Frobisher Strait, being erroneously regarded as a passage into Hudson Bay.

Froebel, Friedrich Wilhelm August, frēd'rĭH vĭl'hĕlm ow'goost frē'bĕl, German educationist: b. Oberweissbach, Thuringia, 21 April 1782; d. Marienthal 21 June 1852. It was Froebel who said, "The clearer the thread that runs through our lives backward to our childhood, the clearer will be our onward glance to the goal"; and in the fragment of autobiography he has left us, he illustrates forcibly the truth of his own saying. The motherless baby who plays alone in the village pastor's quiet house, the dreamy child who wanders solitary in the high-walled garden; the thoughtful lad, neglected, misunderstood, who forgets the harsh realities of life in pondering the mysteries of the flowers, the contradictions of existence, and the dogmas of orthodox theology; who decides in early boyhood that the pleasures of the senses are without enduring influence and therefore on no account to be eagerly pursued; — these presentments of himself, which he summons up for us from the past, show the vividness of his early recollections and indicate the course which the stream of his life is to run.

The coldness and injustice of the new mother who assumed control of the household when he was 4 years old, his isolation from other children, the merely casual notice he received from the busy father absorbed in his parish work, all tended to turn inward the tide of his mental and spiritual life. He studied himself, not only because it was the bent of his nature, but because he lacked outside objects of interest; and to this early habit of introspection we owe many of the valuable features of his educational philosophy. Whoever has learned thoroughly to understand one child, has conquered a spot of firm ground on which to rest while he studies the world of children; and because the great teacher realized this truth, because he longed to give to others the means of development denied him, he turns for us the heart-leaves of his boyhood.

It would appear that Froebel's characteristics were strongly marked and unusual from the beginning. Called by every one "a moon-struck child" in Oberweissbach, the village of his birth, he was just as unanimously considered "an old fool," when, crowned with the experience of 70 years, he played with the village children on the green hills of Thuringia. The intensity of his inward life, the white heat of his convictions, his absolute blindness to any selfish idea or aim, his enthusiasm, the exaltation of his spiritual nature, all furnish so many cogent reasons why the people of any day or of any community should have failed to understand him, and scorned what they could not comprehend. It is the old story of the seers and the prophets repeated as many times as they appear; for "these colossal souls," as Emerson said, "require a long focal distance to be seen."

At 10 years old the sensitive boy was fortunately removed from the uncongenial atmosphere of the parental household; and in his uncle's home he spent five free and happy years, being apprenticed at the end of this time to a forester in his native Thuringian woods. Then followed a year's course in the University of Jena, and four years spent in the study of farming, in clerical work of various kinds, and in land-surveying. All these employments, however, Froebel himself felt to be merely provisional; for like the hazel wand in the diviner's hand, his instinct was blindly seeking through these many restless years the well-spring of his life.

In Frankfort, where he had gone intending to study architecture, Destiny touched him on the shoulder, and he turned and knew her. Through a curious combination of circumstances he gained employment in Herr Gruner's Model School, and it was found at once that he was what the Germans love to call "a teacher by the grace of God." The first time he met his class of boys he tells us that he felt inexpressibly happy; the hazel wand had found the waters and was fixed at last. From this time on, all the events of his life were connected with his experience as a teacher. Impelled as soon as he had begun his work by a desire for more effective methods, he visited Yverdon, then the centre of educational thought, and studied with Pestalozzi. He went again in 1808, accompanied by three pupils, and spent two years there, alternately studying and teaching.

There was a year of lectures at Göttingen after this, and one at the University of Berlin, accompanied by unceasing study and research both in literary and scientific lines; but in the fateful year 1813 this quiet student life was broken in upon, for impelled by strong moral conviction, Froebel joined Baron von Lützow's famous volunteer corps, formed to harass the French by constant skirmishes and to encourage the smaller German States to rise against Napoleon.

No thirst for glory prompted this action, but a lofty conception of the office of the educator. How could any young man capable of bearing arms, Froebel says, become a teacher of children whose Fatherland he had refused to defend? how could he in after years incite his pupils to do something noble, something calling for sacrifice and unselfishness, without exposing himself to their derision and contempt? The reasoning was perfect, and he made practice follow upon the heels of theory as closely as he had always done since he became master of his fate.

After the Peace of Paris he settled down for a time to a quiet life in the mineralogical museum at the University of Berlin, his duties being the care, arrangement, and investigation of crystals. Surrounded thus by the exquisite formations whose development according to law is so perfect, whose obedience to the promptings of an inward ideal so complete, he could not but learn from their unconscious ethics to look into the depths of his own nature, and there recognize more clearly the purpose it was intended to work out.

In 1816 he quietly gave up his position, and taking as pupils five of his nephews, three of whom were fatherless, he entered upon his life work, the first step in which was the carrying out of his plan for a "Universal German Educational Institute." He was without money, of course, as he had always been and always would be,— his hands were made for giving not for getting; he slept in a barn on a wisp of straw while arranging for his first school at Griesheim; but outward things were so little real to him in comparison with the life of the spirit, that bodily privations seemed scarcely worth considering. The school at Keilhau, to which he soon removed, the institutions later established in Wartensee and Willisau, the orphanage in Burgdorf, all were most successful educationally, but, it is hardly necessary to say, were never a source of profit to their head and founder.

Through the twenty succeeding years, busy as he was in teaching, in lecturing, in writing, he was constantly shadowed by dissatisfaction with the foundation upon which he was building. A nebulous idea for the betterment of things was floating before him; but it was not until 1836 that it appeared to his eyes as a "definite truth." This definite truth, the discovery of his old age, was of course the kindergarten; and from this time until the end, all other work was laid aside, and his entire strength given to the consummate flower of his educational thought.

The first kindergarten was opened in 1837 at Blankenburg (where a memorial school is now conducted), and in 1850 the institution at Marienthal for the training of kindergartners was founded, Froebel remaining at its head until his death two years after.

With the exception of that remarkable book 'The Education of Man' (1826), his most important literary work was done after 1836; 'Pedagogics of the Kindergarten,' the first great European contribution to the subject of child-study, appearing from 1837 to 1840 in the form of separate essays, and the 'Mutter-und-Kose Lieder' (Mother-Play) in 1843. Many of his educational aphorisms and occasional speeches were preserved by his great disciple the Baroness von Marenholtz-Bülow in her 'Reminiscences of Froebel'; and though two most interesting volumes of his correspondence have been published, there remain a number of letters, as well as essays and educational sketches, not yet rendered into English.

Froebel's literary style is often stiff and involved, its phrases somewhat labored, and its substance exceedingly difficult to translate with spirit and fidelity; yet after all, his mannerisms are of a kind to which one easily becomes accustomed, and the kernel of his thought when

reached is found well worth the trouble of removing a layer of husk. He had always an infinitude of things to say, and they were all things of purpose and of meaning; but in writing, as well as in formal speaking, the language to clothe the thought came to him slowly and with difficulty. Yet it appears that in friendly private intercourse he spoke fluently, and one of his students reports that in his classes he was often "overpowering and sublime, the stream of his words pouring forth like fiery rain."

Froebel's educational creed cannot here be cited at length, but some of its fundamental articles are:

The education of the child should begin with its birth, and should be threefold, addressing the mental, spiritual, and physical natures.

It should be continued as it has begun, by appealing to the heart and the emotions as the starting-point of the human soul.

There should be sequence, orderly progression, and one continuous purpose throughout the entire scheme of education, from kindergarten to university.

Education should be conducted according to nature, and should be a free, spontaneous growth,— a development from within, never a prescription from without.

The training of the child should be conducted by means of the activities, needs, desires, and delights, which are the common heritage of childhood.

The child should be led from the beginning to feel that one life thrills through every manifestation of the universe, and that he is a part of all that is.

The object of education is the development of the human being in the totality of his powers as a child of nature, a child of man, and a child of God.

These principles of Froebel's, many of them the products of his own mind, others the pure gold of educational currency upon which he has but stamped his own image, are so true and so far-reaching that they have already begun to modify all education and are destined to work greater magic in the future. The great teacher's place in history may be determined, by-and-by, more by the wonderful uplift and impetus he gave to the whole educational world, than by the particular system of child-culture in connection with which he is best known to-day.

Judged by ordinary worldly standards, his life was an unsuccessful one, full of trials and privations, and empty of reward. His death-blow was doubtless struck by the prohibition of kindergartens in Prussia in 1851, an edict which remained nine years in force. His strength had been too sorely tried to resist this final crushing misfortune, and he passed away the following year. His body was borne to the grave through a heavy storm of wind and rain that seemed to symbolize the vicissitudes of his earthly days, while as a forecast of the future the sun shone out at the last moment, and the train of mourners looked back to see the low mound irradiated with glory.

In Thuringia, where the great child-lover was born, the kindergartens, his best memorials, cluster thickly now; and on the face of the cliffs that overhang the bridle-path across the Glockner Mountain may be seen in great letters the single word *Froebel*, hewn deep into the solid rock. Consult: von Marenholtz-Bülow, 'Reminiscences of Friedrich Froebel'; Barnard, 'Papers on Froebel's Kindergarten' (1881); Hauschmann, 'Froebel's Kindergarten System'; Bowen, 'Froebel' (1897); Quick, 'Educational Reformers.' NORA ARCHIBALD SMITH.

Frog. This familiar animal is the type of the anurous *Amphibia* (order *Anura*). The family *Ranidæ*, to which it belongs, is characterized by having the skin smooth, the hind legs long, and the feet usually completely webbed; teeth are present in the upper jaw and palate, seldom in the lower jaw. The tympanic membrane is situated behind the eyes, and is not concealed. The nostrils are placed at the extremity of the rounded muzzle just above its margin, and open directly into the mouth. When the mouth is filled with air the nostrils are closed, and the animal swallows the bolus of air into the sacculate lungs, there being, in the absence of ribs, no provision for such respiratory movements as take place in the chest of mammals. Frogs are thus air breathers, but they are capable of remaining for a considerable time under water. They swim with great vigor, and on land progress by a series of violent leaps, the long hind limbs being powerful levers. Their food is chiefly insects, which they capture by means of the tongue: this organ is covered with a viscid secretion and is attached in front, its free border being behind; it is rapidly projected from the mouth, the insect adheres to it, and is at once swallowed. The frog does not drink, but its soft skin absorbs fluids rapidly, and thus has a double function both of nutrition and as an aid to respiration. As the frog grows the old outer skin cracks from time to time, and is pulled off and swallowed. The animal retires in winter to the bottom of ponds, from which clusters of frogs may be drawn buried in mud. This hibernation, which is associated with low vital energy, ends in February; in March the spawn is deposited in gelatinous masses of many hundreds of eggs, the males riding for a long period at that season on the backs of the females, and fertilizing the eggs as fast as they are extruded. The eggs soon manifest change, and after a time the young escapes as a "tadpole," a larval animal with short body, circular suctorial mouth, and long tail, compressed from side to side. Gills project on either side of the head from a cleft which answers in position to the gill opening of fishes. The hind limbs first appear as buds, later the fore limbs project, the gills disappear, the lungs becoming more fully developed; the tail gradually shrinks and disappears, and the animal, which was at first fish-like, then closely resembled a newt (or urodele amphibian), finally assumes the adult or anurous form. This is a true process of metamorphosis as complete as that of the butterfly; since there is a change not merely of form and proportion, but also of internal organs. The frog is highest among *Amphibia*, and the successive stages of its development resemble each the adult form of a lower group in its line of ancestry.

Frogs, themselves useful in clearing gardens of slugs and insects, are in turn the prey of birds, especially herons and aquatic birds, of serpents, and fish, the latter destroying large quantities of the spawn. Though exposed to droughts, they can bury themselves in the moist

soil and thus live after the ponds are dried up. Though thus tenacious of life, the stories of frogs being found in stone and in trees are for the most part founded on imperfectly noted facts, though it is possible that a frog may now and then get closed into a cavity for which, after entering, it had grown too large; but an aperture must always be present by which water can get access to them. Their fossil history goes back to the early Tertiary days, and probably will be found to extend farther, as Eocene examples differ little from modern forms. See AMPHIBIA.

It is by no means easy to define the word «frog» in classification, as distinguished from «toad» (q.v.), and the safest method here will be to deal only with the aquatic family *Ranidæ*, already defined, accepted as the most highly developed of amphibians. It contains about 280 species and is represented in every part of the world not too cold except southern South America and Australia, where all the so-called frogs belong to a related family, the *Cystignathidæ*, whose members, especially of the sub-family *Cystignathinæ*, may be said to represent the *Ranidæ* in Notogæa. «Some of them,» says Gadow, «can be distinguished from the true, typical frogs solely by the arciferous type of the shoulder-girdle and sternum.

The type-genus *Rana* contains more than half the known species, and is scattered all over the northern hemisphere, but is absent from the southern. It is to this genus that the common frogs of Europe and the United States belong — the bull-frog, spring-frog, European grass-frog, etc. The American bull-frog (*R. catesbiana*) is the largest of the whole tribe, occasionally reaching a length of eight inches; and its muffled grunting cry may be heard a mile or more over the water. It is greenish bright upon the head and mottled elsewhere, while the legs are distinctly blotched. This species abounds in all sluggish waters from Kansas eastward, laying its eggs in long strings, and its tadpoles require two years to reach maturity. It is bold and voracious, catching fish, salamanders, other frogs and even ducklings. Its size and the chicken-like daintiness of the flesh in its hind legs, or «saddle,» make it the favorite frog for market, and great quantities are eaten in all parts of the country. In the springs, swamps and ditches lives the green frog (*R. clamata*), not half as big, but very similar in color except that it is yellowish or white below. Another green aquatic frog, still smaller, is the leopard frog (*R. virescens*), whose bright coat is marked with irregular blotches of black edged with whitish, in two rows along the back, and the legs are barred. This species is numerous everywhere as far west as the Sierra Nevada. Another checkered frog, confined to the Eastern States, is the pickerel frog (*R. palustris*), which is light-brown with two rows of large oblong square blotches of dark brown on the back, and one or two on the sides. The head is short, and a dark line extends from the nostril to the eye, while the upper jaw is white, spotted with black spots. Another well-known little kind is the wood-frog (*R. sylvatica*), which goes to the water to breed in early spring, but during most of the year lives in the dry woods. It is a variable reddish brown, with the side of the head marked with a dark brown band. Several other less conspicuous species of frog inhabit North America, including a few representatives of another family (*Engystomidæ*), besides the tree-frogs, elsewhere described.

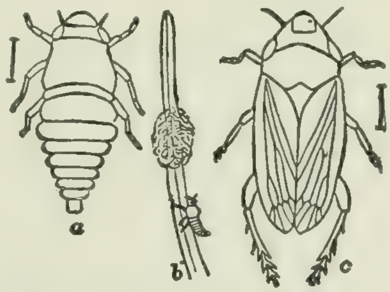
For frogs generally consult Gadow's 'Amphibia and Reptiles' (1901); for those of the United States the writings of Holbrook, C. C. Abbott, O. P. Hay, A. W. Butler, and especially 'North American Batrachia,' by E. D. Cope. See also AMPHIBIA; METACHROSIS.

Frog-mouths, a group of large Australian and Indian nightjars constituting the sub-family *Podarginæ* and remarkable for their huge mouths. The Australian More-pork (q.v.) is an example.

Frog-shell, a small mollusk of the *Triton* family (genus *Ranella*), so called because of its shape and mottled colors.

Frogfish, any of several sea-fishes of low organization, toad-like forms and carnivorous habits, constituting the family *Antennariidæ*, and related to the goosefish (q.v.), itself sometimes called «fishing frog.»

Froghoppers, or **Froth-flies,** minute plant-feeding homopterous bugs of the family *Cercopidæ*, which dwell upon plants and may, when very numerous, seriously damage grass-crops. The eggs are laid on the stems of plants in the autumn, and survive in the winter. When the embryos hatch (and these resemble the parents,



a, immature young (enlarged); *b*, froth about eggs, and young froghopper, natural size; *c*, adult (enlarged).

but are wingless) they exude a viscid liquid which is whipped into froth, called in England «cuckoo-spit,» by the thrashing of the «tail,» an anal appendage probably respiratory in function. The «spittle» is supposed to be a protective disguise, nevertheless the immature insects are preyed upon by wasps, etc. These bugs are called «froghoppers» in double allusion to the froth about their eggs and to their great leaping powers.

Froh'man, Charles, American theatrical manager: b. Sandusky, Ohio, 1858. Having managed several road companies, he took charge of the Empire Theatre, New York, in 1893, and in 1895–6 organized the syndicate which exercises so large a monopoly in American theatrical affairs.

Frohman, Daniel, American theatrical manager: b. Sandusky, Ohio, 1853. He began business life with five years in newspaper offices; he subsequently became manager of a traveling theatrical company, since which he has successfully managed several New York theatres, as well as English and American stars and theatrical companies. He is at present manager of the

Lyceum Theatre, Daly's Theatre, and the Daniel Frohman Stock Company.

Froissart, Jean, zhŏṅ frä-swä or froi'särt, French chronicler: b. Valenciennes, Hainault, 1333; d. Chimay 1419. He began at 20 to write the history of the wars of the time and made several journeys to examine the theatre of the events he was about to relate. His 'Chronicle' (as the title is usually abbreviated) covering the years 1326–1400, is of capital importance for its period. To a collection of the verses of Wenceslaus of Brabant, Froissart added some of his own, and gave to the whole the title 'Meliador, or the Knight of the Golden Sun.' All his extant poems were published at Brussels (1870–2). His chronicles form a work of permanent value, because of their accurate and impartial account of important events of the 14th century, and of the vivid pictures which they contain of the life of an age so strikingly different from our own. They narrate events connected with France, England, Scotland, Spain, Brittany, etc. See Darmesteter, 'Froissart' (1894).

Fromentin, Eugène, ė-zhān frō-mŏṅ-tăṅ, French painter: b. La Rochelle 24 Oct. 1820; d. St. Maurice, near La Rochelle, 27 Aug. 1876. He began life as a law student, but early turned his attention to landscape painting, working in the studio of Louis Sabat. In 1842 he traveled in Algeria, and it was after this journey that under the guidance of Marilhat, the painter of Oriental scenes, he resolved to work a new vein in the same department by painting the North African deserts. In 1847 he exhibited at the Salon for the first time and visited Algeria twice (1848–52). The fruits of these wanderings were not only numerous pictures, but also two literary works descriptive of his travels. These were: 'A Summer in the Sahara' (1856), and 'A Year in the Sahel' (1858), works distinguished by powerful and richly colored style, and poetic imagination. As a painter his aim was to depict the light and atmosphere of the desert with truth and delicacy, yet imparting to it his own subjective interpretation, and he showed a marked taste for studies in gray and violet. The masterly analysis of ancient painting, which appears in his 'Masters of a Former Day' (1876), embodies the results of his travels in Holland and Belgium (1875), where he made a careful study of the Dutch and Flemish masters.

Frommel, frō'mĕl, **Emil,** German theologian: b. Karlsruhe 5 Jan. 1828. He was an army chaplain, and published several theological works of importance. 'Tales For the People' (1873–86), and similar collections of humorous and realistic compositions, will more surely form his memorials in the future.

Fronde, frŏnd (Fr. frôṅd), the name of a political faction which played a conspicuous part in French history during the minority of Louis XIV., and gave rise to the insurrectionary movement known historically as the War of the Fronde. The members of this party obtained the contemptuous name of Frondeurs (slingers), being compared to boys throwing stones from slings, owing to the pertinacious lampoon warfare which they waged against the powerful minister of that day, Cardinal Mazarin, and the Queen Regent, Anne of Austria. Mazarin, as a foreigner and a parvenu, was detested by the French people — both patrician and proletarian — and especially had incurred the opposition of the Parliament of Paris to his measures. In 1648 Mazarin ventured on the bold step of arresting two of the most popular members of the latter body, and on the next day 27 August (*la journée des barricades*) the Parisians rose in arms, dispersed some of the royal troops sent out against them, and barricaded the approaches to the Louvre, compelling the court party to retire to St. Germain, thus leaving Paris in the hands of the insurgents. Upon the Prince de Condé advancing to besiege the capital, the parliament called the citizens to arms, when the Prince de Conti, the Duc de Beaufort, ("Le Roi des Halles," and son of Henry IV.), and numerous others of the great nobles of the kingdom, came forward to head the insurrection. The famous Cardinal de Retz and the Duchesses de Longueville and de Montbazon also joined the popular cause. The Prince de Condé, too, changed sides and went over to the malcontents, with whom the court party shortly afterward patched up a treaty of peace of but brief duration. Fresh contentions arose, and Mazarin caused the arrest of Condé and Conti. This step excited a revolt in the provinces, and Marshal Turenne hastened to the rescue of the Frondeur princes, but was routed in the battle of Rethel (1650). The cardinal, however, enjoyed but a temporary supremacy; the parliament again agitated against him, and procured his banishment from France, leaving the Prince de Condé master of the situation. Subsequently, the contest degenerated into a war of intrigue and is regarded as one of the most useless conflicts ever waged. The court finally agreeing to dismiss Mazarin a general amnesty was proclaimed. Condé attempted to continue the struggle, but was proscribed, and entered the service of Spain, while Mazarin, after a time, returned to Paris, and again obtained the reins of government.

Front Royal, Engagement at. Front Royal, Va., is 12 miles east of Strasburg, and is the key to Luray Valley. On 23 May 1862 it was held by Col. Kenly with 9 companies of the 1st Maryland infantry, 2 companies of the 29th Pennsylvania, a company of the 28th New York, and a section of Knap's battery, under command of Lieut. Atwell, in all about 900 men. Soon after noon of the 23d "Stonewall" Jackson, moving down the Luray Valley to cut off Bank's retreat from Strasburg to Winchester, pushed through the town, driving in Kenly's pickets and advance-guard. Kenly made a stand on a ridge about a mile north of the town, where he was joined by about 100 men of the 5th New York cavalry, but was soon flanked and pushed across both branches of the Shenandoah, and failed to burn the bridges behind him. When across the river he drew up on its north bank and, with artillery and musketry, resisted for some time all efforts to cross; but Jackson's cavalry forded the stream, both above and below the bridges, thus flanking his position, and Kenly fell back toward the cross-road leading to Middletown, closely followed by Confederate cavalry. He had gone four miles when his cavalry rear-guard was stampeded, and his infantry fiercely attacked, the resistance continuing until his force was cut to pieces and captured, with Atwell's two guns and the entire supply-train. Nearly all the New York cavalry escaped. The Union loss

was 18 killed, 56 wounded, and 718 captured; the Confederate loss was 11 killed and 15 wounded. Jackson pushed on after Banks, leaving Col. Conner with the 12th Georgia and a battery at Front Royal. On the 30th the 1st Rhode Island cavalry, the advance of McDowell's corps, dashed into the town, surprised Conner, and captured 156 officers and men and one gun, the loss in the cavalry being 8 killed and 5 wounded.

E. A. Carman.

Frontaura, frōn-tow'rä, **Carlos,** Spanish author: b. Madrid, Spain, 4 Sept. 1834. He published: 'The Philanthropist,' a comedy; 'Fortunes and Misfortunes of Rosita,' a novel.

Frontenac, Louis de Buade, loo-ē dė boo-äd frônt'näk, Comte de, French colonial officer: b. France 1620; d. Quebec 28 Nov. 1698. He entered the army in 1635, and at an early age became brigadier. In 1672 he was appointed governor of the French possessions in North America, to be recalled 10 years later, in consequence of endless quarrels with his intendant and the Jesuits. In spite of his violent temper he gained the confidence of the settlers and the respect of the Indians, and in 1689, when to the horror of constant attacks from the Iroquois the misery of a war with England was added, he was again sent out by the king, as the only man who could rouse the colonists to hope and action. During the next nine years he loosed his savage allies on the defenseless villages of New England, repulsed a British attack on Quebec, and so broke the power of the Iroquois that they were never again a terror to the colony. See Parkman, 'Frontenac and New France Under Louis XIV.' (1877); Winsor, 'Cartier to Frontenac' (1894).

Frontier Posts. See Northwest Territory.

Frontinus, frŏn tī'nŭs, **Sextus Julius,** Roman writer, who flourished in the second half of the 1st century after Christ. He was thrice consul, and commanded with reputation in Britain, under Vespasian. He was appointed by Nerva to superintend the aqueducts of Rome, and left an extant work on this subject, 'De Aquis Urbis Romæ,' as well as one dealing with the art of war, 'Strategemata.'

Fron'to, Marcus Cornelius, Roman orator and rhetorician: b. Cirta, a Roman colony in Numidia, about 100 A.D.; d. about 175. He went to Rome during the reign of Hadrian, soon acquired great fame as a speaker and teacher of rhetoric, and was in consequence selected as tutor to M. Annius Verus and L. Commodus, afterward emperors under the names Marcus Aurelius and Lucius Verus. He became a member of the senate, and was a consul in 143 A.D. Till 1814 the only extant writings of Fronto were a worthless tract, 'De Differentiis Vocabulorum' and some fragments; but in that year Angelo Mai recovered many of Fronto's letters from a palimpsest in the Ambrosian library at Milan. These were part of the orator's correspondence with Antoninus Pius, Marcus Aurelius, Lucius Verus, and other distinguished friends, and were published under Mai's editorship in 1815. In 1823 Mai published a new edition of the letters, containing many others which he had discovered in the Vatican library, but the standard edition is that of Naber (Leipsic 1867).

Frost, William Goodell, American educator: b. Le Roy, N. Y., 2 July 1854. He was graduated at Oberlin College in 1876, and afterward studied at Harvard and Göttingen, Germany. He was appointed professor of Greek in Oberlin College in 1879, and president of Berea College 1893. He has published: 'Inductive Studies in Oratory'; 'Greek Primer.'

Frost, the moisture in the atmosphere crystallized or congealed by the cold, upon the earth's surface, or upon various objects and surfaces situated or existing upon it, as grasses, shrubs, trees, window panes, etc. The various phenomena of hoar frost, window frost, etc., grouped under this head, occur over a large portion of the land surface of the earth. In the United States, hoar frosts often occur during the spring and autumn months, over the whole northern portion of the country, and more rarely also in the Southern States, sometimes causing much damage by freezing and injuring the young corn sprouts and early fruits and vegetables. Frosts occur only during calm, cold nights when the temperature falls below 32° F. In the United States the meteorological conditions usually preceding the formation of frosts are northerly winds, accompanied by high barometer, and especially the coincidence of these conditions with the near approach, or passing, of a storm from the west or southwest. The formation of hoar frost depends in some degree upon surface topography and local causes, occurring much more frequently within the deep valleys leading down from mountain heights, than in broader valleys or level regions. In the former, during calm cold nights, the cold air of the hill and mountain tops, by virtue of its greater specific gravity, flows down and mixes with, or flows underneath and replaces, the warmer, lighter air of the valleys, thus furnishing the conditions favorable to frost formation. The cooling of objects by radiation of heat, and by the evaporation of moisture from them, greatly facilitates the formation of frost. Frost crystallizations exhibit a wonderful variety, both of form and structure. The formation of each of the various types seems to depend upon a great number of meteorological and other conditions, some of them obscure. The temperature of the air, its electric condition, humidity, etc., and also the nature of the substances upon which they form, each seem to exert an influence in determining and modifying their form and structure. Two principal types of hoar frost occur,— the columnar, and the tabular. Commonly, both varieties do not occur simultaneously, but on a given night one or the other type will greatly predominate and form the bulk of the crystals. Frost crystallizations in general greatly resemble those of snow, but because their development is usually restricted in one or more directions by the objects or surfaces upon which they form, the resemblance is segmentary, rather than complete. In general, columnar forms vary from similar snow crystallizations, by virtue of their hollow cylindrical, or cup-like character, and by often attaining to much greater dimensions. Sometimes, during extreme cold, such forms attain a length of many inches. Tabular forms rarely attain perfect symmetry, but exhibit within them air tubes and inclusions, assume crystal forms possessing both close and open structure, and develop upon the

same extremely thin plane as do similar snow crystals. As commonly deposited in spring or autumn, they do not usually greatly exceed in size similar snow forms, but during intense and prolonged cold, as in winter, they attain much greater dimensions. A very beautiful effect is sometimes produced by the deposition upon the trees, shrubs, etc., of a heavy coat of hoar frost. Each limb and leaf and delicate twig is transformed and beautified, and presents a white appearance, as though frosted with silver. During zero weather, large and delicately formed branching tabular crystals, and long, icy needles, form in beautiful pendent clusters upon, and depend from, the rafters and timbers of barns, etc., close to where domestic animals are kept; and also upon ferns and similar plants overhanging icy terraces or ice-covered pools. Similar forms also form directly upon or project from icy surfaces. Even the clouds furnish their quota of frost crystallizations. When low-lying clouds enshroud mountain tops covered by forests, they often deposit a portion of their moisture upon the branches of the trees, commonly in the form of long, granular or fibrous needle-shaped crystals. Fogs, when they occur during hoar frost formation, usually deposit moisture upon the forming crystals in granular form. The most beautiful and varied frost crystallizations are those that form upon the window panes of dwelling houses, etc., in arctic or temperate zones. These fairy-like creations, seemingly in imitation of leaves, feathers, ferns, trees, starry firmaments, tropical forest effects, etc., occur as three distinct entities: the granular, the crystalline, and the membraneous. The latter variety forms only in heated rooms, upon window panes covered with an uncongealed film of water, as a dew-like condensation of moisture. It occurs most frequently in the form of long, curving, feather-like forms, or as an exceedingly delicate membranaceous-like network of diverging and coalescing lines. It is due to a process of crystallization that takes place during the conversion of a film of water into ice. The crystalline variety of window frost forms only upon window panes that are free from water in liquid form. Crystals of this class assume branching, star-like forms (often as four- or six-pointed branching stars), curving filaments, fibrous crystallizations, and those resembling sea-moss, long serrated lines, etc. Many of these are very beautiful and interesting. Some of them develop within minute striations in the surface of the glass and will reappear in the same identical positions upon a given pane, with each renewal. When identical meteorological and other conditions recur again and again, the types of frost coexistent with each will, in general, recur simultaneously with them. During zero weather, if conditions are favorable, the formation and growth of these beautiful frost creations takes place very rapidly. A beautiful and absorbingly interesting experiment consists in melting a heavy coat of window frost off a portion of a window pane (by placing an oil lamp close to it). Only the central portion of the pane should be cleared of all moisture; around this a film of water should be left upon the glass. Soon after the lamp is removed the feather-like membraneous frost will form around the outer edges of the film of water, and quickly radiate in beautiful curves toward the centre of the pane. They stop instantly when they reach the clear glass. Soon minute and delicate serrated crystal lines, or tiny crystal stars, appear upon the clear glass space, and slowly develop, and usually coexistent with them, a thin film of granular texture will be laid down upon portions of the clear glass. The latter is not usually deposited in slow progressive order, but in intermittent order. Large spaces of the clear glass are often covered simultaneously, by a succession of auroral-like flashes; each flash, in the twinkling of an eye, spreading a thin granular film upon unoccupied portions of the glass. Singularly enough, the granular deposit does not form near where the true crystalline frost is, the latter repels the former and prevents its formation upon the spaces immediately surrounding it.

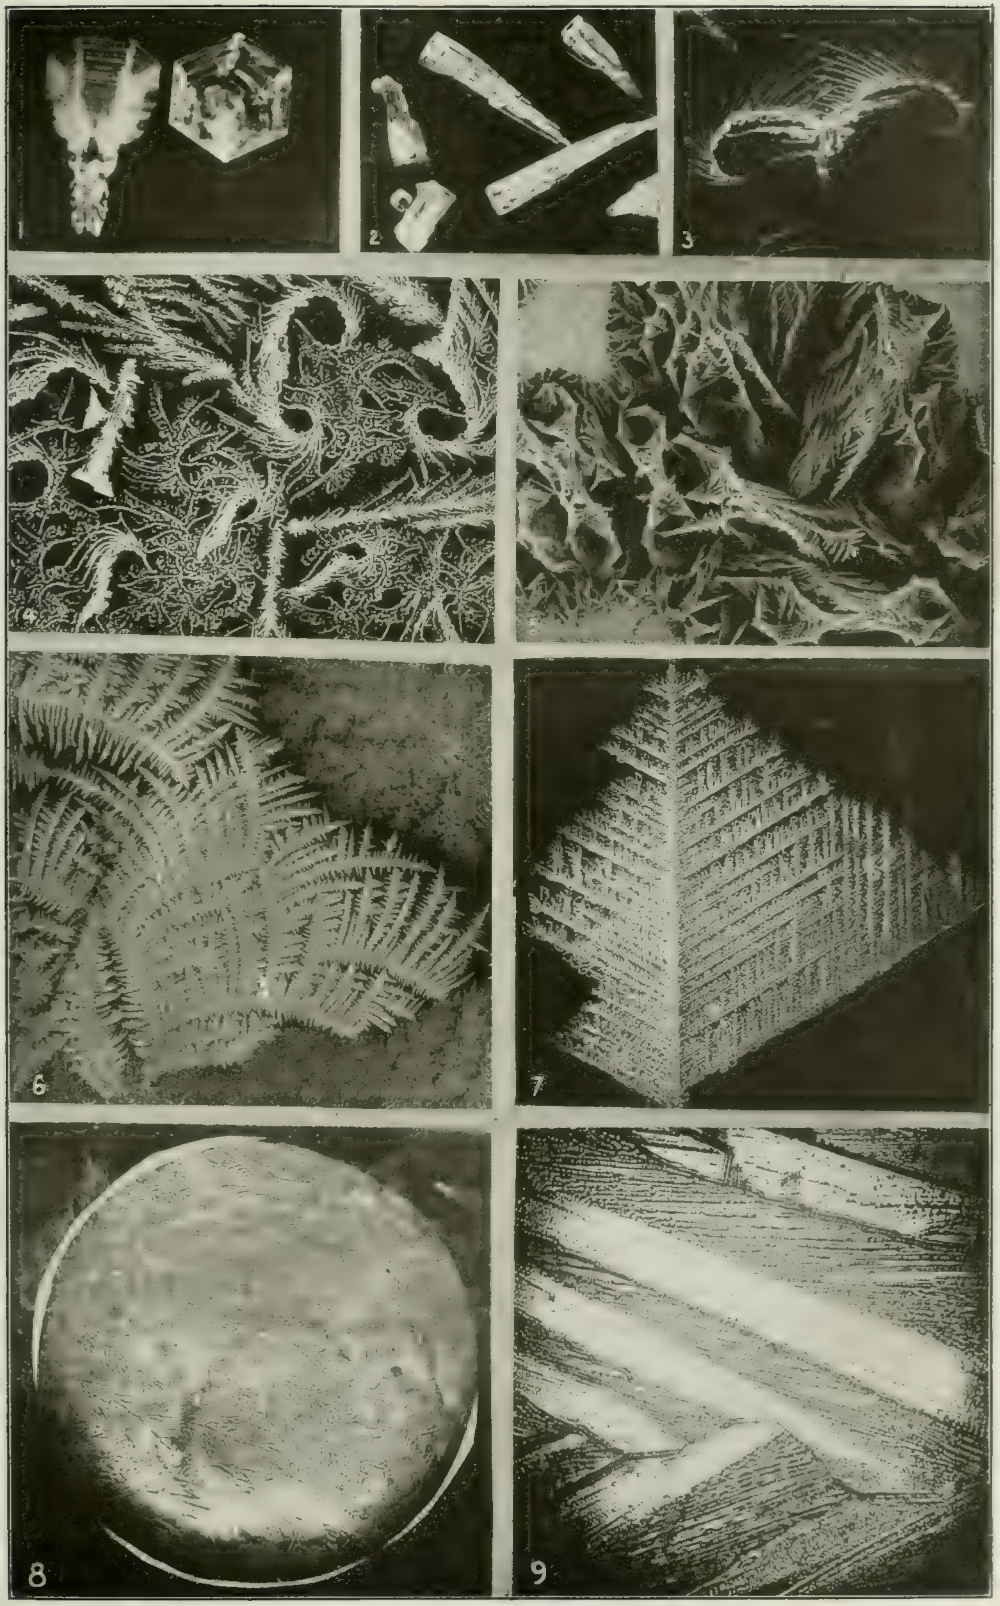
The phenomena included under the title frost, as commonly accepted, are understood to include both the processes of freezing and the mechanical effects produced thereby. Considered under this broad definition, frost plays an important part in the economy of nature, both beneficent and otherwise. It enters the crevices and minute cracks in the rocks and rends the rocks apart; and is thus an important agent in aiding and hastening their disintegration, and in converting them and the solid materials of the earth into soil. Its beneficent action in loosening and pulverizing the soil, by entering it and forcing the particles of compacted soil and clods apart through its expansive action upon the particles of moisture disseminated therein, is well known, and is of inestimable value to agriculture and to humanity. The damage sometimes done to vegetation, trees, etc., through the frosts entering them, and rending their fibres, cells, etc., apart, is often very great, and partial failures of crops such as corn, vegetables, fruits, etc., are due to this cause. As any considerable motion of air, the presence of clouds covering the sky, or the placing of a light covering, as of cloth or similar material, over the objects to be protected, greatly reduces or prevents the formation of frost upon them and of injury thereby, artificial preventives are often resorted to. Sometimes smoke-producing fires are built around or within enclosures or fields containing plants, fruits, or vegetables, and light, tent-like coverings are placed over small fruit trees, shrubs, etc., and other tender vegetable or plant growths, and thus the damage by frosts is prevented, or minimized. See also SNOW.

W. A. BENTLEY,
Author of 'Snow and Snow Crystals.'

Frost, Arthur Burdett, American illustrator and author: b. Philadelphia 19 Jan. 1851. He studied under Thomas Eakins in the Academy of Fine Arts, Philadelphia, and coming to New York secured employment on the 'Graphic,' and later entered the studio of Harper and Brothers. In 1877 he went to England, and in 1900 he exhibited at the Paris Exposition. His early work was full of interest and attracted much attention, and his later work showed the spirit of the true artist. He has published: 'Stuff and Nonsense' (1888); 'Bull Calf and Other Tales' (1892); 'Sports and Games in the Open'; and 'Golfers' Alphabet.'

Frost-bird, or **Frost-snipe**, a stilt sandpiper (q.v.).

Frost-bite. See CHILBLAIN; COLD.



1. Columnar window frost.
2. The same, cup-like.
3, 4, 5, 7. Crystalline window frost.
6. Branching hoar frost.
8, 9. Membranous window frost, highly magnified.

Frost-fish, a name given to various fishes, because they appear at the time of early frost, as does the tomcod (q.v.) so called in New England. The frost-fish of New Zealand is one of the scabbard-fishes (q.v.).

Frostburg, Md., a town in Allegany County, picturesquely situated on the Cumberland & P. R.R.; about 2,200 feet above the level of the sea. It has large foundries, planing-mills, and fire-brick works, and an extensive trade in coal. The city controls its own water supply. The government is controlled by a mayor, chosen annually, and a city council, both provided for under the charter of 1870. Pop. (1900) 5,274.

Froth-fly, or **Froth-hopper**. See FROGHOPPER.

Froth'ingham, Arthur Lincoln, American archæologist: b. Boston, Mass., 21 June 1859. He was educated in Rome, Italy, and at Leipsic; lectured on archæology at Johns Hopkins University in 1882–6; and became professor of archæology and the history of art at Princeton University in 1887. He founded the 'American Journal of Archæology' in 1885; and was associate director of the American School of Classical Studies, Rome, in 1895–6. His publications include: 'A History of Sculpture'; 'Mediæval Art Inventories of the Vatican,' and various monographs on Syria.

Frothingham, Ellen, American translator: b. Boston, Mass., 25 March 1835; d. there 11 March 1902. She was a daughter of Rev. N. L. Frothingham (q.v.) and inherited strong literary tastes, particularly in the direction of German literature. Her first published work was a translation of 'Nathan der Weise' (1868), usually ranked as the best English version of Lessing's famous drama. She also published translations of Goethe's 'Hermann und Dorothea' (1870); Lessing's 'Laokoon' (1874); Grillparzer's 'Sappho' (1876); Marie-Herbert's 'Poems of Therese' (1899).

Frothingham, Nathaniel Langdon, American Unitarian clergyman and religous writer: b. Boston, Mass., 23 July 1793; d. there 4 April 1870. He was graduated from Harvard in 1812 and entering the ministry was pastor of the First Church in Boston 1815–50. He was author of: 'Deism or Christianity'; 'Sermons in the Order of a Twelvemonth' (1852); and 'Metrical Pieces' (1855–70). He was one of the earliest American students of German. His writings are marked by grace and refinement.

Frothingham, Octavius Brooks, American clergyman: b. Boston, Mass., 26 Nov. 1822; d. there 27 Nov. 1895. He was a son of N. L. Frothingham (q.v.), and was graduated from Harvard in 1843, and from the Cambridge Divinity School in 1846. His radical views led to the resignation of his pastorate in the North Unitarian Church, Salem, Mass. He was pastor in Jersey City 1855–9; then organized the Third Unitarian Church in New York, where he preached very radical and advanced views till his resignation in 1879. The remainder of his life was devoted to travel and literary pursuits, his home being in Boston. His works were: 'Stories from the Lips of the Teacher'; 'Stories from the Old Testament'; 'The Religion of Humanity'; 'The Cradle of the Christ'; 'Memoir of W. H. Channing'; 'The Safest Creed'; 'Beliefs of the Unbelievers'; 'Creed and Conduct'; 'The Spirit of the New Faith'; 'The Rising and the Setting Faith'; 'Lives of Gerrit Smith, George Ripley, Theodore Parker'; 'Transcendentalism in New England'; 'Recollections and Impressions'; etc.

Frothingham, Richard, American historian: b. Charlestown, Mass., 31 Jan. 1812; d. 1880. He was at various times a member of the State legislature, was mayor of Charlestown 1851–3, and managing editor of the Boston *Post* 1852–65. He published: 'History of Charlestown' (1848); 'History of the Siege of Boston' (1849); 'Life and Times of Gen. Joseph Warren' (1865); 'The Rise of the Republic of the United States' (1871).

Froude, frood, **James Anthony**, English historian: b. Dartington, Devonshire, England, 23 April 1818; d. Salcombe, Devonshire, 20 Oct. 1894. He was the youngest son of Archdeacon R. H. Froude, rector of Dartington, and was educated at Westminster and Oxford. His brother, Hurrell Froude, was one of the leaders in the "Oxford Movement" and both were influenced by Newman, the earliest work of the younger Froude being a contribution to the 'Lives of the Saints,' edited by Newman. He soon emerged from Tractarian influence, however, and for the rest of his life remained indifferent to the Church in which he had been reared. The first two volumes of his history of England appeared in 1856 and at once attracted marked attention, both favorable and adverse, on account of the brilliant style and the audacity of the writer's opinions. The book flatly reversed many historical judgments, and interpreted motives in a manner more common now than then, but very startling to readers in the middle of the 19th century. His attempted vindication of Henry VIII. must be accounted a failure, brilliant and able as it is, and although it is a most striking portrait of Henry that he has painted, it cannot be called a faithful likeness. His treatment of Mary of Scotland is certainly hostile, and has been met with severe criticism. His judgment of Elizabeth, though far from impartial, is more nearly accurate than that of either of the other two personages. He excelled in vigorous, dramatic presentation of men and events, and in the judgment of sober critics appears to have cared much more for picturesque narrative than for absolute historical accuracy. As a historian he will long continue to be read and admired, but his apparent indifference to historical truth at times will not permit of his inclusion in the first rank of historians. He visited the United States in 1872 on a lecture tour, his lectures being afterward published with the title of 'English Misrule in Ireland.' In 1874 he visited South Africa, his impressions being later given to the world in lectures at Edinburgh, and in 1882 made an extended tour through Australia, the West Indies and the United States, the literary outcome of which were: 'Oceana' and 'The English in the West Indies.' He was the friend of Carlyle, whose literary executor he became, and his life of the Sage of Chelsea, his 'Reminiscences of Carlyle' and 'Letters and Memorials of Jane Carlyle' have excited a vast amount of controversy. In 1892 Froude succeeded the historian Freeman as regius professor of history at Oxford, his lectures in that capacity

afterward constituting his volume on Erasmus. It may be said that Froude was more distinctly a man of letters than a historian. He is always readable even when one is forced to dissent from him most strongly, but he touched on too many themes to give to the writing of history the devotion toward it so characteristic of such men as the late Samuel Rawson Gardner, Prof. Freeman, or John Richard Green, and he was temperamentally indifferent to the claims of entire truthfulness. He may not have consciously distorted facts, but his selection of certain details and suppression of others for the apparent sake of making the particular hero in question brighter, or the particular villain darker, does not commend itself to the lover of truth for its own sake. His important works include: 'Shadows of the Clouds,' published under the pseudonym "ZETA" (1847); 'The Nemesis of Faith' (1848); 'The Book of Job' (1851); 'The History of England from the Fall of Wolsey to the Death of Elizabeth' (1856–70); 'Short Studies on Great Subjects' (1867); 'Inaugural Address Delivered to the University of St. Andrews' (1869); 'The Cat's Pilgrimage' (1870); 'Short Studies: Second Series' (1871); 'Calvinism' (1871); 'The English in Ireland in the 18th Century' (1872–4); 'Short Studies: Third Series' (1877); 'Life and Times of Thomas Becket' (1878); 'Cæsar: a Sketch' (1879); 'Bunyan' (1880); 'Two Lectures on South Africa' (1880); 'Reminiscences of the High Church Revival' (1881); 'Short Studies: Fourth Series' (1882); 'Reminiscences of Thomas Carlyle' (edited 1881); 'Thomas Carlyle: History of the First Forty Years of his Life' (1882); 'Letters and Memorials of Jane Welsh Carlyle' (edited 1883); 'Thomas Carlyle: History of his Life in London 1831–81' (1884); 'Life of Lord Beaconsfield' (1890); 'The Divorce of Catharine of Aragon' (1891); 'Life and Letters of Erasmus' (1894). The first two volumes named above he attempted to suppress in later life, and succeeded with 'The Shadow of the Clouds,' which cannot now be found anywhere.

Frozen Strait, the passage which connects Repulse Bay and Fox Channel, and separates Melville Peninsula and Southampton Islands. It is from 10 to 20 miles wide and in lat. 65° N. This strait is frozen, as its name indicates, nearly all the year, although some bodies of water farther north are free from ice from two to five months each year.

Fructidor, frük-tē-dōr, signifying the month of fruit and gold, was the name in the French republican calendar of 1792–1806, for the 12th month of the republican year. It commenced on 18 August and ended on 16 September, and was the third summer month.

Fruit, that part of a plant in which the seed or other reproductive element is perfected; in ordinary plants the matured ovary with its pericarp and other parts. This botanical usage is largely extended in popular usage, with the central idea that the fruit is a product of the plant useful to man.

Formation of Fruit.— Starting with those simplest flowers in which all the carpels are separate, we find the stigma and style usually withering back as no longer of service, and the ovary enlarging, as the fertilized ovules grow up into seeds. But in many such simple flowers more ovules are produced than are fertilized, and generally also more fertilized than can be developed up to maturity; hence the reduction of the ovules is exceedingly common, as is simply exemplified in the horse-chestnut.

A second principle of fruit-making is reached through keeping in mind the origin of the ovary from one or more carpellary leaves, of which the individual development has been so greatly checked that they remain closed upon the ovules, and frequently even coalesce with each other from the base upward, so forming a many-celled ovary. Yet the tendency to their individual expansion is not lost; in many monstrosities, and normally a few types, such as the common mignonette, the carpellary leaves early begin to expand, so opening the ovary and exposing the seeds long before ripeness. Far more frequently, however, this final development of the carpellary leaves is delayed until the growth-processes of the seed and fruit have ended, and it is, therefore, accompanied, or even preceded, by their death; the separation often indicating the lines at once of leaf-margin and leaf-fall.

In the best-developed carpellary leaves, such as those of the more floral *Ranunculaceæ,* we naturally find the ovary opening along the line of its united ovule-bearing margins. This is what is termed a follicle.

Since, however, the ovules are on the united margins, the midrib tends to interpose little or no resistance to a tendency to split or tear along its fold. Such "dehiscence by both dorsal and ventral suture" gives us the legume or pod. Another type is the *siliqua* (or when shortened and broadened the *silicula*) of *Cruciferæ.* Here the placental edges of two united carpels develop a transverse septum which divides the fruit; and this is left when the lobes split away, as so familiarly in honesty.

Among united ovaries which readily split open at the united margins (*septicidal*) we may note that of gentian (q.v.), while the more familiar three-celled ovary of a violet, with its parietal placentation, gives a characteristic example of dehiscence along the midribs of the united carpels, so opening the loculi (*loculicidal*). In the five-celled capsule of the geranium (q.v.) the carpellary leaves separate not only at the sides but also at the base, so curling inwards

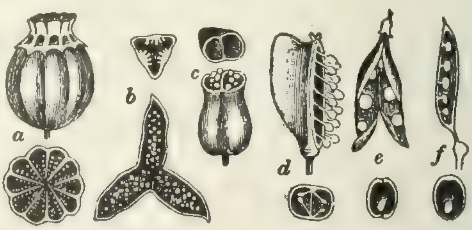


FIG. 1.— *f,* follicle; *e,* legume; *d.* silicula; *c,* capsule of henbane; *b,* of violet; *a,* of poppy.

and projecting the seed. Where, however, the placentæ remain more or less completely upon a central column from which the valves are detached, the dehiscence is said to be septifragal.

In henbane (*Anagallis*), etc., the dehiscence is circular (*circumscissile*). Many-celled capsules are numerous in which the leaf-opening or dehiscence is greatly reduced from completeness; witness the valvular and porous dehiscence

of the *Lychnis* and of the poppy respectively. Such cases clearly point us to those of carpels which do not open at all. Such indehiscent fruits, produced from carpels so persistently embryonic, are usually short, few or one-ovuled, and, for the most part, little specialized. Thus the follicle of the *Ranunculaceæ* of more specialized floral character becomes shortened into the one-seeded indehiscent *achene* of the anemone or buttercup. In the achene of the grasses (which similarly represents the capsule of the ancestral lilies) the thin dry pericarp becomes inseparable from the seed-coat (hence the term caryopsis); in many trees (for example, hazel) it becomes hardened and thickened as a nut. In composites, too, the achene is practically a nutlet, although often (on account of its being inferior) superfluously termed a cypsela. Less extremely reduced representatives of the various multicellular ovaries to which such fruits correspond are afforded us by borages or labiates, in which the two-celled ovary of the primitive solanaceous type becomes, as in thorn-apple, etc., subsequently divided into four parts. In *Umbelliferæ* we have another characteristic form of schizocarp, as all such fruits are termed which split up without truly carpellary dehis-

FIG. 2.— *e, f*, achenes of buttercup; *c, d*, caryopsis of oat; *a, b*, achenes with pappus; *g*, "lomentum"; *i, h*, nutlets and ovary of borage; *l, k*, umbelliferous type of schizocarp.

cence, although the tendency to this can be seen still to have some influence. Here the separate portions (or mericarps), each resembling an achene or nut, are two in number, and when ripe swing off upon the ends of a forked carpophore.

So far all our fruits have been dry; but a new physiological "principle of fruit-making" is necessary to comprehend those in which the pericarp is succulent. For, just as the effect of fertilization is seen in many animals to extend beyond the mere ovum to the parent organism, and also in many of the lowest plants, so it is in the case before us. Even in fruits which are dry on ripening we have seen that the ovaries or loculi, on which no demand is made for the growth of fertilized ovules, become reduced or disappear. Sometimes it may be merely the coats of the seed (as in the pomegranate) which undergo the complex histological and chemical changes which we sum up as those of succulence and ripening; at other times largely their placentas, as in the gooseberry and currant. Yet, as in these, the innermost tissue of the ovary may become succulent as well. In the orange also the familiar succulent tissue in which the seeds are immersed are the enlarged succulent cells of the endocarp; the grape, too, gives a characteristic example of soft endocarp. These

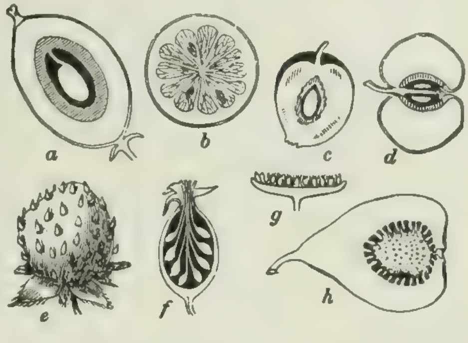

FIG. 3.— *a*, drupe; *b*, orange; *c*, a single drupelet of bramble; *d*, pome; *e*, strawberry; *f*, hip of rose; *g*, capitulum of Dorstenia; *h*, fig.

may all be classed as berries or baccate fruits, for the distinction of the succulent product of an inferior ovary as a berry, from that of a superior one, as a uva or grape, need hardly be allowed to increase our nomenclature. A pepo is merely a berry in which the epicarp is thick and tough (for example, a melon, with which the orange and pomegranate may be reckoned). Where the succulent change, instead of primarily affecting the deeper tissues of the fruit, and so producing a berry, leaves the endocarp hard, we have the drupaceous or stone-fruit. The endocarp here forms a more or less complete "stone" around the kernel or seed, the difference from an ordinary nut being due to the succulence of an outer layer (mesocarp), with a more or less leathery outer skin, the epicarp. The plum, peach, and nectarine are the most obvious examples; but, since we may have many carpels thus transformed, we may have an aggregate fruit or syncarp of tiny drupes. The walnut and even cocoanut are hence not true nuts (see NUT). The immature succulent mesocarp of the former is familiar in pickles, the walnut we crack being merely the stony endocarp (which is exceptionally specialized in being set free by the bursting of the mesocarp on ripening). The familiar cocoanut fibre is the fibro-vascular tissue of the mesocarp, the fruit being thus broadly comparable to a peach which has wizened while still young and stringy. But, as in the kindred grass, the coats of the ovule further unite to the endocarp.

The numerous carpels of the strawberry, although, of course, corresponding to those of the allied raspberry, remain mere nuts; here, however, the subjacent portion of the floral axis or receptacle becomes succulent. In the perigynous or epigynous *Rosaceæ* the same change may take place; hence the rose-hip is a succulent axis, enclosing a multitude of nuts. The apple or "pome" is more akin to the drupe, since the carpels, here deeply sunk in the upgrown floral axis, develop a hard endocarp corresponding to the stone of a drupe.

Fertilization may even be followed by succulent or other thickening of the floral envelopes, or of the floral axis with subjacent bracts — the

various cupules, as of acorn, beech, hazel-nut, etc., being of this nature. Or we may have a spurious fruit developed at the expense of an entire inflorescence, as in the pineapple, Dorstenia, and fig.

Chemical Composition of Fruits.— Our knowledge of the chemistry of fruit may be dated from the analyses of Fresenius (1857). But because of the innumerable varieties of almost every cultivated fruit, the effects of different soils and climates upon these, and still more of the fluctuation due to better or worse seasons, the results of any one chemical analysis would tend to convey an idea of undue precision. Thus — for example, while the ratio of sugar to free acid in certain grapes of an ordinary wine-year was found to be 16 to 1, in a very bad year it sank to 12, and in a very good year rose to 24. Hence a broad outline may be of more general use than the statistics of any one analysis.

The percentage of water may be taken as varying from 78 to 80 in the grape and cherry, as from 82 to 85 in plums, peaches, apples, and pears, as 82 to 87 in brambles, currants, etc., and as much as 95 in the watermelon. The proportion of insoluble residue — skin and cellulose, stone and seed — obviously also varies greatly with succulence and ripeness, but may be taken, one fruit with another, at not less than from 4 to 6 per cent. Unripe fruits may contain a notable proportion of starch, but this is fermented on ripening into glucose and other sugars, fruit-sugar, grape-sugar, cane-sugar, or (in *Sorbus*) sorbin. The only fruits which retain starch in important quantity are those of the banana, breadfruit-tree, and baobab; hence the exceptional nutritive value of these. The olive alone yields a notable proportion of oil. The proportion of sugars varies exceedingly, dates, dry figs (48 per cent), and raisins (56 per cent), again very important foods, heading the list. Grapes, of course, stand high, from 12 to 18, indeed sometimes as much as 26 per cent, cherries from 8 to 13, apples 6 to 8, pears 7 to 8, plums 6, red currants 4.75, greengage 3.5, peach and apricot only 1.5. The proportion of pectin bodies is, however, exceedingly notable, especially in fruits such as the three last named. In unripe fruits (as also in roots) we find pectose, a body apparently related to cellulose, but easily transmuted by a natural ferment or by boiling with dilute acid into pectin, $C_4H_6O_4$, and its allies. These are all more or less soluble in water, with which they readily form a jelly (whence the peculiar consistency of our fruit-preserves). The proportion of soluble pectin and gum varies considerably and is of great importance to the blandness and agreeableness of fruit, the harder and more common apples having considerably less than 3 per cent and the best rennets nearly 8. The harsh red currant, indeed, like berries in general, has exceedingly little (0.25 per cent); while the apricot has as much as 9, the greengage 12, and the peach 16 — a circumstance which explains the peculiarly melting quality of these fruits, especially the last-named. The free acid also varies greatly, from 2.4 per cent in the red currant, 1.4 in the raspberry, and nearly as much in the sourest cherries, to 0.5 in sweet cherries and a minimum of 0.1 or less in the sweetest pears. That of apples and of grapes, of course, varies greatly, but both may generally be taken at from 1 to 0.75, while the apricot and peach stand at 0.3 or 0.4. The acid is primarily malic, but citric, acetic, oxalic, tannic, and others may also be present.

The quantity of albuminoids is of course small, in fact, inadequate to render most fruits a staple food. Yet it is by no means inappreciable, ranging from nearly .5 per cent in the majority of fruits to .7 or .8 in the grape (2.7 in raisins), and above 1 in the melon and tomato. Hence to acquire albuminoids equal to those of one egg we must eat 1½ pounds of grapes, 2 pounds strawberries, 2½ pounds apples, or 4 pounds pears. To replace 1 pound starch = 5½ pounds potatoes, we need 5.4 pounds grapes, 6.7 of cherries or apples, or 12.3 of strawberries. See FOOD.

The quality of fruits depends largely upon the proportion of sugar, gum, and pectin to free acid, largely also upon the proportion of soluble to insoluble matters, but in very great measure also upon the aroma. This quality is due to the presence of characteristic ethers, often accompanied by essential oils, although not of course in ponderable percentage. Cultivation and selection operate strongly on all three factors.

Keeping of Fruit.— Many of the finest fruits undergo very speedy decomposition, which, as distinguished from the intrinsic processes of ripening, is due to the attacks of bacteria, molds, or yeasts; and the problem of their preservation is therefore primarily one of preventing these. In damp and stagnant air, especially with considerable or frequent changes of temperature, these fungus pests multiply with special readiness; hence a fruit-room must be cool and shady, yet dry and airy, and the fruit carefully gathered rather before full ripeness, handled so as to avoid in any way bruising or tearing the skin, and laid out and occasionally looked over so that rottenness in one may not affect the rest. Under these conditions apples especially may be kept for many months; indeed many varieties of fruit — for example, winter-pears — require these conditions for satisfactory ripening. On antiseptic principles we see how it is that the dense-skinned and wax-coated grape can be so largely imported in sawdust, or how unripe gooseberries, and even very perishable pears can be kept for months similarly packed in well-sealed jars in a cool place. The process of preserving with sugar in jars promptly covered up is similarly an antiseptic one; but in the systematic application of antiseptic principles we may still look for considerable progress in the preservation and transport of fresh fruit upon a large scale. The method of drying fruit has also been in use from remote times, especially with dates, figs, and raisins.

See CIDER; FRUIT, CULTIVATION OF; FRUIT TRADE, THE AMERICAN; FRUITS, COLD STORAGE OF; GARDEN; and articles on the various fruits, as APPLE, CHERRY, PEACH, etc.

Consult works on fruit-culture by Bailey (1897); Burbidge (1881); Cheal (new ed. 1892); Downing; Du Breuil (1886); Fish (1882); Fuller (1881); Hogg (1885); Roe (1886); Thomson (1881); Wood (1880).

Fruit, Cultivation of, the planting, protecting and ripening of fruit for food. The skilful labor of the cultivator has so greatly improved the original indigenous wild fruit of different zones, that it is worth while to consider from the beginning this gradual process of

amelioration. In the tropics, the fruits grow spontaneously with little need for cultivation. The plantain and banana, the guava and sapodilla yield their refreshing fruit without the aid of man. In temperate climates the wild fruits are scarcely edible. Wild cherries, crab-apples, and wild grapes are harsh and sour. By cultivation the crab is changed into the golden pippin, the wild pear into a Bergamotte, and the wild grape into a Concord cluster. There are two or three axioms which underlie all principles of successful fruit culture. The wild fruits if left in their natural state reproduce themselves only. The first step is to domesticate a new generation by sowing their seeds amid new conditions. Take for instance the common wild cherry (*Cerasus avium*). Plant its seed in garden soil and a tree of a different kind appears; each seedling differs from the original plant, and some few will be superior to it. When once this variety appears, selection of the best among many will gradually lead to perfection. This perfection we see in the pears, apples, grapes, and plums of to-day. But only by assiduous care can the present standard be kept up. «There can be no doubt,» says Dr. Lindley, «that if the arts of cultivation were abandoned for only a few years, all the annual varieties of plants in our gardens would disappear and be replaced by a few wild forms.» Hence the necessity for constant and vigilant cultivation of our present fruits.

Dr. Van Mons, professor at Lourain, was the first to make any great discoveries in ameliorative cultivation. In 1823 his nurseries contained 2,000 seedlings of merit. His theory was that all fine fruits are artificial products. All that wild nature can produce is a healthy, vigorous tree, and a fruit sufficient to protect perfect seeds for continuing the species. The object of cultivation is to enfeeble the tree's excess of vegetation, to diminish the size of the seeds and increase the quantity of flesh or pulp. The older the tree the more likely are its seedlings to return to the wild state. While the seeds of the oldest varieties of good fruit mostly yield inferior sorts, seeds taken from recent varieties of bad fruits, and reproduced uninterruptedly for several generations will certainly produce good fruit. A most important aid in producing the desired varieties is by cross-breeding. This is effected by taking the pollen of one blossom and dusting it upon the pistil of another from which the original stamens have been removed. The development of plums and apples has been much aided by this process, and Mr. Coxe has described an apple which was a cross between a Newton pippin and a russet. It was in appearance half the one and half the other, one end tasting like a pippin, the other like a russet. After a new and choice variety of fruit has been obtained, and of which probably, there is only one tree, it may be propagated by grafting and budding. Grafting is as old as the early Roman Republic; it was also practised by the ancient Greeks. The French orchardists are most expert in it and practice it in more than 50 different ways. The proper time for grafting is in the spring, as soon as the sap stirs, which commences earliest with the cherry and plum, and ends with the apple and pear. Budding differs from a common grafting. Merely a bud, with the smallest possible quantity of the adjoining bark and wood, is inserted in the incised tissues of another tree. All stone fruits are difficult to graft, but can be budded with ease. Fruit trees are also propagated by cuttings, that is, by taking twigs from a good variety and setting them out to take root; or by layers and suckers. A layer is a cutting, part of which is sunk in the ground, while the end is not detached from the parent tree. Suckers are shoots sent up from the root and easily detachable so as to be planted.

The grape vine is almost invariably propagated by cuttings, as are gooseberries and currants. But one of the most important considerations for the fruit cultivator is the soil and its preparation. No good fruit can be produced on dry or barren soil, and fertilizing, watering, and thorough sifting of the orchard or vineyard bed is absolutely necessary for success. Almost equally important is the slope and aspect of the land to be occupied. The warding off of diseases and insect pests from growing fruit also calls for great care on the part of the fruit cultivator.

Fruit-bats, the bats of the family *Pteropodidæ,* called also fox-bats or flying-foxes, because of their fox-like heads and faces. They compose one of the two grand subdivisions of bats, the *Megachiroptera* (see Bat), confined to the tropical parts of the Old World. These are the largest of all bats, and differ from the other bats in that they are entirely frugivorous. There are several genera, the most important being the genus *Pteropus.* The best-known species is the Indian fox-bat (*P. medius*), common in India, Ceylon and neighboring islands. As evening falls these bats fly out of the branches, where they have hung, like great black fruits, all day, and start on their nocturnal depredations, which they continue until dawn, when they return to their homes, — thousands sometimes forming a single colony, wrangling and jostling one another for the most desirable places on the limbs. Once settled they hang, head down, until day is over. They are so numerous and so destructive to crops in certain localities that they are hunted vigorously; but, even when they are shot by thousands, the numbers do not seem to be materially decreased. There are certain species that sometimes feed on flowers as well as fruit; but this is not generally the case. The Indian fruit-bat, Lyddeker says, will greedily drink palm-juice from the pots hung on the trees to collect it, and at times, individuals have been found at the foot of the trees quite helpless from intoxication.

The spread of wing is from 4 to 5 feet in the Indian and Malay species; smaller than these are the ugly-faced *Harpyias,* so named because of the supposition that they were the «harpies» of the old mythology.

Fruit-crows, the somewhat crow-like birds of that section of the South American family *Cotingidæ* called *Gymnoderinæ.* This

section contains a number of most unusually ornamented birds, such as the bill-bird, and umbrella-bird (qq.v.), and most of them have bare spaces, or wattles, about the head. They are woodland birds whose habits are little known, but they feed mainly on seeds and berries, and make large nests in trees and bushes.

Fruit-fly, any of the flies of the family *Trypetidæ*, whose eggs are laid and maggots are bred in fruit, for example, the apple-maggot (q.v., under APPLE), or in plant-stems. The Mexican orange-worm (see ORANGE INSECT-PESTS) is another well-known species, while the galls so frequently observable upon the golden-rod are the work of a third (*Trypeta solidaginis*). The maggots remain within the fruit or gall during the winter, then, if not already thrown down, creep out, drop to the ground, and transform into pupa and imago. They vary in color from buff to brownish-black, and are frequently beautifully banded or spotted. See also POMACE-FLY.

Fruit growing. Fruit growing as a distinct phase of agriculture is of comparatively recent development in America. The early settlers, who were located chiefly along the Atlantic Coast, in the Lake Region and the Mississippi Valley, found an abundance of wild fruits of many species similar to those known to them in their European homes, and in many cases superior in size, flavor, and quality, to the wild fruits of Europe. This fact encouraged them to introduce the cultivated forms and varieties of the Old World, so that as soon as regular and reliable means of communication were established with the mother countries, seeds, scions, and young trees of the choice varieties of western Europe and the Mediterranean region were secured for testing in practically all of the colonies from the Saint Lawrence Valley southward to Florida. Naturally these early introductions were made in a desultory way and the larger portion of them failed through inability of the types and varieties developed in Europe and western Asia to endure the more intense climatic conditions that prevailed in similar latitudes on the American continent east of the Rocky Mountains. The art of grafting was evidently known to some of the early colonists for as early as 1647 it is recorded that the apple was grafted on wild stocks in Virginia, where in 1686, one orchard of 2,500 apple trees is known to have existed. In 1647 Governor Stuyvesant planted on Manhattan Island a grafted tree of the Summer Bonchretien pear, said to have been imported from Holland. This tree, which is the earliest recorded grafted tree planted by the colonists, stood at what subsequently became the corner of Third avenue and Thirteenth street, New York city, until it was accidentally broken down by a dray in 1866.

The early efforts with orchard fruits were devoted chiefly to the introduction of such as would yield a supply for the family of the owner, rather than to develop a commercial industry. About the only exception to this was the apple, which was planted quite largely in many sections for cider making. This was especially true from Virginia northward, one Massachusetts village, consisting of forty families, having attained the distinction early in the 18th century of producing «near ten thousand barrels of cider.» The early efforts toward the introduction of wine-grapes are related under GRAPE CULTURE.

Bailey states that there are not less than 150 species of native North American fruits fairly well known, of which not more than 40 are of commercial importance. These cover a very wide climatic range, from the hardy plums and apples of the far north to the figs, oranges, and lemons of California, and the oranges, pineapples, mangoes, guavas, and other tropical fruits of Florida. The great diversity of soil and climate render it possible to produce in the United States, Canada, and Mexico, practically all of the important fruits and nuts known to commerce throughout the world, so that America has become in large degree independent of the Old World in the matter of fruit supply. The chief exceptions until recently have been certain sub-tropical fruits and nuts, such as oranges, lemons, dates, figs, almonds, and walnuts, but production of these has shown such rapid increase during the past few years as to largely displace the former imports of these fruits. For convenience in discussion, the various fruits have been grouped by Prof. L. H. Bailey, 'Principles of Fruit Growing' (1897), into four classes, which may be summarized as follows:

Class I.— Tree-fruits, comprising about 100 species divided into 13 sub-classes.

Class II.— Vine-fruits, comprising the grapes and passi-floris, divided into two sub-classes.

Class III.— Small-fruits, comprising about 20 species, divided into three sub-classes.

Class IV.— Herb-like fruits, comprising about 10 species, divided into four sub-classes.

While the effort to produce a home supply was evident at a very early day, the development of a large commercial fruit industry can hardly be said to date earlier than 1850. Before then plantings of orchard fruits were limited to the needs of the farmer's family or the nearby village or city, except in a few localities where apples and grapes were grown for the manufacture of cider and wine respectively. Each improvement in transportation has been followed by a marked increase in fruit planting and production, frequently at points remote from those where the product is consumed. This is most noticeable in the case of the more perishable fruits, such as the strawberry and peach. The planting of these for the supply of the cities along the Atlantic seaboard has gradually spread southward and westward until there are large shipments of these fruits each year from points as far south as Florida, and as far west as Texas. The fruits grown in the drier climate of the Pacific coast have been found to endure transportation better than those of more humid regions, and their peaches, plums, apricots, cherries, grapes, and pears, as well as the citrous fruits are marketed with little risk in eastern cities. The perfecting of the refrigerator-car service on land has played an important part in this development, and in conjunction with refrigerated compartments on ocean steamers, has resulted in the beginning of what promises to become a very important export trade in such fruits as peaches, pears, plums, and possibly some other perishable fruits that fail to endure the vicissitudes of ordinary transportation.

Types and methods.— The early efforts at commercial fruit culture in America were

1. Birdseye view of a well-cultivated peach orchard.. 2. Strawberry growing in Wisconsin.

573

FRUIT GROWING.

1 Napoleon cherry trees in California. 2. A West Virginia peach orchard.

mainly based upon European varieties, and the methods of culture were such as were followed in the Old World. The unsatisfactory behavior of a large proportion of the imported varieties gradually led to the substitution of seedlings of American origin, which, in the case of most of the important species, have proved much better adapted to American conditions. Prior to the middle of the 19th century most of the American varieties of orchard fruits that came into prominence were accidental seedlings, which were observed to yield fruit of special value, and were, therefore, named and propagated as commercial sorts by their discoverers, for examples, the Baldwin, Ben Davis, and Winesap apples, and the Catawba grape. In recent years attention has been devoted to the breeding of sorts better suited to special conditions or for specific uses, and rapid progress has been made along this line in strawberries, grapes, plums, and peaches. At first these efforts consisted chiefly of the growing of seedlings from seed of choice varieties without effort to control the male parentage, but more recently much definite work has been done in breeding through the cross-pollination of varieties possessing the characters that are desired in the offspring. Notable work in this line has been done by Munson of Texas, Burbank of California, Webber of the United States Department of Agriculture and others. The result of the tendencies above indicated has been to create a distinctive American pomology, consisting largely of Old-World species but mainly of varieties of American origin. In the case of the strawberry, the raspberry, both black and red, the blackberry, dewberry, and gooseberry, the plums of the Mississippi Valley region and the grapes grown east of the Rocky Mountains, the species as well as the varieties are largely of American origin. (Consult Bailey, 'Evolution of Our Native Fruits.')

The gradual change in varieties cultivated has been accompanied by a radical change in methods of culture. With the development and improvement of agricultural implements, hand labor has largely given way to horse-power methods so that a large acreage is now effectively managed with few hands at comparatively small cost, except during the harvesting and marketing of the crop which, with most of the fruits, is still done by hand labor. The prevention of injury by fungous diseases and injurious insects has necessitated the development of economical and effective means of combating these pests. While radically different treatment is needed for different pests, the last decade has witnessed a very general resort to the use of fungicides and insecticides (qq.v.) applied to the trees or plants in the form of sprays.

Methods of cultivation and pruning differ widely for different fruits and in different sections of the country, but in recent years there has been a marked tendency toward clean cultivation of the soil during the early part of the growing season to insure vigorous growth of wood and foliage, followed by the sowing of some leguminous or other cover crop, which is allowed to grow during fall and winter for plowing under the following spring. This practice, where pursued, aids in maintaining the proper proportion of humus in the soil, and when supplemented by applications of phosphoric acid and potash as needed, promotes a healthy and vigorous growth capable of producing normal crops of well-matured fruit. While the pruning of orchard trees to fixed and arbitrary forms is as yet little practiced in America, more attention is paid each year to pruning for specific purposes, such as the stimulation of growth, the setting of fruit buds or the reshaping of the tree or vine. In most sections the practice of heading trees low is on the increase, such trees being found to endure greater climatic extremes without injury, and the accessibility of their most remote branches greatly facilitates their treatment with sprays and the harvesting of their crops.

The necessity for shipping long distances has resulted in the development of methods of marketing fruits which differ widely from those practiced in the Old World. One of the most marked features is the almost universal use of "gift" packages. For most fruits except the cheaper and lower grades of apples and pears, chiefly used for cider making, evaporating, or canning, special light wooden packages are made of convenient size and form in which to pack the fruit for shipment. In most cases these packages go with the fruit, no effort being made to return them to the shipper or use them a second time. It is noticeably true that the highest type of grading and packing fruit for shipment is found in those regions which are remote from the consuming centers of population, and to a considerable extent the same is true of the methods of cultivation, pruning, thinning, and spraying, the heavy expense of long shipment necessitating the production of a more attractive product, which will command a price sufficiently high to leave a profit to the grower. The increasing tendency to plant large areas under single direction and management has had the effect to still further systematize the operations and render the product more uniform in size, quality, and marketability from year to year, while in certain localities, co-operative grading and packing are accomplishing similar results.

ORCHARD TREES AND PRODUCTS, CENSUS OF 1900, CROP OF 1899.

	Trees.	Bushels.
Apple	201,794,764	175,397,626
Apricot	5,010,139	2,642,126
Cherry	11,943,287	2,873,499
Peach and nectarine	99,919,428	15,433,623
Pear	17,716,184	6,625,417
Plum and prune	30,780,892	8,764,032
Unclassified orchard fruits	2,215,267	630,321
Cider	1,754,927 bbls.	
Vinegar	392,497 bbls.	
Dried and evaporated fruit	144,804,638 lbs.	
Value of orchard products	$83,751,840	

Magnitude of fruit industry.— Comprehensive and accurate statistics of fruit culture in North America are unfortunately lacking, but enough is known regarding certain fruits to indicate the large and growing importance of the fruit industry as will be noted below under the discussion of the several fruits mentioned. The Twelfth Census (1900) showed totals as above for the United States, while the known facts regarding the annual production and sale of

young trees by American nurseries indicate that orchard planting continues with little abatement.

Commercial apples.— The apple is both the most widely grown and generally liked of the fruits of North America. It is grown to a greater or less extent in every state and territory of the Union and Province of Canada. The range of the varieties of this fruit as to date of maturity is so great that with proper attention to their selection planters in many sections can have a continuous supply of this fruit from their own orchards during at least ten months of the year. Since the development of commercial cold storage (q.v.) and the improvement of railroad transportation from the South, the supply of American grown apples in wholesome condition in city markets is practically unbroken. (See APPLES; FRUITS, COLD STORAGE OF; FRUIT-TRADE.)

Pear and quince.—While the pear has never attained in America the relative importance that it holds in England, France, and Germany, it succeeds well. The varieties of best quality are chiefly of the European type (*Pyrus communis*) and several of the most important are of European origin, such as Bartlett, Flemish Beauty, Anjou, Angouleme, Clairgeau, Louise Bonne. The pear requires a somewhat richer soil and more cultural attention than the apple, and is subject to a bacterial "blight" which it is difficult to control in regions where the tree makes a strong and rapid growth, as in the South. In such regions this type is rapidly giving away to the Oriental type (*Pyrus sinensis*), the varieties of which are derived primarily from the Chinese sand pear. The most important of these are Kieffer and Le Conte — sorts of indifferent quality but thriving and producing crops under conditions where the better varieties cannot survive. Kieffer has been more largely planted in recent years outside of California than any other sort, and is largely used for canning. It is also well adapted to the export trade. The most important commercial pear districts are in western New York, western Michigan, central California, New Jersey, and the Chesapeake Peninsula. In the latter two regions the Kieffer predominates; in the others, Bartlett is the leading commercial sort. The quince is but sparingly grown in a commercial way, except in a few localities in western New York, New Jersey, Pennsylvania, Michigan, and California.

Stone-fruits.— Among the stone-fruits the peach ranks first in commercial importance, though its climatic range is narrower than that of the several types of plums. The rapid development and magnitude of the American peach industry constitute one of the striking features of our fruit culture. Although prior to 1870 commercial peach orchards were chiefly confined to New Jersey and Delaware, large and successful plantings are now found in all the warmer and moister states, so that total crop failures of this delicious fruit have become practically unknown. Single orchards of 100,000 trees are no longer rare, and in some instances more than 300,000 trees are under one management. The major portion of the crop is grown for marketing in the fresh state or for canning, except in California where large quantities are sundried in addition to these uses. The standard sorts of widest distribution are probably Early and Late Crawford, Elberta, Oldmixon, Stump, and Smock. The varieties of the Peento and South Chinese groups are grown chiefly in Florida, while the Spanish, Chinese Cling, and Persian groups, respectively, are grown to the northward, with the Chili type of the latter group as the most thoroughly tested as to winter hardiness.

The various types of plums are found under successful culture over a wider climatic range than any other tree fruit in America, but are of less commercial and economic importance than the apple or peach. The European types are considerably planted in the northern states, especially New York and Michigan, and constitute a very important feature of the fruit culture of the Pacific Coast. The yield of prunes is increasing rapidly, having averaged more than 120,000,000 pounds per annum, from 1898 to 1902 in California alone. In the colder portions of the North, especially in the Upper Mississippi Valley, hardy varieties of the native *Prunus Americana* have been developed, which are proving of great value. Among these are Wolf, Stoddard, De Soto, Wyant, etc. The Japanese varieties, now widely planted, are proving useful additions to our lists, though in some cases very susceptible to injury by the fruit rot (*Monilia fructigena*).

Cherries are widely planted as door-yard trees, but their commercial culture is comparatively limited in the eastern states. The sweet varieties are grown to some extent in western New York, but only in California and Oregon are they largely grown with profit. The leading varieties are Napoleon, grown on the Pacific Coast as Royal Ann and Black Tartarian. The sour varieties have a wider commercial range, and Early Richmond, Montmorency Ordinaire, and English Morello are the leading sorts.

Apricots are but sparingly grown outside of California, where there is a large production for drying and canning, as well as for shipment in the fresh state.

Small fruits.— The strawberry is widely and largely planted for commercial shipment, and fruit grown in the open air is obtainable in city markets from January to the middle of July. It is grown in all the northern states, and extensively for shipment in the Gulf States, South and North Carolina, Virginia, Tennessee, Arkansas, and Missouri. Varieties are transient and numerous, but all the varieties grown to any extent are of American origin.

The raspberries — red, black, and purple — blackberries, dewberries, currants, and gooseberries are grown in smaller areas, though in certain localities their culture has assumed distinct importance.

The cranberry, which, as a cultivated fruit, is distinctly an American product, is extensively grown in Massachusetts and New Jersey and somewhat in Wisconsin.

Citrous fruits.— The citrous fruits chiefly grown are the orange, including the mandarin or kid-glove type, the lemon, and the pomelo. The citron and the kumquat are now being commercially planted, the former mainly in California, the latter in Florida. The lime is also grown to some extent in the latter state. Prior to the great freeze of 1894–95, orange culture was the most important branch of horticulture in Florida, the annual yield having exceeded 5,000,000 boxes. Since then the yield

1. Dewberry field in Maryland. 2. Gathering peaches in Georgia.

has been relatively small, though showing marked increase in 1903. The yield of oranges and lemons in California has steadily increased for several years, having averaged more than 5,000,000 boxes per annum for the past five years.

Nuts.— Of the nuts grown in America only the almond, walnut, and pecan have attained much commercial importance, the two former in California, the latter throughout the Gulf States and lower Mississippi Valley. Chestnuts of European and Japanese types are being planted on a somewhat extensive scale in the Eastern States, and appear well adapted to the existing conditions. Cocoanuts are somewhat planted in southern Florida.

Tropical and sub-tropical fruits.— Of these the most important are the fig, olive, and pineapple, all of which have attained commercial prominence. The two former are more largely grown in California, the latter in Florida. The mango and avacado are now being planted in considerable areas in south Florida, and several other species, including the guavas and anonas, to a less extent. WILLIAM A. TAYLOR,

Pomologist, U. S. Department of Agriculture.

Fruit-pigeons, a group (*Trevoninæ*) of pigeons of very brilliant and often curious plumage, and frequently of large size, which are scattered from India to the South Sea islands. They spend their lives in the tops of the forest trees and feed wholly upon fruits, which are swallowed whole. There are about 180 species, chiefly of the genera *Carpophaga* and *Ptilopus.*

Fruit Trade, The American. The American fruit trade, which has now attained such proportions that it is entitled to be regarded as an important factor in our national commerce, had practically no existence one hundred years ago. At the beginning of the 19th century, for example, it is doubtful if there was a merchant in the United States who realized any considerable profit from his transactions in fruit. The extent of the trade at that time was represented by a few of the large importing houses, and their interest in this branch of the provision business was confined to the occasional receipt of a cargo of assorted fruits from some Mediterranean port, a few half-casks of dried prunes, currants, raisins, and figs, with, perhaps, some preserved citron. In fact, it was some years after the birth of the last century before even the New York grocers could see any advantage in trading in the native fruits that were frequently brought to the city by the neighboring farmers, and it was not until many years later, or at sometime about 1830, that any of the Metropolitan business men began to give any serious attention to the importation of foreign fruits.

Of course, this does not imply that foreign fruits were not imported from time to time. As early as 1804, a consignment consisting of about 30 bunches of bananas had been brought into the United States by Captain John N. Chester, of the schooner Reynard, but while, during the next 26 years, similar small lots were imported, it was not until 1830 that John Pearsall, a member of the firm of J. & T. Pearsall, decided that it would pay him to negotiate for cargoes of this fruit at regular intervals. He accordingly chartered the schooner Harriet Smith, and, within a few weeks, unloaded the first large cargo of bananas ever brought to New York. It consisted of 1,500 bunches.

The first cargo of oranges arrived at New York, in a sailing ship from Sicily, in 1832. Within a few months a cargo of lemons followed, and, within a comparatively short time, the importations of fruit from the Mediterranean ports became an established branch of our international trade. For fully 30 years these fruits from Italy, especially in the case of lemons and oranges, held full possession of the American market, and sailing ships, which were chartered expressly for that purpose, sped back and forth across the Atlantic to bring these fruits, the demand for which was constantly increasing. In fact, so eager was the competition in those days that entire shiploads were often purchased by importers and dealers before they had been a day at sea, and while the quality and condition of the goods could be nothing more than a matter of speculation.

Prior to 1865, the market for foreign fruit in this country was largely controlled by the great importing houses, most of whom purchased direct from the Italian producer. Among the houses that were most famous some half a century ago, one may mention the names of such firms as Devlin & Rose; Chamberlain, Phelps & Company; James Robinson & Company, and Lawrence, Giles & Company, all of New York; Daniel Draper & Company, and Conant & Company, of Boston; Dix & Williams, of Baltimore, and S. S. Scattergood & Company, and Isaac Jeanes & Company, of Philadelphia. In 1865, however, the Italian fruitgrowers consented to consign their fruit to the American firms, and this method of transacting business continued unchanged until about 1880, when several of the largest Italian fruit houses sent men to this country to represent their interests in the American market, since which time they have quite generally maintained their control over the importations from Sicily and the mainland, the Italian shippers feeling that it is safer to deal directly with a compatriot than indirectly with a stranger. As the result, Italy is still the largest importer of fruit in America. Spain's attempt to introduce her oranges was unsuccessful, and now, with the exception of her lemons and her Malaga and Almeria grapes, she sends but little of her product to this country.

The great changes in the conditions of the American fruit trade have all occurred since 1865. Prior to that time the importer of foreign fruit had little reason to figure upon any great local competition, but, since the close of the Civil War, the development of American resources has completely altered the situation. In the earlier days, New York, New Jersey, and Delaware were practically the only States in which small fruits were raised in any considerable quantities, but, even in such instances, there was nothing like a systematic trade in these products. If the Delaware peach crop failed, there was no other section of the country that could come

to the rescue, for California at that time was not what she is to-day, one of the most resourceful fruit-growing States in the Union.

The first consignment of fruit from California came by express to New York, in 1867. Although picked green, and brought through with as much care as possible, considering the primitive methods of shipment then in vogue, the condition of the fruit upon its arrival did not compensate for the expense involved in the experiment. Although financially a failure, however, both the shipper and the transportation company had learned something from the experience, with the result that, in November of the following year, a second shipment of pears and grapes was brought through in such good condition that the pears sold at $3.50 to $5 a box, and the grapes, which were principally Tokays, from $10 to $15 for each 40-pound crate. This fruit, which was consigned to N. R. Doe, came from California in four ventilated cars attached to a passenger train, and, although the transportation charges were heavy, the return was sufficient to prove that the experiment could be made a source of great profit. From this beginning the California overland fruit trade has grown steadily until to-day thousands of carloads of such fruits are shipped from that portion of the country every year, of which upward of 2,000 are consigned to New York alone. Including its canned fruits and nuts, the shipments from California, both by sea and rail, showed an aggregate of nearly 520,000 tons in 1900, and this amount, great as it may seem, has been exceeded every year since the last census figures were published.

The development of the Florida fruit trade dates from early in the seventies, and then, as now, oranges were the staple fruit of that State. Of far better quality than the foreign fruit, they speedily attained a degree of popularity that gave them a most important position in the market. For years, therefore, their sway was uncontested, and it was not until the California growers began to develop their orange industry so extensively that the Florida producer commenced to experience the effect of any rivalry.

One apparent result of the growth of the fruit industry of this country has been the creation of a greater demand for fruit in general, a demand which is now so great that even the foreign fruit trade has profited by it. As in the case of the California fruit, this situation is largely due to the condition of American transportation rates. These are so high that, even in the case of Florida fruit, the Sicilian shipper can box, transport, and pay all charges on his product, including the item of customs duties, and still land the fruit at New York at a smaller total expense than any of the local growers can market their output.

That the local fruit is able to hold its own, however, in spite of such handicaps, is indicated by the fact that the shipment of oranges from California and Florida each year closely approximate 9,000,000 boxes. In addition, there are the other fruits from California, the market for which is constantly widening, to say nothing of the millions of pineapples that are sent to the North from Florida every season, and the annual harvest of olives, which is not far short of $300,000 in value. At the same time our importations of fruit are still eight or nine times greater in value than our exports, nor is there many apparent indications that these figures will undergo much change. At present, as in the past, our exports are confined almost exclusively to our shipments of apples, an item in our commerce that has increased so materially that the exports which amounted to scarcely more than $25,000 in value in 1850, have grown to such an extent that they represented more than $3,500,000 in 1905. England is the greatest receiver of this product, and if her demand for apples continues to increase as it has during the past few years it will not be long before it will require no less than 1,500,000 barrels to meet the requirements of the great auction-houses of London, Liverpool, and Glasgow alone.

The wide development of the fruit trade which has been effected during the past 25 or 30 years has naturally resulted in the organization of many associations which have been planned as safeguards for those who are engaged in such commercial enterprises. To-day there are institutions of this character in all the large cities of the country, but those that are best known are the New York Fruit Exchange, which operates on principles similar to those of other great exchanges; the Fruit Buyers' Union, which aims to systematize the methods of the green-fruit import and auction business, and the National League of Commission Merchants, which purposes to obtain uniformity and integrity of method in the commission business. Through the efforts of these organizations, and the local exchanges and associations in other parts of the country, the dealers in fruit are now able to transact a business which aggregates, including both imports and exports, an amount which will exceed $25,000,000 per annum. In addition to this there is the enormous domestic product, which, while it varies from year to year, and has never been reduced to exact statistics, will undoubtedly represent a sum that is equally as great.

Fruits, Cold-storage of, the preservation of fruits, by keeping them in a refrigerator or ice-box of such a temperature as will neither freeze them nor permit the process of ripening to advance. The problem of cold-storage has at length been solved by experiments recently made (1903) by the government expert, W. H. Ragan of the Department of Agriculture, at Washington. It had been generally supposed that cold-storage fruit quickly rotted, on exposure to the ordinary atmosphere of the dwelling-house in summer or winter. It has, however, been discovered that when fruit is put up in a proper condition, and kept subject to a proper temperature, it remains uninjured by storage for some time. Thirty-two degrees is considered suitable temperature for the cold-storage of fruit. Peaches of good color, yet still hard, if fresh from the tree, have been kept in cold-storage for four weeks, and found at the conclusion of that period in fairly marketable condition. They have

maintained this condition for at least four days. It is only when they are in bad condition, imperfect and poorly colored, that they spoil on exposure, after resting in cold-storage.

In order to obtain good results the temperature of a cold-storage warehouse should be kept uniform throughout. Freshly plucked fruit is alone suitable for storage, for a delay of a few days, even of a few hours, will result in serious loss. While pears must be gathered as soon as they reach their full size on the tree, apples may best be stored when well matured and highly colored, though still hard. The storing should be made in small packages, certainly of not over 50 pounds; this is especially the case with regard to quickly fermenting fruits, such as pears and peaches. The careful ventilation of the cases, barrels or boxes, which enclose the fruit, is absolutely indispensable. Nothing is more likely to prolong the preservation of fruit in cold-storage than wrapping them individually. Double-wrappings are even better than single. The inner paper should be porous, like blank newspaper tissue, the outer may be paraffin paper.

Fry, Elizabeth Gurney, English philanthropist and prison reformer: b. Earlham, Norfolk, England, 21 May 1780; d. Ramsgate, Kent, 12 Oct. 1845. Brought up a Quaker by her family she did not adapt her mode of life to that prescribed by the more rigid and orthodox of the sect, till 1798, being then induced to do so by the preaching of William Savery, an American Friend traveling in England on a religious mission. This change was consummated by her marriage in 1800 with Joseph Fry, himself a «plain Friend.» In 1810 Mrs. Fry became an occasional preacher and thenceforward devoted herself to offices of the purest benevolence and piety. Owing to her unwearied exertions, important reforms were effected in the prison systems, not only of Great Britain, but also in those of France and Germany. See ‹Memoirs› by Tompson (1846); Corter (1853).

Fry, James Barnet, American military officer: b. Carrollton, Green County, Ill., 22 Feb. 1827; d. Newport, R. I., 11 July 1894. He was graduated at the United States Military Academy in 1847, and after serving as assistant instructor at West Point, he was assigned to the 3d Artillery, then in Mexico, where he remained till the close of the War. In 1863 he was appointed provost marshal-general of the United States, with headquarters at Washington, D. C.; and in 1864 was promoted brigadier-general. He was brevetted major-general in the regular army, 13 March 1865, for «faithful, meritorious, and distinguished services,» and after the War served in the divisions of the Pacific, the South, the Missouri, and the Atlantic, till 1881, when he was retired. He was the author of: ‹The History of Brevets›; ‹The Army under Buell.›

Fry, William Henry, American composer and journalist: b. Philadelphia August 1815; d. Santa Cruz, W. I., 21 Dec. 1864. He early showed a singular aptitude for music, and in 1835 produced four overtures which were performed by the Philharmonic Society of Philadelphia, who presented the composer with an honorary medal. He next wrote the operas of ‹Aurelia› and the ‹Bridal of Dunure.› In 1845 he brought out his opera of ‹Leonora,› an Italian version of which was performed in 1858 in New York. In 1846 Fry visited Europe as the correspondent of several American newspapers, and after his return in 1852 gave his attention to music, producing several symphonies of merit. In 1855 appeared his next work, a ‹Stabat Mater,› brought out at the New York Academy of Music. He subsequently became attached to the editorial staff of the New York *Tribune*, and attained much popularity as a public lecturer.

Frye, William Pierce, American lawyer, legislator, and statesman: b. Lewiston, Me., 2 Sept. 1831. The son of Col. John M. and Alice M. Frye. He was graduated at Bowdoin College in 1850 and after studying law in the office of William Pitt Fessenden, he began the practice of his profession at Rockland, and later at Lewiston. He was elected to the State legislature from the latter city in 1861, 1862, and 1867. In 1864 he was a presidential elector on the Lincoln ticket. After serving a term as mayor of Lewiston, he was elected attorney-general of the State, on the Republican ticket, holding the office from 1868 to 1870. He was elected to Congress from his home district in 1871, and was re-elected no less than five times.

In 1881 he resigned his seat in the House of Representatives to accept the nomination to the United States Senate, filling the vacancy caused by the resignation of James G. Blaine, who entered Garfield's cabinet as secretary of state. Senator Frye was re-elected to the Senate in 1889, 1895, and 1901. He was elected president pro tem. of the Senate in 1896, and has twice acted as permanent presiding officer of that body — after the death of Vice-President Hobart in 1899, and after the elevation of Vice-President Roosevelt to the Presidency in 1901. After the close of the Spanish-American war Senator Frye was a member of the Peace Commission in Paris. He was chairman of the Commerce Committee in the Senate and has exerted a great influence on national legislation. He has been looked upon as one of the great leaders of the Republican party, and has had much to do with framing legislation on the tariff and as regards American shipping. During the exciting days of the Spanish-American war he acted as chairman of the Senate Committee on Foreign Relations. Senator Frye was given the degree of LL.D. by Bowdoin College in 1889, and also by Bates College in 1881.

Fryer, John, American Orientalist: b. Hythe, Kent, England, 6 Aug. 1839. Educated in London, England, he has occupied several educational posts and acted as government translator in China. He was appointed Agassiz professor of Oriental Literature in the University of California in 1892. Among his writings are: ‹Educational Directory for China› (1895); ‹Translator's Vade-mecum, or Vocabulary of Scientific Terms in Chinese and English.›

Fteley, Alphonse, American civil engineer: b. Paris, France, April 1837; d. Yonkers, N. Y., 6 Aug. 1903. He was educated at the Ecole Polytechnique, Paris, and came to the United States in 1865. He was resident engineer of the Waterworks Bureau of Boston (1873–80); chief assistant city engineer of Boston (1880–4), and subsequently consulting engineer. He was also chief engineer of the New York Aqueduct Commission (1888–1900). In the last

named capacity he planned the Croton dam in 1891, and the Jerome Park reservoir in 1894.

Fu-Kien, foo-kē-ĕn', or **Fokien,** a province of China, bounded north by Che-Kiang, northwest and west by Kiang-Si, south by Kwang-Tung, and southeast by the China Sea; area, 38,500 square miles. The coast is deeply indented by bays and studded with islands, including Amoy, Hai-Tan, and others. The island of Formosa formerly belonged to the province. The interior is generally mountainous; but by cultivating not only the plains and slopes, but terracing the hillsides, often to their summits, the far greater part of the surface is turned to good account. The higher mountains are covered with trees, and the cultivated terraces sometimes number 30 to 40. The Min and its tributaries are the most important rivers. The principal products are rice, wheat, barley, tea of superior quality, silk, sugar, indigo, camphor, and tobacco. The minerals include iron and alum, which, with porcelain, various tissues, and the above products, are the chief exports. The capital is Fu-Chau. Amoy, a treaty port, and other important commercial towns are also included in the province. Pop. 25,790,556.

Fu-Shan, foo-shän', a town of China, in the province of Kwang-Tung, 21 miles southwest of Canton, on one of the branches of the delta of the Si-Kiang. It has manufactures of silk, iron and steel, etc., and carries on some trade. Pop. (1900) 200,000.

Fuà-Fusinato, foo-ä foo-sē-nä'tō, **Erminia,** Italian poet: b. Rovigo, 5 Oct. 1834; d. Rome 27 Sept. 1876. She was married to the poet Arnaldo Fusinato (q.v.) in 1856. Her spirited appeals to national sentiment in 1848 brought her widely into notice. In 1852 was published her 'Verses and Flowers.' She wrote a series of 'Stornelli,' advocating Florence as the national capital instead of Rome. Her complete poetical works, 'Versi,' were published in 1879; her 'Literary Writings' in 1883.

Fuca, Juan de, hoo-än' dā foo'kä (originally Apostolos Valerianos), Greek navigator: b. Cephalonia; d. Zante 1602. He was for many years in the Spanish naval service. In 1592, when he discovered the sea-passage separating Vancouver Island from Washington, and connecting the Pacific Ocean with the Gulf of Georgia and with Admiralty Inlet and Puget Sound, he thought he had chanced upon a connection between the Atlantic and Pacific oceans. This straight has been called after his name.

Fuca, Strait of. (See Juan de Fuca, Strait of.)

Fuchs, fooks, or **Fuchsius, Leonhard,** German botanist: b. Membdingen, Bavaria, 17 Jan. 1501; d. Tübingen, 10 May 1566. He studied the classics under Reuchlin at Ingolstadt, and was graduated Doctor of Medicine in 1524. He afterward turned his attention to botany, of which science he must be looked upon as one of the fathers. In his 'Historia Stirpium' (1542), he gave a clever description of domestic plants, alphabetically arranged, and laid the foundation of a permanent botanical nomenclature. The fuchsia (q.v.) was named after him.

Fuchsia, fū'shĭ-a or fook'sĭ-a, a genus of plants, the type of the tribe *Fuchsieæ,* natural order *Onagraceæ,* named after the botanist Leonhard Fuchs. The genus contains more than 50 known species, chiefly natives of Mexico, Peru, and Chile. Some have been found in New Zealand. The plants are shrubby or arborescent, sometimes climbing; the flowers are pendent, large, and fine, with brilliant and delicate coloring — purple, rose, and white; the calyx is four-cleft, the corolla four-petaled, the fruit four-celled. The leaves are opposite and verticillate. The flowers are both axillar and terminal, usually one flower springing from the axil, more rarely in racemes at the top of the branches. Fuchsias are much cultivated in conservatories, and are favorite house-plants throughout the United States. Some varieties are hardy enough to bear a northern climate. They are propagated with great facility from cuttings, but the berries, which are preserved and eaten in South America, rarely ripen elsewhere.

Fuchsine, fook'sĭn, an aniline dye prepared by the action of arsenic acid, stannic chloride, or other oxidizing agents upon a mixture of aniline and its homologue toluidine, which yields a mass with a bronze or coppery lustre, called rosaniline. This dissolved in water, precipitated with common salt, and the precipitate washed and crystallized from water, forms fuchsine, which in commerce receives various fancy names, as magenta, aniline or new red, roseine, rubine, etc. It is largely used for dyeing purposes, and wines and even confectionery are sometimes colored with it.

Fuchsius. See Fuchs.

Fuchs' Soluble Glass, so named after its inventor, Johann Nepomuk von Fuchs (1774–1856), who discovered the process in 1823, is a silicate of potassium, made by fusing 15 parts quartz sand, 10 of potassic carbonate, and 1 of charcoal. A similar compound is made from 15 parts sand, 8 carbonate of sodium, and 1 of charcoal. The mixture being made, is heated in a crucible until it is liquefied, care being taken that the materials do not remain too long in contact with the crucible, otherwise alumina, etc., may be dissolved, and the product alter its character. After cooling it forms a hard vitreous mass, tolerably permanent in the air, with conchoidal fracture; and varying in color, passing from pale-green into black. It is soluble in water, with alkaline reaction; the solution is not very stable, being apt to deposit silica on standing, and particularly if carbonic acid gas be absorbed. Soluble glass is employed to render wood uninflammable, and along with a solution of calcium to give stonework a waterproof coating. It is also the fixing agent in fresco coloring according to the art of stereochromy.

Fudge Family in Paris. A satire written by Thomas Moore in 1818, the under-bred English in foreign countries being the subject.

Fuego (fwā'gō) **Island.** See Fogo.

Fuel, any material which is burned for the purpose of warming buildings, generating mechanical power, or accomplishing other useful results. Fuels may be conveniently divided into three general classes: Solid fuels, comprising coal, lignite, peat, coke, charcoal, and wood; Liquid fuels, comprising petroleum, shale oils, and animal and vegetable oils; and Gaseous fuels, comprising natural gas, producer gas, water gas, coal gas, and «mixed gas.» Wood was formerly the chief and practically the only fuel that was used in considerable quantities,

save in regions where an abundant supply of peat could be had; but it has now been almost altogether displaced by coal, save in remote country districts, where the use of wood is still general. For detailed information concerning the various fuels mentioned above, the separate articles in this encyclopedia relating to them should be consulted. (See, for example, COAL; GAS; PEAT; PETROLEUM; WOOD; etc.) In the present article the subject will be discussed only in its general aspects.

In selecting a fuel, the main points to be considered are: (1) its cost; (2) the quantity of heat that is developed by its combustion; and (3) the mechanical problems that are involved in its use.

The cost of a fuel varies greatly, according to the location of the point of consumption with respect to the point of production; and it often happens that a fuel that is economical in one part of the world is too expensive for serious consideration in some other part. An illustration of this fact has already been given in the case of wood, and the same principle applies with equal force to many other fuels. Petroleum, for example, is too expensive to compete extensively with coal in most parts of the world, and yet in certain regions the case is exactly reversed, and petroleum is far the cheaper of the two. Coal was practically the only fuel in extensive use in Texas, for example, until the recent discoveries of petroleum were made in that region. Since that time, however, petroleum has proved itself a formidable rival of coal throughout the southwestern part of the United States. Much of the Russian coal is of an inferior quality, and upon the Russian railways, and on the Black and Caspian seas, petroleum fuel is now used in large quantities. The oil that is most commonly burned in these regions is known as «petroleum refuse,» and is the residuum that remains behind in the retorts, after the lighter parts of the Baku oil have been distilled off as naphtha, gasoline, kerosene, etc. In the United States the distillation of petroleum has been so far elaborated and perfected, in the effort to obtain every product that would have a marketable value, that there is comparatively little «refuse oil» available for fuel purposes; and where petroleum is used as fuel in this country, it is usually in the form of the crude oil, as it comes from the well. The total production of petroleum, in the United States, is altogether inadequate to the needs of the country in the way of fuel, and it has been estimated that the Pennsylvania Railroad would alone consume more than the entire supply, if it were to adopt petroleum to the exclusion of coal. It is therefore evident that petroleum can never replace coal to any considerable extent, however convenient and economical it may be in special cases.

The heating value of a fuel is most accurately determined by the actual combustion of a sample of the fuel, and the experimental determination of the quantity of heat that this sample yields. An approximate estimate may be had, however, by means of a formula that will be presently given.

In the direct determination of the heating value of a solid fuel like coal, a weighed quantity of the fuel is placed in a closed vessel called a calorimeter, which is surrounded by a known quantity of water. The details of the experiment vary to a considerable extent in different forms of calorimeter, but the central idea is to burn the fuel in pure oxygen gas, and determine the quantity of heat given off by observing the increase in the temperature of the water by which the calorimeter is surrounded. In some forms of the instrument the sample is burned in a stream of oxygen gas, the products of the combustion being preserved for subsequent analysis. In other forms, the combustion is effected in the presence of a fixed quantity of compressed oxygen, the vessel in which it takes place being hermetically sealed, so as to retain all the products of combustion within itself. In practically all cases the fuel is ignited, when the apparatus is in readiness, by means of a platinum wire, which is placed in contact with the sample, and heated white-hot by means of an electric current. In making a test of this kind, the sample of fuel is finely pulverized in a mortar, and the quantity used varies from 1 to 20 grains, smaller quantities being used, naturally, in the sealed calorimeters than in those in which a free current of oxygen is provided. In calorimetric work great attention must be paid to small details of manipulation, and reliable results cannot be had without a considerable amount of training and experience. The results of such tests are usually expressed, in England and the United States, by giving the number of pounds of water whose temperature would be raised by 1° F., through the complete combustion of one pound of the fuel, if the heat that is developed were all absorbed by the water. The quantity of heat that is required to raise the temperature of one pound of water by 1° F. is commonly taken as the unit of heat in work of this kind, and is known as the «British thermal unit» (abbreviated to «B. T. U.»). It is often called merely a «heat unit» (abbreviated to «H. U.»), but this practice is not to be commended, since it is quite likely to lead to confusion with the French, or metric heat unit, which is known as the «calorie,» and is defined as the quantity of heat required to raise the temperature of one kilogram of water by 1° C. (The calorie is equal to 3.968 British thermal units.)

The percentage of incombustible matter in coal varies greatly, some specimens of Pennsylvania anthracite containing as little as 2.24 per cent (Carpenter), while in certain other kinds of coal, from other localities, the proportion of ash occasionally is as high as 25 or 30 per cent. If the weight of the ash is deducted from the total weight of the coal, and the residue is called the «combustible,» good Pennsylvania anthracite or bituminous coal may be expected to develop about 14,000 B. T. U. per pound of combustible, and substantially the same figure may also be given for coke. Peat develops from 6,000 to 10,000 B. T. U. per pound, but peat invariably contains a considerable amount of moisture, and a very sensible part of the heat of combustion is absorbed in evaporating this, with a corresponding reduction in the quantity of heat that is available for useful purposes. Soft wood is said to yield more heat than hard wood, ash, beech, birch, elm, and oak averaging about 8,500 B. T. U. per pound of wood, while pine yields about 9,000 B. T. U. The various petroleum oils differ considerably in composition, and hence also in the quantity of heat that is developed upon combustion. As a general average,

it may be said that one pound of petroleum yields about 19,000 B. T. U. Natural gas also varies in composition and in fuel value, but American gas of average quality may be expected to yield about 1,000 B. T. U. per cubic foot. For other data of this sort, and for full information concerning the general subject of fuels and practical calorimetry, consult: Herman Poole, 'The Calorific Power of Fuels.' See also Kent. 'The Mechanical Engineer's Pocket-Book.'

When it is not convenient to make a direct calorimetric test of a fuel, an approximate estimate of its heating power may be had by calculation from some one of the numerous formulæ that have been proposed for this purpose, provided the chemical composition of the fuel is known. Dulong's formula is perhaps the best known, but Mahler's is simpler, and appears to give even better results. If C is the weight of carbon present in the fuel, and H is the weight of hydrogen, each being expressed as a decimal fraction of the total weight of the fuel, then (according to Mahler's simplified formula) the combustion of one pound of the fuel will generate $(20050C + 67500H - 5400)$ B. T. U. This formula works well with various coals, and it also gives fairly good results when applied to wood and to oils.

The mechanical questions that have to be considered in connection with the use of a proposed fuel can only receive brief illustrative treatment in the present article. It often happens, for example, that a considerable supply of vegetable matter is at hand, which is theoretically a possible fuel, but which cannot be utilized in practice until certain serious difficulties can be overcome. Sawdust is an example of this kind. It is often embarrassingly abundant about saw-mills, but it is almost invariably damp, and it mats together so compactly that no chimney will provide sufficient draft to draw through it the air that is necessary for combustion. This difficulty has been overcome, in practice, by the construction of special furnaces in which the air required for combustion is drawn over the top of the sawdust, which is thereby caused to burn from the top downward; the mass being turned over at frequent intervals, so that fresh surfaces may be exposed. The bagasse, or exhausted cane, of the southern States, is also burned with success by similar methods. As a final example of the overcoming of mechanical difficulties in the way of using a fuel, the pulverization of coal may be cited. In the mining of anthracite coal, a certain proportion of the product is unavoidably broken too fine for use upon ordinary grates. Special grates of various kinds have been tried, with varying degrees of success, in the effort to render this fine product available for the production of steam. Recently the attempt has been made to make use of it by pulverizing it still further, until it is in fact reduced to the form of an almost impalpable powder; the powder so obtained being blown into the furnace in the form of a spray of dust, together with the precise quantity of air requisite to ensure perfect combustion. The use of such finely pulverized fuel appears to be destined to increase; the main difficulties that are now in the way being the expense of the pulverization, and the danger of storing any considerable quantity of a combustible that is so finely subdivided that it may be regarded almost as an explosive, so far as danger from fire is concerned.

Fuero (from the Latin *forum*), a Spanish word signifying jurisdiction, law, privilege. It is applied to the various written codes and characters of particular districts, towns, etc., and signifies generally those laws, privileges, and immunities founded on usage and sanctioned by the suzerain or supreme authority. Fueros are both civil and ecclesiastical. The earliest, as well as the most universal, is the *fuero juzgo.* This name (a corruption of the Latin *forum judicum*) is given to a 13th century translation of a code of the 17th century. It contains the Gothic laws which, up till this time, gradually superseded the Roman. Each law receives the name of the Gothic sovereign by whom it was promulgated. This code has formed the foundation of Spanish law down even to modern times. The fueros of Leon, known by the name of *fueros bonos*, contain a complete constitution, civil and ecclesiastical, recognize the rights of self-taxation, and of the nobility of all subjects by birth. The constitution of free towns under these fueros is essentially republican, the king having only a right to name the corregidor, who must be confirmed by the junta of the province, an assembly elected by a very liberal suffrage. As the various monarchies became consolidated under a single head, the kings became anxious to evade or withdraw privileges which interfered with the organization of their kingdom, and after 1592 when Philip II. entered Aragon with an army hanged the grand-justiciary, whose office it was to administer the oath, and abolished the constitution, the fueros as a political institution ceased to exist, although some local and municipal privileges continued to be called by that name. In 1833 a civil war broke out in the Basque provinces, in assertion of the fueros, which were formally recognized in 1844. In 1876, however, the fueros of these northern provinces were superseded by the general laws of the kingdom.

Fuerte Ventura, fwär'-tä vĕn-too'rä, one of the Canary Islands, belonging to Spain. It has an area of 650 square miles and numerous extinct volcanoes. Its principal harbor is Cabras on the east coast. Pop. (1900) 11,662.

Fuertes, James Hillhouse, American civil and sanitary engineer: b. Ponce, Porto Rico, 10 Aug. 1863. He was graduated from Cornell University in 1883. He has constructed works for the sewerage, drainage and water supply of various cities in the United States, Canada and Brazil, and is a non-resident lecturer at Cornell. He has published 'Water and Public Health' (1897)

Fuertes, Louis Agassiz, American painter of birds: b. Ithaca, N. Y., 7 Feb. 1874. He was graduated from Cornell University in 1897. He has illustrated: 'Birding on a Broncho' (1896); 'Citizen Bird' (1897); 'Song Birds and Water Fowl' (1897), and other books.

Fugger, fook'ĕr or füg'gėr, the name of a wealthy and illustrious German family of Suabia, descended from a weaver, who originally lived in the environs of Augsburg, about 1300. They were at first successful in selling clothes, but afterward extended their dealings, and became

merchants, accumulating an immense fortune. Reaching the height of their affluence at the commencement of the 16th century, they rendered considerable services to the Emperors Charles V. and Maximilian, by making them large advances. These princes bestowed titles of nobility on the Fugger family, and they soon became connected with the best blood of Germany. Promoted to the highest dignities of the empire, they did not any the more neglect the pursuits of commerce. Their riches were always forthcoming for the improvement of their birthplace, Augsburg, where they erected some handsome monuments and founded philanthropical institutions. The best known of them are the three brothers, Ulric, James, and George; and afterward Raymond and Antony, both sons of George. Ulric received for his loans to Maximilian the courtship of Kirchberg, and the seigniory of Weissenhorn, which afterward remained in the possession of his family. He was a great encourager of learning. Antony and Raymond bore, to a great extent, the expenses of the expedition of Charles V. against Algeria, obtaining from him the permission to coin money. One day, at an interview with the emperor, Antony, as a mark of his regard and esteem, threw into the fire all the title-deeds and securities which Charles had deposited with him. Toward the close of the 18th century the family withdrew altogether from trade, confining themselves to the management of their landed estates. Count Anselm Maria of Babenhausen, of the Wellenberg line (b. 1776; d. 1821), was raised by the Emperor Francis II. to the dignity of a prince of the empire. The principality of Babenhausen was annexed to Bavaria in 1806, and Leopold Fugger Babenhausen (1827–85), grandson of the first prince, was a hereditary imperial councilor, and lord high-chancelor of Bavaria. He was succeeded by his brother Karl Ludwig Maria Fugger (b. 1829), who in 1891–3 was president of the Bavarian Reichsrat.

Fugio. See CENT.

Fugitive, in law, is a term applied to persons who having violated the laws of a State escape into a foreign territory. As one State cannot pursue criminals into the territories of another, the practice prevails among the more enlightened nations of mutually surrendering such fugitives to the justice of the injured State. This practice is founded on national comity and convenience, or on express compact. The United States recognize the obligation only when it is created by express agreement (see EXTRADITION). As between the States of the American Union, extradition is made compulsory by the Federal Constitution, Art. IV. Sec. 2, which provides that "a person charged in any State with treason, felony, or other crime, who shall fly from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime." In the several States there are statutory provisions or established usages regulating the procedure in such cases.

Fugitive-slave Laws. In the colonies and under the Confederation, fugitive slaves could only be reclaimed through intercolonial or interstate comity, and in framing the Constitution, one of the chief inducements for the South to join was a fugitive-slave clause. The mandate to deliver them up, however, was only to the States which could not be punished for refusing to comply; and as the free States recognized no obligation of comity on this point, the general government passed the first fugitive-slave law, signed by Washington 12 Feb. 1793. The oral testimony of the alleged owner was all the evidence required, and on this any magistrate, even a town justice, was ordered to surrender the alleged fugitive; $500 fine was imposed for rescue, concealment, or obstruction of arrest. This made kidnapping free blacks a pastime, and it was extensively carried on in the Border States; motions to amend the law and require more evidence were voted down. On the other hand, the Border States complained of increasing escapes, and Congress promptly passed an amendment (30 Jan. 1818), enabling a claimant to make his proof before a judge of his own State, and abolishing the habeas corpus in such cases. The Northern magistrates, however, revolted against the obligation; Pennsylvania passed a law contravening the national act and providing its own methods of reclamation, and made them incumbent on her own magistrates; a Maryland slave-seeker thereupon carried off an alleged slave by force, and on his indictment the Supreme Court decided (Prigg *v.* Pennsylvania) that the execution of Federal laws could not be imposed on State officials. Taney dissented; and on this doubt the Northern States began to pass "personal-liberty laws" to prevent their officials being so employed, or their buildings used as places of detention. This roused the South to demand an effective fugitive-slave law as the price of remaining in the Union; and that of 1850 (see COMPROMISE OF 1850), the death-knell of the Northern-Southern Whig party, was passed, placing the whole course of reclamation in Federal hands. The entire machinery of the United States, from courts to army, was made part of a grand system for this one purpose, and new officials were appointed for it; marshals were liable to $1,000 fine, plus the value of the slave, if he escaped or even was forcibly rescued, and bystanders were held guilty of treason for refusing to assist; the owner's oath was full evidence, that of the alleged fugitive was not to be received, and the habeas corpus was rendered null; obstruction, rescue, or concealment, were punishable by six months' imprisonment and $2,000 damages and fine; if the claimant "apprehended" a rescue, the marshal was to take the fugitive to the claimant's State himself before surrendering him; lastly, an affidavit and general description made in the claimant's own State was to be valid for a reclamation in any other. This atrocious act was met by more stringent personal-liberty laws, which made it hard for the alleged owner or his United States agents to find any State soil to stand on in executing the writs or holding the fugitive; and in 1859 Wisconsin openly threatened to secede if the mandates were executed on her soil. Its political result was an undreamt-of boomerang, each seizure rousing a glare of public notice and hatred, often inflamed still more by the incidents — as riot and bloodshed, the murder of her child by a mother to save it from slavery (see GARNER CASE), the prosecution for treason of two Quakers who refused to join the hunt (see CHRISTIANA CASE), the seizure of long-time free black citizens of towns, etc. The

Free-Soil party demanded its repeal; the Republican party inherited and pressed the claim; and the success of the latter in 1860 was taken by the South as notice that the next administration would repeal it.

Fugue, fūg, a musical term derived from the Latin word *fuga*, — a flight, and signifying a polyphonic composition constructed on one or more short subjects or themes, which are harmonized according to the laws of counterpoint, and introduced from time to time with various contrapuntal devices. The interest in these frequently heard themes is sustained by diminishing the interval of time at which they follow each other, and monotony is avoided by the occasional use of episodes, or passages open to free treatment. The chief elements of a fugue are: (1) the subject; (2) the counter-subject, or contrapuntal harmonization of the answer by the part which has finished the enunciation of the subject; (3) the answer; (4) episodes; (5) the stretto; and (6) the pedal point.

There are three kinds of fugue, the simple, containing one subject; the double, consisting of two subjects, occasionally intermingled and moving together, and the counter fugue, in which the subjects move in a direction contrary to each other. In all the fugues the parts *fly*, as it were, after each other, whence the name. The great masters of fugal form are Johann Sebastian Bach and Handel.

Fuller, Anna, American novelist: b. Cambridge, Mass., 9 Nov. 1853. Her works are: ‘Pratt Portraits; Sketched in a New England Suburb’ (1892); ‘A Literary Courtship’ (1893); ‘Peak and Prairie’ (1894); ‘A Venetian June’ (1896); ‘One of the Pilgrims’ (1898); ‘Katherine Day’ (1901); ‘A Bookful of Girls’ (1904).

Fuller, Arthur Buckminster, American Unitarian clergyman: b. Cambridgeport, Mass., 1822; d. at the battle of Fredericksburg, Va., 13 Dec. 1862. He was graduated from Harvard in 1843, studied in the Harvard Divinity School, and held pastorates in Manchester, N. H., and Boston and Watertown, Mass. In the Civil War he was chaplain to a Massachusetts regiment. He edited several works of his sister, Sarah Margaret Fuller d'Ossoli (q.v.).

Fuller, George, American artist: b. Deerfield, Mass., 1822; d. Boston 21 March 1884. As early as 1857 his work attracted attention, and during the last years of his life his pictures were warmly admired by many for their richness of tone and peculiar handling, though they never appealed to the popular taste. His best-known works are: ‘The Romany Girl’ (1879); ‘She was a Witch’ (1879); ‘Winifred Dysart’ (1881); ‘A Turkey Pasture in Kentucky’; ‘Fedalma’ (1884).

Fuller, Henry Blake, American author: b. Chicago, Ill., 9 Jan. 1857. He was intended for a mercantile career, but entered literature with ‘The Chevalier of Pensieri-Vani’ (1891), and ‘The Châtelaine of La Trinité’ (1892). He next wrote: ‘The Cliff Dwellers’ (1893), and ‘With the Procession’ (1895), novels of Chicago life; ‘The Puppet-Booth’ (1896), dramatic sketches; ‘From the Other Side’ (1898), short stories; ‘The Last Refuge’ (1900); ‘Under the Skylights.’

Fuller, Melville Weston, eminent American jurist and one of the chief justices of the Supreme Court of the United States. He was born in Augusta, Me., 11 Feb. 1833; graduated at Bowdoin College (A.M.) in 1853, and attended a course of lectures at the Harvard Law School (LL.D.), and was admitted to the bar in his native city in 1855. He began the practice of law, meanwhile becoming the associate editor of the ‘Age,’ a Democratic newspaper. In 1856 he was elected city attorney and president of the common council. He resigned these offices and removed to Chicago, where he established an extensive law practice.

In 1862 he became a member of the Illinois State Constitutional Convention, and in the following year was elected from Cook County to the lower house of the State legislature. He rose rapidly in State and national politics, and from 1864 to 1880 was regularly a delegate from Illinois to the Democratic national conventions. In 1876 he placed Thomas A. Hendricks in nomination and was himself seriously considered as a candidate for presidential nomination in 1880. The same year he practically retired from politics, but gained additional fame as a lawyer during the next few years. In the famous lake-front case in Chicago he was counsel for the municipality, and in the Cheney ecclesiastical case, he defended Rev. C. E. Cheney, a Protestant Episcopal clergyman, rector of Christ Church, Chicago, against an action brought by an ecclesiastic council.

In April 1888 President Cleveland appointed him chief justice of the United States Supreme Court to succeed R. M. Waite (q.v.), deceased. He was confirmed 20 July 1888, taking the oath of office 8 October. About this time Bowdoin, Harvard College, and the Northwestern University conferred degrees upon him. In the Supreme Court he soon became a prominent figure, and he was largely responsible for the expansion of Federal power, by means of the decision asserting the implied authority of the executive to protect the Federal judge on occasion when there is just reason to believe that, while in the exercise of official duties, they are exposed to personal danger. This was especially applicable to the case of one Nagle, an Arizona cowboy, who was made a United States marshal to protect the person of Chief Justice Field, and who while performing this duty, shot and killed Judge Terry, of California.

In 1899 Justice Fuller was a member of the Arbitration Commission convened at Paris for the adjustment of the Venezuela boundary question.

Fuller, Sarah Margaret. See OSSOLI, SARAH MARGARET, MARCHIONESS D'.

Fuller, Thomas, English historian and Anglican: b. Aldwinkle, Northamptonshire, June 1608; d. London 16 Aug. 1661. He was graduated from Queen's College, Cambridge. In 1630 took orders and was appointed perpetual curate of St. Benet's parish, Cambridge, and became very popular as a preacher. In 1631 he became prebend in the cathedral of Salisbury. The same year he published a poem entitled ‘David's hainous Sin, heartie Repentance, and heavie Punishment.’ He gave up his Cambridge curacy in 1633, and next year became rector of Broadwindsor, Dorsetshire. His ‘History of the Holy Ware’ appeared 1639, soon after the

MELVILLE WESTON FULLER.

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1888.

publication of which he removed to London, and was chosen lecturer at the Savoy Church in the Strand. In 1642 he published his 'Holy and Profane State' (folio). In 1650 he published 'Pisgah Sight of Palestine and the Confines thereof, with the History of the Old and New Testament acted thereon' (folio), and in 1650 appeared his 'Abel Redivivus,' consisting of lives of religious reformers, martyrs, divines, etc. In 1655 he published the 'Church History of Britain, from the Birth of Jesus Christ to the Year 1648'; to which was subjoined the 'History of the University of Cambridge since the Conquest,' and the 'History of Waltham Abbey.' The year after his death was published his principal literary work, the 'Worthies of England' — a production valuable alike for the solid information it affords relative to the provincial history of the country and for the profusion of biographical anecdote and acute observation on men and manners. Consult 'Life' by Bailey (1874).

Fuller-Maitland, John Alexander, English musical critic: b. 1856. He was graduated from Trinity College, Cambridge, in 1879, and in 1889 became musical critic on the staff of the London *Times*. He contributed to Sir George Grove's 'Dictionary of Music and Musicians,' the appendix to which he edited; translated (with C. Bell 1884) Spetta's 'Johann Sebastian Bach,' wrote a standard 'Life of Robert Schumann' (1884), and further published: 'Masters of German Music' (1894); 'The Musician's Pilgrimage' (1899).

Fullerites, a religious sect near Athol, Mass., known as Fullerites or Howlandites, established 15 Sept. 1855, by Frederick T. Howland, a Quaker, of New Bedford, Mass. Among early converts was Leonard C. Fuller, the present head of the community. Their religious belief resembles somewhat that of the Adventists, but differs in the vital point that the reign of Christ, under the expected new dispensation, is to be spiritual and not personal as held by the Adventists. They believe the judgment day has already begun; the earth is not to be destroyed, but changed; they entirely renounce spiritualism. The community live chiefly upon farinaceous food; they drink principally water and sometimes herb tea. They live on the apostolic plan of having all property in common. They dress very plainly and no jewelry is worn. Sabbath is observed from 6 P.M. Friday until 6 P.M. Saturday. They own a farm of 210 acres.

Fullers' Earth, a pulverulent material formerly much used for fulling cloth and wool, but now more generally employed as a filtering material for the clarification of oils. It is not a substance of definite composition, but consists essentially of clay, mixed with sufficient finely divided silicious matter to destroy its plasticity. The production in the United States in 1902 was $98,144, chiefly from Florida. It also occurs in Georgia, Arkansas, and other States.

Fullerton, George Stuart, American professor of philosophy: b. Fathegarh, India, 18 Aug. 1859. He was graduated from the University of Pennsylvania and in 1887 he was appointed professor of philosophy in the same institution. He is the author of: 'Preliminary Report of Seybert Commission on Spiritualism' (1887); 'The Conception of the Infinite' (1887); 'A Plain Argument for God' (1889); 'The Philosophy of Spinoza' (1894); 'On Spinozistic Immortality' (1899).

Fullerton, Lady Georgiana Charlotte Gower, English novelist: b. Tixall Hall, Staffordshire, England, 23 Sept. 1812; d. Bournemouth, Hampshire, 19 Jan. 1885. She was married to Alexander George Fullerton in 1833, and followed him into the Roman Catholic Church in 1846. Her first novel, 'Ellen Middleton' (1844), was followed by 'Grantley Manor' (1847). Her later stories, after her conversion to the Catholic faith are in a mild way "stories with a purpose," the purpose being to develop the influence of religious belief on life and character; among them are: 'Lady Bird' (1852); 'Too Strange Not to be True' (1864); 'Mrs. Gerald's Niece' (1871); 'A Will and a Way' (1881). She wrote also 'The Gold-Digger, and Other Verses' (1872). See Craven, 'Life of Lady Georgiana Fullerton,' translated from the French by H. J. Coleridge (1888).

Fulling, the act of cleansing, scouring, and pressing woven woolen goods, etc., to render them stronger, firmer, and closer; called also milling, because these cloths are usually scoured by a water-mill. The principal parts of a fulling-mill are the wheel, with its trundle, which gives motion to the tree or spindle, whose teeth communicate that motion to the pestles or stampers, which fall into troughs, wherein the cloth is put, with fullers' earth, to be scoured and thickened by this process of beating it. The operation takes from 48 to 65 hours, and results usually in considerable shrinkage in length and width; it obviates the tendency to unravel and renders the threads of the cloth so firm and close as to be almost imperceptible.

Fulmar, fŭl'mar, an Arctic petrel (*Fulmarus glacialis*), which breeds on rocky coasts of the North Atlantic in enormous colonies, and comes southward in winter. It is about the size of a large duck. The head and neck are pure white; the back and long wings of a pearly gray; breast, belly, and under surface white; bill large, strong and yellow; legs and toes brownish. The young are brownish gray. In the Hebrides, and especially in St. Kilda, where these birds reside in incredible numbers, they are of great value to the people. The fulmars breed on the faces of the highest precipices, on which every grassy shelf over a few inches in extent is covered with their nests, which are slightly excavated in the turf and lined with dry grass and withered tufts of sea-pink. One egg is deposited at a time, which the cliffmen obtain by descending with ropes from the summit of the cliffs. The birds, when seized, vomit a quantity of clear amber-colored oil of a disagreeable odor, which is one of the most valuable products of St. Kilda. The old birds feed the very young with it. The fulmar feeds on animal substances, chiefly fat. It flies buoyantly and rapidly, and withstands heavy gales, skimming the surface of the water. When a whale is caught, though few of the fulmars should be present, they assemble in thousands as soon as the cutting up is commenced; hence the whalers call them "whale-birds" or "mollymauks." They follow in the greasy track of a ship, coming within a few yards of the men engaged in cutting, and devour the morsels of fat voraciously and in great quantity.

Various other large oceanic petrels are called fulmars, as the "Cape pigeon" (*Daption capensis*), giant petrel, "nelly" or "bonebreaker" (*Ossifraga gigantea*) of the Indian and Antarctic seas, and several species in the North and South Pacific. See PETREL.

Fulminates, fŭl'mĭ nāts, compounds of fulminic acid, all of which are violently explosive. The most important of these is mercuric fulminate, which is formed by dissolving 10 parts by weight of mercury in 120 parts of nitric acid (specific gravity 1.4) and, when cooled, pouring this solution into 110 parts of 95 per cent grain alcohol. At the normal temperature a reaction sets in which becomes quite turbulent, dense white fumes being given off and then red fumes, and after this, the mercuric fulminate separates out as a gray, crystalline powder. It has the formula of $HgO_2N_2C_2$, and belongs to the class of chemical substances known as oximes. Its specific gravity is 4.42. When dry, mercuric fulminate explodes violently if struck or compressed or rubbed between hard surfaces, when heated to 186° C., when touched with strong sulphuric or nitric acids, or when in contact with sparks from flint and steel or electric sparks. In all these cases the body undergoes a detonating explosion, and its principal use is to produce detonation in high explosives, though it is also used in percussion caps and primers to ignite gunpowder and other low explosives. Mercuric fulminate should be stored and transported only in the moist condition, yet even in this condition it can be exploded by the explosion of dry fulminate in contact with it. Certain amines like fulminating silver, gold, mercury and copper are frequently confounded with the fulminates because they are also explosive. The best known of these is Berthollet's fulminating silver, which was used in the bomb which killed the Czar of Russia. This body is made by treating freshly precipitated silver oxide with ammonia water. It separates out as a black, crystalline mass, which explodes on the slightest concussion when dry and may even be exploded by rubbing when moist, so that it requires the greatest caution in handling. It has been repeatedly formed accidentally in the ammoniacal silver solutions used in silvering mirrors and in the silver baths used in the wet processes of photography and has given rise to serious explosions. See EXPLOSIVES.

Fulmina'tion, a term used in chemistry to denote the sudden decomposition of a body by heat or percussion, accompanied by a flash of light and a loud report, and differs therefore but little from detonation: except that the latter refers more to the sound, and the former to the flash. See DETONATION; EXPLOSIVES; FULMINATES.

Fulminic Acid. See FULMINATES.

Fulton, Robert, American inventor: b. Little Britain, Lancaster County, Pa., 1765; d. New York 24 Feb. 1815. Early in life he manifested a taste for painting, and purposing to adopt it as a profession, went to England to study under Benjamin West. In that country, however, he became acquainted with the Duke of Bridgewater, the founder of the canal system of Great Britain, who induced Fulton to abandon art, and take to the study of mechanical science. This nobleman was at the time engaged in a scheme of steam navigation, which he imparted to Fulton. The latter visiting Birmingham was brought into communication with the celebrated James Watt, who had just succeeded in his great improvement of the steam-engine, with the construction of which Fulton made himself thoroughly familiar during his stay. About this time he invented a machine for spinning flax, and another for making ropes, for which he obtained patents in England. In 1796 he published a 'Treatise on the Improvement of Canal Navigation.' From 1797 to 1804 he resided in Paris with Joel Barlow, the American representative at the French court. During this period he invented a submarine or plunging boat, called a "torpedo," designed to be used in naval warfare. He invited the attention of the French government to his invention, and Bonaparte, then first consul, appointed Volney, La Place, and Monge as a commission to examine it. Several experiments were made in 1801 in the harbor of Brest. He could easily descend to any depth, or rise to the surface; and where there was no strong current, the boat was quite obedient to her helm while under water. On one occasion, he remained in the torpedo several feet below the surface for more than four hours; but the motion of the boat while submerged was very slow, and it was clearly unequal to the stemming of a strong current. The French government declined to patronize the project, and Fulton accepted an invitation from the English ministry, who also appointed a commission to test the merits of his torpedo. He appears, however, to have received but little encouragement, and in 1806 returned to the United States. Having been supplied with the necessary funds by Robert Livingston (q.v.), who had been American ambassador at Paris, Fulton had the satisfaction of proving, in 1807, that steam could be applied to the propulsion of vessels with entire success. His achievement excited universal admiration, and from that time steamboats were rapidly multiplied on the waters of the United States. His first steamboat, called the Clermont (of 140 feet keel and 16½ feet beam), made a progress on the Hudson of five miles an hour. His second large boat on the Hudson was the Car of Neptune, and was built in 1807. He afterward built other steam vessels, one of them a frigate, which bore his name. His reputation became established, and his fortune was rapidly increasing, when his patent for steam vessels was disputed, and his opponents were in a considerable degree successful. Though an amiable, social, and liberal man, the anxiety and fretfulness occasioned by the lawsuits about his patent rights, together with his enthusiasm, which led him to expose himself too much while directing his workmen, impaired his constitution, and he died at the early age of 49. He was buried in Trinity churchyard, New York, and in 1901 a monument to his memory was placed there by the American Society of Mechanical Engineers. His name is perpetuated in the immediate locality by Fulton Street, Fulton Market and Fulton Ferry. Consult: Colden, 'Life of Fulton' (1817); Preble, 'History of Steam Navigation' (1883).

Fulton, Ill., city in Whiteside County, on the Mississippi River, and on the Chicago, M. & St. P., the Chicago, B. & N. and the Chicago & N. W. R.R.'s; 36 miles northeast of Rock

ROBERT FULTON.

Island. The Northwestern College of Illinois was opened here in 1865, and other prominent educational institutions are located in this vicinity. There are extensive lumber manufactories, clay-mills, sewer-pipe works, stove and metal foundries, and there is a large trade here in grain, lumber, and produce. The municipality is governed by a mayor and council elected every two years by popular vote. Pop. (1900) 2,685.

Fulton, Mo., city and county-seat of Callaway County, on the Chicago & A. R.R., 125 miles west of St. Louis. Here are located the State Institution for the Deaf and Dumb, State Lunatic Asylum No. 1, Westminster College (Presbyterian), founded 1852; the Woods College of the Christian Church of Missouri, and the Synodical College and Conservatory of Music. Fulton is noted for its fire-brick and pottery works, the city having an extensive supply of coal and fire-clay. The town was settled in 1821, and was incorporated as a city in 1859. The charter has never been changed since that date. The mayor and council are elected annually. The city owns and operates its electric light and water plants. Pop. (1900) 4,883.

Fulton, N. Y., city in Oswego County, on the Oswego River and the Oswego Canal, and on the New York C., New York, O. & W., and Delaware & L. R.R.'s, 25 miles northwest of Syracuse. It has a public library, city hall, opera house and other public buildings. It is the centre of the cheese trade of northern New York, and there are manufactures here of paper, woolen goods, flour, fire-arms, tools, water-motors, cutlery, paper-mill machinery, condensed milk, canned goods, etc. Fulton was settled in 1791 and was originally incorporated as a village in 1835. The villages of Fulton and Oswego Falls, with an aggregate population of 8,206, were consolidated and chartered as a city in April 1902. A mayor and common council govern the city, being elected every two years by popular vote. The municipality owns and operates the waterworks.

Fulvia, fŭl'vĭ-a, Roman matron: d. about 40 B.C. After being twice married she became the wife of Mark Antony. Antony divorced her to marry Cleopatra, upon which she attempted to persuade Augustus to take up arms against her husband. When this scheme did not succeed she retired into the East, where Antony received her with great coldness. This broke her heart, and she soon after died.

Fumiga'tion, an attempt at disinfection by gaseous agents. Fumigation is probably a very unsatisfactory mode of bringing about disinfection. The agents that are used most effectively are chlorine gas, sulphur dioxide, and formaldehyde. It has been distinctly demonstrated that chlorine gas as a disinfecting agent is untrustworthy, and that its application is attended with many disadvantages. Sulphur dioxide, in the absence of moisture, gives practically no results, and even when aqueous vapor is generated in a room previous to the use of the gas its bactericidal action is very slight. Moreover, sulphur dioxide in the presence of moisture in the air tarnishes brass and silver, gilt frames, etc., and corrodes fabrics and other stuffs. It is not a satisfactory disinfectant. Formaldehyde gas has been used since 1890 for fumigation. The vapor is extremely pungent, and it has a strong affinity for all organic substances. Its practical value as a disinfectant has been demonstrated to be above that of any other gaseous substance. It cannot, however, be said to give absolute results, and although its power of penetration is greater than in that of any of the others mentioned it is still only a surface disinfectant. The interior of a heap of clothing, for instance, if exposed to the gas, is not affected at all by it. Formaldehyde gas as a fumigant is not sufficiently strong to kill many household pests. This casts suspicion on its value as a room disinfectant. Moreover, it is very costly. In general it may be gathered that gaseous disinfection by fumigants is somewhat of a farce; and although formaldehyde gas approaches more closely the requirements of the ideal, it is far from being perfect. The best disinfectant for rooms is unquestionably sunlight. Short of this, thorough cleansing, rubbing down the walls, etc., should be carried out. As noted in the article on disinfection, it is the effort of hygienists to particularize on the type of disease agents which they desire to eradicate. The general modes of disinfection heretofore much in vogue were largely founded on a lack of knowledge of what the infecting agents have been. See BACTERICIDE; DISINFECTANTS.

Fu'mitory («smoke of the earth»), a name commonly given to species of the genus *Fumaria.* It is a native European weed which has been naturalized in America. The climbing fumitory or mountain-fringe of the United States grows well under cultivation. To the family *Fumariaceæ* belongs the genus *Corydalis,* found throughout most of the north temperate zone.

Funchal, foon-shäl, Madeira, the capital and seaport of the island in the centre of a large bay on the south coast of Madeira. It is irregularly built; the streets are narrow, winding, ill-paved, and dirty. An old castle, which commands the roads, stands on the top of a steep, black rock, called Loo Rock, surrounded by the sea at high water. The entire produce of the island, consisting mostly of wine and fruit, is exported from Funchal. Pop. (1901) 19,600, among whom are many English, French, Portuguese, and mulatto and negro freedmen. See MADEIRA.

Funck-Brentano, funk brōn-tä-nō, **Théophile,** French philosophical and critical writer: b. Luxembourg 20 Aug. 1830. He became professor at the School of Political Sciences in Paris in 1873. His thorough studies in law and medicine have imparted to his philosophical writings an exactitude of thought and inspired a special stress on method, very apparent in such works of his as: 'New Thoughts and Maxims' (1858); 'Exact Thought in Philosophy' (1869); 'Greek Sophists and Contemporary English Sophists' (1879); and others. As a critic he is esteemed for the happy presentation and careful elaboration of his thought.

Function, (1) In biology, the action proper to tissues, organs, or groups of organs in plant and animal life. The function of respiration is the joint action of lungs and skin; digestion is a very compound function, to which organs and groups of organs contribute. The actions are capable of being grouped in subordination to three leading phenomena of every liv-

ing thing — namely, sustentation, reproduction, and relation. To the first belong digestion and all the other functions which contribute to the vegetative life; the processes of the second are, as examples of cell transformation, so far identical with those of the other two, but the results are different; the cell changes of the nervous system which regulates the relations of living things, are again identical with those of the other two sets of phenomena. Functional diseases are those due to organs perfect in structure but not performing their functions properly; as opposed to organic or structural diseases, due to defect of structure.

Organs often have more than one function — a *primary*, or that for which it is principally intended, and a secondary, some subsidiary purpose which it performs. It sometimes happens that important changes take place in the course of the evolution of a type, or the development of an individual, whereby the primary function disappears and some secondary use becomes preeminent or exclusive. Thus "a brilliant speculation," says Carpenter, "has indicated pairs of tracheal gills on the meso- and metathorax as the possible origin of insect wings. The primeval insects forsook, so it is thought, the water for the land; and the plates, becoming useless for breathing, were enlarged and finally changed into organs of flight." Another strong and familiar example is the case so often presented among crustaceans where the mouth parts are largely structures ("foot-jaws") originally ambulatory, but now entirely devoted to the seizing and mastication of food. Change of function results in change of structure.

(2) In mathematics, one quantity is said to be a function of another, or of several others, when its value depends on those of the latter. Thus the area of a triangle is a function of its three sides, and $y = a + bx + cx^2$ is a function of a, b, c, and x. Functions receive distinctive names according to the nature of the dependence above referred to. Thus the function above written is said to be an algebraical function of x, since y is obtainable from x by the performance of a limited and definite number of algebraical operations. Log x, sin x, a^x, on the other hand, are said to be transcendental functions of x, and for obvious reasons receive the distinctive names of logarithmic, trigonometrical, and exponential functions. See COMPLEX VARIABLE.

Fundamental Note, Tone, or **Bass,** (1) The lowest or gravest note that a string or pipe sounds in generating a series of harmonics. The fundamental note of a stretched string is sounded when the string vibrates as a whole. The fundamental note of an open organ-pipe is sounded when there is one node at the middle of the pipe. In a closed organ-pipe the closed end or stopper acts as the node when sounding the fundamental note.

(2) The fundamental note also signifies the root of a chord, irrespective of the inversions of the chord; thus in the common chord of C, C E G, C is the fundamental note and remains so in the inversions E G C, G C E, E and G being called the bass notes.

Fundamental Units is the term employed in physics for units which constitute the foundation of calculations with regard to other quantities; units used for measuring others. Fundamental units are three, namely, a definite length, a definite mass, and a definite interval of time. For example, in the decimal system, the centimetre, gram, and mean solar second.

Funded Debt. See DEBT, NATIONAL.

Funding, in finance, the conversion of floating debt into an interest-bearing obligation with a definite period, on which bonds can be issued. One such operation is of special interest in United States history, as part of the operations by which Hamilton, as leader of the Federalists (q.v.), and then secretary of the treasury, succeeded in setting the government on a firm foundation. The Act of 4 Aug. 1790 funded not only the foreign and domestic debt in full, but the State debts incurred in carrying on the Revolutionary War; the bonds were at 6 per cent, but those for the domestic debt did not bear interest till 1800.

Funds, Public. See DEBT, NATIONAL.

Fundy, Bay of, a huge arm of the Atlantic Ocean extending into the land between New Brunswick and Nova Scotia, and the State of Maine, and terminating in two smaller bays, Chignecto Bay and the Basin of Minas. Its length up to Chignecto Bay is 140 miles, and its extreme breadth 45 miles. It is noted for its high tides, which are influenced by the Gulf Stream, and rise about 30 feet at St. John and 60 feet at the head of Chignecto Bay, rushing into the latter with remarkable force. At Bay Verte, 14 miles distant, the tide rises little more than 4 or 5 feet. Along its northwest side the Bay of Fundy receives the St. John, the largest river in New Brunswick, and also the St. Croix. The tides in the Fundy are perilous to navigation and produce dangerous bores, especially in the upper reaches of the Bay. At low tide there is a long expanse of mud flats, at times over 2 miles in length, and the inreaching estuaries are completely drained. At the entrance to the Bay of Fundy are the Grand Manan and other islands. See TIDES.

Fü'nen, an island of the Danish archipelago, separated from Jütland by the strait called Little Belt; area 1,123 square miles; pop. (1901) 279,501. Its shores are deeply indented; its interior is undulating, and there are numerous lakes, streams, and marshes. The largest stream is the Odense, 36 miles long. It trades principally with Sweden and Norway. It forms with other islands a province of Denmark (q.v.). Chief towns: Odense, the capital, Svendborg, and Nyborg.

Funeral Rites, the last religious and ceremonial tribute of friendship and love paid to the remains of the dead. Among the Hindus the corpse is perfumed and adorned with flowers; it is then burned; after many ceremonies the bones are deposited in a casket and buried, but afterward disinterred and thrown into the Ganges. A second series of obsequies commences after the period of mourning has expired, and this is followed by commemorative rites. The voluntary immolation (*suttee*) of the widow of the deceased, now abolished, was the most remarkable part of the ceremony. The Mohammedans bury their dead. The interment takes place as soon as possible, in obedience to the command of the Prophet: "Make haste to bury the dead, that, if he have done well, he may go forthwith into blessedness; if evil, into hell-fire." No signs of excessive grief, no tears nor lamenta-

tions, are allowed, as it is the duty of a good Mussulman to acquiesce without a murmur in the will of God. On arriving at the burial place the body is committed to the earth with the face turned toward Mecca. Monuments are forbidden by the law, but they are constantly erected. The Egyptians, it is well known, embalmed their dead. Among the Jews the next of kin closed the eyes of the deceased; the corpse was then washed, and, in the case of persons of some consequence at any rate, laid for a time in spices or anointed with spices, swathed in linen bandages, and deposited in the tomb. The mourning customs of the Jews may be collected from various passages of the Scriptures. They went bareheaded and barefoot, covered their mouths and kept silence, put on sackcloth and sat in ashes; funeral songs were sung by persons hired for the purpose. Splendid monuments were sometimes hewn out of the solid rock, with numerous niches: as each niche was filled, its entrance was stopped up by a large stone rolled against it. In the religious creed of the Greeks and Romans sepulture was an act of piety to the dead; without it the spirit had to wander 100 years on the banks of the gloomy Styx. The last breath was generally caught by a near relative, who opened his mouth to receive it; the body was washed and crowned with flowers, a cake of flour and honey placed in the hand, as a bribe for Cerberus, and an obolus in the mouth, as a fee for Charon. Interment and burning were practised indifferently. In interment the body was placed with the face upward and the head toward the west. In burning the pile varied in form and material: it was lighted by the nearest relative; perfumes and wine were poured on it, and the richest clothes of the dead were burned with him. The ashes were then collected and deposited in an urn. This description applies to the Greeks and Romans, whose rites were nearly identical.

In the Roman Catholic Church the body is washed immediately after death, a crucifix is placed in the hands, and a vessel of holy-water at the feet, with which the visitants sprinkle it. The Ritual prescribes that the corpse be borne in procession from the house in which it lies to the church, attended by the parish priest with acolytes and servitors all in cassock and surplice, and one of them bearing the processional cross in the van. Before the procession moves, the priest first sprinkles the coffin with holy-water and recites the *De Profundis* and the *Miserere* while the procession is in movement. Taken into the church, the coffin is laid on trestles in the middle of the nave, the feet to the east or the sanctuary, if the deceased was a layman, the head to the sanctuary if he was a priest; lighted candles surround the coffin. Then follows the Office for the Dead, and after that the Mass for the Dead. After the Mass the priest, attended by the acolytes, pronounces the Absolution and certain prayers, meanwhile sprinkling the coffin with holy-water and fumigating it with frankincense. The procession is now reformed and the body borne to the place of burial. There the *Benedictus* is sung or recited, followed by the Antiphon, *Ego sum resurrectio et vita* ("I am the resurrection and the life"); the corpse is again sprinkled, a final prayer is pronounced, and the body is laid in the grave or tomb. In the funerals of children, the vestments of the clergy are white instead of black, joyous psalms are chanted or recited, there are antiphons of praise and thanksgiving instead of petitions for mercy and forgiveness; and the church bell is not tolled.

In the Greek Church there are distinct services for laymen, monks, and priests severally. The officiant holds a short service at the house of the defunct; service is held at the church, to which the body has been brought, and then at the grave, where the priest takes a shovel and sprinkles dust cross-wise on the body. Finally, before the grave is closed, he casts wax or ashes from his censer upon the coffin. The English Church, followed very closely by the Protestant Episcopal Church in the United States, uses the order for the Burial of the Dead in the Book of Common Prayer. It is a stately and somewhat elaborate service, which is frequently used in part by other Protestant bodies. The first section of the service is recited in church, to which the body has been brought, or at the house of the defunct. It consists of anthem, psalms and a lesson. The second section, sometimes called the committal, is recited at the grave, where dust is scattered on the coffin as it has been lowered.

Fungi, fŭn'jī (singular *Fungus,* Latin name for mushroom), the general name applied to a multitude of lower plants of quite diverse structure, but which agree in not containing chlorophyll, the green coloring matter of the vegetable kingdom. Formerly the fungi were regarded as constituting a natural group (class or order) of plants, but are now recognized by modern botanists as belonging to many natural groups of plants.

The peculiarities of fungi are physiological; they result from their food habits, and are not primarily structural and of profound significance. When we enumerate the physiological changes involved in the change of a plant from an independent life to one of parasitism or saprophytism, we have considered all of the essential differences between the fungi and the green plants from which they have been derived. We may say then, that a fungus is a lower plant which has suffered certain physiological changes on account of the fact that it has become parasitic or saprophytic.

Before going farther it is necessary to define certain terms which must be used in any discussion of the fungi. A plant is a *parasite* when it lives upon or in another living plant, absorbing food from it, and living at its expense. The mere fact of growing upon another plant does not make the first parasitic, for there are many small plants which merely find lodgment upon larger species, not, however, absorbing anything from the plants on which they are lodged. When it is necessary to distinguish such plants, they are called *epiphytes.* In the case of parasites the plant upon which they live is spoken of as the *host.* When a plant lives upon a plant which is no longer living, it is called a *saprophyte.* Thus the toadstools which grow so freely on manure and other decaying vegetable matter are saprophytes. It is sometimes necessary to have a term to apply to plants which are neither parasitic nor saprophytic, and then we use the word *holophyte.* Thus all common green plants are holophytes. When it is desired to contrast holophytes with

both parasites and saprophytes, we can use the term *hysterophyte* for the parasitic and saprophytic plants.

Applying the terms we have now defined, we may say that all fungi are hysterophytes, some living parasitically upon their hosts, others living saprophytically.

All holophytes are green in color, and the significance of this is purely physiological. Green plants absorb the gas carbon dioxide, and in green cells this is combined with some of the elements in the ever-present moisture of the plant into a chemical compound allied to starch and sugar, and characterized by consisting of nearly equal amounts of carbon and oxygen, combined with nearly double the amount of hydrogen.

Such compounds are known as carbohydrates and they are made by all holophytes, and then used in the processes of assimilation and growth. It has been demonstrated that plants which are not green cannot make the carbohydrates, and since all plants need these compounds for building up their tissues, it follows that colorless plants must obtain them by taking them from living or dead green plants. Last, it should be borne in mind that even green plants cannot make the carbohydrates in darkness. For this work they need light and in fact the greatest importance of light to a plant is in connection with this process of making carbohydrates. Accordingly plants which are not green, and which as a consequence do not make carbohydrates, often grow in darkness or in feeble light. This is quite characteristic of the fungi, great numbers of which grow as well in darkness as in light, or in some cases grow even much better in the darkness than they do in the light.

The fungi are very numerous, some recent estimates placing the number of species as high as 250,000, of which not more than one third have as yet been described. They occur wherever there is organic matter of any kind upon which they can subsist. Wherever there are living plants or animals there are fungi which obtain food either from the living cells of their hosts, or the dead and cast-off cells and tissues. Some species occur in the lower layers of the air, in all exposed waters, and in the soil. They are the most numerous of living things when we consider individuals alone. They range in size from extremely small to many centimetres in length. The smallest are far too minute to be seen by the naked eye, some being visible only by the aid of the most powerful microscopes. Of some of the smallest species it would require 25,000 to 30,000 placed side by side to measure one inch. On the other hand there are toadstools a foot or so in height and diameter, and puff-balls two to three feet in diameter have been recorded.

The fungi as thus described are found in three of the grand divisions (branches) of the vegetable kingdom.

Branch Protophyta. The Protophytes.— Here are gathered a thousand or so species of microscopic aquatic plants in which the cells have a very low organization. No distinct nucleus is present, and the coloring matter in the typical plants pervades the whole cell, and is of a bluish or brownish-green color instead of a bright green as in higher plants. They reproduce by simple fission, and by the production of spores. There is no hint of any sexual reproductive process. They occur in ponds, pools and streams, to which they give a greenish color by their great numbers. In decaying they usually give off a fetid odor.

While the typical Protophytes are greenish — and are known as green slimes — many have become parasitic or saprophytic, and have lost their green color. These colorless species are known as Bacteria, and are the lowest of the fungi.

Bacteria (Fig. 1) are then to be regarded as colorless green slimes, their lack of color being due to their parasitic or saprophytic habits. Some species are minute rounded cells of remarkable minuteness. To these the generic name *Micrococcus* has been given, and many species have been recognized by botanists.

FIG. 1.— Bacteria. A, *Streptococcus pyogenes;* B, *Micrococcus tetragenus;* C D, *Sarcina lutea.* All highly magnified.

Other genera with spherical cells are *Streptococcus, Staphylococcus, Sarcina*, etc. Other bacteria consist of cylindrical cells which tend to adhere end to end in filaments or rods. In the genera *Bacillus* and *Bacterium* the rods are straight or little curved, and short or of moderate length, while in *Vibrio* and *Spirillum* the rods are more or less spirally curved. In still other genera, as *Crenothrix, Leptothrix*, etc., the rods are elongated. See BACTERIA.

Branch Phycophyta. The Phycophytes.—These plants, of which there are probably nearly 10,000 species, may very properly be called the seaweeds, since they are typically aquatic, living in the salt and fresh waters of the earth. Typically they are bright green, and the cells of which they are composed have well-formed nuclei. However, the chlorophyll is confined to definite portions of the protoplasm, and is not diffused throughout the cell. Some of the lower species are spherical, rounded cells, but for the most part they consist of filaments of cylindrical cells, or in some instances they are masses of cells constituting leafy-stemmed plants. They reproduce by fission as in the Protophytes, but in addition all, or nearly all, Phycophytes reproduce sexually also. In the simplest cases of sexuality, two equal and similar cells detached from older plants fuse into a new and larger cell, and then this new cell grows into a new plant. Sometimes the new cell becomes covered with a

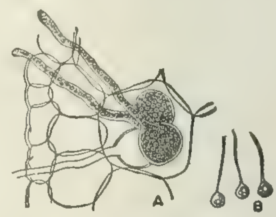

FIG. 2.— A, *Olpidium brassicæ*, one of the simplest of the fungi (*Synchytriaceæ*), parasitic in cells of a crucifer; B, three zoospores. Highly magnified.

thick wall, and for a time ceases activity as a «resting spore,» before it develops into a new plant.

While most Phycophytes are green plants, several hundred species have become parasitic or saprophytic in habit (Figs. 2 and 3) and have therefore lost their color, and become fungi. Among these are the following families, namely:

FIG. 4

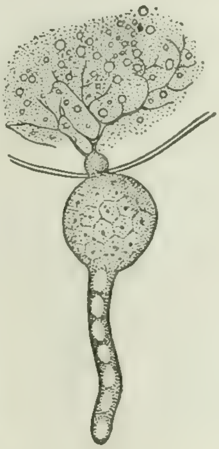

FIG. 3

FIG. 3.— *Rhizidiomyces apophysatus*, another of the lower fungi (*Chytridiaceæ*); the root-like organs are parasitic in a cell of a water mould. Highly magnified.

FIG. 4.— *Saprolegnia thureti;* A, fly with attacking filaments; B, end of a filament forming zoospores. C, zoospores escaping. A, natural size; B and C, highly magnified.

Water Moulds (*Saprolegniaceæ*) which are minute filamentous, colorless plants living in the water on living and dead plants and animals. (Fig 4.) Each plant is a more or less branched thread, some portion of which penetrates the host and thus obtains food, while the other part is external and bears the reproductive organs. The filaments are cylindrical, and are peculiar in having few cross partitions. They are to be regarded as composed of many cells which have not separated themselves by partitions. The nuclei are numerous, and very small.

The more common mode of reproduction is as follows: A terminal portion of a branch forms a partition at some distance from the extremity and the protoplasm in this segment becomes denser, and a little later divides into a great number of small cells, each of which remains naked (that is, no cell wall is formed around it), and soon escapes by a rupture of the end of the segment. (Fig. 4.) These escaped cells are known as zoospores, since they have a very active swimming motion, very like that of some of the lower microscopic animals. The similarity to the lower animals is shown still more by the identity in their locomotive organs, which consists of one or two slender protoplasmic whips (cilia) by whose rapid lashing the zoospores are propelled. After a short period of activity they come to rest, when they cover

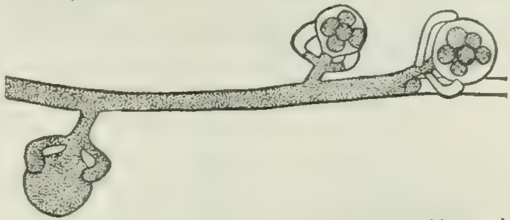

FIG. 5.— *Achlya racemosa*, showing antherids and oögones. Highly magnified.

themselves with a cell wall, and begin to elongate into a filament like that of the plant from which they came. Reproduction by means of zoospores is very rapid, since they are formed in such great numbers when conditions are favorable.

The sexual organs, which are rather rarely formed, consist first of an enlarged and rounded end segment in which the protoplasm is quite dense. From the sides of the branch below the end segment (or from elsewhere on the body of the plant) slender branches grow up and in turn their ends become cut off by cross partitions. (Fig. 5.) The first end segments (the rounded ones) are oögones, or in plainer words they are egg-organs, and in them one or more eggs are produced. The second segments (slender) are male organs called antherids, and the protoplasm they contain has the function of the spermatozoids of many plants (and animals). At the proper time the antherids puncture the egg-organs, and by the inflow of the contents of the former the eggs are fertilized. Later these eggs may germinate and produce new plants like those on which they were borne.

Downy Mildews (*Peronosporaceæ*) are much like the water moulds, but instead of being aquatic, they live in the tissues of land plants. Like the water moulds they are composed of branching, non-septate filaments. The main body of the plant grows in the intercellular spaces of the host, where there is nearly as much moisture as under aquatic conditions. (Fig. 6.)

FIG. 6.— Portion of a filament of *Albugo candida*, with its haustoria penetrating host cells. Highly magnified.

From this internal part of the plant short branches grow out into the air, and these become swollen terminally into rounded segments, which are in fact short zoosporangia. Instead of forming zoospores at once, they first fall off and then those that fall into water develop zoospores,

much as in the water moulds. As these structures are very minute, a droplet on a leaf is large enough for the germination of hundreds of the detached zoosporangia. Here again, the zoospores, after coming to rest, develop into new plants, which at once penetrate the host. In some species the zoosporangia grow at once into a filament, without forming zoospores.

The sexual organs of downy mildews are much like those of water moulds, the differences being quite immaterial for the present discussion. (Fig. 7.)

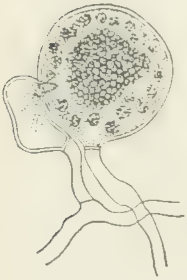

Fig. 7

Fig. 8

Fig. 7.— *Peronospora alsinearum*, showing antherid penetrating the egg-cell. Highly magnified.
Fig. 8.— *Mucor stolonifer*. Highly magnified.

It is evident from a comparison of the structure and reproductive organs of water moulds and downy mildews, that the latter are derived from the former. Just as the water moulds have been derived from the green plants of the green felt family (*Vaucheriaceæ*) by the adoption of parasitic and saprophytic habits, so by the change from strictly aquatic conditions to those found in the intercellular spaces of land plants, water moulds have been changed to downy mildews. Every difference between the two families may be accounted for by this difference in the environment of the plants.

Black Moulds (*Mucoraceæ*) show an additional modification of the water mould type. They are non-aquatic, mostly saprophytes, a few only being parasites. They live for the most part on dead organic matter, animal or vegetable, which is still moist, and but few species can live in the water. The commonest species live on the starchy and sugary substances in pantries, cellars, and other places where these substances are found in the presence of sufficient moisture. Organic substances which are dry are not attacked by black moulds.

Each black mould plant is a branching tubular filament, which has few cross partitions. One part of the plant usually grows in the substance of the organic matter, and another grows upward into the air. (Fig. 8.) The former absorbs food matter, while the latter bears reproductive organs, as in the water moulds. The ends of the aërial branches enlarge as in the two preceding families, but instead of forming zoospores, the protoplasm in the terminal segments forms many small spores, each covered with a cell wall. These spores are the homologues of the zoospores in previous families, but as the plants are not aquatic, these zoospores have ceased to be aquatic also. With a good cell wall to protect their protoplasm, they may be blown about in the air without drying up. It is in this way, in fact, that black moulds are propagated, the air currents carrying the spores sometimes for long distances, and when they fall upon organic matter under favorable conditions they quickly give rise to a new crop of mould plants. On the filaments which penetrate the nutrient substance, or grow over its surface, are to be found (rarely, however, in the common species) sexual organs somewhat resembling those of the two preceding families. (Fig. 9.)

Insect Fungi (*Entomophthoraceæ*) are somewhat similar to black moulds, but are parasitic in the body tissues of insects, and accordingly show considerable structural modifications. (See below.) Fig. 10.

Branch Carpophyta. The Carpophytes.— The plants which constitute this immense group are of much higher structure than those in the two preceding branches. They are still typically aquatic, and so are seaweeds, but this name is not as commonly applied to them as to the Phycophytes. The typical species are green plants, but in one group (the red seaweeds) the chlorophyll is hidden by a red or purple coloring matter. The plant-body is usually composed of an axis on which are symmetrically arranged branches or leaves. The lower end of the axis is supplied with root-like organs by which it is attached to the soil or other support, and the plant commonly stands upright. Some species show a wonderful beauty of form and color, and on this account are greatly prized by amateur botanists, who collect and preserve them under the name of sea mosses.

All Carpophytes reproduce by two common methods. In the first, certain end cells separate from special branches, and float away to germinate and grow directly into plants like those from which they came. In the second method of reproduction an egg-organ, much like that of

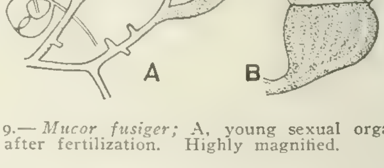

Fig. 9.— *Mucor fusiger;* A, young sexual organs; B, after fertilization. Highly magnified.

the Phycophytes, is fertilized by spermatozoids from an antherid which, again, does not differ in any essential respect from that of the Phycophytes. However, the result of the fertilization is the formation of a more or less compound body which the botanist recognizes as a primitive kind of «fruit.» Hence, the aquatic Carpophytes are sometimes known as «Fruit Tangles.» In these fruits are spores, and these on escaping and germinating give rise to new plants.

POISONOUS FUNGI.

1. Golden Cantarelle (Cantharellus aurantiacus).
2. Puffball (Scleroderma aurantiacum).
3. Green Toadstool (Russula furcata).
4. Devil's Toadstool (Russula emetica).
5. Poisonous Toadstool (Lactarius terminosus).
6. Bulbous-leafed Mushroom (Agaricus phalloides).
7. Thickfoot (Boletes pachypus).
8. Satanic Fungus (Boletus satanas).
9. Antler-Fungus (Calocera viscosa).
12. Witch-Fungus (Boletus luridus).

The chlorophyll-bearing Carpophytes comprise nearly 2,500 species, and are widely distributed in the salt and fresh waters of the globe. From these have sprung an enormous host of parasitic and saprophytic species, which are colorless, and constitute the great bulk of the fungi of the world, aggregating fully 100 times as many species as those from which they sprang.

In changing from the holophytic structure and habits of their ancestral types, these hysterophytes (fungi) have suffered much degeneration of the vegetative plant-body, while the reproductive apparatus has been relatively enlarged and multiplied. This is in accordance with the well-known law that since hysterophytes do not make carbohydrates they have little need of large vegetative bodies, and further, that since they are dependent upon particular hosts or organic matter for their food, they must provide more lavishly for propagation. Many of these fungi are little more than absorbing and reproducing organisms, the vegetative plant-body having almost entirely disappeared through disuse. These fungi are readily separable into two great classes, by characters derived from their reproductive apparatus. The first of these classes is known as the Sac Fungi, and the second as the Club Fungi.

Fig. 10

Fig. 11

Fig. 10.— *Empusa muscæ;* filaments from body of fly. Highly magnified.

Fig. 11.— A, several spore-sacs (*asci*) in different stages of development; B, a mature spore-sac. Highly magnified.

Sac Fungi (*Class Ascomyceteæ*).— The distinguishing mark of the plants of this class is that the spores which occur in their fruits develop in certain end cells and remain enclosed within the cell wall until matured. (Fig. 11.) These spore-containing cells have been aptly likened to sacs (Latin, *asci;* singular, *ascus*) and from this we derive the name of the class.

There are more species of sac fungi than of all other kinds. They range in size from very minute to many inches in extent. They include some of the most harmfully parasitic plants as well as many which live saprophytically upon refuse organic matter. Among the many families (more than 40) in this class, the following may be noticed:

Powdery Mildews (*Erysiphaceæ*) are to be regarded as primitive sac fungi, but little removed from their aquatic ancestors. The plant body consists of branching filaments which creep over the surfaces of their hosts, from which they obtain food by means of root-like absorbing organs, which penetrate the host cells. Certain branches form spores by the simple process of separating their terminal cells in succession and this is done so abundantly that the spores form powdery masses on the surface of the hosts. These spores float away on wind currents, and those that germinate on similar hosts give rise to new plants.

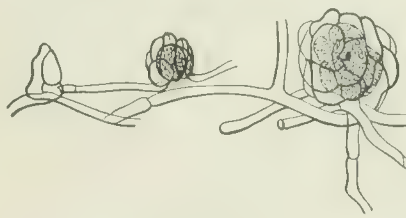

Fig. 12

Fig. 12.— Sexual organs of *Erysiphe* and formation of fruit. Highly magnified.

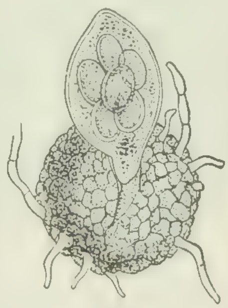

Fig. 13

Fig. 13.— Mature fruit of powdery mildew, with escaping spore-sac. Highly magnified.

The sexual organs (egg-cells and antherids) occur on the creeping filaments, and are short lateral branches, the former somewhat thicker than the slender antherids. (Fig. 12.) The two come in contact with one another, and the protoplasmic contents of the antherid pass into the egg-cell fertilizing it. As a result the egg-cell sends out one or more branches, the end cells of which develop into *asci,* while from below the egg-ceil there grows up a cellular, globular covering, constituting the outer wall of the fruit, and enclosing the *asci.* The spores in the *asci* when set free by the rupture of fruit and *ascus* walls, germinate and on similar hosts give rise to new plants. These fruits are usually blackish and may be seen by the naked eye as minute globular bodies on the mass of filaments. (Fig. 13.)

Truffles (*Tuberaceæ*) are evidently related to the powdery mildews, but their life history is not so well known. They are saprophytic, living on the decaying organic matter in the soil in forests. Little is known as to their early life, and the formation of their non-sexual spores, but these are thought to be somewhat like those of the powdery mildews. Their fruits are

formed under ground, and may be compared to a mass of compound fruits of the powdery mildews. The sexual organs, which probably precede the development of the fruits, have not yet been discovered. The fruits of the common truffles of Europe are from one to two inches in diameter, and warty and dark colored externally. (Fig. 14.) Internally they consist of a soft, whitish tissue, in which are numerous cavities, each containing several *asci.* Practically nothing is known as to their propagation. A few little known species occur in America, but in Europe they are common. See TRUFFLE.

Black Fungi (*Sphæriaceæ*) are typically parasites which grow in the tissues of higher plants, and whose small black fruits are formed on the surface of the host. Here again we are evidently dealing with plants related to the powdery mildews, but with an increased parasitism. They are known to form non-sexual spores much as in the powdery mildews. Their fruits also resemble the fruits of the powdery mildews, and probably result from a fertilization, but thus far the sexual organs have evaded discovery. (Fig. 15.)

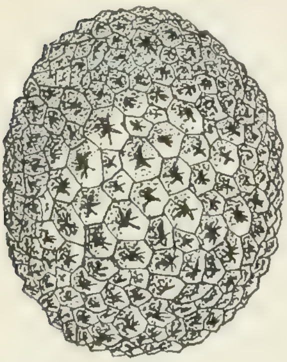

FIG. 14

FIG. 15.— *Nectria cinnabarina;* A, bark with enlarged fruits; B, spore-sacs. Highly magnified.

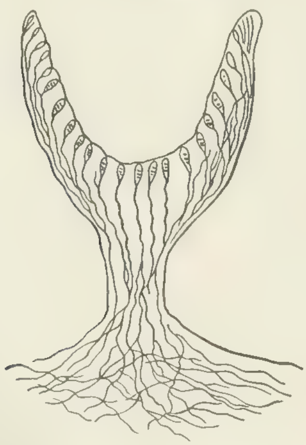

FIG. 16.— Diagrammatic vertical section of a cup fungus.

Cup Fungi (*Pezizaceæ*) are typically saprophytes (Figs. 16 and 17), growing in the tissues of decaying plants, as rotten logs, sticks, etc. In these fungi the plant is filamentous and grows through the decaying tissues as slender white, branching, threads. Non-sexual spores resembling those of the powdery mildews are known for some species. Sexual organs, consisting of a globular egg-cell, and a slender antherid, are found on

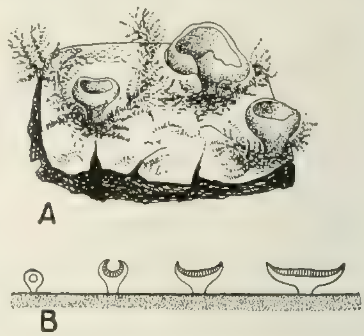

FIG. 17.— *Humaria rutilans;* A, three fruits, natural size; B, vertical sections of fruits of different ages.

the creeping filaments. (Fig. 19.) Fertilization takes place as in powdery mildews, with a similar result, the fruits, however, being at length cup-shaped instead of globular. In many species the fruits (Fig. 17) are globular when young, but as they mature they open out into cup-shaped structures (Fig. 17), in the concave surface of which are found many *asci.* (Fig. 18.) It will readily be seen that were these cup-fruits to remain closed, their structure would be closely similar to that of the fruits of the powdery mildews. However, the fruits of the cup fungi are often of considerable size, sometimes being as large as an inch or more in diameter.

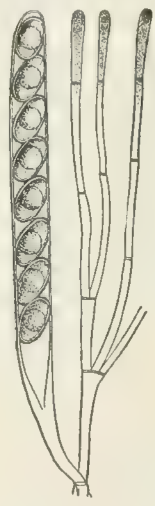

FIG. 18

FIG. 19

FIG. 18.— *Humaria rutilans;* spore-sac, and three paraphyses. Highly magnified.
FIG. 19.— Egg-cells and antherids of a cup fungus. Highly magnified.

Lichens (see article LICHENS) are now regarded as nearly related to the cup fungi and black fungi. (Fig. 20.) In all essentials they agree with those fungi, but they are usually treated separately on account of the peculiar parasitism and

9. Stone-Mushroom (Boletus edulis)
12. Champignon, or Cultivated Mushroom (Agaricus campestris)

symbiosis which they exhibit. There are several families of the lichen-forming fungi, aggregating between 2,500 and 3,000 species.

FIG. 20.— *Physcia stellaris*, a common lichen. Natural size.

Yeasts (*Saccharomycetaceæ*) are here briefly referred to in order to call attention to the excessive degradation which they have suffered. Although they consist of single cells, or short chains, they are now regarded as greatly reduced sac fungi. They grow in the watery solutions of sugars, starches, and other carbohydrates, and one result of their activity is the formation of alcohol, while at the same time carbon dioxide is set free. It is for the alcohol that yeasts are used in breweries and distilleries, and it is for the escaping carbon dioxide gas that they are used in the making of bread. See YEAST.

Rusts (*Uredinaceæ*) are minute plants, parasitic in the tissues of higher plants. (Fig 21.)

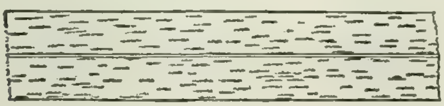

FIG. 21.— *Puccinia caricis*, a common rust on sedges.

They consist of branching filaments which grow through and live upon the host tissues. Certain branches cluster together and form rows of spores by terminal abstriction (*æcidiospores*) (Fig. 22 A) and later others form single terminal spores (*uredospores*) (Fig. 22 B), and still later other branches form one, two, or several thick walled spores in terminal *asci* (*teleutospores*). (Fig. 22 B.) These all begin within the host tissues, but they eventually break through the epidermis into the air. Lastly, when the teleutospores germinate each produces a short filament (promycelium) on which four minute spores (*sporidia*) develop. There are thus four kinds of spores in a typical rust plant, and these have been taken to characterize as many stages in the plant's life history, namely: 1. Cluster-cup stage (*æcidiospores*); 2. Red Rust (*uredospores*); 3. Black Rust (*teleutospores*); 4. Promycelium (*sporidia*). In most rusts these stages occur on the same host in the order given, but in some the first stage occurs on one host, and the remaining stages on another. The latter is the case with a rust of wheat, in which the cluster-cups occur on Barberry leaves, and the æcidiospores then germinate upon and infect the leaves of the wheat, on which the red rust, black rust and promycelium then follow in succession. No sexual organs have as yet been discovered, but analogy would suggest that they are to be looked for before the development of the teleutospores.

In this account the rusts are considered to be reduced sac fungi, of the cup fungus type, the degeneration being due to their excessive parasitism.

Smuts (*Ustilaginaceæ*) are still more parasitic than the rusts, and as a consequence have suffered still greater degeneration. (Fig. 23.) They grow wholly within their hosts, and do not even bring their spores to the surface. They consist of branching filaments which penetrate the tissues of their hosts, and at last form spores homologous with the teleutospores of the rusts. The latter in germinating produce sporidia. Comparing the rusts with the smuts we note that while there are four stages in the former, there are but two in the latter, the first and second having apparently disappeared.

Imperfect Fungi.—At this point should be mentioned the so-called imperfect fungi, an immense aggregation of many thousand species (12,000 or more) of which we know but one stage (apparently the first) and so are unable to assign them to their proper place in the system. They are minute and mostly parasitic plants, occurring in the tissues of higher plants, and sending their spore-bearing branches out into the air. Some plants formerly placed here have been

found to be early stages of certain sac fungi (black fungi, or their relatives) and it is suspected that most, if not all, of them will eventually be so disposed. At present they are grouped under three general kinds, as follows:

Spot Fungi (*Sphæropsideæ*), which produce whitish or discolored spots, and later develop closed, spheroidal cases, containing free spores. *Septoria* and *Phyllosticta* are common genera.

Black-dot Fungi (*Melanconieæ*) are like the spot fungi, but there are no spore cases, the spores developing in masses beneath the epidermis which they eventually rupture. *Gloeosporium* is a common genus.

Moulds (*Hyphomyceteæ*) produce their spores on branches which grow out through the stomata of the host. Here we find the parasitic species of *Ramularia, Cercospora,* etc., and the mostly saprophytic species of *Monilia, Botrytis,* etc.

Club Fungi (*Class Basidiomyceteæ*).— The distinguishing mark of the club fungi (often spoken of as the higher fungi) is that the spores which develop in certain end cells in their fruits do not remain inside of these cells, but push out into the ends of terminal or lateral protuberances and so come to appear to be external. (Fig. 24.)

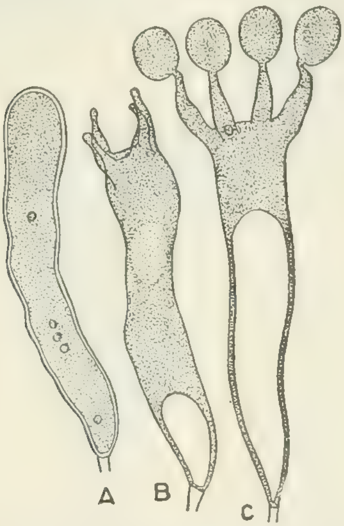

Fig. 24.— Spore-clubs in different stages of development: A, when very young; B, with the spore-branches beginning to form at the summit; C, showing the spore-branches with nearly mature spores at their ends. All highly magnified.

These club-shaped, spore-bearing cells are technically known as *basidia* (singular, *basidium*), whence the scientific name of the class. The spore-clubs (*basidia*) of this class are regarded in this discussion as the homologues of the spore-sacs (*asci*) of the preceding class.

Between 10,000 and 12,000 species of fungi of this class are known. Many attain to considerable dimensions, especially their fruits. They are typically saprophytic, but it is now known that many of them are more or less parasitic, also, when the opportunity offers.

About 10 families are commonly recognized, four of which, only, will be noticed here.

Puff-balls (*Lycoperdaceæ*) are saprophytes whose branching filaments penetrate decaying wood or earth rich in organic matter, and finally produce globular fruits which rise above the surface. (Fig. 25.) These fruits are filled with tortuous canals whose walls are studded with spore-clubs (basidia) on which the spores are produced. At maturity the interior tissues of the fruits deliquesce, setting free the spores, which escape into the air a little later as a dusty cloud, by the rupture of the fruit-wall. From these spores new plants are produced, but we do not know the whole life history of these common fungi. Although the sexual organs should precede the formation of the fruits, they have not yet been observed

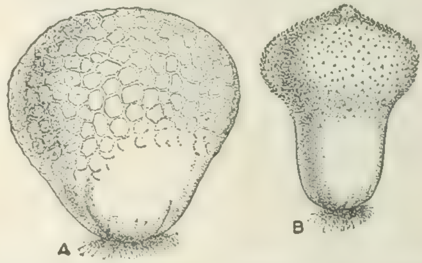

Fig. 25.— Two species of puff-balls; A, *Lycoperdon cœlatum;* B, *Lycoperdon gemmatum.*

Stink-horns (*Phallaceæ*) are closely related to the puff-balls, which they closely resemble in all stages excepting the last. Here the spore-bearing portion of the globular fruit is confined to a vertical, circular layer of tissue about midway between the centre and the circumference. At maturity the spore-bearing tissues deliquesce and at the same time the tissues below rapidly elongate, bursting the fruit-wall and carrying up the spores into the air. (Fig. 26.) These fruits

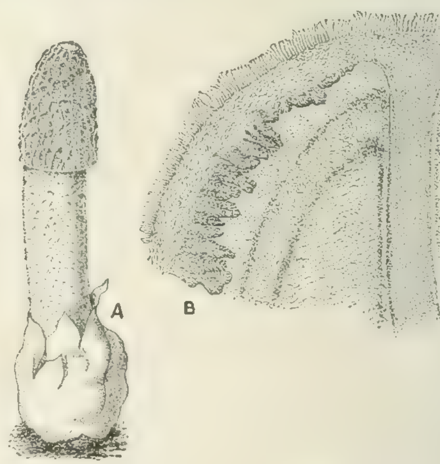

Fig. 26.— A, a stink-horn (*Ithyphallus impudicus*) after the rupture of the volva; B, highly magnified section of the spore-bearing layer.

have very bad odors, which attract insects, and it is thought that these help to distribute the spores. Stink-horns are from an inch or two to six or more inches in height, and grow commonly in lawns and pastures, where their presence is indicated by their intolerable odor.

Toadstools (*Agaricaceæ*) are fungi of the puff-ball kind, consisting of white, branching filaments which creep through the nutrient sub-

stance or the host tissues. Most species are saprophytes, but some are parasites. When the fruits are young they resemble those of puffballs, but as they grow older a circular layer of spore-bearing tissue develops, and this, by the rapid growth of lower lying tissues, is carried up on a stalk, very much as is done in the stink-horns. (Fig. 27.) Here, however, the stalk is

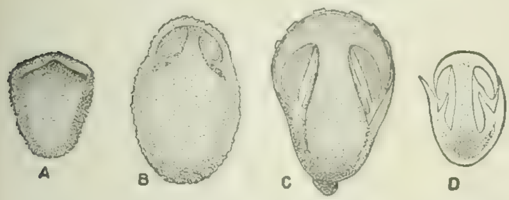

FIG. 27.— Development of a toadstool (*Amanita muscaria*) shown in vertical section. A, very young stage; B and C, later stages; D, after the bursting of the volva.

formed earlier, and the spores are usually developed after the rupture of the fruit-wall.

A typical toadstool fruit has the following structure: There is first at the bottom the cup-shaped remnant of the original fruit-wall (technically, the *volva*); from this rises the cylindrical stem (*stipe*), terminating in an expanded cap (*pileus*). The stem and cap together resemble on expanded umbrella, or a one-legged stool (Fig. 28), from which latter fact the common name "toadstool" was doubtless suggested. The lower surface of the cap is folded into many vertical radiating plates, called gills (*lamellæ*), and these are studded with the spore-clubs, bearing the spores. This gill portion corresponds to the circular spore-bearing layer of the stink-horns, and the gills themselves are to be regarded as devices for increasing the number of spores, by an enlargement of the surface studded with spore-clubs.

FIG. 28.— Two fruits of *Armillaria mellea* attached to the filamentous plant; several young fruits at the left. Considerably reduced.

While in typical toadstools the cap is rounded and centrally attached to the stem, in some species its growth is not uniform, and the stalk is excentric, or even lateral. Lastly, let it be remembered that the toadstool which we see is not the plant itself (that is below the surface) but it is the fruit of the plant which develops in order that it may produce spores.

Pore Fungi (*Polyporaceæ*) are so named because the spore-bearing structure on the under side of the cap of the fruit consists of a mass of small vertical pores, instead of plates, and by this character they may be readily recognized. In typical pore fungi the general structure and development are similar to those of the toadstools, the change from gills to pores being the only important difference. Here, however, many of the species instead of growing into regular umbrella-shaped fruits, have the stalk more or less laterally placed. In others, again, the lateral stalk is very short, and from this the step is a very short one to its complete suppression, when the cap is sessile marginally, as in the bracket fungi, which are so common on decaying logs and other forms of timber.

Some pore fungi are fleshy, but for the most part they are hard and tough, often resisting

FIG. 29.— *Agaricus campestris*, the cultivated mushroom, showing several stages of development.

decay for many years. Some of the species are perennial, adding successive layers of pore tissue to their fruits for some years.

ECONOMIC RELATIONS OF FUNGI.

The economic relations of the fungi are of great importance. Some are edible, and furnish wholesome food to man and other animals, some are used in the arts, some yield medicines, some are the cause of disease in man and other animals, and some again attack and destroy other plants, including many of the cultivated plants of our farms and gardens.

Edible Fungi.—Here perhaps we should include those bacteria which have to do with the flavor of butter and cheese, and those moulds whose presence in cheese adds to its edibility. Of far greater importance, however, are those species which are eaten for the nutriment which they contain. Truffles are collected in Europe, and sold in the markets. Dogs and pigs are trained to search for them, the attendant bagging the truffle when found by the keen scent of the animal. The Morels are sac fungi related closely to the cup fungi; each Morel (fruit) is a hollow-stalked body two to five inches high, with a crinkled and pitted conical cap in whose surface are imbedded the spore-sacs. They grow in fields and thickets, and when fresh are wholesome. Morels are often called mushrooms, although this name should be restricted to the next group.

Mushrooms (Fig. 29) are of the toadstool kind, and popularly any species which is edible is called a mushroom, while those which are poisonous are called toadstools. Many species

are collected from the forests and fields by experts who have learned to distinguish them from the poisonous ones, but by far the most commonly used species is the common mushroom (*Agaricus campestris*) which is cultivated by gardeners for this purpose. See MUSHROOMS.

Medicinal Fungi. — The most important species is the Ergot (*Claviceps purpurea*), one of the sac fungi, which is parasitic in the heads of rye.

Pathogenic Fungi (on Animals).—Many bacteria are the direct cause of diseases of animals, including man. See BACTERIA.

Some of the water moulds cause a serious disease of fishes, especially of young fishes in "hatcheries." Occasionally an epidemic, known as the "Salmon Disease," has been known to occur in the streams of Great Britain. Investigation has shown it to be due to a certain species of water mould.

The insect fungi (*Entomophthoraceæ*) annually destroy immense numbers of flies, locusts, caterpillar larvæ, etc. The common house fly is attacked by *Empusa muscæ* in summer and autumn. Every infected insect fastens itself by means of its tongue to some object, and soon perishes miserably, its body walls being pierced by innumerable spore-bearing branches. In the autumn myriads of locusts ("grasshoppers") are destroyed by *Empusa grylli.* When attacked by the fungus the locust climbs a grass or weed stem around which it finally clasps its legs and dies firmly attached. Many other insects, including mosquitoes, are destroyed by these beneficial fungi. Thus far all attempts to artificially apply these fungi in combating insects have been unsuccessful.

Pathogenic Fungi (on Plants). See DISEASES OF PLANTS.

CHARLES E. BESSEY,
University of Nebraska.

Fungicides, fŭn'jĭ-sīd, any agent used to prevent the growth of fungi or their spores. The most important uses of fungicides are in agriculture and horticulture for controlling the fungi that attack crops. These may be divided into two general classes: (1) Fungi which burrow among the tissues of the host plants and expose little more than their fruiting organs to the air. (2) Fungi which expose almost all of their vegetative parts to the air, only the holdfast, absorbing organs (*haustoria*) entering the tissues of the host. From the nature of their growth it is easily seen that members of the second group may be attacked at any time, but that since the vegetative parts of members of the first group are protected by the tissues of the host they cannot be reached effectively by any fungicide without injuring the host. Controlling agencies in such cases must therefore be preventive.

For the control of the exposed fungi the chief agent is sulphur in out-door practice, applied as a powder, which is dusted upon the foliage, preferably with a powder gun. In the greenhouse it is more frequently evaporated, by strewing powdered sulphur upon the heating pipes or upon burlap suspended in warm parts of the greenhouse. This is a slow way, and is mainly preventive. When a considerable quantity must be evaporated in a short time the sulphur is gently heated over an oil stove. It is imperative that the sulphur be kept from igniting, because the fumes are destructive to host as well as fungus. For cleansing a greenhouse of objectionable fungi when the plants are out, the sulphur may be burned and all reachable parts sprayed liberally with Bordeaux mixture.

Various compounds of copper are used as preventives of the attacks of internal feeding fungi and as remedies for the exposed. Chief of these salts is copper sulphate, which may be applied in a pure solution only to dormant wood, walls, etc. It is used at the rate of one pound to the gallon, and will, at this strength, destroy lichens and algæ as well as fungi. For use upon foliage and other actively growing parts it must be mixed with some substance which will counteract its causticity. Lime is most frequently used, and the compound is called Bordeaux mixture from the French city where its usefulness was accidentally discovered about 1882. It is made as follows: A known number of pounds of copper sulphate are dissolved in an equal number of gallons of water, contained in a wooden tank or barrel, the salt being suspended at the surface of the water to ensure quick solution. In another receptacle a known number of pounds of lime, as free from magnesium as possible, are slaked with a little water, and when slaking is complete, enough more water is added to make the proportion one pound of lime to a gallon of water. When needed for use six gallons of the copper sulphate solution and four or five of the lime solution are separately diluted with enough water to make a combined total of 50 gallons. The two diluted solutions are then thoroughly mixed, and afterward tested with ferrocyanide of potash to make sure that there is no uncombined copper sulphate. A brownish discoloration indicates that more lime must be added to neutralize the free copper salt. The mixture is then ready for general use, but for peaches, plums, cherries, and some other plants, another 25 gallons of water must be added because of the susceptibility of the foliage to injury. The stock solution of copper may be kept for weeks, but the lime solution should stand for only a few days and the completed mixture for only a few hours, because the particles tend to flocculate and settle, a process which impairs the usefulness of the mixture.

Copper sulphate is often used as *eau celeste,* a solution of one pound of the salt to two gallons of water plus three half-pints of standard ammonia, and then diluted with water to make 25 gallons. Since the strength of the ammonia varies, this solution often burns the foliage, there being insufficient ammonia to neutralize the free copper sulphate. This fungicide and ammoniacal solution of copper carbonate are used when a non-staining solution is needed, as in spraying ornamental plants and fruit which is nearing maturity. The latter solution is made by dissolving one ounce of copper carbonate in one pint of ammonia and mixing with 10 gallons of water.

The seeds of various cereals are often dipped in hot water formalin solution and copper sulphate solution to destroy fungous spores, and hot water is also used to some extent for destroying exposed fungi, spores, etc.

All solutions must be applied as a mist-like spray, to ensure which a nozzle with a small aperture is essential. The first application to fruit trees should be before the buds begin to

swell. This may be a stronger solution than those used after growth starts. The second should be given when the buds begin to swell, the third when the blossoms have fallen. No spray should be given during the blossoming period.

Consult: Lodeman, 'The Spraying of Plants' (1890); Prillieu, 'Maladie des plantes agricoles' (1895); Massee, 'Text-book of Plant Diseases' (New York 1899); various bulletins of the United States Department of Agriculture and of many of the State Agricultural Experiment Stations.

Fungus, fŭn'gŭs. See FUNGI.

Fungus-eaters. The fungi enter largely into the food of the lower animals, and somewhat into the fare of the higher forms. The moulds, slimes, and various aquatic forms are devoured by echinoderms and mollusks, both bivalves and univalves, who take in the minute floating forms, or their spores, or eat the fixed growths from stones and other resting places, and by vegetable-eating fishes and crustacea. Pond-snails will keep the glass sides of an aquarium clean of vegetable growths, a large part of which is fungoid. Worms, slugs, and insects in great variety feed upon the vast array of fungi not aquatic. Beetles are especially fond of the larger forms — the toadstools and tree-borne polypores. A large Javan beetle, known from its shape as the "fiddle-beetle" (*Mormolyce phylloides*), spends its life within and about certain fungi growing on tree-trunks. A whole family of small flies (*Mycetophilidæ*) breed in fungi, including the cultivated mushroom, beds of which are often largely damaged by the work of their maggots bred there; hence the group is termed "fungus-gnats." In the United States the woodland toadstools are eagerly fed upon when ripe in August and September, not only by great numbers of insects, slugs and snails, but by salamanders, tortoises (especially), and by all sorts of squirrels; but they seem to be rarely if ever eaten by birds. For the edibility of fungi by man, see MUSHROOM.

Fungus-gnat. See FUNGUS-EATERS; GNATS.

Funk, fŭnk, **Isaac Kauffman,** American publisher: b. Clifton, Ohio, 10 Sept. 1839. He was graduated at Wittenberg College, Ohio, and after several pastorates, the last of which was in Brooklyn, N. Y., began a publishing business in 1872; founded and published the 'Metropolitan Pulpit' (now the 'Homiletic Review') in 1876, and the 'Literary Digest' in 1890. He has published also the 'Standard Dictionary' of which he was editor-in-chief (1890–4). He is an earnest Prohibitionist, and in 1884 founded the 'Voice,' a prohibition journal, and has been the Prohibition candidate for mayor of New York. In 1901 he began the publication of the important 'Jewish Encyclopedia.'

Funnel-marks, painted designs on the funnels of ocean steamships to designate the ownership of the vessel. American line steamships are thus designated by a black funnel, white band, with black top; Anchor line, black funnel; Cunard line, red funnel, with black rings and black top; French line, red funnel with black top; White Star line, cream funnel with black top; Wilson line, red with black top; North German Lloyd line, cream funnel; Red Star, black funnel, white band, black top; Netherlands line, black, with white band and green borders; Hamburg-American line, buff for express steamers, black for regular steamers; Scandinavian-American line, yellow, with white band and blue star, and black top; Bristol line, black, white band in centre, blue star in centre of white band.

Funston, Frederick, American military officer: b. New Carlisle, Ohio, 9 Nov. 1865. He was educated at the State University, Kansas, and was a commissioner of the Department of Agriculture to explore Alaska 1893–4. He served in the insurgent army in Cuba in 1896–7, and, receiving in 1898 a commission as colonel of the Twentieth Kansas Volunteers, went to the Philippines, where he became brigadier-general of volunteers the next year. In March 1901, he commanded an expedition which succeeded in capturing the Filipino leader, Aguinaldo, and was appointed brigadier-general in the United States army in the same month.

Fur-bearing Animals. In the broader sense any animal which yields a pelt used in the preparation of marketable furs. In a narrower, more zoological sense, the term is restricted to that family of carnivora, the *Mustelidæ*, which contains the weasels, martens, sables, badgers, skunks, wolverines, otters, and sea-otters. The family is not a large one, but is of great economic importance, and many of its genera and species are of very wide distribution, mostly in northern regions. Two groups, the Arctic sea-otter and the skunks, are exclusively American. All are small animals; fierce, and voracious, living in burrows, or holes in trees or rocks, and active in winter. They belong in the arctoid division of carnivores, are most nearly related on the one hand to the bears and on the other to the dogs. For further particulars see FUR-TRADE; and the names of prominent species, as: BADGER; FERRET; MARTEN; OTTER; POLECAT; SABLE; SEA-OTTER; SKUNK; WEASEL; WOLVERINE; etc. Consult: Elliott Coues, 'North American Mustelidæ' (Washington 1877).

Fur Seal, the fur-bear or northern fur-seal (*Otaria*, or *Callorhinus, ursina*), whose pelts form the seal-skins of commerce. (See FUR TRADE.) There is also a southern fur-seal (*O. nigrescens*), dwelling along the southern coast of South America. See SEAL.

Fur Trade, The. The history of the fur trade is so closely interwoven with the early history of America that it is extremely difficult to narrate one without reference to the other. Among all the industries that helped to make this country one of the great commercial nations of the world there was none that exerted such an important influence upon the early prosperity of the colonies as that which was represented by those who took the pelts of animals and prepared them for manufacture into various articles for the use of mankind. It was the rich peltries of North America that were the magnet that attracted the hardy French and British adventurers to the shores of the new world, and it was their brawn that blazed the trail through the wilderness that the more timid agriculturalist might have the courage to follow in their footsteps. In the early days of this country's history it was the hunter and the trapper who explored the unknown regions. To obtain the furs that represented one of the great sources of wealth in the new country they journeyed into the most distant and inaccessible

parts of the land, and that they might have havens of safety in which to store their pelts, and, incidentally, rest secure from the attack of savage foe, they established the small settlements, so many of which have since grown into prosperous communities. It was the fur trader, therefore, who was the real pioneer in North America. Always in advance of civilization, his labors in leading the way for the settlement of the country provided a means of advancement that would have been much delayed if it had not been for these preparatory efforts. The Canadian provinces, for example, owed practically all their primary prosperity to their fur trade. In those days there were no mines to stimulate the immigration into that country, and the French pioneers who first made it their home soon discovered that there could be no more profitable source of income than that which was afforded by the possibility of trading in furs, for in Canada, as throughout the English colonies further south, the native Indians were so ignorant of the value of the pelts which they gathered that they were willing to dispose of them upon terms that permitted an enormous profit to the successful trader in such articles.

During the early days in the history of the fur industry in North America there was practically no limit to the percentage of profit that could be made in buying furs. To become a successful trader in pelts the one thing that was necessary was to import a large quantity of cheap and practically worthless trinkets from Europe. For these the Indians would exchange the most valuable peltries without hesitation. In fact, the conditions under which the fur trade with the natives was conducted soon became such a serious scandal that reformatory measures were absolutely necessary, the better class of traders becoming unwilling to sanction the unmitigated dishonesty and unbridled licentiousness of the class of men who were known as *coureurs des bois*, or rangers of the woods. It was to suppress this class that the licensing system was introduced, and, although this too soon became subject to abuse, for a time at least it tended to free the traffic from its most scandalous conditions.

It was during these early days that the feuds between the British merchants of New York and the Canadian traders became a serious factor in the industry. There can be little doubt that the former set out deliberately to encroach upon the business of the fur interests of Canada, and the trouble regarding the infringement of territorial rights had become a most serious situation when the Hudson's Bay Company was formed, in 1670. This company, which was chartered by Charles II., had the exclusive privilege of planting trading stations on the shores of Hudson Bay, and all its tributaries, and when, about a century later, France lost possession of her Canadian colonies, the Britons assumed almost exclusive control over the great fur trade of America. Prior to the beginning of the 19th century this trade was chiefly monopolized by the powerful trading companies.

First in the field, of course, was the Dutch East India Company, with its prosperous trading-posts at New Amsterdam (now New York), Beaverwyck (now Albany), as well as at several points on the Delaware and on the Maine coast. Next came the extensive Hudson Bay Company, which practically monopolized the trade in furs for 200 years, or until the Northwestern Company entered the field and established a somewhat successful rivalry, although its efforts were confined almost entirely to the Pacific coast.

It was in 1808 that John Jacob Astor formed the American Fur Company, establishing a line of trading-posts that extended across the continent, with a depot for furs at the mouth of the Columbia river, from which point he intended to ship direct to China and India. The name of the concern was afterwards changed to the Pacific Fur Company, and Mr. Astor saw his enterprise on the high road to success, when, in 1813, he was treacherously sold out to the Northwest Company by his resident partner, the latter claiming that, as the United States was then at war with Great Britain, the British soldiers would have taken the establishment by force if he had not made other disposition of it. After this incident, Mr. Astor confined his operations to the district east of the Rocky Mountains, where he, with his partner and successor, Ramsay Crooks, transacted a profitable business in furs for many years. The Russian-American Fur Company, which had its main trading post at Sitka, Alaska, with many subordinate posts on the Yukon, carried on an immense traffic in such lines until 1867, when all its rights and properties were transferred to the United States with the purchase of Alaska.

It was somewhat prior to 1809 that John Jacob Astor conceived his great project to make the American fur trade independent of the Hudson's Bay Company. As his scheme was partly based upon the fact that such an enterprise would have a strong tendency to spread the civilization of the East into the far western country, he asked the aid of Congress in carrying it into execution. Briefly described, Mr. Astor's idea was to establish a connected chain of trading posts from the Great Lakes to the Pacific Ocean, with a central depot for packing and shipment at the mouth of the Columbia river; to acquire one of the Sandwich Islands as a provision station, and to establish a line of vessels to sail from the west coast of North America to the most important ports in India and China. Washington Irving, in his "Astoria," presents a graphic description of this gigantic enterprise which met with such a strange disaster when Astoria, the town founded at the mouth of the Columbia river in 1811, was so unnecessarily abandoned during the War of 1812. The balance of Mr. Astor's career, however, was quite as remarkable. Year after year his fur business was extended until its operations surpassed those of any house that had hitherto been established. In addition to its immense American business a gigantic export trade was carried on with many countries, and, when the founder of the company died, he left a fortune that was estimated at $20,000,000. William Backhouse Astor, his son, was interested with him in the fur trade, and when, in 1827, the house of John Jacob Astor & Son was merged in the American Fur Company, he became its president.

The first great establishment founded in St. Louis — one of the principal depots of the fur trade from the middle of the 18th century until 1859 — was that of Laclede, Maxon & Com-

pany, in 1763. In the early days of this house the brothers Auguste and Pierre Chouteau were connected with it, and the establishment, which was extremely successful, employed a large number of trappers and voyageurs. In 1808, the Chouteau brothers and a number of their associates in the older firm, withdrew to form the Missouri Fur Company. This prospered until about 1813, when, because of the war with Great Britain, it was dissolved. During the next few years several of its members transacted business independently, but, in 1827, the Rocky Mountain Fur Company of St. Louis was formed to send trappers to the Pacific coast. At this time the perils of the work were so great that fully 40 out of every 100 persons employed in it perished, and yet the life of adventures offered so many fascinations that there was no lack of hardy men eager to take the places of the slain. After several years of varying success the company was dissolved. In 1834, however, Pierre Chouteau, Jr., who had been educated in the fur trade by his father, organized the house of Pierre Chouteau, Jr. & Company, a firm name which was practically a household word among hunters and trappers from the Mississippi and the Lakes to the Pacific during the next 25 years. In 1859, the business was sold to Martin Bates and Francis Bates of St. Louis and New York.

The year 1859 saw the American fur trade more widely diffused than ever before. The passage of the industry into the hands of individuals had commenced to be apparent as early as 1821, and while, by the middle of the century the aggregate amount collected each year was much greater than it had been 40 years previously, the opportunities for making great fortunes in the trade had gone. A writer in 'Silliman's Journal' (1834) gives an interesting description of the situation of the fur trade at that time. He says:

«The Northwest Company did not long enjoy the sway they had acquired over the trading regions of the Columbia. A competition, ruinous in its expenses, which had long existed between them and the Hudson's Bay Company ended in their downfall and the ruin of most of the partners. The relict of the company became merged in the rival association, and the whole business was conducted under the name of the Hudson's Bay Company. This coalition took place in 1821. Almost all the American furs which do not belong to the Hudson's Bay Company find their way to New York and are either distributed thence for home consumption or sent to foreign markets. The Hudson's Bay Company ship their furs from their factories of York Fort and from Moose River, on Hudson Bay; their collection from Grand River, etc., they ship from Canada; and the collection from Canada goes to London. None of their furs come to the United States, except through the Indian market. The export trade of furs from the United States is chiefly to London. A quantity of beaver, otter, etc., is brought annually from Santa Fe. Dressed furs for edgings, linings, caps, muffs, etc., such as squirrel, genet, fitchskins, and blue rabbit, are received from the north of Europe; also cony and hare's fur; but the largest importations are from London, where is concentrated nearly the whole of the North American fur trade.»

It was as early as 1834 that those who were interested in this industry began to fear that the American fur trade had commenced to decline and, even at that time, it was quite freely predicted that its downfall would be rapid. By this period there were practically no new lands to be explored. The hunters and trappers in the employ of the great fur trading companies had gone everywhere and had slaughtered so indiscriminately that it seemed almost impossible that the fur-bearing animals should not be exterminated. While in some few cases this prediction has been proved to be only too true in a majority of instances the fear has been shown to be without foundation, for many of the fur-bearing animals, especially the small mammals, actually increased in number. They seemed to thrive better in the neighborhood of small settlements, where they were able to feed upon the farmers' crops. Some of the larger species, like the bear or the beaver, were much reduced in number, although even they did not meet so sad a fate as that of the buffalo, which has now been reduced to a few herds which are being cared for in southern Canada and in the Yellowstone Park. Up to 1875 these animals existed in countless herds on the western plains, where they were of incalculable value, to the Indian as well as to the white man, not only on account of the fact that their skins represented one of the most important commodities in the fur trade, but for the reason that they supplied both the white adventurer and the Red-skin native with food and clothing. Soon after 1870, however, the popular demand for this fur became so great that it is estimated that not less than 4,500,000 of these animals were recklessly killed, merely for the sake of their hides, between the years 1871 and 1874, and it is this ruthless extinction of the buffalo that is responsible for the conditions which now compel the United States Government to supply the Indians with regular meat rations. Of the millions of buffaloes that roamed the plain before the fur companies commenced their campaign of slaughter only a few hundred still remain, and they are so safely guarded that it is hoped that the species may be preserved from absolute extinction.

The table on following page presents a list of the principal fur animals of America, with such descriptive facts concerning them as can be tabulated, and the uses to which their skins are applied.

Among all these fur-bearing creatures the seal is of paramount interest to the trade owing partly to the great demand for such skins and partly to the efforts that are being made to prevent this valuable mammal from following the buffalo into comparative oblivion. There are many varieties of seals, but the four which are most extensively used by the trade are the Alaskan, Victoria or Northwest coast, Copper Island, and Lobos Island. Of these the most extensive fishery is the Alaskan. It was a material element in determining the value of the Alaskan province when it was purchased from Russia at a heavy cost by the United States, and it was one of the principal inducements upon which the purchase was made. That those who engineered the purchase of this territory were not mistaken in their valuation of the seal fisheries has been shown by the fact

PRINCIPAL AMERICAN FUR ANIMALS.

Common name	Scientific name	Habitat	Color	Uses
Beaver	Castor fibre	N. America, N. Europe, Asia	Chestnut brown	Muffs, trimmings, robes.
Silver fox	Canis vulpes	Northern latitudes	Silver gray	Muffs, trimmings, boas, robes.
Cross fox	Canis vulpes	Northern latitudes	Silver gray	Muffs, trimmings, boas, robes.
Red fox	Canis vulpes	Northern latitudes	Red	Muffs, trimmings, boas, robes.
Arctic fox	Canis vulpes	Northern latitudes	White	Muffs, trimmings, boas, robes.
Blue fox	Canis vulpes	Alaska, Greenland	Slate or purple	Muffs, trimmings, boas, robes.
Gray fox	Canis vulpes	Virgina	Gray	Muffs, trimmings, boas, robes.
Raccoon	Procyon lotor	N. America	Grayish yellow	Robes, rugs, gloves.
Wolverine	Gulo luscus	N. America, Europe, Asia	Dark brown	Robes, muffs, trimmings.
Fisher	Mustela pennanti	N. America	Dark brown	Muffs, boas.
Mink	Mustela vison	High latitudes	Dark brown	Muffs, boas, capes.
Lynx	Felis Canadensis	N. America, Europe	Silver gray	Robes, muffs, boas, collars.
Wildcat	Felis rufa	N. America	Yellowish brown	Robes.
Skunk	Mephitis mephitica	N. America	White and black	Muffs, collars
Black bear	Ursus Americanus	Northern latitudes	Black	Rugs, robes.
Cin'am'n bear	Ursus cinnamonum	Northern latitudes	Dark brown	Rugs, robes.
Grizzly bear	Ursus ferox	Northern latitudes	Brown	Rugs, robes.
Polar bear	Ursus maritimus	High latitudes	White	Rugs, robes.
Isabella bear		Northern latitudes		Ladies' goods.
Badger	Taxidea Americana	N. W. America	Sandy gray	Painters' brushes, muffs, boas.
Sea-otter	Enhydris lutris	N. Pacific	Dark brown	Coats, muffs, collars, caps.
Otter	Lutra Canadensis	N. America, Europe	Chestnut	Muffs, collars.
Fur-seal	Callorhinus ursinus	Alaska, Shetland	Yellowish gray	Mantles, cloaks.
American wolf	Lupus Occidentalis	N. America	Black, gray, white	Robes, rugs.
Prairie-wolf	Lupus latrans	N. America	Dark gray	Robes, rugs.
Panther	Felis concolor	All America	Light dun	Robes, rugs.
Musk-ox	Ovibos moschatus	Upper Canada	Dark brown	Sleigh-robes.
Buffalo	Bison Americanus	N. W. America	Drab brown	Robes, coats.
Marten	Mustela Canadensis	N. America	Light brown	Coat lining, capes.

that since Alaska became the property of the United States this industry has afforded a very considerable source of revenue to the Government through the lease of the seal fishing privileges, while the furtherance of this industry has not only engaged a large amount of American capital but has provided employment for a large number of American people.

From the early part of the 19th century until 1862 the seal fisheries were leased by the Russian Government to the Russian-American Company, a corporation composed of several wealthy Siberian merchants, but when the United States assumed control of the Alaskan territory these rights reverted to this Government. Even at this early date the question of the possible extinction of the seal had been seriously agitated, and it was not long after American acquisition of the territory that Congress passed a law forbidding the killing of seal upon the islands of St. Paul and St. George except during the months of June, July, September, and October. The laws further prohibited the killing of females, or males under one year of age, and it forbade the use of firearms; the taking of seal in adjacent waters, or on places where they were accustomed to haul up to remain, and limited for a term of twenty years the number to be killed on these islands to 100,000 annually, reserving the right to further restrict the number if at any time it appeared necessary or advisable to do so in order to prevent the serious reduction of the species.

The Alaskan Commercial Company obtained its lease of the seal fisheries in 1870. It continued for a term of 20 years, and gave the corporation the right to take seal, under the regular Government restrictions, in return for a rental of $50,000 per annum, and a further tax of $2 for each seal thus taken. The headquarters of this corporation were in San Francisco, John F. Miller, afterwards senator from California, being its first president. He was soon succeeded by Lewis Gerstle, one of the original stockholders, and the affairs of the company were principally directed by Messrs. Gerstle, Sloss, Niebaum, and Neumann on the Pacific coast, by Mr. Hutchinson at Washington, and by Sir Curtis Lampson (since deceased) at London. As the Government became pretty well persuaded that the amount of revenue received from the fur-seal fisheries had not corresponded with the number of seals taken, the lease was not renewed, but instead, when it expired, 1 May 1890, a lease was granted to the North American Commercial Company for the ensuing twenty years. This lease, which expires 1 May 1910, gave them the exclusive right to take seals in Alaskan territory for an annual rental of $60,000 and a tax of $2 per head upon all seals taken, and an additional bonus of $7.62½ on each skin. Even under such new conditions matters did not turn out satisfactorily, however, and the United States Government finally brought suit against the North American Commercial Company to recover $214,293.37, a sum alleged to be due on the company's contract since April, 1895. The case was fought through the lower courts and was finally settled in the Supreme Court of the United States. This suit has been regarded as one of the utmost importance and is reported in full in the 171 U. S. p. 137. The action, as brought by the Government, was to recover the annual rental of $60,000, as well as the tax and the bonus on each skin. The court found that there was no abatement on account of the tax or bonus, but held that the rental should be reduced in proportion as the whole number of skins allowed to be taken in any one year bore to the maximum allowed by law. As the result, instead of paying a stipulated rental of $60,000 per year, the North American Commercial Company now pays a fixed rental of 60 cents for each skin taken, which, with the tax and bonus, makes a total payment to the Government of $10.22½ per skin taken and shipped.

During the past few years the Government has restricted the lessees of the seal fisheries to a limited catch per year. The following table shows the maximum limit of seals allowed to be killed and the total number taken and shipped from 1859 to 1905 inclusive:

RESTRICTION AND SHIPMENT OF FUR SEALS.

Year	Allowed to be killed	Shipped
1895	15,000	15,000
1896	30,000	19,200
1897	20,000	16,818
1898	30,000	18,032
1899	30,000	16,812
1900	30,000	22,470
1901	30,000	22,672
1902	30,000	22,368
1903	30,000	19,292
1904	15,000	13,128
1905	15,000	14,368

In fact, as the matter now stands, the Government annually fixes a maximum and minimum number of seals that may be killed, and before the opening of the season the approximate number to be taken is fixed upon by the agent stationed at the Alaska fisheries.

The first seals to arrive at the Pribylov Islands each season are the bulls, each one of which immediately proceeds to locate the "homestead" that he and his future harem are to occupy. This "homestead" is about 10 feet square, and, as there is considerable space to be filled, the competition in the beginning — from the 1st to the 5th of May — is not very great. A few days later, however, the breeding grounds become so crowded that late comers find no place to locate their "homestead," with the result that the most terrific combats ensue, some of which are attended with mutilation if not, as is quite frequently the case, by death. The bulls who do not succeed in obtaining a place, or who are unable to oust others from their stronghold, are compelled to live apart from their companions. They are mainly old bulls who have been weakened by age, or young bulls, less than five years of age. The "whites" call them "bachelor seals," while the Aleuts know them as "holluschickie," and they usually number from one-third to one-half of the entire herd.

It is from these bachelor seals that the lessees of the islands are permitted to take the skins that are shipped in batches of 200 to 300 casks to London that they may be sold at auction, the great fur sales being held in that city. Each cask contains from 40 to 45 skins, which are rolled up separately, tied with cord, and packed in salt.

Nearly all the vessels that are employed in the seal fishery are the property of Canadians, but are manned by Indians, the latter making the most successful hunters, and their operations are conducted as follows: When a herd is discovered the natives launch their canoe and steal cautiously towards it. If the animals are asleep, every effort is made to approach them without waking them, for, in that manner, they may easily be speared, when they are almost invariably captured, whereas, when they are shot, they are so liable to sink to the bottom before the canoes can reach them that many valuable skins are lost.

The Victoria seals are captured at an earlier date than the Alaskan seals, and they are chiefly females and old bulls. The Copper Island seals are taken on "Copper Island," one of the islands of the Aleutian group, which is still the property of Russia. Their fur is inferior to Alaskan seal, however, in spite of the fact that it is generally believed that it is the same animal but taken at a different season of the year. It is lighter in color, being of a dark brown hue, and is generally inferior in quality. At the same time from 40,000 to 50,000 of these skins are taken annually.

According to the decision of the Bering Sea Court of Arbitration, announced at Paris, 15 August 1893, a close season was established to begin 1 May and to continue until 31 July, these restrictions to apply both in the north Pacific Ocean and in Bering Sea. A protected zone was also established extending for 60 miles around the islands, Pelagic sealing being allowed in Bering Sea, outside that zone, from 1 August. The use of firearms in sealing was forbidden.

In spite of all the precautionary measures that were adopted it is generally conceded that the Paris Court of Arbitration was a failure, at least so far as the prevention of the extinction of the seals was concerned. In 1901, Governor Sheakley, in a report submitted to the secretary of the interior, insisted that the extinction of the fur-bearing animals in Alaska was almost inevitable. Speaking of the rapidly diminishing seals, he said that the official inspection of skins taken by the pelagic sealers during the previous year showed anywhere from 55 to 80 per cent of female skins, a condition which merely confirmed previous investigations upon that subject, and he explained that so long as buckshot was being picked from the hides of young males killed in the Pribylov Islands, and maimed and wounded seals still limped about the hauling grounds, to say nothing of the fact that female skins predominated in the pelagic catches that arrived in London, it was unnecessary to make any further investigation as to the cause of the demolition of the seals. In his opinion, there was nothing that could be done at the islands to better the situation, for the rehabilitation of the rookeries would be an easy matter if adequate protection could be afforded the females. In 1902, Henry W. Elliott, the Government's fur expert, sounded a similar warning by assuring the Government that better protection was needed than that which was afforded by the finding of the Paris tribunal, and, about two years later, 9 March 1904, he again appeared before Congress to announce that his worst fears were about to be realized as the killings on the islands had run down to the very dregs of the young male life which the law permitted to be killed. In his 1905 report the secretary of commerce and labor considered this subject quite fully, and recommended that strong efforts be made to secure the necessary international regulations to put a stop to pelagic sealing. It was also shown by figures that, as the result of this wanton destruction of seal life, the herd on the Pribylov Islands had been reduced from approximately 2,000,000 animals in 1885, to about

200,000 in 1905, while the ravages of these pelagic sealers had reduced the number of skins taken from 100,000 in 1885, to less than 15,000 during 1905.

It is not for seal-skins alone that the American fur trade is indebted to Alaska, however, for that territory helps to supply the world with many other pelts including those of the sea and land otter, the brown and black bear, the beaver, fox, mink, marten, lynx, wolf, muskrat, and wolverine. An industry pursued incidentally with that of sealing on the Pribylov Islands is that of raising the blue fox for its pelt. This foxing industry, which is conducted by the agents of the lessee, permits of the killing of the fox under proper restrictions, the catch during the winter of 1904 amounting in all the islands to 289 blue fox skins and 13 white fox skins. Efforts have also been made by the agents of the department of commerce and labor, by the careful selection of the best animals for breeders and an insistance upon an adequate quantity of fox food to be furnished by the lessee, to induce an increased birth rate among these animals. What makes this experiment particularly interesting is that the proceeds from the sale of these skins are applied to the support of the native inhabitants of the islands, their services being required in the taking and curing of all kinds of pelts.

The manufacturing of skins into articles of commerce is not only an industry in itself but one that requires considerable knowledge and experience, as both the durability and the appearance of most furs depend much upon the mode in which they are cured, dried, and made up. To prepare most skins for packing and transportation — after they have been stripped from the animal — they are first carefully cleaned of fat and flesh, and are then dried in a cool, dry place. When thoroughly dry they are ready for shipment. This methid, of course, does not apply to the seal-skin, the manner of packing them in salt having already been described.

To present anything like definite figures regarding the consumption of furs is an extremely difficult matter as the demand for the many varieties vary from year to year owing to the fickleness of fashion. It is also due to fashion's foibles that some of the animals having the most beautiful skins are not exterminated, for when the demand for a certain variety of fur ceases for a season or two, with it ceases the destruction of the animals, which leaves them a period of safety in which they may recover their normal status as to numbers.

The American fur industry, like most other business and professions, is divided into departments and few firms now carry on all the branches of the business, as it was formerly done, under one roof. The taxidermist, for example, has one of the collateral branches of the fur trade. The manufacturing furriers and fur dealers represent an enormous investment of capital, especially those who are large exporters and importers of furs, for, in spite of the fact that London and Leipsic still have a firm hold upon the international trade, there are many fur houses in this country that conduct constantly increasing operations with the foreign markets owing to the superiority of American manufactures in furs. In addition to these, however, there are many other branches that are more or less directly connected with the fur industry. Among them one may mention the manufacturers of hats and caps, jobbers of furs, dealers in hatters' furs, proprietors of skunk and other fur farms, fur sewing machine houses, and firms making machinery and materials for the use of furriers, such as muff-blocks, head-forms, skulls, and down muff-beds. According to the 1900 census the aggregate number of establishments handling fur goods in the United States was placed at 994, but these firms paid $5,315,584 in wages to 9,709 employees. The cost of materials used during the census year amounted to $15,742,508, while the value of the product manufactured, including the receipts for custom work and repairing, amounted to more than $27,735,264. The total domestic exports of furs and fur skins during the year 1905, amounted to $6,599,222, while the imports of furs and fur skins, undressed, during 1905, were $10,502,907. The following table gives the value of the imports and exports of furs and the manufacturers of furs in this country from 1880 to 1905, inclusive:

FURS AND MANUFACTURES OF FURS.

Year	Imports	Exports
1880	$ 6,424,112	$5,404,418
1885	5,257,547	4,153,287

Furies, Eumenides, or **Erinyes,** called by the Romans FURIÆ and DIRÆ, were Greek mythological divinities, the avengers of murder, perjury, and filial ingratitude. They sprang from the drops of blood which fell from Uranus when he was mutilated by his son Kronos or Saturn. Others make them the daughters of Acheron and Night, and of Pluto and Proserpine. Later mythologists reckon three of them. and call them Alecto the unresting, Megæra the jealous, and Tisiphone the avenger. They were supposed to be the ministers of the gods, and to execute their irrevocable decrees; their sphere of action consequently was both in the infernal regions, to punish condemned souls, and on the earth to rack the guilty conscience and chastise by mental torments. Æschylus, in the celebrated tragedy of the Eumenides, introduced 50 furies, and with them Horror, Terror, Paleness, Rage, and Death, upon the stage. These terrible beings were described as clothed in black robes, with serpents instead of hair, with fingers like claws, a whip of scorpions in one hand and a burning torch in the other, an outstretched tongue, and eyes dripping with gore. They were suckers of the blood of men; when they were enraged, a venom oozed from them that spread like a leprosy-spot wherever it fell,

and made the ground barren. They were regarded with great dread, and the Athenians hardly dared to speak their names, but called them the *venerable goddesses*, by a similar euphemism the name Eumenides, signifying the soothed or well-pleased goddesses, being introduced. They dwelt in the cave called after them, at the northeast corner of the Areopagus at Athens, below the seats of the judges. Erinyes, the more ancient name, signifies the hunters or persecutors of the criminal, or the angry goddesses. The sculptors represented them as beautiful hunting nymphs, whose character was indicated only by the sternness of their expression, by the torch, dagger, and other similar emblems.

Furman University, a coeducational institution in Greenville, S. C.; founded in 1854 under the auspices of the Baptist Church. Reported in 1901: Professors and instructors, 15; students, 217; volumes in the library, 2,000; productive funds, $65,000; grounds and buildings valued at $80,000; benefactions, $25,000; income, $37,500; president, A. P. Montague, LL. D.

Furnace, a structure wherein a vehement fire and heat may be made and maintained, as for melting ores or metals, heating the boiler of a steam-engine, warming a house, baking pottery or bread, and other such purposes. Furnaces are constructed in a great variety of ways, according to the different purposes to which they are applied. In constructing furnaces the following objects are kept in view: (1) To obtain the greatest quantity of heat from a given quantity of fuel. (See FUEL.) (2) To prevent the dissipation of the heat after it is produced. (3) To concentrate the heat and direct it as much as possible to the substances to be acted on. (4) To be able to regulate at pleasure the necessary degree of heat (see HEAT) and have it wholly under the operator's management. An air furnace is one in which the flames are urged only by the natural draught; a blast furnace, one in which the heat is intensified by the injection of a strong current of air by artificial means; a reverbatory furnace, one in which the flames in passing to the chimney are thrown down by a low-arched roof on the objects which it is intended to expose to their action.

Those furnaces in which gaseous fuel is burned form a class of considerable importance. The gas to be consumed and the air to be used in the combustion are introduced into the combustion-chamber by separate pipes or openings, preferably in parallel streams near to each other, or in opposite directions along one channel so as to mingle before entering the chamber. The fuel may be either some naturally occurring gas, or one specially manufactured for the purpose, or the by-product of some other industrial process, for example, the waste gases of the blast furnace. Four methods of preparing fuel gases are distinguished: dry distillation, as in the case of coal-gas; preparation from oils; the producer method; and the water-gas method. Producer-gas was first introduced by Siemens. Regenerators are furnaces in which the gaseous fuel and the air to be mixed with it are heated before combustion with a view to increasing the working temperature of the furnace. The advantages of gas furnaces may be briefly summarized thus: no ashes or slag, high temperature, certainty of action and capability of exact regulation, simplification of working power, comparative cheapness, and economy. The electric current has been successfully utilized in the production of heat for chemical and metallurgical operations, and in this way temperatures otherwise unattainable have been reached. See ELECTRIC FURNACE; GAS; GAS, NATURAL.

Furnaces, Electric. See ELECTRIC FURNACES.

Furnaces, Metallurgical. See METALLURGY.

Furneaux (fėr nō') **Islands,** a group in the South Pacific off Tasmania, to which colony they belong. The total area is about 1,050 square miles. The principal islands are Flinders, Cape Barren, and Clarke. The inhabitants number about 700, and earn their livelihood by seal-fishing, the capture of sea-fowl, etc. The islands were discovered in 1773 by Tobias Furneaux (q.v.).

Fur'ness, Horace Howard, American Shakespearian scholar and editor; son of William Henry Furness (1802-96) (q.v.): b. Philadelphia 2 Nov. 1833. He was graduated at Harvard in 1854; studied law, and was admitted to the bar in 1859. The honorary degree of Ph.D. was conferred on him by the University of Göttingen in recognition of his services to Shakespearian literature. He is the editor of the exhaustive 'New Variorum Edition' of Shakespeare, the successive volumes of which appearing since 1871, include: 'Romeo and Juliet' (1871); 'Macbeth' (1873); 'Hamlet' (2 vols. 1877); 'Lear' (1880); 'Othello' (1886); 'Merchant of Venice' (1888); 'As You Like It' (1890); 'Tempest' (1892); 'Midsummer Night's Dream' (1895); 'Winter's Tale' (1898); 'Twelfth Night' (1901).

Furness, William Henry, American clergyman and author: b. Boston, Mass., 20 April 1802; d. Philadelphia 30 Jan. 1896. He was educated at Harvard; studied theology at Cambridge, Mass., and was pastor of the First Unitarian Church in Philadelphia in 1825-75. He was an earnest supporter of the anti-slavery movement and was a German scholar of eminence, translating much from the German in both prose and verse. He was a radical in his religious views but made a life study of the character of Jesus, which forms the theme of several of his works. Among his numerous works are: 'Remarks on the Four Gospels' (1836); 'Jesus and His Biographers' (183[illegible]); 'A History of Jesus' (1850); 'Thoughts on the Life and Character of Jesus of Nazareth' (1859); 'The Veil Partly Lifted' (1864); 'Jesus' (1871); 'Verses and Translations from the German Poets' (1886); 'Pastoral Offices' (1893).

Furness, William Henry, 1828–67, American artist, son of the preceding: b. Philadelphia, Pa., 21 May 1828; d. Cambridge, Mass., 4 March 1867. He very early made a reputation by the excellence of his crayon portraits, and having earned from the sale of these the means for foreign travel, studied art in Europe for two years. On his return to America he established himself as a portrait painter in Philadelphia, and subsequently in Boston, and at the time of his death was one of the foremost portrait

painters in the country. Among noted portraits by him are those of his father, Dr. Furness; Charles Sumner, and Lucretia Mott.

Furness, William Henry, 1866, American ethnologist: b. Wallingford, Pa., 1866. He is a son of H. H. Furness (q.v.), and was educated at Harvard and the medical school of the University of Pennsylvania. He has published: 'Folk-Lore in Borneo' (1899); 'Life in the Luchu Islands' (1899); 'Home Life of the Borneo Head Hunters: its Festivals and Folk-Lore' (1902).

Furnishing Goods. See CLOTHING AND FURNISHING TRADE.

Furniture, formerly all the various movable appliances or articles in the interior of a house, now more commonly applied to articles of wood or metal. The ancient Egyptians aimed to variety rather than symmetry in the arrangement of their houses. They had chairs made of the finest woods in great variety of design, covered with rich cloths or skins, and inlaid with gold or ivory. They also used folding stools, sofas, couches, and carpets or rugs. Their tables were of variety of shapes and constructions. Bedsteads were made of wicker-work and sometimes of bronze. The forms of household articles of furniture found in or represented on Assyrian monuments and remains, show great artistic elaboration and a profusion of highly wrought ornament. The Assyrians were especially skilful in the chasing of metals, and they delighted in reproducing natural objects on their ornaments. The Greeks had couches covered with skins or drapery, on which several persons might lie with their bodies half raised; these were used at meal times by the men only, women and children sitting on seats; they had large armchairs with footstools, portable small chairs without arms, and stools with carved legs made to fold up.

Among the Romans, Greek art gained a predominant influence, and the conquerors of the world were at all times glad to employ natives of Greece to design and execute the works intended to display the opulence of their masters. On the ornaments of the *triclinia* or couches on which they repose, immense sums were bestowed. They were often inlaid with precious materials, such as ivory, tortoise shell, gold and silver, and had ivory or metal feet. They consisted of a framework which was strung with girths, on which rested a mattress stuffed with straw, wool, or feathers, and covered with rich drapery. The *lectus cubicularis*, or bed, was higher than the couch, but not unlike it. The tables were generally of costly foreign wood, resting on frames of carved marble or an ivory column. The curule chairs, or seats of state of the patricians and magistrates, were wrought in ivory; and to form an estimate from the number of beautiful utensils in marble and bronze richly chased and inlaid with silver, that have been found in the ruins of a comparatively insignificant city, Pompeii, the wealth of the Romans in movable property of this nature must have been very great. The library first appears as a separate apartment in a Roman house; that discovered at Herculaneum was small, and lined with presses about the height of a man, in which the rolls of papyrus and parchment were kept. Still, according to modern ideas, the Roman rooms would seem rather bare of furniture. They had no writing tables or cabinets; couches, chairs, tables, and candelabra comprised the whole of the furniture with the exception now and then of a water clock, or a chafing dish.

Among European states from 500 A.D. to 1500, the ecclesiastical style prevailed in furniture as in every other species of art, attaining its greatest eminence in the decorated Gothic of the 14th century. Articles of furniture previous to 1500 are very rare. For three centuries after the Conquest domestic furniture was very scanty. The hall was furnished with tables and benches, the furniture of a bedroom consisted of little more than a bed and a chest. Chairs were large and cumbrous, and were usually fixtures; wooden forms, sometimes with black rails, being placed against the walls. The furniture of the dining-room was very limited. Boards on trestles were in general use as tables. In the 14th and 15th centuries remarkable progress was made and a considerable degree of splendor in furniture was attained. Defense began to be not the only object studied in the construction of buildings. The Gothic paneling of the carved bedsteads, chairs, screens, etc., was dazzling with scarlet, blue, and gold, and costly embroidered hangings and curtains heavy with heraldic symbolism, cabinets, reading-desks, prie-dieus, ivory and enameled coffers, fire dogs, or andirons elaborately chased and gilded, began to appear.

The progress of this decorative style was suddenly arrested by the «Renaissance,» or revival of ancient classical art and literature, of which Italy was the earliest seat, and from whence the impulse was given that communicated itself speedily to the rest of Europe. A genuine and self-evolved style instantly went out of fashion, and was discarded for an imitation and counterfeit one based on the copying of understood classic models which were applied without consideration to the most incongruous objects. The classical temple was the dominant idea in the manufacture of furniture as well as in the construction of a palace or a cathedral, and columns were considered as necessary in one species of art as in the other. All the architectural details of Roman buildings were then applied to furniture; the lions, griffins, chimeras, etc., of the temple frieze encumbered the stately pillars of the Italian palaces, and caryatides and Roman trophies replaced the patron saint and the crucifix. With all its absurdities, it must be noted that this style was in the hands of great men, and their productions display a boldness and vigor of line, and a mastery over human and animal forms that give dignity to a licentious freedom of design in which all appropriateness is forgotten. Specimens of the Renaissance are still met with, though daily increasing in value. Gothic art never recovered its lost ground.

With various modifications the Renaissance style continued dominant for nearly two centuries. In England it degenerated into positive ugliness, the furniture of the time of Elizabeth and James I. having very little to recommend it in tasteful design. It is distinguished by a mixture of overwrought heavy molding, combined with thin spindly columns, twisted legs, and other inelegant characteristics. Magnificence is sometimes attempted in the value of the material, as in the famous set of chamber fur-

niture in chased silver executed for a royal visit at Knowle Park, the seat of the dukes of Dorset in Kent. It was succeeded by the style named after the French monarch, its patron and encourager, Louis XIV.

The modern predominance of France in the construction of furniture is owing to the minister Colbert. He it was who brought together the best workmen of Europe, and by an edict of the year 1667 established the French royal manufactory of furniture. The new style which the productions of this establishment assumed appears to have been worked out undesignedly, and, like every such successful phase of art, was the genuine product of circumstances. Novelty and magnificence seem to have been the great features aimed at; these were sought by varied treatment of surface in cabinet furniture (as inlays of metals, ivory, enamels, porcelain tablets, tortoise shell, etc.), and by an incrustation of broken scroll panel work, which hid the real constructive forms and frittered away the graceful outlines of the Renaissance into a confused and unsymmetrical mass. Under Louis XV. the same school of art continued, and it received new elaboration under the successors of Boule, Riesner, and Gouthier; their works are known to connoisseurs as articles of vertu by the respective styles of each master, and fine specimens bring almost fabulous prices. Probably more of this class of furniture is to be found in Great Britain than in all the rest of Europe, a great change of owners having been brought about by the French Revolution. While the splendid extravagances of Louis XIV. were holding sway in France, the prevailing taste in England seems rather to have been modified by the fashion introduced from Holland by William III. The native woods, oak or wainscot, chestnut, etc., were about this time superseded for furniture by the dark and heavy West India mahogany, the invariable material of the ill-designed and awkward furniture familiar to us in the immortal designs of Hogarth. A better style based on that of France was introduced by Chippendale, but a severer and more artistic taste was displayed by the designs of Heppelwhite and Sheraton. In the latter part of the reign of Louis XVI. another change is apparent in French furniture. Greece and Rome were looked up to as standards of correctness in furniture as well as in politics. But instead of impressing their own genius on designs inspired by ancient models as did the great artists of the Renaissance, the authors of this revival were too often content with frigid imitation. The classical style did not long hold sway, and since that time the practice of both France and England (and with them the rest of Europe) has been purely eclectic. At present designs after the best work of the older makers are much in favor in both Europe and America. See Furniture Industry in America, The.

Furniture, Colonial. When the Colonists first landed, and during their early struggle for existence, little if any attempt was made to import furniture, and we have nothing now which could be rightfully claimed to have been brought over from Europe before the coming of the Mayflower (1620). The New Englanders were the first to make furniture copying the designs of the original pieces, which were of heavy oak with severe lines and flat carvings. Their puritanical minds apparently abhorred anything of an ecclesiastical cast. As early as 1650 the southern planters imported fine pieces from England, of oak richly carved and inlaid, the designs being influenced by the Renaissance just dawning in France, and the Elizabethan and Jacobean periods in England. The authorities in the South tried to prevent trade with Holland and New England, so a comparison of the English furniture, prior to the Revolutionary War, with that of Maryland and Virginia, shows that the English life of that time was planted there as far as it was possible. Since we find so few of these original pieces, we can only think that the planters becoming wealthy so rapidly, and wishing to keep up to the "prevailing English style," must have discarded the old for the new, as their invoices show large importations of furniture up to the Revolutionary War.

There was a marked difference between the houses of New York and of New England. The Dutch built theirs of brick, while those in New England were mostly of timber, and a striking feature in the living-room of the former was the chimney-piece, which among the wealthy was elaborately carved and tiled and held vessels of brass repoussé and Delft-ware. The fire-place with its colored tiles continued to be a decorative feature, even after coal succeeded wood as fuel and grates took the place of andirons. The floor of the average house was sanded, and rooms had no special character. The ideas which the Dutch brought from the Orient influenced the designs not only around New York but in New England as well, and fast grew into favor. Strange shapes from the East, introducing marqueterie in exotic woods, were eclipsing the old chests of drawers, cupboards, etc., and actual products of the Far East filled many of the Dutch houses. The cabriole legs superseded the severer lines. Other woods beside oak, such as walnut, pine, red cedar, maple, etc., were introduced; ebony was scarce, so the "black egg ornament" was often of white wood stained black.

In the first half of the 18th century New York was an important place, and inventories show that fashions in New York compared favorably with those of London and Amsterdam. The bed was disappearing from the hall; carpets were introduced, and in 1750 they had flowered carpets and "painted floor cloths." The walls, of houses of the better class, were papered before the middle of the 18th century, and for 50 years we have an interesting wall-paper period; their chief designs were large illustrating panels, such as "The Lady of the Lake," "The Four Seasons," etc. Fire-places were growing smaller as wood was harder to obtain, and in 1745 Franklin invented what is now known as the "Franklin stove." Upholstery was taken up and there were many cabinet-makers in New York, Boston, and Philadelphia; skilled workmanship was in demand, and "choice timber and metal furnishings for cabinets" were advertised. Then came the period when mahogany was the favorite wood, and, just as in England, all designs had a tendency toward greater lightness and grace of line, and showed the Chinese influence strongly. In 1776 the home of a wealthy Amer-

ican compared favorably with that of an Englishman in similar circumstances. "Chippendale" was the rage, both imported and domestic. There was a marked difference between the North and South — the Northerners lived more simply, but with a certain amount of fashion and elegance; in the South everything was ease and luxury, and many houses were noted for their costly furnishings. Around Charleston, S. C., at the present time are some excellent examples of typical Southern homes of the 18th century, containing many of the original pieces of furniture. The classic or Greek style adopted by Adam in England, found its way here, and was seen in architecture and interior woodwork, noticeably in mantels and built-in cupboards, but was little used in articles of furniture.

Mt. Vernon — now a museum of relics — is the most interesting colonial house, on account of its associations. It was inherited by George Washington in 1751 from his half-brother Lawrence Washington. Soon after it was almost entirely refurnished, and though by no means palatial was extremely comfortable. There were few of the original Washington pieces left there, as Mrs. Washington bequeathed the furniture to four grandchildren, but now many articles are gradually finding their way back, either through gift, or through purchase by the Mt. Vernon Ladies' Association of the Union. There are many Washington pieces, used by him while in Philadelphia, now in possession of the Historical Society of Pennsylvania. Second in interest is Monticello, the home of Thomas Jefferson. Its architecture and decorations are delightful, and it still contains proofs of the owner's good taste and love of art.

"Colonial designs," as termed in the vocabulary of the dealer of to-day, were not known until the colonies had become States. They are traced in America first through the Dutch, who had taken many points from Spain and the Orient, namely the ball and claw pattern. Chippendale adapted them with more lightness and grace of line, but the French Empire style which came in at that time changed it into the massive mahogany, and gave the rope-carved pillars and lion-claw feet. American makers omitted the elaborate brass and ormolu trimmings used by the French, and depended upon the beautiful grain of the wood, often veneering to obtain handsome effects. The superiority of the old furniture is due to its construction; the old makers worked solidly, dove-tailing, and blocking all drawers, and to-day the age of the wood has greatly added to its value, the stained mahogany loses the beautiful golden shafts of light. The polish was attained by constant rubbing, while to-day most pieces are simply varnished.

Mahogany was brought into England by Sir Walter Raleigh, but was not in general use until about 1725. In New England it was extensively used a little later, being imported from the West Indies. The Honduras and Mexican varieties most commonly used to-day, do not materially improve with age, and are much lighter in weight than the West Indian, therefore a really old piece may often be told by its heaviness. The date of a bureau, chest of drawers, etc., may frequently be ascertained from its handles.

Handles.— The oldest handles, chiefly brass, rarely pewter, were drop-handles, formed like an earring, backed by a small plate. Next in order was a larger plate, usually engraved, with a bail large enough to insert two fingers. The next was a larger plain plate similar to a fleur-de-lis in shape, the bail being much larger, and from now on, held into the drawer by brass nuts instead of wires as formerly, but in reproductions iron nuts are nearly always used. It gradually developed into a thin oval plate embossed with moldings, sometimes with centre design, and the bail, fitted into posts, falls outside the plate, preserving the same curve. Still later came the knob and empire rosette handles, sometimes with ring, usually of brass but also of glass or plain wood.

Chests.— No matter how meagre an inventory, it always included a box, chest, or case. First the ordinary ship's chest of pine with iron handles, which was appraised very low. There are several good examples of these in State historical societies, including one brought over in the Mayflower. Few of these were made after 1725. The oldest carved chests were in low relief with often the date and name of the person for whom it was made; they were afterward made with one drawer, having panel or turned ornaments. This developed into the "chest of drawers," made of oak and more elaborately decorated, which in turn developed into the "chest upon chest," sometimes having as many as nine drawers, and the three-tier "steps" for displaying china was sometimes placed upon these. The "high-boy" is not mentioned until the chest of drawers was placed upon a frame about three feet high, having one or more drawers; it had six legs, and later the part where the centre legs were omitted was finished with "drops." This, in the latter part of the 18th century, became a very handsome article of furniture, with carved top, usually "shell" or "sun" pattern, decorated with gilt torches or balls, and cabriole legs and carved feet.

The Dressing-Table, or "low-boy," came from England in 1716. At first it had but one drawer, afterward it was the same as the frame for the "high-boy," only about three inches lower. The "high-boy" and "low-boy" were often made to match. The Chippendale and Sheraton designs were usually furnished with dressing-boxes and mirror.

The Settle was an evolution of the chest. Handsome examples are rarely found in this country, although there are many varieties of the "fire-side" settle in painted pine and oak found in New England, with a shelf to hold a candle. The settles which appeared in the latter part of the 18th century, following the Chippendale, Sheraton, and Heppelwhite designs, might better be termed sofas, which later took on the Empire designs, with "claw-and-ball" and "wings-and-claw" feet, and "cornucopia" and "swan-neck" ends.

Beds were among the first and most frequently mentioned articles of furniture in wills, being highly prized. In the 17th century the Southern planters owned elaborate European bedsteads, usually of oak. In New England they were very simple affairs, while among the Dutch the bed, at first, was only a sort of bunk. The four-poster soon supplanted all, first of oak, but later of mahogany. Some were most elaborate, with rope-carved, or pineapple and acanthus-leaf posts, and ball-and-claw feet, with

1–5. Handles.
6. Dressing table.—Constitution mirror.
7. High-boy.
8. Windsor chair.
9. Four-post bed.

tester drapery, valance, curtains and coverlet to match, of white or bright colored materials, chiefly drugget, lindsey-woolsey, or dimity, though later chintz was popular. In the South, mosquito canopies were prevalent, sometimes colored to match the color scheme of the room. Feather beds were universally used, resting on ropes or sacking pulled taut, and owing to their height, "bed steps" were necessary. We also find mention of turkey feathers and cat-tails being used as fillings, and early in the 18th century hair mattresses appeared.

Cupboards were usually built into the wall, and whether called "livery," "court," "standing," or "press," were all fitted with light movable shelves to hold linen and display china and glass. There are few of these open cupboards to-day. First the upper part was enclosed with doors (later ones show glass doors with lattice work), afterward a drawer was added, then the lower part was enclosed, and when fitted with lock and key was highly prized as an article of furniture. These partly opened cupboards were called "beaufait," afterward contracted to "boufet." Closed-in cupboards show German as well as Dutch origin, and the finest examples were found among the Dutch, usually spoken of as "kasse," carefully carved and painted.

Chairs are scarcely mentioned before 1650, forms or benches being used almost entirely, the chair being considered the seat of honor, but toward the end of the century there was a marked increase in the numbers mentioned in the inventories. They were made of oak, pine, and walnut, turned or paneled, simply carved and with high backs, the seats either rush or cane. About the 17th century we notice leather and "turkey-work" seats with brass nail-heads. The "ball-and-claw" foot, introduced by the Dutch, appeared at the close of the 17th century and remained in favor for nearly a hundred years. Chairs made of wicker and cane were known as early as 1711, and in 1720 came the painted chairs from Holland, usually black, often decorated, with rush or cane seats. The Windsor chair, first made and used in Philadelphia in 1725, was the most popular style up to the 19th century. It was usually of hickory or ash and had a wooden seat, the back was high and either "spindled" or "fan-shaped," sometimes having an extra headpiece. The style known as Chippendale appeared in 1720, the development being apparent before Chippendale worked. Its chief characteristics were the traceried splat, bow-shaped back and cabriole legs, also the "plate-backed," which was a solid splat, usually jar-shaped, and hoof feet. The all-upholstered "wing" chair seemed to be in general use before 1750. Mahogany was now easily procurable and the tendency was toward greater lightness, and most of the designs, from now on, follow the English cabinet-makers; Chippendale, with a strong Chinese influence, then Sheraton and Heppelwhite, some being beautifully decorated with hand-paintings, carvings and inlay. In 1770 we have another style, modeled after the old "splat-back," but with the splats crosswise. About 1800 the style commonly known as "empire" began to be felt, and gave us the "lion" and "bear" claw-feet and rolling backs, copied after old Egyptian designs. The strong empire was partially modified here by the Sheraton influence. There is a style in America, a modification of the empire, with heavy mahogany splat-back, usually jar-shaped, often having the back and back legs in one piece. These were in favor until 1840; they were usually covered with "horse-hair" and are now offered as "Colonial" designs!

Tables.— What has been said of the development of chairs may be applied to tables, as almost every form of chair had its corresponding table. First we had the "table-borde," a board, often 12 feet long by 2 wide, resting on a cross-legged trestle. It gradually became customary to leave the "borde" on the trestle instead of removing it after each meal, and it was then known as a table. Marble and slate-topped tables appeared about 1693, and were considered "the latest thing." Before the 18th century we had imported "chair-top" tables, "drop-leaf," and the "100 legged," which was the first extension table, all with turned posts. About 1735 the Dutch influence was strong, and to-day we have some excellent examples, dating from 1750, of mahogany "pie-crust," "dish-top," etc. The "centre-pillar" table came in with the Empire period. Tea tables were found in every parlor of the 18th century, always ready with complete tea-service, spirit-lamp, kettle, tea-box, tongs, strainer, etc. Among the Dutch the table was frequently of rare or japanned woods, many with adjustable tops. Card tables, of which there were many, usually had a plain surface, though some were covered with green cloth; they had folding tops and corner shallows for counters. Work tables were mostly of Sheraton design, the top lifting up, disclosing compartments for sewing materials. Candle tables were of various heights, with a top only large enough to hold a candlestick.

Desks.— A desk was originally a wooden box with slanting lid, the writing materials, and frequently the Bible, were kept inside under lock and key, and the top served the double purpose of reading and writing desk. The large desk or "secretary" appeared about 1660 and seems to have been another development of the "chest of drawers," usually having two or more drawers in the lower half. The lid on the upper part was either let down on chains or rested on two wooden slides. The interior was fitted with many drawers and pigeon-holes, and they had often secret compartments. Later, a cabinet was placed on top and developed into the "cabinet-top" desk, made in one piece and reaching almost to the ceiling. The "table-topped" desk belonged to a later period, a good example being the one used by Washington while in New York in 1789, now in the City Hall. There are some good specimens of Sheraton and Heppelwhite desks in this country belonging to their respective periods. The later empire or "Colonial" pieces were large and heavy, mostly "bureau-fronts."

Clocks.— There is slight mention of household clocks prior to 1700, but in the 18th century clock-making was quite an art; the Willard Brothers of Massachusetts were the first to become famous. Around New York were found some "Frisian" wall clocks from Holland, run by weights, with elaborate designs of gilded and painted mermaids, cherubs, etc. The English "lantern" clock was on the same order, being of brass with heraldic metal work. This developed into the "bracket" clock, through having a wooden hood placed over it for protection; it

was very popular about 1700. The first mention of a tall clock is in the latter part of the 17th century, when long pendulums, also moving figures upon the dial, became fashionable. It was spoken of as "clock and case," and was very plain, of oak or walnut but later of mahogany. Many of them were destroyed during the Revolution, the works being hidden and the cases, in some instances, used for shipping bayonets. Few tall clocks were made after 1815. After the Revolution cheaper time-pieces were in demand, and to meet it, clocks having white enamel dials and wooden works were invented. From then on, there were many styles of cheap clocks for walls and mantels, including the "banjo" clock patented by Willard in 1802; the "lyre" clock, and many "Colonial" designs in wood, some with painted glass covering the pendulum.

Looking-Glasses.— The first record is in an inventory in Maryland 1639. They were rare at that time even in England, being imported from Venice. The frames were of olive-wood, black or gilt, and when the glass exceeded four feet were made of small pieces joined by moldings. Later the frames were heavily carved and inlaid, but always retained the Italian appearance. We find mention of a parlor in a Maryland house in 1732, "set off with pier glasses." In New England it hung over the mantel-piece and was known as the "chimney-glass," usually ornamented at either side with candle sconces. At the end of the 18th century the shield and oval glasses appeared, showing the influence of the English cabinet-makers, followed by the Empire, with rope-carved pillars, acanthus-leaf and lyre carvings, sometimes having the top partitioned off for paintings. What is known as the "Constitution" mirror did not appear until after 1800; most of them bore the eagle at the top.

Mirrors, during the 17th and 18th centuries, were either of convex or concave glass with elaborate frames, and were frequently used for decoration.

Sideboards came into fashion about 1780, taking the place of cupboards and side tables. They were nearly always of mahogany. First after Sheraton, with inlay, noticeably the "bell-flower" design down the slender legs; later "Colonial" of heavy mahogany with the cupboards extending nearly to the floor, ball-and-claw feet and rounded pillars, similar to the bed-posts.

Washstands.— First called a "bason-frame." Few good examples before the latter part of the 18th century, which were influenced by the English cabinet-makers, and later by the Empire.

Warming-Pans were a necessity, especially in New England. The pan was usually of brass with cover, 14 inches in diameter, with a long wooden handle fastened to the pan by an iron socket. Hot coals were placed in it, and when rubbed between the sheets warmed the beds. They were often decorated with open-work carvings and were quite ornamental hanging beside the fire-place.

Screens were used to protect the face from the heat of the fire, were small, made of embroidery or painted wood, with round or square frame, fastened on a post which could be raised or lowered.

Children's Articles.— We find frequent entries of articles of furniture for children. Cradles, the first one brought over in 1620; high-chairs, also "fenders," to keep the children away from the fires.

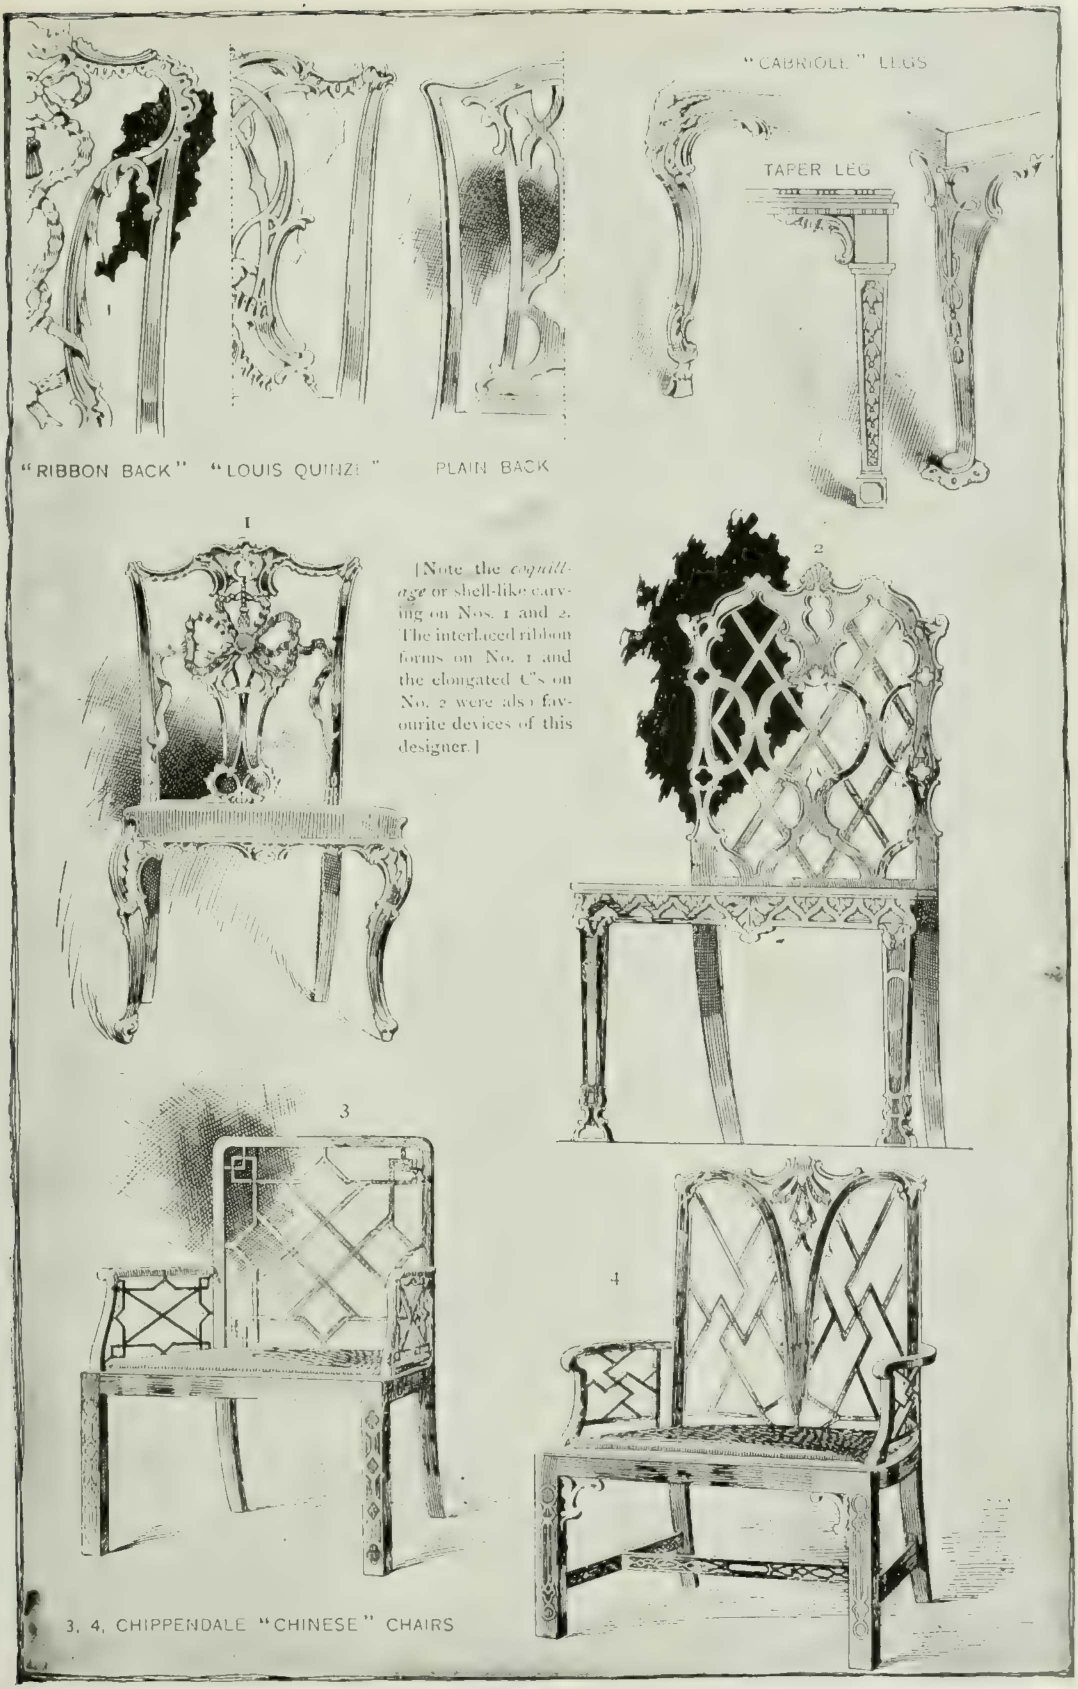
There were several miscellaneous articles of furniture mentioned after 1750, including "dumb-waiters," now called "butler's trays"; "wine-coolers," "knife-boxes," "sewing-boxes," "clothes-trees," etc.

Collections.— Among the many permanent collections of Colonial furniture may be mentioned the Connecticut Historical Society, Hartford, Conn.; the Pilgrim's Society, Plymouth, Mass.; the Essex Institute, Salem, Mass.; Van Courtlandt Mansion, Van Courtlandt Park, N. Y.; American Antiquarian Society, Worcester, Mass.; Historical Society of Pennsylvania, Philadelphia; Washington's Headquarters, Morristown, N. J.; Independence Hall, Philadelphia, Pa.; and Mt. Vernon, Va.

Bibliography.— Singleton, 'Furniture of Our Forefathers'; Lockwood, 'Colonial Furniture in America'; Morse, 'Furniture of the Olden Times'; Wallace, 'Colonial Interiors'; Chandler, 'Colonial Interiors'; Corner and Sodeholtz, 'Colonial Interiors and Exteriors'; and 'The House Beautiful' (monthly).

Louise Cowperthwaite,
Of George C. Flint Company, New York.

Furniture Industry in America, The. The early cabinet-shops of America were like the second-hand repair-shops to be seen to-day in New York, Boston, Philadelphia, and other large cities. A great many cabinet-makers made furniture until late in the 1st century of commercial independence on simple Chippendale lines. Gradually the Empire fashions, which were making themselves felt all over Europe, spread to America, and shapes became heavier and more pretentious, mahogany being used almost exclusively. Heads of animals were also used, and claw-feet became a general feature. Common furniture was heavy and unattractive. The general condition of things at this time was unfavorable to the development of art industries. Little thought was given to progress in the manufacture of furniture and for some years there was a decline. Upon a revival of commerce cabinet-makers changed their style, and began producing a debased rococo style, which did not have the elegance or character of the Louis XV., but was covered with a florid ornamentation in which the only consideration was display. The extravagance of curves and lavish ornamentation brought about a reaction, and toward 1830, following the fashion in England and France, an attempt was made to construct furniture in the Gothic style, but with very unsatisfactory results. The lack of artistic training of the manufacturers who were, as a rule, cabinet-makers or carvers by trade, made it very difficult for them to handle a method of decoration and construction so little appropriate in itself to the requirements of home comfort. This Gothic style of furniture, monumental in appearance, was made to a limited extent only, although its influence is to be noticed on other furniture placed on the market at this time and later. The making of rococo furniture was kept up by a large number of cabinet-makers, the cheaper furniture being for many years made in this style. It was also during this period that steam, applied to cabinet-makers' machinery for



CHARACTERISTIC CHIPPENDALE CHAIR-DESIGNS

Thomas Chippendale flourished about 1750-1760. His "Design Book" was published in 1752.

CHARACTERISTIC HEPPELWHITE FURNITURE

Messrs. A. Heppelwhite & Co., Chippendale's successors, published their "Design Book" in 1789. The Heppelwhites were designers rather than manufacturers.

the first time in 1815, occasioned a revolution in the manufacture of furniture, bringing labor-saving devices into more general use, and enabling the cabinet-maker to supply the rapidly increasing demand for his product. In 1825, Richardson, of Philadelphia, introduced the circular saw, and Taylor, Rich & Company erected the first mahogany-mill in America, a number of these saws being used there. Ordinary furniture, which until now had been very plain, was covered with endless scroll-work and moldings, produced so easily by the new machines. The manufacturers indulged for a time without restraint in this ornamentation. The use of machinery in shops, and the increased facilities for transportation, wrought a wonderful improvement in the furniture trade; and the cabinet-shop, which had until this time been of small importance and partially engaged in making articles kindred to furniture, suddenly assumed large proportions, and confined itself to furniture only, using in the making of it the new devices which were constantly being brought forth by ingenious inventors. The value of the furniture product in the year 1850 may be estimated at about $15,000,000, and the industry gave employment to 37,000 people, out of a population of a little over 23,000,000. For a long time a great number of hand-shops survived, making to order special high-grade work; and they succeeded in impressing their patrons with the idea of the inferiority of machine-made furniture, which at this early stage in the introduction of machinery was not entirely without foundation. The extensive use of machinery in shops had the immediate effect of again changing the style of furniture. Manufacturers looked for a fashion in which they could use their facilities to the best advantage, and at the same time retain the attractiveness of their earlier work. This they found in the Renaissance, which for a number of years superseded all other styles in the best class of furniture.

Up to this time the furniture industry had been confined to the Eastern States, principally in and around Boston; but a number of factories were now started in the West, where situated in proximity to large forests and regions where population and wealth were rapidly increasing, they soon became important factors in the production of furniture in the United States. These factories, equipped with new machinery and using native timber, produced at first a low grade of furniture in which art seems to have been very little considered. Those who wanted more artistic furniture purchased it from the East. The art revival which had taken place in Boston and New York was fostered by increased travel in Europe, where exhibitions were taking place at short intervals in London and Paris. Moreover, the consideration that old furniture was beginning to receive brought forcibly to the people the inferiority of that then made, and manufacturers gave more attention and study to its appearance than before. Trade kept increasing with the general wealth, and in 1860 the production reached $25,500,000; but the number of workingmen employed in this industry, owing to the improvements in machinery, had fallen to 28,000, although the population had then reached almost 31,500,000.

Industries in general were now to receive another blow, on account of the War of the Rebellion. As soon as this conflict was over, the extraordinary activity which had prevailed in military circles was transferred to the industrial field, and from this time on it is by leaps and bounds that improvements can be noted. The furniture trade was in the hands of two classes of manufacturers, one class of whom, having taken the place of the old hand-shop workers made high-class work to order, continuing the old traditions, but now using machinery extensively. The other class of manufacturers studied the wants of the people, and produced suitable articles at prices which were within the reach of the masses. It is to them that we are indebted for the gigantic development of the industry, as they placed within the reach of all, strong, ornamental, and practical furniture. We have seen that men of taste had recognized for some time that our furniture was inferior to that made at the end of the last century, and had begun to study not only the styles of that period, but also those of the English and French prevailing in the past. As a result we find that a great variety of styles were employed in the productions of the leading firms, who were always striving for novel effects.

A work published in London, England, in 1868, entitled 'Hints on Household Taste,' by C. Eastlake, waged war on modern work, advocated returning to the primitive principles of Gothic construction; and gave positive instructions as to what was right or wrong, not only in the line of furniture, but in draperies, carpets, and other household decoration, as precisely as if the art had been a science. This book was looked upon as a sort of gospel treatise on furnishing, and however much we may at this time ridicule some of the ideas conveyed, it directed the public mind in its search for more artistic surroundings at home. From that time other styles were discarded, and designs in accordance with the newly developed taste took their places. The movement in favor of more perfect construction and the use of straight lines exclusively became general, the stiff appearance being relieved by an abundant use of arches, spindles, turnings, etc. This style allowed the manufacturers to do the greater part of the work by machinery, for which it seemed specially adapted. The increased interest that the public took in furniture developed the trade in an unprecedented manner, the production for 1870 being $68,500,000, or nearly two and one half times that for 1860. The number of men employed at this time shows a similar increase, being 55,800, out of a population of 38,500,000 people. The Centennial Exhibition in Philadelphia (1876) had a far-reaching influence, especially on western manufacturers, who until this time had not had occasion to compare their products with those of the best manufacturers of America and Europe. This exhibition marks the highest point that the Eastlake or early English was to attain. A number of the most prominent manufacturers of this country had their exhibits made in this particular style. It was quickly taken up by the manufacturers of cheaper furniture, who until then had given very little attention to artistic form, and they are responsible for the enormous quantity of furniture in imitation of this description that can yet be seen in the auction-rooms of large cities. The strife for originality, which was soon to be one

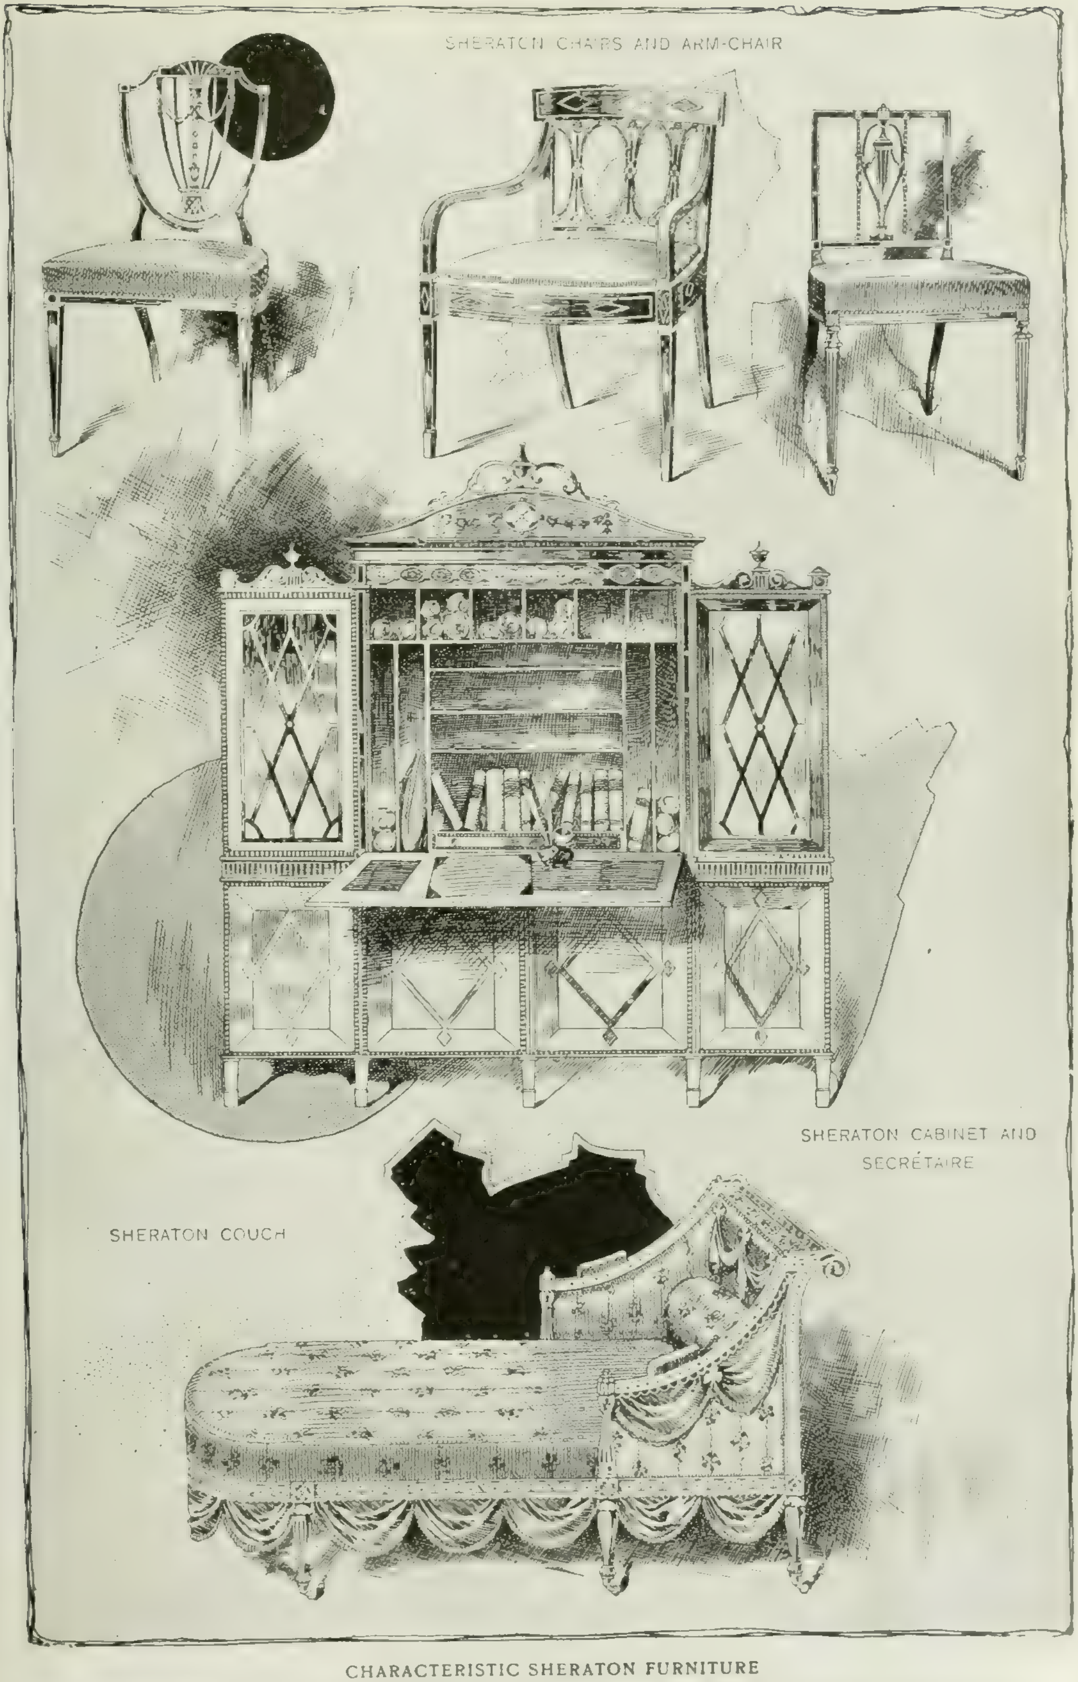
of the characteristics of western manufacturers, had now begun to show itself; but an insufficient knowledge of art subjects rendered many of their designs more strange than beautiful, and more noticeably so when they were working on the lines of any given style; but through diligent efforts their designs were steadily improved, and this, in connection with their superior facilities, has secured to them a large part of the eastern trade. The volume of business showed a substantial increase during this decade, although not as large as during the preceding period. The value of the output of furniture for 1880 was $77,845,000 — an increase of 13.5 per cent in value, but a decrease from $1.77 to $1.55 per capita of the population. The wonderful changes which occurred in architecture in the next decade, especially the Romanesque revival due to H. H. Richardson, had a distinct effect on furniture. Richardson himself designed some Romanesque furniture. Furniture manufacturers eagerly welcomed this departure, for the ceaseless demand for new things, as strong then as it is now, obliged them to change their patterns very frequently. Unfortunately, by passing through the hands of manufacturers of cheap furniture, it lost all of its original beauty. During this decade great improvements were made in woodworking machinery, and a large number of new devices were invented. Among them was the carving machine, which enabled manufacturers to ornament even the cheapest kind of furniture. The amount of business done in 1890, large as it was, did not keep up with the increase of population. The value of the product in 1890 was $86,362,685, an increase of 11 per cent over that of 1880; but the amount per capita of population dropped to $1.38, as compared with $1.55 in 1880, and $1.77 in 1870. The International Paris Exposition of 1889 revived a taste for the 18th century furniture, especially of the Louis XV. style, which was quickly taken up by the people of the United States. In spite of the seeming difficulty of using machinery in making such work, American manufacturers made and are still making a large quantity of furniture, in that dainty mode, which certainly equals that of the same class made in Europe, and is generally better constructed. All the 18th century styles, French or English, have been and to a certain extent are now used by American manufacturers:— Louis XV., Chippendale, Louis XVI., Sheraton, Hepplewhite, Empire and the Flemish Renaissance.

Since the decline of the Empire style in the first half of the last century manufacturers have been satisfied to copy the styles of the past, with such modifications as conformed to commercial requirements. The public demand for reproductions of old furniture increased to such an extent as to leave little room for originality in their production. Within recent years a strong feeling has developed that the old styles are not in keeping with present ideals and new styles should be evolved to emphasize simplicity of construction, grace of style, beauty of proportion and harmony of color. The Mission style, at first heavy and shapeless, is acquiring more subtle and refined lines, thereby increasing in public favor. The novelty of the last century is a free natural style called Art Nouveau. Its introduction to this country from France a few years ago was attended by failure. The market was flooded with goods of inferior make in which the vagaries of this style were mistaken for its distinctive features. The meaningless curves and coarse ornaments of the beginning are being discarded and a refined elegance is now taking their place. The extensive adoption of this style in other art industries warrants the belief that it soon will be a distinctive feature in furniture.

Many of the numerous articles of furniture manufactured are distinctly American. The bureau, the rocking-chair, the folding-bed, the chiffonier, as now made with toilet, and in general most of the combination pieces of furniture made with a view of economizing space in apartments in large cities, are of this class. The American bureau is a combination of the old chest of drawers and the dressing-table, having the drawer-room of the one and the swinging mirror and table-top of the other. This has been imitated in Europe to a limited extent, in the production of what is known as the English dressing-table. As made in this country, the bureau is one of the most practical pieces of furniture used. The rocking-chair, almost entirely unknown in Europe, is found in every home in this country, yet it is difficult to ascertain when it was first put in use. We do not find any mention of it in the descriptions of articles of furniture in the 18th century. The first patent issued for improvements in rocking-chairs is dated as far back as 1830. The folding-bed, in the shape of a sofa, with a box-seat for bedding, has been used in Europe for over a hundred years, but America claims the folding-bed in other forms, such as the wardrobe, the cabinet, the mantel, and the combination; some of these were made as early as 1847. The demand for folding-beds, which reached its climax a few years ago, is now showing a material decline.

The woods used in the manufacture of furniture are varied, and subject to frequent changes. Early in the century, mahogany, maple, and black walnut were in favor; then cherry and ash became fashionable; toward 1880, oak, so long forgotten, took a prominent place. At the present time black walnut is almost entirely out of use. Oak has kept its popularity for the hall, the library, and the dining-room. Mahogany, curly birch, and maple are still extensively used; all of them for the bedroom, and mahogany for the dining-room and the drawing-room in the better grades of furniture. The changes in furniture covering have been more frequent and radical than those in the woods. Haircloth and other coverings in use 30 years ago have been superseded by materials more varied in texture and coloring. Their variety is almost endless, and they show, perhaps as much as anything else, the advance that art as applied to furniture has made in this country. The present centres of the furniture industry are, with one exception (Grand Rapids, Mich.), the largest cities, which, with their densely populated suburbs and surroundings, offer large markets. The cities whose productions amount to more than $2,000,000 per annum, in the order of their importance, are: New York, Chicago, Grand Rapids, Philadelphia, Cincinnati, St. Louis, Boston.

The following statistics show the furniture



CHARACTERISTIC SHERATON FURNITURE

Thomas Sheraton (1751-1806) was the last of the famous cabinet-makers of the 18th century. In 1790 he published his first collection of "Designs for Furniture," and this was followed by numerous other publications of a similar class.

factory product of the United States for 1900 according to the twelfth census:

Total	$125,315,986

The furniture industry of the United States has to-day reached a magnitude unknown elsewhere. The perfect equipment and organization of our mammoth factories capable of an enormous production emphasize the necessity for a larger market. Intelligent efforts are now being made in this direction by a number of manufacturers with the hope that eventually a large foreign trade may be secured for our American product. GEORGE W. GAY,

Revised by GEORGE G. WHITWORTH, *Berkey & Gay Furniture Co., Grand Rapids, Mich.*

Fur'nivall, Frederick James, English scholar: b. Egham, Surrey, 4 Feb. 1825. He was educated at University College, London, and Trinity Hall, Cambridge, where he graduated B.A. in 1846, and M.A. in 1849, and adopted the study of the law, being called to the bar in 1849. He has, however, devoted his life chiefly to the study of early and middle English literature; and he has been mainly instrumental in establishing the Early English Text Society, the Chaucer Society, the New Shakespeare Society, the Browning Society, the Wickliffe Society, and the Shelley Society. He is also honorary secretary of the Philological Society. The societies named have given a powerful impulse to English scholarship by their publications, and this is in no small measure due to Dr. Furnivall. For them and for the Roxburghe Club and the Rolls Series he has edited numerous works, notably the Six-Text edition of Chaucer's 'Canterbury Tales' (1868–75.) Other works of his are: 'Early English Poems and Lives of the Saints' (1862); 'Early English Meals and Manners' (1867); 'Book of Nurture' (1867); 'Education in Early England' (1867); 'Bibliography of Browning' (1881); and 'The Fifty Earliest English Wills in Court of Probate' (1882).

Furrer, fur'ĕr, **Jonas,** Swiss statesman: b Winterthur 1805; d. 1861. After studying at Zurich, Heidelberg, and Göttingen, he became president of the Grand Council of Switzerland in 1839, a position which he again occupied in 1844. In 1845 he received his appointment as president of the Cantonal Diet, and when the new Federal Constitution went into effect he was elected president of the Swiss Confederation. He wrote 'Das Erbrecht der Stadt Winterthur' (1832).

Fursch-Madi, Emma, French opera singer: b. Bayonne, France, 1847; d. Warrenville, N. J., 19 Sept. 1894. After studying at the Paris conservatory, she began to sing in public concerts under the direction of Pasdeloup, and then appeared in opera, first as Marguerite in 'Faust,' and then in Verdi's opera 'Aïda' at the Théâtre de la Monnaie, in Brussels. For three years she sang in Covent Garden, London, and in 1884 came to New York to fill an engagement at the Academy of Music. She then appeared frequently at the Metropolitan Opera House. From 1891 she taught music and singing in the New York College of Music.

Fürst, Julius, German scholar: b. Zerkowo, Posen (Prussian Poland), 12 May 1805; d. Leipsic 9 Feb. 1873. He was of Jewish parentage, and at an early age he had a remarkable knowledge of Hebrew literature, Old Testament Scriptures and Oriental languages. In 1825, after having studied at Berlin, he took a course in Jewish theology at Posen. In 1829, after having abandoned his Jewish orthodoxy, he went to Breslau, and in 1831 to Halle, where he completed his studies in Oriental languages and theology. In 1833 he entered journalism in Leipsic, later securing a position as tutor and lecturer in the university there, from which position he was promoted in 1864 to the chair of Oriental languages and literature, a post he filled with great distinction until his death. His works, especially those on the Semitic languages, are of great value, and among the most important may be mentioned: 'Lehrgebäude der aramäischen Idiome' (1835); 'Concordantiæ librorum Sacrorum veteris Testamenti Hebraicæ et Chaldaicæ' (1837–40); 'Bibliotheca Judaica' (1849–63); 'Hebräisches und Chaldäisches Handwörterbuch' (1851–61); 'Geschichte des Karäerthums' (1862–5); 'Geschichte der biblischen Litteratur und des jüdisch-hellenistischen Schrifttums' (1867–70). From 1840–51 he edited 'Der Orient.'

Furst, William, American composer and conductor: b. Baltimore, Md., 25 March 1852. He studied music in his native town and at the age of 14 was a church organist. His comic opera 'Electric Light' was produced and conducted by him in 1878 and for the five seasons following he received engagements as conductor of opera. He became musical director of the Tivoli Theatre, San Francisco, in 1884. His opera 'She' ran for nine weeks there, and was produced for two seasons in New York. His chief productions are: 'Theodora' (1888); 'The Isle of Champagne' (1891); 'Honeymooners' (1893); 'Princess Nicotine' (1893); 'The Little Trooper' (1894); 'Ghismonda' (1894); 'The Merry World' (1895).

Furtado, Francisco José, Brazilian statesman: b. Oeiras (Piauhy) 13 Aug. 1818; d. Rio de Janeiro 23 June 1870. After graduating from the Academy of Law at Caxias and serving for some time as judge, he entered politics and rose to be leader of the Liberals. In 1847 he was elected deputy and re-elected several times. In 1856 he was elected president of the new province of Amazonas, remaining such until 1859, when he was made minister of justice. In 1864 he was elected senator, but held that position for a few months only, and in August 1864 was made premier and minister of state, in which position he did much toward the establishment of a good monetary system. During his term of office as minister of state the dispute with Uruguay was settled and war between Brazil and Paraguay was declared. In 1870 he was again a member of the Senate and as such, being an opponent of slavery, exerted all his influence in behalf of legislation looking toward its final abolition.

Fury and Hecla Strait, in the Arctic region, in lat. 70° N., separates Melville Peninsula from Cockburn Island, and connects Fox Channel with the Gulf of Boothia. It was discovered by Parry (q.v.) in 1822, and named after his ships.

Furze, fėrz, a European genus (*Ulex*) of very branched and thorny shrubs, with linear sharply pointed leaves, solitary flowers, and two-lipped calyx, belonging to the order *Leguminosæ*, sub-order *Papilionaceæ*. The common furze (*U. europæus*), also called whin and gorse, is abundant in many parts of southern Europe and in Great Britain, although not reaching any considerable elevation, and often suffering from the frost of severe winters. It affords a wholesome fodder, especially when young, or when the thorns are artificially bruised, and is grown often on dry and barren hillsides not fitted for other forage crops. A double flowering variety is grown in gardens.

Fusan, foo-sän', or **Pusan**, Korea, a seaport town on the south shore of the peninsula, from the 16th century became more and more under Japanese influence. In 1876 it was formally opened to Japanese trade, and soon after to all nations. At the outbreak of the war between Japan and China (1894–5) the bulk of the population were Japanese, who have the trade in their hands. The imports (chiefly Manchester goods, salt, and Japanese wares) have an annual value of over $1,000,000; the exports (rice, beans, hides, etc.), of $1,300,000. Pop. (1900) 15,000, of which 10,000 are foreigners.

Fuse, a device employed for firing explosives. In mining, quarrying and in military and naval mining operations there is used the "Bickford, safety running" or "tape" fuse which consists of a tubular cord of cotton or hemp that has been rendered slowly combustible, the cavity in the centre of the cord being filled with a slow-burning gunpowder composition. To make the fuse firm and hard, so as to prevent its being cut by the sharp edges of the rock during tamping, the outside of the cord is served with a covering of strong twine, which is wound about it at nearly right angles to the direction of the twist of the cord by the process called countering. To protect the powder from moisture, the wrapped fuse is immersed in a bath of heated varnish composed of glue, soap, and whiting. Finally, to prevent the surfaces of the fuse from sticking together when coiled they are coated with dry whiting, bran, or powdered soapstone. The fuse described is known as "single fuse" and, as the varnish used is not waterproof, this fuse is only suitable for use in dry ground. In wet ground, a fuse is used which is made by coating the countered cord with tar or resin varnish and then, before the varnish is quite set, countering it with tape and again coating it with varnish. This is known as "taped fuse." When the fuse is to be subjected to especially severe treatment, it is provided with a double coat of twine or thread and is known as "double fuse." The varieties in use are: "common hemp fuse"; "common cotton fuse"; "white fuse"; "superior mining fuse"; "single-taped fuse"; "double-taped fuse"; "triple-taped fuse"; "small gutta-percha"; "large gutta-percha"; "small gutta-percha taped," and "large gutta-percha taped." Running fuse comes in lengths of about 50 feet, and, when properly made, is so uniform in quality that it can be depended upon to burn at the rate of 3 feet per minute. This is important, as it is necessary for the safety of the operator. The fuse should be stored in a dry place so that the powder core may not become damp; and, if so treated, it will retain its efficiency until the varnish has lost all its essential oils and become dusty. Care must be taken not to touch the tape with any oily or greasy matter, as this penetrates through the varnish to the powder core and affects the rate of burning. The fuse should not be roughly handled, as pinching and squeezing alter the rate at which the powder burns. Care should be exercised in opening out a coil which has become stiff through age or exposure to cold weather, for the fuse is then brittle, and if the covering is cracked by sudden and violent unrolling the fuse becomes unfit for use. If there be any doubt as to the behavior of a coil of fuse a piece one foot long should be taken and its rate of burning timed.

Although in firing single charges, safety fuse answers admirably, where several charges are to be fired simultaneously, the safety fuses are connected together by "instantaneous fuses." These consist of a strand of quickmatch enclosed in hemp or flax and several layers of gutta-percha and tape, or of a core of guncotton enclosed in a leaden tube. Besides these nitroglycerin compositions have been proposed by Quentin and Nobel, and one containing mercuric fulminate by Philip Hess.

In naval and military operations, and for simultaneous blasts in mining and quarrying, "electric fuses" are preferred to running fuses. These are gunpowder "igniters" or fulminate "detonators," that are fired by electricity. They are classified as "low tension fuses," designed for use with strong currents of low potential, from primary or secondary batteries, or from dynamo-electric machines; "medium tension fuses," for use with magneto-electric machines which generate currents of medium potential, and "high tension fuses," for use with condensed sparks capable of traversing a sensible air space. The use of the word tension is not warranted by the present condition of electrical science, but it has become technical in this art. To-day, only low tension electric fuses are employed and they are described under Detonators (q.v.).

Fuses are employed in ordnance for exploding shell and they may consist of a compressed core of gunpowder enclosed in a tube of wood or metal, or of a fulminating composition or of both. They are known as "nose fuses" when put in the front end or "nose" of the conical pointed shell, or "base fuses" when inserted in the lower end or base of the shell. They are known as "time fuses," when they are planned to burn a certain length of time after they have become ignited, before they set fire to the explosive charge in the shell; "percussion fuses" when they are set in operation by the impact of the shell against an object after it has been projected from the gun. They may act instantaneously in firing the charge in the shell, or there may be a column of compressed powder interposed between the charge of explosive in the shell and the fulminating composition which is fired by impact. As sometimes a second or more intervenes between the striking and the bursting of the shell, these are styled "delayed action fuses." They may be used with armor piercing shells designed to penetrate armor and burst within the ship. In time fuses, used with spherical shell, the powder in the fuse used to be ignited from the flame of the burning charge with which the shell was propelled from the gun. In modern time fuses, there is a metal cylinder which serves as a hammer placed within the fuse case and held in place by brittle pegs of metal, or by a number of small balls. When the shell containing such fuses is fired, the inertia causes the hammer to strip from the pegs and set back toward the base of the shell, or, if it be a shell from a rifled gun, the centrifugal force causes the balls to fly outward and release the hammer. When the shell strikes, and is arrested in its flight, the hammer moves forward, strikes a percussion cap and fires the charge.

"Chemical fuses" have been used in firing gunpowder mines and torpedoes. As an example of these we cite the mixture of cane sugar and potassium chlorate used in the Harvey torpedo. Above a column of this mixture was placed a small glass bulb filled with concentrated sulphuric acid, the whole being enclosed by a soft copper cover projecting from the torpedo. When this cap was struck, it collapsed and broke the glass bulb, and, as the sulphuric acid came in contact with the mixture of sugar and chlorate, the latter burst into flame and ignited the powder in the torpedo. Such fuses have been used by anarchists in infernal machines and they have ascertained the rate at which the acid would eat through sheets of bibulous paper so that by interposing a sufficient number of sheets of paper they could set the train in operation and get safely out of the way before the machine exploded. Fuses, consisting of columns of compressed gunpowder composition, are used in pyrotechny by which to ignite the charges in rockets, bombs, roman candles and other devices. By their use the operator is enabled to get to a safe distance after igniting the device before it functions fully.

Fuses are used in "electrical installations," but these are of an entirely different character from the above. They consist of strips of metal of low fusibility which are interposed, in electric lighting and other circuits, between the generator and the lamp, or other device, to prevent damage to the device by an excess of current. When the load is greater than is desired the current heats the fuse to its fusion point, when it melts and cuts out the circuit. See ELECTRIC FUSES; EXPLOSIVES.

CHAS. E. MUNROE,
Columbian University, Washington, D. C.

Fusee, fū-zē', in clock and watch making, is the conical pulley used in connection with the main spring, to equalize the power of the latter, so that the watch may run regularly. The spring coiled within the barrel, when fully wound up and at its greatest tension, draws on the part of the chain wound on the smaller portion of the fusee. The first wheel of the watch or clock is attached to the fusee, and as the latter unwinds by the gearing motion in the watch, the spring also uncoils and loses a part of its tension; as this proceeds, the chain draws on a larger portion of the fusee, and attains an increased leverage on the latter to counterbalance the decreased power of the spring.

Fusel Oil, an injurious and exceedingly objectionable constituent of improperly prepared distilled liquors (q.v.), consisting of an indefinite and variable mixture of amyl alcohol (see AMYL) with certain other alcohols and ethers, and certain organic acids and their esters. Fusel oil always contains amyl alcohol, and usually contains butyl and propyl alcohols also. It comes over in the later parts of the distillate, and may be separated from ethyl alcohol (in large measure at least) by resort to fractional distillation.

Fushimi, foo-shē'mē, Japan, a seaport town in the province of Yamashiro, southern coast of Nippon, on the right bank of the river Uji-gawa, which serves as a trade outlet and depot for Kioto, Otsu, and Nara, and is connected by steam service with Osaka. Pop. (1900) 21,515.

Fusible Metal, any alloy, or metallic mixture, which melts at a comparatively low temperature. (See ALLOY; AMALGAM; BISMUTH; CADMIUM.) Fusible metals are used in the arts for many purposes. Automatic sprinklers, for example, are capped with alloys of this sort, which are chosen so as to have melting points that are higher than any temperature that would normally occur in the room that is to be protected. If a fire breaks out, however, the abnormal rise of temperature so produced causes them to melt, the water in the sprinkler pipes being thereby released, and the fire extinguished. Fusible metals have also been used quite generally in the manufacture of "fusible plugs," for the protection of steam boilers; such plugs being screwed into the boiler at the height which is considered to be the lowest limit to which the water level in the boiler can be allowed to descend with safety. So long as the inner end of the plug is covered with water, the plug itself is thereby kept too cool to melt under the influence of the furnace gases; but when the protecting action of the water is removed by the water level descending below the safety limit, the hot furnace gases melt the material of the plug, and the steam in the boiler escapes. Fusible plugs are excellent appliances, and in fact they are required by law in some of the States. There is no advantage in filling them with an alloy, however, because in any event the alloy must have a melting point higher than

that of the steam that the boiler is to generate (365° F., for a gauge pressure of 150 pounds per square inch), and pure tin, with a melting point of 450° F., is entirely satisfactory for the purpose. Indeed, tin is far superior to any alloy for this purpose, because its melting point remains sensibly constant for an indefinite time (so long as oxidation is prevented), while the melting points of alloys that are continuously exposed to heat for considerable periods become quite uncertain, and are often found to be far higher than when the alloy is freshly prepared.

Fusible Plug. See FUSIBLE METAL.

Fusidæ, fū'sī-dē, a family of gastropod mollusks, by some conchologists regarded as only a genus (*Fusus*) of the family *Fasciolariidæ.* In either case it is a world-marked group allied to the turban-shells and volutes in structure, but having a long, more or less spindle-shaped, comparatively thin shell, with a very long canal. The animal is closely similar in its soft parts to a whelk or a murex. The family contains the genera *Fasciolaria, Clavella, Latirus,* etc., but interest centres chiefly on the genus *Fusus,* of which many species are known in various parts of the world, and which goes back to Cretaceous time in geological history. North American species are inconspicuous, but some of the several kinds found upon the coast of Great Britain are highly valued by collectors of shells, and constantly sought for by fishermen who bring them up in their dredges from time to time. The "red-whelk" or "roaring buckie" of Scotland is a species (*F. antiquus*) made famous in folklore and by Wordsworth's poem; and it is extensively eaten in various parts of Great Britain and along the continental coast. In Zetland its shell was formerly used by the peasantry as an oil lamp. *F. proboscidialis* is one of the largest of mollusks.

Fusing Point. See MELTING POINT.

Fustel de Coulanges. See COULANGES, NUMA DENIS FUSTEL DE.

Fus'tian, named after Fustat, a suburb of Cairo, where the material originated, is (1) a species of cotton cloth similar to velvet, having, in addition to the warp and weft, a species of pile, consisting of other threads doubled together, which are thrown up in ridges and conceal the groundwork of the fabric. When in the loom, this pile presents the appearance of a set of loops; these are cut in two and sheared down, and when polished and finished, present an evenly ribbed surface on the exterior. The best fustians are known as cotton-velvet and velveteen; besides these there are moleskin, corduroy, and several other kinds. (See WEAVING.) (2) In literature, fustian signifies a forced, bombastic style of writing, abounding with metaphors or other rhetorical figures.

Futa-Jallon, foo'tä zhä-lôn', a region of West Africa, in Senegambia. It is extremely mountainous, and remarkable for the romantic beauty of its scenery; and is the source of the rivers Senegal, Gambia, etc. Large herds and flocks are pastured; and the soil produces in abundance bananas and other fruits, besides numerous palm-trees, which furnish dates, wine, and oil. The inhabitants are fanatical Mohammedans. They are governed by an elective chief under French protection. The capital is Timbo. Pop. (1900) 600,000.

Futhark, foo'thôrk, the Runic alphabet which derives its name from the first six letters, *f, u, th, a, r, k,* and is applied to all the systems of phonetic signs of the Teutonic stock, for the same reason as those of classical derivation are called "alphabet" or "abecedarium." They occur in the same order in Old German, Gothic, Anglo-Saxon, and Northern Runes, with a nomenclature in all of them borrowed from trees and other familiar natural objects, suggestive of the derivation of the series of phonetic symbols from a primitive system of pictorial writing. See ALPHABET; RUNIC CHARACTERS.

Fyffe, fīf, **Charles Alan,** English historian: b. Blackheath, Kent, England, December 1845; d. 19 Feb. 1892. He was graduated at Oxford in 1868; and called to the bar in 1876, but never practised. As correspondent of the *Daily News* during the Franco-Prussian war he is said to have sent to that journal the first account of the battle of Sedan that appeared in print. His historical works are distinguished by accuracy and a pleasing, perspicuous style. They include: 'History of Greece' (1875), in a series of 'History Primers'; and the well-known 'History of Modern Europe' (1880, 1886, 1890), covering the period from 1792 to 1878.

Fyles, Franklin, American dramatic critic and author. In 1886 he became dramatic critic of the New York *Sun.* He wrote several successful plays, including the military dramas, 'Cumberland '61,' and 'The Girl I Left Behind Me,' and some works in book form, among them 'The Theatre and Its People,' a popular account of the profession; 'A Ward of France'; 'Drusa Wayne'; etc.

G

G seventh letter of the English alphabet and of other alphabets derived from the Latin. In very early Latin, G stood for the proper g-sound (g hard, as in go) and also for the k-sound of C, as in cup; afterward the k-sound was represented by K, while G continued to represent the sound of G hard; but K did not remain long in the Latin alphabet, being superseded by C (always hard and equivalent to K). Both in Greek and Latin the gamma (Γ, G) was always the hard guttural in whatever situation, and hence *geographia* was pronounced gheographia, *genus* ghenus, etc. The softening of g-hard to j when g precedes e, i, or y, began to prevail in the 6th century of our era, and it persists in the modern languages derived from Latin and in our own. In languages having words derived independently by each from some common stock, for example, the Indo-European languages, the interchange of c-hard, g-hard, k, and the aspirate gutturals ch, gh, is very common; examples: Eng. kin, Lat. *genus,* Gr. *genos;* Gr. *chen,* Ger. *gans,* Eng. goose; Gr. *gnonai,* archaic Lat. *gnosco,* Ger. *kennen,* Eng. ken; Lat. *hesternus,* Gr. *chthes,* Ger. *gestern,* Eng. yester: the same equivalence of g and y is seen in Ger. *gelb,* Eng. yellow; Ger. *gähnen,* Eng. yawn; Ger. *garn,* Eng. yarn. In French words of Teutonic origin an original w is often represented by gu (equal to g-hard), thus Wilhelm becomes *Guillaume;* Ger. *weise,* Fr. *guise;* Teuton *werra,* Eng. war, Fr. *guerre.*

Gabb, William More, American palæontologist: b. Philadelphia 1839; d. 1878. In 1862–5 he was director of the palæontological section of J. D. Whitney's geological survey of California, and later made surveys in Santo Domingo (1868) and Costa Rica (1873). His publications include: Vols. I. and II. of the 'Geological Survey of California' (1864); and monographs on the topography and ethnology of Costa Rica and the geology and topography of Santo Domingo in the 'Transactions' of the American Philosophical Society and Petermann's 'Mittheilungen.'

Gabbro, găb'rō, a general name for a large group of evenly crystalline igneous rocks, composed, typically, of plagioclase and pyroxene. Gabbros show by analysis much the same composition as basalts; the silica ranging from 46 to 59 per cent. They may be regarded as plutonic basalts, basalt magmas which have cooled at great depths. Under the general term gabbro, are included anorthosites, abundant in Canada and the Adirondacks, high in silica and composed almost wholly of crystalline labradorite; true gabbros; norites, composed of plagioclase and orthorhombic pyroxene. With decreasing pyroxene and increasing olivine gabbros grade into peridotiles. Gabbros are heavy, dark-colored, usually greenish, rocks. They occur in the Adirondacks, in the neighborhood of Baltimore, Md., and particularly in the highlands along the north shore of Lake Superior, from Duluth to the international boundary. The gabbro near Duluth has this composition: SiO_2 49.15; Al_2O_3 21.90; Fi_2O_3 6.60; FeO 4.54; CaO 8.22; MgO 3.03; Na_2O 3.83; K_2O 1.61. See BASALT.

Gable, the triangular or quadrangular end of a house or other building, from the cornice or eaves to the top, and distinguished from a pediment by this, among other things, that it has no cornices, while a pediment has three. The word is also applied to the highly decorated canopy or screen which in Gothic church architecture rises over some doors or windows. The wall of a house which is surmounted by a gable is called the gable-end. In modern towns the gable-ends of houses are usually at right angles to the line of the street, but in the Middle Ages the reverse was usually the case, the gable-ends being turned toward the street. Many old towns in France, Belgium, and Germany, are still to be seen with this peculiarity, and some even in Britain. In Scotland, a wall separating two houses, and common to both, is called a mutual gable, and according to Scotch law such a gable is the property of the builder, who can therefore prevent the owner of an adjoining property from using the support of his gable, unless he pays half the cost of erecting it.

Gaboriau, Emile, ā-mēl gä-bō-rē-ō, French writer of detective stories: b. Saujon, Charente-Inférieure, France, 9 Nov. 1835; d. Paris 28 Sept. 1873. His early years were a succession of vicissitudes; the army, the law, and even the Church, were in turn the objects of his inconstant attentions till at last when he had already contributed to some of the smaller Parisian papers, he leaped into fame at a single bound with his story 'L'Affaire Lerouge' (1866), in the feuilleton to 'Le Pays.' It was quickly followed by 'Le Dossier 113' (1867); 'Le Crime d'Orcival' (1868); 'Monsieur Lecoq' (1869); 'Les Esclaves de Paris' (1869); 'La Vie Infernale' (1870); 'La Clique Dorée' (1871); 'La Corde au Cou' (1873); 'L'Argent des Autres' (1874); and 'La Dégringolade' (1876).

Gabriac, Paul Joseph de Cadoine, pōl zhō-zĕf dė kä-dwän gä-brē-äk, MARQUIS DE, French diplomatist: b. Heidelberg, Baden, 1 March 1792; d. Paris 12 June 1865. He was

consul-general in New York in 1812–14; appointed minister to Stockholm in 1823; and minister to Brazil in 1826. While in Brazil he induced all the other states in South America to adopt the French maritime law. He was created a peer in 1841, and made a life senator in 1853. His publications include: 'The Question of Brazil' (1829); 'The Republics of South America Considered in Their Future' (1851); 'King Pedro I., Notes and Personal Recollections' (1854).

Ga'briel (Heb. "hero of God"), among the post-exilic Jews, one of the seven archangels (q.v.). In the book of Daniel and in the third gospel he is the messenger and interpreter of God. The rabbins represented him as the angel of death to the Israelites, as Azrael was to the Mohammedans. According to the Talmud he is the prince of fire, who presides over the thunderstorms and the autumnal ripening of fruits. By the command of God he set fire to the temple before it could be burned down by the soldiers of Nebuchadnezzar. According to the teaching of the Koran he is one of the four angels, of which the other three are Michael, Uriel, and Raphael, most highly favored by God, and dictated the Koran to Mohammed.

Gabriel, Brothers of Saint, an order of the Roman Catholic Church in France, founded by the Abbé Deshayes in 1835. Its object was stated as the education of the young, especially deaf-mutes and the blind. In 1880 the order reported 122 elementary schools, 3 boarding schools, 8 schools for deaf-mutes, and 2 for the blind. Its headquarters are at Saint Laurent-sur-Sèvre, La Vendée.

Gabriels, Henry, American Roman Catholic prelate: b. Wannegem-Lede, Belgium, 6 Oct. 1838. He studied classics in the colleges of Audenarde and Saint Nicholas and theology in the Seminary of Ghent, where he was ordained priest, 21 Sept. 1861. He continued his studies at the University of Louvain, from which institution he received the degree of S. T. L. in 1864 and the honorary degree of Doctor in Theology in 1882. When the Theological Seminary of Troy, N. Y., was founded, Dr. Gabriels was one of the four priests sent from Belgium to manage it. He was diocesan examiner for New York and Albany, vicar-general of Ogdensburg and Burlington and one of the secretaries of the Third Plenary Council of Baltimore, the decrees of which he assisted in formulating. For 20 years Dr. Gabriels was rector of Troy Seminary and for nearly 30 years its professor of dogmatic theology, Church history and Hebrew. On 21 Dec. 1891, Pope Leo XIII. appointed him bishop of Ogdensburg and he was consecrated at Albany, N. Y., 5 May 1892. The diocese of Ogdensburg at present (1905) has a Catholic population of about 84,000; 121 priests; 138 churches; 16 parochial schools; 5 hospitals; 2 orphanages, etc. King Leopold of Belgium has recently conferred upon him the decoration of the Royal Order of Leopolds, in recognition of the services he has rendered the Belgium Church and people, particularly by his writings.

Gabriel's Insurrection, an attempted slave rising near Richmond, Va., in 1800, headed by a slave named Gabriel, called also "General Gabriel" and "Jack Bowler." He belonged to a planter named Thomas Prosser, and was about 24; tall, powerful, and noted as a fighter. He drew about a thousand negroes into a plot to attack Richmond by night, massacre the inhabitants, seize the arsenal and arming themselves effectively, rouse a general insurrection. One August night he collected his forces, armed them with scythe blades, and marched toward the city. Meanwhile a negro had disclosed the plot; James Monroe, then governor, had ordered out the militia; a creek in Gabriel's way proved to be unfordable, and hearing that the citizens were in arms, the whole force dispersed to the swamps and woods. They were hunted out, and many hanged, including Gabriel.

Gade, Niels Wilhelm, nēls vĭl'hĕlm gä'dė, Danish composer: b. Copenhagen 22 Feb. 1817; d. there 21 Dec. 1890. In 1841, by his overture entitled, 'Echoes of Ossian,' he gained in Copenhagen the prize of the Musical Union. He was supported during his studies abroad by a royal stipend, and in 1844 was appointed to succeed Mendelssohn in the direction of the Gewandhaus concerts at Leipsic. In 1850 he was appointed musical director to the king of Denmark, and in 1876 received a life pension. His works, which are Mendelssohnian in character, include seven symphonies, several overtures, sonatas, quintets, etc.; a lyrical drama, 'Comala'; a religious cantata, 'The Crusaders'; an opera, 'The Nibelungen'; etc.

Gadfly. See HORSEFLY.

Gadidæ, găd'ĭ-dē, a family of fishes, the cods, sub-order *Anacanthini* (spineless fishes), with ventral fins attached to the breast or throat. The body is rather long, a little compressed, and covered with small, soft scales; the teeth are in several rows; the gill covers, which are large, have seven rays; the median fins are generally very large, and divided into several portions. They are voracious fishes. They are found chiefly in the depths of the colder seas, and are largely used for the food of man. Fossil remains are rare, but scattered bones have been found as far back as the Eocene. See COD; HADDOCK; LING; etc.

Gadolin, gä'dō-lēn, **John,** Finnish chemist: b. Abo, Finland, 5 June 1760; d. Wirmo, Finland, 15 Aug. 1852. He studied chemistry under Bergman and in 1797 was appointed professor of chemistry in Abo — an office which he held till 1822. He devoted himself to investigations on mineral and metallurgic subjects. But the research for which he is specially remembered was upon a black mineral found in the porcelain feldspar quarry at Ytterby, near Stockholm, by Arhenius, of which an account had been published in 1788. In 1794 he read a paper to the Academy of Sciences, and showed that it contained a new kind of earth. This discovery was subsequently confirmed by Ekeberg, who called the earth yttria, and the mineral gadolinite, after its first investigator. The yttria was afterward shown to be a mixture of several earths.

Gads'den, Christopher, American patriot: b. Charleston, S. C., 1724; d. there 28 Aug. 1805. He was educated in England; returned to the United States in 1741 and later engaged in business in Philadelphia; was a member of the first Colonial Congress which convened in New York in October 1765, and was also a member of the first Continental Congress which assem-

bled in Philadelphia in 1774. He joined the American army as colonel at the beginning of the Revolution, and was promoted brigadier-general in 1776.

Gadsden, James, American diplomatist: b. Charleston, S. C., 15 May 1788; d. there 25 Dec. 1858. He was graduated at Yale College in 1806; served with distinction in the War of 1812; and afterward took part in the campaign against the Seminole Indians. He was appointed minister to Mexico in 1853, and on 30 December of that year negotiated the Gadsden Purchase (q.v.), which fixed a new boundary between Mexico and the United States.

Gadsden, Ala., town and county-seat of Etowah County, on the Gadsden and Attalla Union, the Louisville and Nashville, and other railroads, 60 miles northeast of Birmingham. It is dominated by Lookout Mountain, on the north bank of the Coosa River which gives its name to the rich coal and iron mines in the vicinity. There are several steam-mills which manufacture considerable quantities of yellow-pine lumber. Further industries include steel and wire-nail mills, cotton mills, a pipe works, a car and foundry establishment, a pressed-brick plant, a cotton-seed oil mill and ginnery, and coal and iron interests. There are 15 churches, a national and a state bank, and two newspapers, a daily and a semi-weekly. Pop. (1900) 4,282.

Gadsden Purchase, The, a tract of territory, embracing 45,535 square miles, which was purchased by the United States from Mexico in 1854. This region, which is bounded on the north by the Gila River, on the east by the Rio Grande, and on the west by the Colorado, was acquired by treaty and the payment of $10,000,000, and is now included in the southern part of the Territories of Arizona and New Mexico. It is called the Gadsden Purchase after James Gadsden (q.v.), United States minister to Mexico in 1853, by whom, in December of that year, the treaty of sale was negotiated with Santa Anna (q.v.). Issues growing out of the execution of the treaty of Guadalupe-Hidalgo (q.v.) made this negotiation a matter of great importance, as well as a business of much difficulty. Disputes had arisen concerning the boundary line between Chihuahua and New Mexico, involving the possession of the Mesilla Valley, of which, though claimed by the United States, the Mexicans took armed possession. The 11th article of the treaty, imposing upon the United States the obligation to restrain the Indian marauders on the Mexican frontier, had been neglected, and the reclamations in consequence amounted to between $15,000,000 and $30,000,000. By Gadsden's treaty that article was abrogated and a new boundary was agreed upon, while Mexico also agreed to forego all claims against the United States for damages on account of Indian depredations between the years 1848–53. The settlement of the boundary dispute was considered in this country to be of greater moment than the requisition of the land, which was thought to be of little or no value for cultivation; and it was in the minds of enterprising Americans that through this region the Southern Pacific Railroad, already projected, might find an advantageous route, as in fact it did. In Mexico the transaction was vigorously opposed, and on account of his part in the sale Santa Anna, in 1855, was banished from his country as a traitor. On the part of the United States, the Senate made some modifications in the original treaty and then ratified it. On 10 June 1854 it was finally proclaimed. Consult Haswell, 'Treaties and Conventions.'

Gadsden Treaty. See ANNEXATION; GADSDEN PURCHASE.

Gads'hill, England, a hill near Rochester, on the road from London to Gravesend. It is commemorated in Shakespeare's play, 'Henry IV.,' as the place where Falstaff had his encounter with the robbers, and an inn at the place is called Falstaff's Inn. It is interesting in modern times for Gadshill Place, opposite the hill, which was long the residence of Charles Dickens and was the home in which he died.

Gadski, Johanna, yō-hän'nä gädz'kē, German opera singer: b. Anclam, Prussia, 1871. She received her musical training in Stettin, made her début in opera in New York, and appeared as Brünhiide and in numerous other Wagnerian parts. She made a concert-tour in America in 1898–9.

Gad'wall, or **Gray Duck,** a migratory wild duck (*Chaulelasmus streperus*) found on all the four continents. It is less in size than the mallard, and mainly black, brown, and white in color. It frequents western marshes in small flocks, but is rare east of the Alleghany Mountains. As a table delicacy it is highly prized.

Gæa, jē'ä, or **Ge,** jē, in Greek mythology, the goddess of the earth. She appears in Hesiod as the first-born of Chaos, and the mother of Uranus and Pontus. She also bore the Titans, Cyclops, Erinyes, Giants, etc. As the vapors which were supposed to produce divine inspiration rose from the earth, Gæa came to be regarded as an oracular divinity; the oracles at Delphi and Olympia were believed to have once belonged to her. Her worship extended over all Greece, black female lambs being offered on her altars. She was also the goddess of marriage, and again of death and the lower world. At Rome Gæa was worshipped as Tellus.

Gaedertz, gĕd'ērts, **Karl Theodor,** German poet: b. Lübeck 8 Jan. 1855. In 1880 he obtained a post in the Royal Library of Berlin, of which he became chief librarian in 1900. His poems in Low German include 'Tulklapp' (1879) and 'Eine Komödie' (2d ed. 1881).

Gæl, gāl, the name of a branch of the Celts inhabiting the Highlands of Scotland, Ireland, and the Isle of Man. Gadhel, or Gæl, is the only name by which those who speak the Gælic language are known to themselves. By way of distinction the Highlanders of Scotland call themselves Gæl Albinnich (Gæls of Albin) and the Celtic population of Ireland call themselves Gæl Erinnich (Gæls of Erin). See CELTS.

Gælic Language and Literature. See CELTIC LANGUAGE AND LITERATURE.

Gag-rules, a series of rules adopted 1836–44 by the House of Representatives, to prevent the reception of anti-slavery petitions and check the possibility of debate on the subject. No other measure created more virulent debate. The Constitution forbids Congress to pass any law "abridging the right of the peo-

ple to petition the government for a redress of grievances," and impliedly to refuse to receive petitions, as an unheard petition is a nullity. From 1831 on, the abolition societies rained petitions on Congress, urging the abolition of slavery in the District of Columbia, over which it had complete legislative power. They were referred to the commitee on the District, which at first reported adversely, then ceased to report at all, despite complaints. The 24th Congress, 1835–6, laid them on the table instead; but in both Houses there soon arose an outcry to bar them from congressional cognizance altogether. In the Senate, Calhoun on 7 Jan. 1836 moved not to receive two such petitions, on the ground that the South must in the end be worn out and degraded by having constantly to justify its institutions, before a body which had no jurisdiction over them anywhere; but after two months' debate, it was voted to receive them and they were immediately rejected, which remained the rule thereafter. In the House, on 8 February, Henry L. Pinckney of South Carolina moved that all the petitions be referred to a select committee, under instructions to report that Congress could not constitutionally interfere with slavery in the States, and ought not to do so in the District; on 18 May the committee so reported, with another resolution that all petitions relating to slavery be laid on the table without action or reference. Under the previous question both resolutions were passed 25–26 May; the last 117 to 68, John Quincy Adams refusing to vote and denouncing them as a violation of the Constitution, the rules of the House, and the rights of his constituents. Thereafter Mr. Adams, as the champion of the right of petition, became involved for years in an endless struggle against the "gag." On 18 Jan. 1837 this struggle was renewed. The furious scenes in which Mr. Adams was pitted against nearly all the rest of the House are among the most picturesque in American history. On 21 Dec. 1837, John M. Patton of Virginia moved and secured the passage (122 to 74) of a resolution to lay on the table without debate, reference, or action, all papers concerning slavery in any State, "District or Territory" of the United States. Adams again denounced it and refused to vote. On 11 Dec. 1838 the "Atherton Gag" was moved by Charles J. Atherton of New Hampshire, and passed 126 to 73; it was the same in essence as the others. On 21 Jan. 1840 the House adopted as its 21st Rule that no paper praying the abolition of slavery or the slave trade should in future be received by the House or entertained in any manner. But this only passed by 114 to 108; the refusal of the right of petition was incensing the North, and forcing even Democratic representatives to protest. Thereafter at every session, in adopting the rules, Mr. Adams moved to strike out the 21st; the violence of the assaults on him increased, but the majorities against him decreased. At the special session of 1841 his motion was carried on a motion to adopt the rules only for 10 days, but reconsidered and defeated. Finally, on 3 Dec. 1844 a motion to lay his motion on the table was lost by 104 to 81, and the 21st Rule was abolished by 108 to 80. Nothing of the kind was again attempted. Since 12 Dec. 1853 petitions are no longer presented in the House, but handed to the clerk.

Gage, Frances Dana Barker, American reformer: b. Marietta, Ohio, 1808; d. 1884. In Ohio, and later at St. Louis, Mo., she appeared as a lecturer on total abstinence, women's rights, and anti-slavery, and underwent the many unpleasant experiences then the lot of abolitionists. She served as a nurse in the Civil War, and wrote over the signature "Aunt Fanny."

Gage, Lyman Judson, American financier: b. De Ruyter, N. Y., 28 June 1836. He removed to Rome, N. Y., in 1848, and was educated at the Rome Academy. He worked in the Oneida Central Bank 1853–5, when he went to Chicago, becoming a clerk, and later, bookkeeper and cashier of a planing-mill company. In 1868 he became cashier and in 1891 president of the First National Bank of Chicago. He was the first president of the Board of Directors of the World's Columbian Exposition, and several times president of the American Bankers' Association and the Civic Federation of Chicago. On 5 March 1897 he was appointed secretary of the treasury, by President McKinley; in 1901 was reappointed; resigning in March 1902. He received the degree of LL.D. from the New York University 4 June 1903. He was the originator of the movement for civic reform which started in Chicago under his inspiration and became a national influence. He wrote the platform of the Economic Conferences, a unique feature of Chicago's social organization, where Republican and Democrat, rich and poor, conservative and anarchist, meet for debate and exchange facts and theories.

Gage, Matilda Joslyn, American woman suffragist: b. Cicero, N. Y., 24 March 1826; d. 18 March 1898. She was secretary to the State Woman Suffrage Society of New York in 1869–70, was later for nine years its president, and in 1875–6 president of the National Woman Suffrage Association. She was president of the Woman's National Liberal Union in 1893, published and edited (1878–81) the 'National Citizen,' and wrote a 'Woman's Rights Catechism' (1870); 'Woman as an Inventor' (1871); 'Woman in Church and State' (1893).

Gage, Thomas, English general: b. 1721; d. 2 April 1787. In 1755 he accompanied Braddock's ill-fated expedition as lieutenant-colonel, and as brigadier-general became in 1760 military governor of Montreal, and in 1763 commander-in-chief of the British forces in America. His inflexible character led the government to regard him as well fitted to end the disturbances in the American colonies. In 1774 he was nominated governor of Massachusetts, a post of peculiar difficulty, and his enforcement of the rigorous decrees of Parliament brought matters to a climax. On the night of 18 April 1775 he despatched an expedition to seize a quantity of arms which had been stored at Concord; and next day took place the memorable encounter of Lexington, which announced that the Revolution had begun. The battle of Bunker Hill (q.v.) made him unpopular. For a short time he was commander-in-chief in America, a post he soon resigned to return to England.

Gahnite, gä'nīt, "zinc spinel," is essentially a zinc-aluminate, $Zn\ Al_2O_4$. The variety automolite has this formula; in kreittonnite the zinc is in part replaced by ferrous iron and magnesium, and the aluminum by ferric iron. The

variety dysluite is similar except that manganese is present instead of magnesium. Gahnite usually occurs in octahedrons of a black, gray, dark-green, or brown color, with a hardness of 7.5 to 8. Its most important localities are in Sweden, Bavaria, and Sussex County, New Jersey.

Gail Hamilton. See DODGE, MARY ABIGAIL.

Gaillard, gä-yä, **Claude Ferdinand,** French painter and engraver: b. Paris, France, 7 Jan. 1834; d. there 19 Jan. 1887. He was a pupil of Léon Cogniet, and studied painting and engraving at Ecole des Beaux-Arts. In 1856 he gained the Prix de Rome. Among his pictures are: 'The Education of Achilles' (1863); 'St. Sebastian' (1876); 'Christ at the Tomb' (1877), besides several portraits, and some copies of old masters. His principal engraved portraits are: 'Chateaubriand,' 'Monseigneur Bouvier,' 'Count of Chambord,' 'Monseigneur Merode.' 'The Plates of St. Sebastian,' of one of Botticelli's 'Holy Families,' and of the 'Man With the Pink,' of Van Eyck, rank among the masterpieces of modern engraving. Gaillard gained three medals for engraving and one for painting, and was decorated with the cross of the Legion of Honor in 1876.

Gaillardet, gä-yär-dā, **Théodore Frédéric,** French dramatic author: b. Auxerre 7 April 1808; d. Plessis-Bouchard 12 Aug. 1882. He practised law at Tonnerre. He sent a drama to the Porte Saint-Martin, which partly rewritten by Alexander Dumas, the elder, and signed by him, achieved an enormous success as 'La Tour de Nesle,' 28 May 1832. This led to a duel with Dumas, Gaillardet afterward gaining a lawsuit which permitted him to place his name as one of the authors of the piece. He is the author of two other plays, 'Struensee ou le Medecin de la Reine' (1832), and 'Georges ou le Criminel par Amour' (1833). He also wrote from private papers found at Tonnerre, and the archives of foreign affairs, the 'Memoires du Chevalier d'Eon' (1836, new edition 1866). Coming to New York in 1839 he founded the 'Courrier des Etats Unis,' a French newspaper which he edited until 1848 and which is still published. He returned to France later and served on the editorial staff of the 'Presse.'

Gailor, Thomas Frank, American Protestant Episcopal bishop: b. Jackson, Miss., 17 Sept. 1856. He was graduated from Racine College, Wis., in 1876, and from the General Theological Seminary, New York, in 1879. Entering the ministry he was rector of the Church of the Messiah, Pulaski, Tenn., 1879–82; and in 1882 became professor of ecclesiastical history in the University of the South, Sewanee, Tenn. In 1893 he was consecrated bishop-coadjutor of Tennessee, and in 1898, on the death of Bishop Quintard, became bishop of Tennessee. His writings include: 'A Manual of Devotion'; 'The Apostolical Succession'; 'Things New and Old'; 'The Trust of the Episcopate.'

Gaines, Edmund Pendleton, American army officer: b. Culpeper County, Va., 20 March 1777; d. New Orleans 6 June 1849. He was appointed second lieutenant in the Sixth Regiment, United States Infantry, in 1799, in 1805 became collector of customs of the port of Mobile, Ala., and received the rank of captain 1807. Serving through the War of 1812, he became brigadier-general in 1814, commanding at Fort Erie, in August, until wounded. He afterward became brevet major-general; commanded the Southern Military District during the first war against the Seminoles 1817, the Western District 1821, being wounded in the second war with the Seminoles in 1837, and the Department of the Southwest when war was declared with Mexico.

Gaines, Myra Clark, American claimant: b. New Orleans 1805; d. 1885. She was a daughter of Daniel Clark, who emigrated from Ireland to New Orleans and inherited his uncle's property there in 1799. He was supposed to have lived a bachelor, but it was known that he was the father of two daughters by a French woman of great beauty. He died in 1813; his will gave his property to his mother. In 1830 letters were found detailing the circumstances of Myra's birth; in 1832 one that gave an account of a will made by her father in 1813, in which he acknowledged her as his legitimate daughter and bequeathed her all his property. She then began her remarkable litigation, first to establish her legitimacy, then to secure her father's estate. The supreme court of Louisiana pronounced her legitimate and his lawful heir in 1856. Subsequently, the United States Supreme Court decided that the facts of her father's secret marriage in Philadelphia and her own legitimacy were fully established. Then began the struggle to secure possession of the estate. She filed a bill in equity in the United States Supreme Court in 1856, and a favorable decision was rendered in 1867. In 1861 the property in New Orleans was valued at $35,000,000, and previous to 1874 she obtained $6,000,000. Appeals and counter-suits were in progress at the time of her death in 1885. She married W. W. Whitney in 1832, and at his death Gen. Edmund P. Gaines, in 1839.

Gaines' Mill, Battle of. After the battle of Mechanicsville or Beaver Dam Creek, 26 June 1862, McCall's division was withdrawn from the field of its victory, and Gen. Fitz John Porter, with it and the Fifth corps, took up a defensive position near Gaines' Mill, east of Powhite Creek, a small stream flowing into the Chickahominy. Porter's corps and McCall's division, numbering in all about 20,000 infantry and artillery and 2,500 cavalry, were the only Union troops north of the Chickahominy, the rest of McClellan's army being south of it. Porter's line was formed in the shape of a semicircle, its left resting in the low ground near the Chickahominy, with its right bending around south of Old Cold Harbor. The line was naturally strong, and was strengthened by rifle-pits, by felling trees in front of them, and by piling rails and such other material as was at hand. The east bank of the creek was quite high and the slope to the creek was covered with brush and timber. The line covered several of the bridges over the Chickahominy, and through the centre and right ran the roads from New Cold Harbor and Old Cold Harbor to Dispatch Station. Sykes' division of the Fifth corps was on the right, and Morell's division on the left, with McCall's division in reserve. Gen. Cooke, with three small cavalry regiments, watched the left. The line was somewhat too extended for the number of troops Porter had at his disposal, but these were well posted and his artillery

placed in good positions, sweeping the ground in front. On 27 June the Confederates advanced upon Porter's position, A. P. Hill and Longstreet from the west, Jackson and D. H. Hill from the northwest. A. P. Hill led the advance from Mechanicsville, and on reaching Powhite Creek, near Gaines' Mill, at noon, Gregg's South Carolina brigade was so stoutly resisted by the 9th Massachusetts, holding an advanced position, that Hill was checked and compelled to deploy a large force to push the Massachusetts men back, which consumed the time until 2 P.M. Meanwhile the other divisions had come up, Longstreet on A. P. Hill's right, Jackson, Ewell, and D. H. Hill in the order named, on A. P. Hill's left. The main battle began a little after 2 o'clock with an impetuous assault by A. P. Hill on Porter's left division, and resulted in the final repulse of Hill with great loss. Longstreet came to his support, Jackson and D. H. Hill closed in on Porter's right, and for nearly two hours Porter's entire line was successively assailed and pressed at every point, but held firm, so firm that Gen. Lee thought that "the principal part of the Federal army was on the north side of the Chickahominy" and "apparently gaining ground." McCall's division was placed in line; all fought well and were admirably handled; but there were not enough of Porter's men long to withstand the energetic and continued pressure of 57,000 Confederates at all parts of the line. At about 4 P.M. Slocum's division of Franklin's corps came on the field from beyond the Chickahominy; its three brigades were separated and disposed of in weak places on the line, and the general attack was repulsed about 5 P.M. A few minutes later another attempt was repulsed, the Union line holding fast and not yielding a foot. The Confederate forces were now all up; Whiting's division had come to the relief of A. P. Hill; and Stuart, with his cavalry and artillery, opened heavily on Porter's right. Gen. Lee now ordered a general advance, which was responded to in a most gallant manner. Porter's lines were fiercely assaulted; parts remained firm, but other parts gave way, and soon all gave back, losing 22 guns and some 2,800 prisoners. Some of the commands fell back in much confusion; others retired in good order, upon the brigades of French and Meagher, of Sumner's corps, which had crossed the Chickahominy, and now assisted in checking the Confederate pursuit. During the night the Union troops crossed to the south side of the Chickahominy, destroyed the bridges behind them and joined the rest of the army in its retreat to Harrison's Landing on James River. The entire number of Union troops engaged was about 34,000; the loss was 894 killed, 3,107 wounded, and 2,836 missing, an aggregate of 6,837. The number of Confederate troops engaged was about 57,000, of whom 8,751 were killed and wounded. Consult: 'Official Records,' Vol. XI.; Webb, 'The Pininsula'; 'McClellan's Own Story'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. Carman.

Gainesville, Fla., city and county-seat of Alachua County, on the Gainesville and Gulf, the Florida Central and Peninsular, and other railroads, 60 miles southwest of Jacksonville. Owing to its temperate climate it is a favorite invalid winter resort. Its industrial interests are chiefly agricultural; fruit growing, especially oranges, is largely carried on. Pop. (1900) 3,633.

Gainesville, Ga., city and county-seat of Hall County, on the Gainesville, and the Richmond & Danville R.R.'s, 53 miles northeast of Atlanta. From its situation at the summit of the Chattahoochee ridge, and owing to the numerous mineral springs in the vicinity, it is a much-frequented health resort. The educational establishments include Gainesville College and the Georgia Seminary. There are milling industries and manufactures of machinery and cars, and the city owns its electric lighting plant and waterworks. Pop. (1900) 4,382.

Gainesville, Texas, city and county-seat of Cooke County, on the Missouri, K. & T., and the Gulf, C. & S. F. R.R.'s., 65 miles north of Fort Worth. This is the centre of an important agricultural and stock-raising district. It has large meat-packing establishments and manufactures of flour, foodstuffs, cotton-seed oil, carriage works, hide and leather factories, and pressed-brick works. The town was first settled in 1851, and was incorporated in 1873. It was governed under a new charter in 1879 with a mayor and council elected by popular vote every two years. Pop. (1900) 7,874.

Gainsborough, gānz'bŭr-ō, **Thomas,** English painter: b. Sudbury, Suffolk, May 1727; d. London 2 Aug. 1788. He was the son of a wool manufacturer, and was educated under his uncle in the grammar-school of his native town. His artistic genius early displayed itself, and for a time he studied art in London under the French engraver Gravelot, and afterward under Frank Hayman. He married at 19, and in 1760 took up his residence in Bath, where he soon acquired a leading position as a portrait painter. He sent pictures to the exhibitions of the Society of Artists from 1761 to 1768, and in the latter year was elected one of the original members of the Royal Academy. He contributed to the Academy exhibitions during the period 1769–72, and again, after an interval of estrangement from Sir Joshua Reynolds, from 1777 till 1783. The pictures shown during the first of these periods comprised some landscapes and numerous portraits, among them those of Garrick (two), the Duke of Argyll, and Lord Nugent. Owing to a quarrel with his friend and patron, Philip Thicknesse, he left Bath for London in 1774, and in the metropolis his fame rapidly increased. Among the pictures exhibited at the Academy after his arrival in London none is more celebrated than the 'Blue Boy' (1779), said to have been painted to refute a statement made by Sir Joshua Reynolds in one of his discourses. Among portraits painted during this period are those of the Duchess of Devonshire, Duchess of Cumberland, Duke of Argyll, Gen. Conway, Sir Bate Dudley, George III. and his queen, Bishop Hurd, the Prince of Wales, Col. St. Leger, Lord Cornwallis, the Princess Royal, and other members of the royal family. Owing to a quarrel about the hanging of some pictures he never exhibited at the Academy after 1783. Before his death he was reconciled to Sir Joshua Reynolds. Among his other works the following should be mentioned: portraits of Mrs. Siddons, Hon. Mrs. Graham, Pitt, Blackstone, Johnson, Sterne, Richardson, Clive,

Burke, Canning, Franklin, besides others; 'The Market Cart'; 'The Watering Place'; 'The Brook'; 'Rustic Children'; 'The Cottage Door'; 'Cows in a Meadow'; 'Gainsborough's Forest'; and other fine landscapes. Both in portrait painting and in landscape painting he is one of the greatest of English masters. A portrait by him of the Duchess of Devonshire was sold in 1876 for £10,605, and was immediately thereafter stolen, not being recovered until 1901 (in the United States). Consult: 'Lives,' by Fulcher (1856); Brock-Arnold (1881); Bell (1897); Wedmore, 'Studies in English Art,' first series (1878); Armstrong, 'Gainsborough and His Place in English Art' (1898); Chamberlain, 'Gainsborough' (1903).

Gairdner, gārd'nėr, **James,** English historian: b. Edinburgh 22 March 1828. At 18 as a clerk he entered the 'Public Record' office in London, where he became assistant keeper in 1859. He has distinguished himself by the rare combination of profound erudition, patient accuracy, and judicial temper which he has shown in the editing of a long series of historical documents: 'Memorials of Henry VII.' (1858); 'Letters and Papers Illustrative of the Reigns of Richard III. and Henry VII.' (1861–3), in the Rolls series; the continuation from Vol. V. onward of the late Prof. Brewer's 'Calendar of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.' (9 vols. 1862–86); and 'Historical Collections of a London Citizen' (1876), and 'Three Fifteenth-Century Chronicles' (1880), for the Camden Society series. Equally valuable are the books addressed to a wider audience: an edition of the 'Paston Letters' in Arber's series (1872–5); 'The Houses of Lancaster and York,' in 'Epochs of Modern History' (1874); 'Life and Reign of Richard III.' (1878); 'England' in 'Early Chroniclers of Europe' (1879); 'Studies in English History' (1881), a series of essays written in conjunction with Spedding; and 'Henry VII.,' 'Statesmen' series (1889).

Gairdner, Sir **William Tennant,** Scottish pathologist: b. Edinburgh 8 Nov. 1824. He was graduated M.D. at Edinburgh in 1845, and from 1862 until his retirement in 1900 occupied the chair of practice of medicine in Glasgow University. Among his published books are: 'Pathological Anatomy of Bronchitis and Diseases of the Lungs' (1850); 'Notes on Pericarditis' (1861); 'Clinical Medicine' (1862); 'Public Health in Relation to Air and Water' (1862); 'On Some Modern Aspects of Insanity: Lectures to Practitioners' (1888); 'The Physician as Naturalist' (1889).

Gaisford, Thomas, English scholar and Greek philologist: b. at Ifort, Wiltshire, England, 22 Dec. 1779; d. 2 June 1855. He was educated at Christ Church, Oxford, took orders in the Church, and in 1811 was appointed regius professor of Greek in the University of Oxford. In 1831 he became dean of Christ Church, remaining such till his death, and in 1847 rector of Westwell and curator of the Bodleian Library. He was a prolific writer, his principal works being: 'Hephæstronis Enchiridion de Metres' (Oxford 1810; Leipsic 1832); 'Poetæ Græci Minores' (1814–20, 4 vols.); 'Stobæi Florilegium' (1822, 4 vols.); 'Herodoti Historiæ' (1824); 'Sophoclis Tragædiæ' (Oxford, 1826, 2 vols.; Leipsic 1827, 8 vols.); 'Suidæ Lexicon' (1834, 3 vols.); 'Paræmiographi Græci' (1836); 'Scriptores Latini rei Metricæ' (1837); 'Etymologicum Magnum' (1848); and 'Eusebii Demonstratio Evangelica' (1852, 3 vols.). He was elected a member of the Institute of France, and in 1856 the Gaisford prize, for Greek composition, was founded at Oxford in his memory.

Gaius, gā'yŭs, the name of several persons mentioned in history: (1) A Roman general, the son of Marcus Agrippa and Julia, daughter of Augustus Cæsar. He was adopted by Augustus and distinguished himself as a soldier during the 1st century B.C., having reduced Armenia and routed Tigranes. (2) A Roman jurist who lived 130 to 180 A.D. Before the revision of the Roman law and the reform of legal studies by Justinian, the 'Institutes' of Gaius, afterward the groundwork of the 'Institutes' of Justinian, were the received text-books of the schools of law. Almost completely lost until 1816, their discovery at Verona by Niebuhr threw a flood of light on the history of the early development of Roman law. (3) A Christian controversialist of the 3d century. He regarded the Epistle of Saint Paul to the Hebrews as apocryphal, and was the first who wrote against Cerinthus and the Millenarians. (4) Gaius, Saint, bishop of Rome, 283 to 296; d. 21 April 296. A native of Dalmatia and nephew of Diocletian, he suffered many hardships during the first persecution of the Christians by the emperor.

Galabat, gä-lä-bät', or **Kalabat,** Africa, a small district situated near the western frontiers of Abyssinia. The people, some 20,000 in number, and fanatical Mohammedans, trade with Abyssinia in coffee, cotton, hides, and beeswax. The district contains about 1,500 square miles.

Galac'tic Circle, the great circle of the heavens which coincides best with the course of the Galaxy or Milky Way. According to Sir John Herschel, the north pole of this great circle is situated approximately in right ascension 12 hours 47 minutes, and declination $+27°$, the circle crossing the equator at the points whose right ascensions are about 6 hours 47 minutes and 18 hours 47 minutes. See Galaxy.

Galac'tin, or **Galactine,** in chemistry, a nitrogenous substance obtained from milk by first precipitating the casein with acetic acid; coagulating the albumen by boiling, removing the fat by ether, concentration, filtration from earthy phosphates, allowing the milk-sugar to crystallize out, and finally precipitating the galactin by alcohol. Thirty-five parts of dried milk yield one part of galactin, which is soluble in water, insoluble in alcohol and ether. It is precipitated by tannin, but differs from gelatine in redissolving at 60°. Galactin emulsifies fat. It is found in the blood, gastric juice, animal membranes, milk, eggs, and many morbid animal fluids. It also exists in the juices of edible plants and in the fluid of the embryonal cotyledons.

Galago, ga-lā'gō, a genus of African lemurs (q.v.), arboreal and nocturnal in habit, living on fruit and insects. They vary from the size of a rabbit to that of a rat, are covered with soft fawn-gray woolly fur, have somewhat bushy tails longer than the body, and hind legs longer and stronger than the arms, with two of the ankle bones (*calcaneum* and *navicular*)

greatly elongated. The head is round like a cat's; the eyes are large with oval pupils contracting in daylight to vertical slits; the ears are naked and very big, expanded during activity, but rolled together when the animal rests. The female is said to bear one young one at a birth, and often carries it about. Soft nests are also made in the branches. The galago proper (*G. senegalensis*) seems to be distributed throughout tropical Africa, and is known in Senegal as "the gum animal" from its frequent habitat in mimosa or gum-acacia forests, and from its alleged habit of gum-chewing. It is said to be eaten there. The largest species (*G. crassicaudatus*) measures a foot in length, not including the bushy tail, which is 15 or 16 inches more. In Zanzibar the komba (*G. agisymbanus*) is said frequently to make itself intoxicated with palm-wine, so that it falls from the tree and gets caught. It is readily tamed and utilized to catch insects and mice in the houses. There are numerous species, and the Madagascar genera *Chirogale, Microcebus* and *Opolemur* are joined with it in the sub-family galaginæ. Consult Beddard, 'Mammalia' (1902).

Gal'ahad, Sir, the noblest of the Knights of the Round Table, of whom he alone was successful in the search for the Holy Grail. He was introduced into the Grail legend by Walter Map (q.v.). See Grail; Round Table, Knights of.

Gal'angal, a dried rhizome obtained from different species of *Alpinia* growing in the East. What is known as the lesser galangal is brought from China. It occurs in small pieces, cylindrical and forked, striated, and diversified with whitish rings; the outside is brown, the inside paler. It has an aromatic taste and odor, and is an agreeable substitute for ginger in dyspepsia. It yields an oil and a soft resin, but its chemical composition is not settled. The larger or Java galangal is coarser, and is not so strongly aromatic. The rhizome of *Alpinia officinarum* has been used in medicine as a stimulant aromatic.

Galan'thus. See Snowdrop.

Galápagos (găl a pā'gōs) **Archipelago,** a group of volcanic islands in the Pacific Ocean, belonging to the Republic of Ecuador. (For population, etc., see Ecuador.) Features of wholly exceptional interest in the natural history of the archipelago were noted by Charles Darwin in his 'Journal of the Voyages of the Beagle,' which forms the basis of the present description. The archipelago consists of 10 principal islands, of which 5 much exceed the others in size. They are situated under the equatorial line, and between 500 and 600 miles to the westward of the coast of Ecuador, and directly south of Guatemala. The constitution of the whole is volcanic; with the exception of some ejected fragments of granite every part consists of lava, or of sandstone resulting from the attrition of such materials. The higher islands (which attain an elevation of 3,000 to 4,000 feet) generally have one or more principal craters toward their centre, and on their flanks smaller orifices. There are, in all the islands, at least 2,000 craters. Though the islands are placed directly under the equator, the climate is not in all parts of them excessively hot; a circumstance which is owing to the singularly low temperature of the surrounding sea. Very little rain falls, except during one short season, but the clouds generally hang low; therefore the summits, at an elevation of 1,000 feet or more, possess a tolerably luxuriant vegetation, while the lower parts of the islands are extremely arid. On a part of Chatham Island, black cones, the former chimneys of the subterranean heated fluids, are so numerous and in form so regular that they give the country a "workshop" appearance, which strongly reminded Mr. Darwin of the great iron foundries of Staffordshire. All the craters on Chatham are extinct, but on the western islands "the volcanic forces were in frequent activity." Charles Island was frequented by buccaneers and whalers long before Ecuador established a small penal colony there (1829–30). The soil of the elevated portions of that island is fertile black mud; the climate of the same regions is tempered by a cool southerly tradewind; and wild pigs and goats are found in the woods, "but the main article of animal food is derived from the tortoises"— which sometimes weigh 200 pounds each. On both Albemarle and Marlborough islands, eruptions occasionally take place. Of the former, Mr. Darwin writes: "I should think it would be difficult to find in any other part of the world an island situated within the tropics, and of such considerable size (namely, 75 miles long), so sterile and incapable of supporting life." On James Island there is a lake from which salt is procured. The equatorial heat was observed in its effect upon the soil of the lower and sterile parts. There the thermometer placed in sand of a brown color immediately rose to 137°, and black sand was so much hotter that it was disagreeable to walk over, even in thick boots. An acacia, a cactus, and one of the euphorbiaceæ — a bush with minute brown leaves — are common in some parts of these lowlands. Near the summits the vegetation has a very different character; ferns and coarse grasses are abundant; and the commonest tree is one of the Compositæ. There are no members of the palm family. "The natural history of this archipelago," Mr. Darwin says, "is very remarkable. It seems to be a little world within itself; the greater number of its inhabitants, both vegetable and animal, being found nowhere else." And again, "In my collections from these islands there are 26 different species of land birds. With the exception of one, all probably are undescribed kinds, which inhabit this archipelago and no other part of the world." The order of reptiles forms the most striking feature in the zoology of the islands, the species not being numerous, but the number of individuals of each kind extraordinarily great. There is one kind both of the turtle and tortoise; of lizards four; and of snakes about the same number. Of the tortoise (*Testudo Indicus*) some old males have been found so large that it required six or eight men to lift them from the ground. Mr. Darwin says: "I frequently got on their backs, and then, upon giving a few raps on the hinder part of the shell, they would rise up and walk away; but I found it very difficult to keep my balance. The tortoise is very fond of water, drinking large quantities, and wallowing in the mud. The larger islands alone possess springs, and

these are always situated toward the central parts, and at a considerable elevation. The tortoises, therefore, which frequent the lower districts, when thirsty, are obliged to travel from a long distance. Hence broad and well-beaten paths radiate off from the wells even down to the seacoast. Near the springs it was a curious spectacle to behold many of these great monsters; one set eagerly traveling onward with outstretched necks, and another set returning, after having drunk their fill." Mr. Darwin inclines to the opinion that the Galápagos islands are the original home of the *Testudo Indicus,* though it is now found in many parts of the world. Also characteristic of this archipelago are the lizards, individuals of the aquatic variety, being 3 or 4 feet long. Many of the islands possess trees, plants, and birds, which do not occur on the others. At the date of Mr. Darwin's visit the birds had not learned to fear man. He writes: "A gun is here almost superfluous; for with the muzzle of one I pushed a hawk off the branch of a tree."

MARRION WILCOX.

Galata, gä'lä-tä, a suburb of Constantinople (q.v.).

Galatea, găl-a-tē'a, in mythology, daughter of Nereus and Doris. The Cyclops Polyphemus persecuted with his love this charming nymph, though he gained nothing but ridicule in return. The handsome shepherd Acis, of Sicily, enjoyed her affection, and suffered death on her account; for Polyphemus, finding them together, and mad with jealousy, hurled a rock at them, which dashed Acis in pieces, while Galatea escaped into the sea. Acis was transformed into a fountain, and hastened to meet his mistress in a safer region.

Galatia, gā-lā'shĭ-a, Asia Minor, the ancient name of an extensive region, so called from its Gallic inhabitants, who were immigrants from Europe. With the Gauls were intermingled a considerable proportion of Greeks; hence the inhabitants were often called Gallogræci, as well as Galatians.

Gala'tians, Epistle to the, one of the epistles of St. Paul, the genuineness of which has never been questioned by a critic of the first rank. The internal evidence is incontrovertible. No forger would have ventured on the admissions made by the writer; no false Paul would have allowed that Paul's apostleship was doubted and his successes discredited. The occasion of the letter seems to have been as follows: At his first visit St. Paul experienced a most favorable reception from the Galatians, who exhibited a strong personal attachment to him (Gal. iv. 14). After his departure the judaizing teachers commenced their work, and on the Apostle's second visit he found the noxious influence taking effect. During his short sojourn he endeavored, by oral instruction, to meet the evil; but learning after his departure to Ephesus that his converts were again lapsing from the faith, he addressed to them this indignant warning. This epistle has been often commented upon. Consult: Winer (1829), Ruckert (1833), Usteri (1833), Meyer (1851), Ellicott (1867), Lightfoot (1887), Findlay (1889), and Drummond (1893).

Gal'ba, Servius Sulpicius, Roman emperor: b. 3 B.C.; d. 15 Jan. 69 A.D. Caligula appointed him general in Germany. He soon repulsed the Germans who had invaded Gaul, and restored the ancient military discipline. After the death of Caligula he caused his troops to swear allegiance to Claudius, who sent him in 45 A.D. as proconsul to Africa, where great confusion prevailed. In two years Galba restored order, obtained the honors of a triumph, and was received among the priests of Augustus. Nero appointed him in 61 A.D. governor of Hispania Tarraconensis, but soon after became so exasperated against him that he ordered him to be secretly assassinated. Galba then revolted, but when news arrived of the insurrection among the prætorians at Rome, and of the death of Nero, 68 A.D., he himself was chosen emperor by the prætorian cohorts in Rome. Ambassadors from the senate made known to him his elevation. He chose a colleague in the government under the name of an adopted son, but instead of Otho, favored by the soldiery, he selected Piso Licinianus, hated by them on account of his rigid virtue. Otho, offended by this neglect, resolved to get possession of the throne by force of arms. The prætorian cohorts first declared themselves in his favor, and Galba, attempting in vain to restore order, was attacked and slain.

Gal'banum, a gum-resin obtained from *Ferula galbaniflua* and allied plants, used in medicine as a carminative and expectorant, and externally as an irritant.

Gale, a tree. See CANDLEBERRY.

Gale College, a coeducational institution in Galesville, Wis., founded in 1844 under the auspices of the Presbyterian Church. It has 10 professors and instructors; 120 students; volumes in the library, 10,000; productive funds, $20,000; benefactions, $2,000; grounds and buildings valued at $30,000; income, $4,500; number of graduates, 700; president, William D. Thomas.

Ga'len, or Claudius Galenus, Greek physician: b. Pergamus, Mysia, 131 A.D.; d. Sicily about 201 A.D. He began the study of medicine at Pergamus, and afterward studied at Smyrna, Corinth, and Alexandria. On his return to his native city in 158 he was appointed physician to the school of gladiators. Six years later he went to Rome, where he stayed four years, and gained wide reputation. Scarcely had he returned to his native city when he received a summons from the Emperors M. Aurelius and L. Verus to attend them in the Venetian territory, and shortly afterward he accompanied them to Rome. There he remained several years, though how long is not known precisely, and about the end of the 2d century was employed by the Emperor Severus. Galen was a voluminous writer not only on medical, but also on philosophical subjects, such as logic, ethics, and grammar. The works that are still extant under his name consist of 83 treatises, acknowledged to be genuine; 19 whose genuineness has been questioned; 45 undoubtedly spurious; 19 fragments; and 15 commentaries on different works of Hippocrates. His most important anatomical and physiological works are: 'Of Anatomical Administrations' and 'Of the Use of the Parts of the Human Body.' As an anatomist, he combined with patient skill and sober observation as a practical dissecter — of lower animals, not of the human body — accuracy of description and clearness of exposition as a writer. He

gathered up all the medical knowledge of his time and fixed it on such a firm foundation of truth that it continued to be, as he left it, the authoritative account of the science for centuries. His physiology does not, according to modern ideas, attain the same level of scientific excellence as his anatomy. He seems to place a more implicit faith in amulets than in medicine, and he is supposed by Cullen to be the originator of the anodyne necklace which was so long famous in England. The best modern edition of Galen's works is by Kühn (1821–33).

Galena, Ill., a city and county-seat of Jo Daviess County, a port of entry on the Galena River, and on the Illinois C.; Chicago, B. & Q., and the Chicago & N. W. R.R.'s, 17 miles from Dubuque. Galena is famous as the home of Gen. U. S. Grant (q.v.) from May 1860 until the opening of the Civil War, and the old Grant homestead still remains one of the attractions of the city. There is here Grant Park, a fine statue of Gen. Grant, a United States customs house, government building, and a public library. The city has an extensive trade by rail and river, and is the centre of large lead and zinc mining interests. There are also smelting works, shoe factories, and other industries. The town, which was named after the galena ore found in the vicinity, was settled in 1827 and incorporated as a city in 1839. The mayor and council are elected every two years. The city owns its electric light plant. Pop. (1900) 5,005.

Galena, Kan., a city in Cherokee County, on the Kansas City, Ft. S. & M., and the St. Louis & S. F. R.R.'s; 7 miles west of Joplin, Mo. It is noted principally for its remarkable growth during 10 years, 1890 to 1900. Like its namesake in Illinois, Galena is engaged largely in lead and zinc mining and smelting. The mining district, about 4 miles square, has 200 concentrating mills, and gives employment to 3,000 men. Over $5,000,000 in ore was mined in 1900. The mayor and council are elected every two years. The deputy marshal and police are appointed by the council. Galena was settled and incorporated in 1877, and its population rapidly increased, as follows: (1880) 1,463; (1890) 2,496; and (1900) 10,155.

Galena, a sulphide of lead (PbS), containing when pure 86.6 per cent lead. It crystallizes in the isometric system, commonly in cubes or cubo-octahedrons, but is often found massive with a well-marked and characteristic cubic cleavage. It has a metallic lustre and lead-gray color. Its hardness is 2.5 and its specific gravity 7.5. Galena is the most important ore of lead, nearly all the world's supply of that metal being obtained from it. As it is always more or less argentiferous the mineral is frequently an important silver ore, the amount of silver present sometimes amounting to over 1 per cent, but galena containing less than 1 per cent silver is often mined as a lead-silver ore. The mineral is widely distributed, frequently being associated with the sulphides of iron, copper, or zinc, and often with native gold. The principal mines working deposits of galena in the United States are in Missouri, Colorado, Idaho, Utah, and Montana. See LEAD; SILVER.

Galenists, gā'lĕn-ĭsts, a religious sect founded by Galen or Galenus Abrahans de Haan. They were a branch of the Mennonites. Galen was a doctor of medicine and a minister among the Mennonites at Amsterdam. He taught freer doctrine in practice and belief than his co-religionists, declaring that the Christian religion was not so much a body of truths to be believed as of principles to be obeyed. His enemies accused him of having Socinian proclivities, a charge from which the States-General acquitted him 14 Sept. 1663.

The term was also in medical controversy during the Renaissance to mean a follower of Galen, whose authority as a physician they maintained against the introduction of new chemical methods into the preparation of medicinal drugs. The new school professed to extract essences, or quintessences, and like modern homœopathists gave doses small in bulk, but alleged to be powerful in effect, as containing a concentrated preparation of the original drug. The Galenists adhered to the ancient tinctures and extracts, which, they maintained, possessed all the virtues necessary.

Galerites, găl-ẹ-rī'tēz, a genus of fossil sea-urchins, peculiar to and abundant in the Cretaceous system. The body in breadth is nearly circular or polygonal. The under surface is entirely flat, and has the mouth placed in its centre, with the vent near the margin. There are five avenues of pores reaching from the mouth to the summit. These fossils are often found silicified. *G. albogalerus* is one of the most abundant; it has received its specific name from its resemblance to the white caps worn by the priests of Jupiter.

Galerius, gă-lē'rĭ-ŭs, or **Galerius Valerius Maximianus,** Roman emperor: b. near Sardica, Dacia; d. 311 A.D. Entering the imperial army, he rose rapidly to the highest ranks. In 292 Diocletian conferred on him the title of Cæsar and gave him his daughter in marriage. On the abdication of Diocletian (305) he and Constantius Chlorus became joint rulers of the Roman empire, Galerius taking the east half. When Constantius died in York (306) the troops in Britain and Gaul immediately transferred their allegiance to his son, Constantine (afterward Constantine the Great). Galerius, however, retained possession of the East till his death.

Gales, Joseph, American journalist: b. Eckington, England, 10 April 1786; d. Washington, D. C., 21 July 1860. He came to the United States with his father in 1793, was educated at the University of North Carolina and learned the printer's trade of his father. In 1807 he was made assistant and later partner of Samuel Harrison Smith in the management of the 'Independent Gazetteer,' which had been removed to Washington and its name changed to the 'National Intelligencer.' He became sole editor of that paper in 1810, and took his brother-in-law, William Winston Seaton, into partnership in 1812. Had it not been for the industry of Gales and Seaton an important part of the proceedings of the Senate and House of Representatives, which they reported, would not have been preserved. Especially is this true of the great debate between Hayne and Webster.

Galesburg, Ill., a city and county-seat of Knox County, on the Atchison, T. & S. F.; the Chicago, B. & Q., and Chicago & N. W. R.R.'s, 43 miles northeast of Burlington, Iowa. This

is the seat of Knox College, founded in 1837, where took place the famous Lincoln-Douglass debate in 1859. Lombard University (Universalist) was established here in 1852, and the St. Joseph Academy and the Ryder Divinity School are also located here. There is a public library containing 24,000 volumes. The Burlington railroad shops give employment to many mechanics, and there are extensive stock-yards, brick-making plants, boiler and engine works, farm machinery works, and carriage factories. Under a general State law, passed in 1872, the mayor and city council are elected every two years, and the smaller offices are filled by appointments made by the mayor with consent of the council. The town was settled in 1837 by pioneers from New York State, and named in honor of Rev. George W. Gale, who planned to establish a theological seminary here. During the Kansas-Nebraska struggle Galesburg was a rendezvous and rallying point for the free-soilers. The city was chartered in 1857. The municipality owns and operates its electric light and water plants. Pop. (1900) 18,607.

Galesville, Wis., a village in Trempealeau County, on the Chicago & N. R.R.; 15 miles east of Winona. It is the seat of Gale College (Presbyterian). Pop. (1900) 862.

Gali, Francisco, frän-thēs'kō gä'lē, Spanish navigator: b. Seville 1539; d. Mexico City 1591. He sailed from Acapulco in 1585 with two vessels, under commission of Pedro Moya de Contreras, provisional viceroy of New Spain, to look for a harbor on the coast of California where ships returning from the East Indies might be restocked with provisions. He visited the Philippines, Macao, the Lin-Kins, Japan, and other islands, and on his return (1584) discovered what is now the Bay of San Francisco. The report of the voyage sent by him to the viceroy of the Indies was published by Linschot in a Dutch rendering in 'Track Charts of the Indies' (1596), and an English translation appears in Hakluyt's 'Voyages.' In the National Library, Mexico, are fragments of what is believed to have been a more extended narrative by Gali. He was a skilful navigator and acute observer.

Galicia, gă-lĭsh'ĭ-a, Austria, a crownland or province of Austria, composed of the kingdoms of Galicia and Lodomeria, the duchies of Auschwitz and Zator, and the grand-duchy of Cracow, and formerly including the duchy of Bukowina. It is bounded on the north, northeast and east by Russia, southeast by Bukowina, south by Hungary, and west by Moravia and a small portion of Prussian Silesia; area, 30,307 square miles; pop. (1900) 7,315,939. The physical features of the country are determined by the Carpathians, which form a long and irregular curve on the south, the convexity being toward Galicia. Farther north the hills subside and merge into vast plains. The chief river in the northwest is the Vistula, which partly bounds the province. The Western Bug, a tributary of the Vistula, is partly in Galicia. The chief river is the Dniester. The only part of the surface belonging to the basin of the Danube is in the southeast. It is drained by the Pruth, and is of limited extent. The climate is severe, particularly in the south, where more than one of the Carpathian summits are beyond the limit of perpetual snow. While Galicia is open to the cold north and east winds, these mountains intercept the warm winds from the south. The winters are long and rigorous, and the summers very warm, but comparatively short.

The soil is much diversified. In the more mountainous districts scanty pasture only is obtained, but in general, where the elevation is small, the ground, more especially where resting on a substratum of limestone, is of great fertility, and yields abundant crops of wheat, rye, barley, oats, and maize. Hemp, flax, and tobacco are also extensively grown, and the sugar beet is cultivated. The domestic animals include great numbers of horned cattle, generally of a superior description, and a fine hardy breed of horses, well adapted for cavalry. Sheep are neglected; but goats, swine, and poultry abound. The rearing of bees yields great quantities of wax and honey, and is a lucrative industry. Bears and wolves are frequently met with in the forests, and all the lesser kinds of game are in abundance. The minerals include marble, alabaster, copper, lead, zinc, calamine, coal. iron, and rock-salt. Only the last two are of much importance. Iron occurs in numerous parts of the central Carpathian chain, and bog-iron ore is frequently met with in extensive seams on the plains. They are both worked to a considerable extent. Rock-salt is particularly abundant, stretching in continuous beds for nearly 250 miles along the base of the Carpathians, and of course beyond the limits of Galicia, into Bukowina and Transylvania. The most important mines have their central locality at Wieliczka. Manufactures have not made much progress. The spinning and weaving of flax and hemp prevail to a considerable extent on the confines of Silesia. Distilleries exist in every quarter. Tobacco, sugar, leather, beer, agricultural machinery, etc., are also manufactured. The principal exports are salt, wood, grain, coal, aniseed, linen and spirits. The population is generally of Slavonian origin, and consists of two principal branches — Polish in the west and Russniak in the east. In religion they are divided among Roman Catholics, Greek Catholics, and Armenians. The number of the Jews is considerable. The court of third instance for the country is the superior court at Vienna; there are two courts of second instance, one at Lemberg and the other at Cracow; and there are various district courts of first instance. The government has its headquarters at Lemberg. Educational establishments, both for superior and ordinary instruction, are numerous. At the head of the former stand the University of Cracow, with about 130 instructors and some 1,300 students, and the younger university of Lemberg, with 80 instructors and a similar attendance. The principal towns are Lemberg, the capital, Brody, Cracow, Stanislau, Tarnopol, Przemysl, Sambor, etc.

The nucleus of the modern kingdom of Galicia and Lodomeria was formed by the duchies of Halicz and Vladimir (the original forms of the present names), which were established about the beginning of the 12th century under two princes of the Russian dynasty of Rurik.

After being the field of continuous strife between Russians, Poles, and Hungarians, Galicia continued a Polish dependency from 1382 till the first partition of Poland, in 1772, when it was

acquired by Austria. Galicia is now one of the Cis-Leithan provinces of the Austrian empire, and is represented in the Reichsrat by 63 deputies, while the affairs peculiar to itself are deliberated and determined on by its own Landtag or Diet. Polish is the language of official intercourse and of the higher educational institutions.

Galicia, Sp. gä-lē'thē-ä, Spain, an ancient kingdom and province, bounded north and west by the Atlantic, south by Portugal, and east by Leon and Asturias, with an area of 11,340 square miles. It has been divided since 1833 into the minor provinces of Coruña, Lugo, Orense, and Pontevedra, whose joint population in 1900 was 2,073,618. The country is mountainous, being traversed by offsets of the Asturian chain, rising in their highest peaks to about 6,500 feet. The west spurs, Capes Ortegal and Finisterre, project into the Atlantic. The numerous short but rapid rivers form small estuaries which afford secure havens and roads. The principal river is the Minho, which, with its feeder the Sil, is navigable for small vessels on its lower course. Galicia has a mild, nourishing climate, but agriculture is in a backward condition, capital is scarce, roads are bad, and railways are few. Rich meadows and dense forests occur everywhere, but the soil is more suited to the cultivation of garden produce than of corn. Mines of lead, tin, copper, and iron pyrites are worked. The inhabitants, called Gallegos, are a robust, vigorous, industrious race. Great numbers of them annually visit central and southern Spain and Portugal, where they find employment as harvesters, water carriers, porters, etc. Chief exports, live cattle, preserved meat, eggs, minerals, fish, fruits, and grain; imports, coal, oil, hides, spirits, sugar, and tobacco. The principal towns are Santiago di Compostella and the two strongly fortified seaports Coruña and Ferrol. Galicia was a kingdom under the Suevi from 411 to 585, and again from 1060 to 1071, at which date it was finally incorporated with Leon and Castile.

Galignani, gä-lēn-yä'nē, **John Anthony,** English journalist: b. London, England, 13 Oct. 1796; d. Paris 31 Dec. 1873. He was taken by his father to Paris in the latter part of 1798, and succeeded him in publishing the weekly paper 'Galignani's Messenger,' which had become popular among the English residents of Paris. He remained a subject of Great Britain during his life, and was very liberal to the charitable institutions of that country. His brother, William (b. London 10 March 1798; d. Paris 12 Dec. 1882) was associated with him in the management of the 'Messenger,' and in the building of a hospital in Neuilly for indigent English people. In his will he provided money and land for the erection in Neuilly of the Galignani Brothers' Retreat for 100 printers, booksellers, etc., or their families.

Galile'an, one of the followers of Judas the Gaulonite, who resisted the payment of the tax imposed by Quirinius, the Cyrenius of St. Luke (Luke ii. 1), and gave the Romans trouble till the capture of Jerusalem by Titus in 70 A.D. Galileans is a name applied to Jesus and his disciples, from the intimate connection they had with Galilee (Matt. xxvi. 69; Mark xiv. 70); hence applied by pagans and Mohammedans, as a term of reproach to Christians generally.

Gal'ilee, Palestine, during the Roman period and at the commencement of the Christian era, a province comprehending the northern part of Palestine, west of the Jordan. In pre-Roman times it was referred to as a district inhabited by the tribe of Naphtali. Its name is derived from the Hebrew *galil,* signifying a circle or circuit. It now forms part of the pashalic of Damascus, in the Turkish province of Syria. Anciently it was divided into Upper and Lower Galilee, and was a fertile region with many towns and villages, thickly inhabited by Syrians, Phœnicians, Arabs, Greeks, and Jews. The Jewish inhabitants, on account of their ignorance, simplicity of manners and less rigid sentiments in regard to religion, were held in contempt by other Jews; but after the destruction of Jerusalem despised Galilee became the refuge of the doctors of Jewish law, and the city of Tiberias the seat of Rabbinical learning. As the cradle of Christianity and the scene at Nazareth, Cana, Capernaum, the Lake of Gennesaret, Mount Tabor, and other localities, of a great deal of Christ's ministry on earth, Galilee has worldwide interest. Consult: Merrill, 'Galilee in the Time of Christ' (1885).

Galilee, Sea of, in biblical history also called the Sea of Chinnereth or Cinneroth, Lake of Gennesaret and Sea of Tiberias, is a large pear-shaped lake in the north of ancient Galilee (q.v.), Palestine. It lies 682.5 feet below sea-level; is 13 miles long by 6 broad, and 820 feet deep. It occupies the bottom of a great basin, and is of volcanic origin. The Jordan flows into it red and turbid from the north, and it is fed also by many warm and brackish springs, but its waters are cool, clear, and sweet. Its shores on the east and north sides are bare and rocky; on the west gradually sloping, and luxuriantly covered with vegetation. On its shores are Bethsaida, Capernaum, Magdala, and Tiberias.

Galilei, Galileo, gä-lē-lā'ō gä-lē-lā'ē, Italian astronomer: b. Pisa 14 Feb. 1564; d. Arcetri 8 Jan. 1642. His father, Vincenzo Galilei, a nobleman of Florence, caused him to be instructed in the ancient languages, drawing, and music, and he very early showed a strong inclination to mechanical labors. In 1581 Galileo entered the University of Pisa, to attend lectures on medicine and the Aristotelian philosophy. That spirit of observation for which he was distinguished was early developed. When only 19 the swinging of a lamp suspended from the ceiling of the cathedral in Pisa led him to investigate the laws of the oscillation of the pendulum, which he was the first to apply as a measure of time. He studied mathematics under Ostilio Ricci, soon exhausted Euclid and Archimedes, and was led, by the works of the latter, in 1586, to the invention of the hydrostatic balance.

He now devoted his attention exclusively to mathematics and natural science, and in 1589 was made professor of mathematics in the University of Pisa. In the presence of numerous spectators he went through with his experiments, which he performed on the tower of the cathedral, to show that weight has no influence on the velocity of falling bodies. By this means he excited the opposition of the adherents of Aristotle to such a degree, that after two years he

was forced to resign his professorship. Later he became acquainted with Francesco Sagredo, a Venetian, upon whose recommendation the Senate of Venice, in 1592, appointed him professor of mathematics in Padua. He lectured here with unparalleled success. Scholars from the most distant regions of Europe crowded about him. In 1597 he invented the sector.

One of the most important mathematical discoveries which he made at a period subsequent to this is that the spaces through which a body falls, in equal times, increase as the numbers 1, 3, 5, 7; that is, if a body falls 16 feet in the first second, it will fall 48 in the next second, 80 in the third, and so on. Whether the thermometer was his invention it is difficult to determine; perhaps he only improved it. He made some interesting observations on the magnet, and by means of the telescope in a short time made a series of the most important discoveries. He found that the moon, like the earth, has an uneven surface; and he taught his scholars to measure the height of its mountains by their shadow. A particular nebula he resolved into individual stars, and even conjectured that the whole Milky Way, with good instruments, might be resolved in the same manner. His most remarkable discovery was that of Jupiter's satellites, 7 Jan. 1610. He likewise observed Saturn's ring, though he had not a just idea with regard to it. He saw the sun's spots somewhat later, and inferred, from their regular advance from east to west, the rotation of the sun, and the inclination of its axis to the plane of the ecliptic.

Galileo's name, meantime, had grown so celebrated that Cosmo II., grand-duke of Tuscany, appointed him grand-ducal mathematician and philosopher, and invited him to become first instructor in mathematics at Pisa. Here he gained a decisive victory for the Copernican system by the discovery of the varying phases of Mercury, Venus, and Mars; as the motion of these planets about the sun, and their dependence on it for light, were thus established beyond the possibility of doubt. He wrote a work afterward on the floating and sinking of solid bodies in water, and in this, as well as in all his other writings, scattered the seeds of many new doctrines.

While thus employed in enlarging the field of natural philosophy, a tremendous storm was gathering about his own head. He had declared himself in favor of the Copernican system, in his work on the sun's spots, and was therefore denounced as a heretic by his enemies. In 1611 he visited Rome for the first time, where he was honorably received, and where a favorable report was made on his writings by the mathematicians of the Collegio Romano at the instance of Cardinal Bellarmin. On his return to Florence, however, he became more and more involved in controversy, which gradually took a theological turn, and in the course of which he declared the literal understanding of the utterances of Scripture with regard to physical phenomena to lead to absurdities. From Rome he received, in the name of the Cardinal Barberini (afterward Pope Urban VIII.) the warning not to overstep the limits of mathematics and physics, but he paid no heed to the well-meant advice. The monks preached against him, and in 1616 he found himself again obliged to proceed to Rome, where he is said to have pledged himself to abstain for the future from promulgating his system either orally or otherwise. The genuineness of the document on the basis of which this is asserted, has, however, been questioned in modern times, and the controversy regarding this matter is not yet finally settled.

In 1618 the appearance of three comets gave him an opportunity to communicate to his friends some general observations on these bodies. His scholar, Mario Guiducci, wrote a work immediately after, in which he severely condemned the Jesuit Grassi. Supposing Galileo to be the author, Grassi attacked him. Galileo replied in his 'Saggiatore,' a masterpiece of eloquence, pronounced by Algarotti to be the finest controversial work Italy has ever produced, and, notwithstanding the errors contained in it, a work always worthy to be read.

About this time he completed his famous work, in which, without giving his own opinion, he introduces three persons in a dialogue, of whom the first defends the Copernican system, the second the Ptolemaic, while the third appears as a blind and unreasoning supporter of the views of Aristotle. With this work, in which the greatest elegance and accuracy of style is united with the clearest and most concise statements, Galileo went to Rome in 1630, and succeeded in obtaining the privilege to print it. Having obtained the same permission in Florence, he published it there in 1632 — 'Dialogo di Galileo Galilei, dove ne' Congressi di quattro Giornate si discorre de' due massimi Sistemi, Tolemaico et Copernicano.' Scarcely had it appeared when it was attacked by the disciples of Aristotle, and most violently of all by Scipione Chiaramonti, teacher of philosophy at Pisa. A congregation of cardinals, monks, and mathematicians examined his work, condemned it as highly dangerous, and summoned him before the tribunal of the Inquisition. The veteran philosopher was compelled to go to Rome, and in June 1633 was condemned to renounce, in presence of a great assembly, kneeling before them, with his hand upon the Gospel, the great truths he had maintained. "Corde sincero et fide non ficta, abjuro, maledico et detestor supradictos errores et hereses," was the formula which he was compelled to pronounce. Upon this he was sentenced to the dungeons of the Inquisition for an indefinite time, and every week, for three years, was to repeat the seven penitential psalms of David. His 'Dialogo' was prohibited, and his system condemned as contrary to the Bible. His judges were merciful enough to commute his sentence of imprisonment to banishment to the villa of the Grand-duke of Tuscany at Rome, then to the archiepiscopal palace at Sienna, and soon after he was allowed to return to Arcetri, not far from Florence.

He employed his last years here principally in the study of mechanics and projectiles. The results are found in two important works on the laws of motion, the foundation of the present system of physics and astronomy. At the same time he tried to make use of Jupiter's satellites for the calculation of longitudes; and though he brought nothing to perfection in this branch, he was the first who reflected systematically on such a method of fixing geographical longitudes. He was at this time afflicted with a disease in his eyes, one of which was wholly

blind, and the other almost useless, when, in 1637, he discovered the libration of the moon. Blindness, deafness, want of sleep, and pain in his limbs united to embitter the last years of Galileo's life. He died in the year Newton was born, and his relics were ultimately deposited in the Church of Sta. Croce, at Florence, where a splendid monument was erected to him near that of Michelangelo.

Galileo was of diminutive size, but strong and healthy. His countenance was agreeable; his conversation lively. He loved music, drawing, and poetry. He knew Ariosto by heart; and in one of his works, first printed in 1793, 'Considerazioni al Tasso,' the product of his leisure hours, he points out the superiority of Ariosto to Tasso, whom he criticises very severely. His style is lively, natural, and fluent. His collected works have been edited by Alberi (16 vols. 1842–56). Consult: Nelli, 'Vita e Commercio Litterario di Galilei' (1821); Brewster, 'Martyrs of Science' (1841); Chasles, 'Galileo Galilei' (1862); L'Epinois, 'Les pièces du procès de Galilée' (1877); L'Epinois, 'La question de Galilée' (1878); 'Galileo Galilei und die Römische Kurie' (1876), Gebler; 'Die Akten des Galileischen Processes' (1877); Favaro, 'Galileo Galilei' (1882); Scarbazzini, 'Galileo Galilei' (1883); Wegg-Prosser, 'Galileo and his Judges' (1889).

Galimberti, Luigi, loo-ē'jē gä-lēm-bãr'tē, Italian cardinal and diplomat: b. Rome 1838; d. 1896. He became professor of church history in the College of the Propaganda and of theology in the University of Rome, and was appointed by Pius IX. canon of the Lateran in 1868. From Leo XIII. he received appointment as canon of Saint Peter's, archbishop of Nicæa, and secretary to the Congregation of Extraordinary Ecclesiastical Affairs. He was papal arbiter in the award to Spain, as against Germany, of the Carolines, and in 1880 was sent as ambassador to Germany, where he was successful in adjusting the difficulties of the "Kulturkampf" through the abrogation by the crown of the so-called "May Laws." In 1893 he was made a cardinal and prefect of the papal archives.

Gal'ion, Ohio, a city in Crawford County, on the Erie and the Cleveland, C., C. & St. L. R.R.'s, 81 miles southwest of Cleveland. Galion is an important railroad town, being a connecting point and division terminal. There are railroad shops and round-houses here, brick and tile works, carriage and wagon factories, wheel and gear works, iron foundries, and lumber-mills. The town was originally laid out in 1831, by settlers from western Pennsylvania, and was chartered as a city in 1878. The city owns and operates its electric light and water plants. The government is composed of a mayor, who holds office for two years, and a common council, elected by popular vote. Pop. (1900) 7,482.

Galitzin. See GALLITZIN.

Gall, Saint, Irish monk: b. Ireland about 550; d. Saint Gall, Switzerland, about 645. He accompanied Saint Columba to France about 585, and took part with him in all his missionary labors. Banished from France, they went together into the wilder regions of Switzerland, and near the Lake of Constance they founded the monastery which bore the name Saint Gall and gave name to the town and canton of Saint Gall. After a few years Columba retired to Italy, leaving his companion abbot of the new house. The monastery was burnt by Hungarians in the 10th century.

Gall, Franz Joseph, fränts yō'sĕf gäl, German phrenologist: b. Tiefenbronn, Baden, Germany, 9 March 1758; d. Montrouge, near Paris, 22 Aug. 1828. He studied medicine at Strasburg and Vienna, and settled in the latter city in 1785 as a physician. In 1796 he began to give courses of lectures on phrenology (q.v.) in Vienna; but these lectures were prohibited in 1802 by the Austrian government as being subversive of the accepted religion. With Spurzheim, who became his associate in 1804, he quitted Vienna in 1805, and began a lecturing tour through Germany, Holland, Sweden, and Switzerland. He reached the height of his fame when in 1807 he settled as a physician in Paris. On March 14, 1808, he and Spurzheim presented to the Institute of France a memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal, and Cuvier) drew up an unfavorable report. Thereupon Gall and Spurzheim published their memoir, 'Introduction to Physiology of the Brain'; this was followed by 'Researches on the Nervous System' (1809); and by 'Anatomy and Physiology of the Nervous System' (1810–19) with an atlas of 100 plates. In 1811, in answer to accusations of materialism and fatalism brought against his system, Gall published 'Of the Innate Inclinations of the Soul and Spirit.' He continued to practise medicine and pursue his researches at Montrouge, near Paris, till his death. See SPURZHEIM, KASPAR.

Gall. See BILE.

Gall-bladder, a pear-shaped bag, attached to the under surface of the liver, the function of which is the storage of bile. It is about four inches long and two inches in diameter at the widest part. It will hold from an ounce to an ounce and a half of fluid. The broad end almost reaches the abdominal wall under the edge of the liver at the border of the ribs, about three inches from the middle line of the body. From a groove on the under surface of the liver two ducts that collect secretion from all parts of the organ join and pass down to the duodenum. The gall-bladder is connected with this common duct by another duct or canal of the same structure. They are all about the size of a quill, but are capable of being distended. Bile is not poured out into the intestine unless the chyme from the stomach passes over the mouth of the duct, but the bile travels down the ducts from the liver, and back through the cystic duct to be stored in the gall-bladder until needed.

Acute catarrhal cholangitis is an acute inflammation of the lining membrane of the ducts, causing swelling of the membrane and obstruction to the outflow of bile. The process is usually an extension of an acute gastritis and duodenitis. Jaundice results from the obstruction to the passage of bile, and aside from this the disease presents the picture of acute gastritis. Three to five weeks usually elapse before the jaundice disappears. Chronic cholangitis is due to the presence of stones, to stricture, to carcinoma, or the pressure on the outside. There is nothing distinctive in its evidences.

Acute cholecystitis is due to infection of the gall-bladder from the intestines by various microbes. It is usually associated with the presence of stones within the bladder. It may be a mere catarrh or may be suppurative, going on to perforation and peritonitis. The symptoms are violent pain, exquisite tenderness on the right side of the abdomen, and a high fluctuating temperature. Operation is usually demanded. Gall-stones, cholelithiasis, a disease attended by the formation of stones within the gall-bladder. These stones are formed chiefly of cholesterin, a normal constituent of the bile. It is held that previous infection and stasis of the bile in the bladder are essential to their formation. Large numbers may be formed and held in the gall-bladder for years without causing disturbance, but there is constant likelihood of inflammation, as well as attempts of the bladder to force out these stones. Stones may be passed directly through the ducts or at any point in the cystic or common duct find lodgment. If stones lodge in the cystic duct no bile can pass into the gall-bladder, but that already there may be added to by a mucous secretion, causing the bladder to distend. This condition is called hydrops of the gall-bladder. A stone lodging in the common duct dams back the bile and causes jaundice of pronounced type.

Hepatic colic is the name given to the intense cramp that accompanies the passage of a gall-stone through the bile-ducts or an attempt at such a passage. There is a sudden excruciating pain in the right side at the free border of ribs or even over the whole abdomen; frequently the pain may shoot up to the right shoulder-blade and arm. The patient rolls and tosses in agony with his face suffused with cold perspiration. Sometimes there is a chill followed by fever. The duration depends on the course of the stone; frequently relief is had in a few hours, only soreness remaining.

D. D. Roberts, M.D.,
Brooklyn, N. Y.

Gall-fly, one of the several minute gall-making insects, as the British ash-fly. See Galls and Gall-makers.

Gall-gnats, a gall-making gnat of the genus *Cecidomyia.* See Galls and Gall-makers.

Gall-stones. See Calculus.

Gal'la. See Nut-galls.

Gallait, Louis, loo-ē gä-lā, Belgian historical painter: b. Tournai, Belgium, 10 May 1810; d. Brussels 20 Nov. 1887. He studied in Tournai, Antwerp, and Paris, where he acquired a name by his portraits as well as his genre and historical paintings. Among his earlier pictures of note were: 'Christ Restoring Sight to a Blind Man'; 'The Strolling Musicians'; 'The Beggars'; 'Montaigne Visiting Tasso in Prison'; 'Abdication of Charles V.' Among his subsequent pictures are: 'Temptation of St. Anthony'; 'The Dead Bodies of Counts Egmont and Hoorn'; 'The Prisoner's Family'; 'The Last Moments of Count Egmont'; 'Alva Signing Death Warrants'; and lastly (1882), 'The Plague at Tournai,' purchased for Brussels Museum at the price of $24,000.

Galland, Antoine, äṅ-twän gä-lōṅ, French Orientalist and archæologist: b. Rollot, France, 4 April 1646; d. Paris 17 Feb. 1715. Attached in 1670 to the French embassy at Constantinople, he three years later accompanied the ambassador to Syria and the Levant. In 1676, and again in 1679, he made other visits to the East. In 1701 he was made a member of the Académie des Inscriptions, and in 1709 professor of Arabic in the Collège de France. The greatest part of his writings relate to archæological subjects, especially to the numismatics of the East; but the work which has secured him the greatest reputation is his translation of the 'Arabian Nights Entertainments' (1704–8), the first translation of these stories made into any language of Christendom. Among his other writings are: 'Remarkable Sayings, Witticisms, and Maxims of the Orientals' (1694), and 'The Indian Tales and Fables of Pilpay and Lokman' (1724).

Gallardo, Aurelio Luis, ō rēl yō loo-ēs' gäl-lär'dō, Mexican poet: b. León, Guanajuato, Mexico, 3 Nov. 1831; d. Napa, Cal., 27 Nov. 1869. He published three volumes of poems: 'Dreams and Visions' (Mexico 1856); 'Clouds and Stars' (Guadalajara 1865); and 'Legends and Romances' (1868); also a collection of poems, 'Home Stories.' He wrote many comedies. The drama, 'Maria Antonieta of Lorena' is regarded as his best work.

Gallas, gäl'läz, an Ethiopian race inhabiting Africa between lat. 9° and 3° S. and lon. 34° and 44° E. Their language is a descendant of the ancient Geez of Abyssinia. They are of average stature, with strong, well-made limbs, skin of a light chocolate brown, hair frizzled but not woolly. Though cruel in war they are frank and faithful to promises and obligations. They are distinguished for their energy, both physical and mental, especially the southern tribes, which pursue pastoral avocations, notably the breeding of horses, asses, sheep, cattle, and camels, and those which live by hunting, especially the elephant. These same tribes are mostly still heathens, though Mohammedanism is rapidly making way among them. The more northerly tribes who dwell about Harar profess a crass form of Christianity, derived from Abyssinia, and for the most part raise cotton, durra, sugar, and coffee. The total Galla population, who call themselves Argatta or Oromo, is estimated at about 3,000,000. Politically they are divided into a great number of separate tribes, which are frequently at war with one another. But their inveterate foes are the Somali, who have gradually driven back the Gallas from the shores of the Red Sea and the extremities of the Somali peninsula, regions which were occupied by them in the 16th century, just as on the other side the Abyssinians and Shoans have beaten them back. The country they now inhabit is a plateau northwest of the Indian Ocean, with a hilly, well-timbered surface.

Gal'latin, Albert, American financier: b. Geneva, Switzerland, 29 Jan. 1761; d. Astoria, N. Y., 12 Aug. 1849. He was graduated at the university there in 1779. In 1780 he went to the United States, and was for a time teacher of French in Harvard College. In 1786 he removed to Pennsylvania, became a member of the State legislature, and in 1793 was elected to the United States Senate, but was declared ineligible. From 1795 to 1801 he served in the House of Representatives, and from 1801 to 1813 was secretary of the treasury, in which

post he showed himself one of the first financiers of his day. He took an important part in the negotiations for peace with England in 1814, and signed the Treaty of Ghent. From 1815 to 1823 he was minister at Paris, and in 1826 was sent to London as ambassador extraordinary. On his return in 1827 he settled in New York, and devoted much of his time to literature, being chiefly occupied in historical and ethnological researches. He was one of the founders and the first president of the Ethnological Society of America; and from 1843 to his death was president of the New York Historical Society. His works include publications on finance, politics, and ethnology; among these last are: 'The Indian Tribes East of the Rocky Mountains, etc.' (1836), and 'Notes on the Semi-Civilized Nations of Mexico, Yucatan, and Central America' (1845). Consult Henry Adams, 'Life of Albert Gallatin' (1879).

Gallatin, Mo., city and county-seat of Daviess County, on the Wabash, and the Chicago, R. I. & P. R.R.'s, and on the Grand River, 55 miles northeast of St. Joseph. It is in a farming region and has lumber industries. Pop. (1900) 1,780.

Gallatin, Tenn., town and county-seat of Sumner County, on the Louisville & N., Chesapeake, and Nashville R.R.'s, 26 miles northeast of Nashville, and three miles from the Cumberland River. Its industrial and commercial activities are connected with stock-raising, agricultural products, lumbering, cotton, and woolen manufactures, flour milling, and foundry and machine products. Pop. (1900) 2,409.

Gallaudet, găl-â-dĕt', **Edward Miner,** American educator: b. Hartford, Conn., 5 Feb. 1837. He is a son of Thomas Hopkins Gallaudet (q.v.), and was graduated at Trinity College in 1856. He organized the Columbia Institute for the Deaf, Dumb, and Blind in Washington, D. C., in 1857, and from it developed the Gallaudet College for the Deaf, of which, in 1864, he became president. His publications include: 'Manual of International Law' (1879), and 'Life of Thomas Hopkins Gallaudet' (1888).

Gallaudet, Thomas, American Episcopal clergyman: b. Hartford, Conn., 3 June 1822. He was a son of Thomas Hopkins Gallaudet (q.v.); was graduated at Trinity College in 1842, and teacher in the New York Institution for Deaf-Mutes 1843–58. He was ordained in 1851; founded and became rector of St. Ann's Church, New York, for deaf-mutes, in 1852; was appointed general manager of the Protestant Episcopal Church Mission to Deaf-Mutes in 1872; and founded the Gallaudet Home for Deaf-Mutes, near Newburg, N. Y., in 1885.

Gallaudet, Thomas Hopkins, American educator: b. Philadelphia 10 Dec. 1787; d. Hartford, Conn., 9 Sept. 1851. In 1817 he founded at Hartford, Conn., the first deaf-mute institution in America, and was president of the same till 1830. In 1838 he became chaplain of the Insane Asylum at Middletown, Conn., where he remained till his death. He was the author of 'Bible Stories for the Young' (1838), and 'The Child's Book of the Soul,' etc. See Lives by Humphrey (1858), and E. M. Gallaudet (1888); Barnard, 'Tribute to Gallaudet.'

Galle, Johann Gottfried, yō'hän gŏt'frēd gäl'lĕ, German astronomer: b. in Pabsthaus, Prussia, 9 June 1812. He studied natural sciences and mathematics in Berlin 1830–3; discovered three comets in 1839–40; was the first to observe the planet Neptune (23 Sept. 1846); and in 1851 became director of the observatory in Breslau and professor of astronomy in Breslau University.

Gallegos, gäl-yā'gōs, Argentina, a river and city in the extreme southern part. The river rises in the Latorre Mountains and empties into the Atlantic Ocean; length 160 miles. The city is near the mouth of the river in Santa Cruz Territory and has a population of about 5,000.

Gallein, găl'e-ĭn, Pyrogallolphthaleïn. Formula, $C_{20}H_{10}O_7$. Obtained by heating for some hours one part of phthalic anhydride with two parts of pyrogallol from 190° to 200°, then dissolving the fused mass in alcohol, precipitating with water, and recrystallizing from dilute hot alcohol. It is used as a dye.

Gallenga, gäl-lĕn'gä, **Antonio Carlo Napoleon,** Italian publicist and author: b. Parma, Italy, 4 Nov. 1810; d. Llandogo, Wales, 17 Dec. 1895. He left Italy in 1831 by reason of political disturbances, and lived abroad. He represented Piedmont at Frankfort in 1848–9, and was a member of the Italian Parliament 1854–64. He was long the London *Times'* special correspondent in Italy. His works, many of them issued under the name of "L. Mariotti," include: 'Italy, Past and Present' (1841–9); 'Castellamonte, an Autobiography' (1854); 'Mariotti's Italian Grammar,' which went through 12 editions; 'History of Piedmont' (1855–6); 'The Pearl of the Antilles' (1873); and several books of travel.

Gal'leon, a name formerly given to a very large kind of vessel, with three masts and three or four decks, such as those used by the Spaniards in their commerce with South America, to transport the precious metals. They were large, clumsy, square-sterned vessels, having bulwarks three or four feet thick, all of which were so encumbered with tophamper, and so overweighted in proportion to their draft of water, that they could bear very little canvas, even with smooth seas and light winds.

Gallery, in architecture, a long, narrow room, the width of which is at least three times less than its length. Galleries are destined for dancing, music, dining on festival occasions and are generally decorated with pictures in oil or fresco. Galleries have sometimes been built merely to receive collections of pictures, or to give a painter an opportunity for fresco paintings; hence a large collection of pictures, even if contained in several adjoining rooms, is called a gallery. A celebrated gallery described by Cicero was established by Verres, the well-known spoiler of Sicily. In modern Europe the gallery founded by Cosmo II. in Florence long held the first place; but it has now been eclipsed by several European galleries. The art treasures of Florence now form two collections, that of Uffizi, and that of the Pitti Palace. The Galérie du Louvre in Paris is among the finest in the world, though in 1815 it was stripped of many works of art, reclaimed by the different nations from whom they had been plundered

Among the other renowned European galleries are those at Versailles and Dresden, the Royal Gallery at Madrid, the Belvedere Gallery at Vienna, the Hermitage at St. Petersburg, the gallery of Berlin, the National Gallery in London, the National Museum at Naples, the Vatican and Borghese collections at Rome, and those in Munich, Brussels, Venice, Antwerp, Milan.

The term gallery is also sometimes applied to what is more properly termed a corridor, or to a platform projecting from the walls of a building supported by piers, pillars, brackets, or consoles, and in churches, theatres, and similar buildings to the upper floors going around the building next the wall. In ship-building, a gallery is a balcony projecting from the stern or quarter of a ship of war, or of a large merchantman; in fortification, a covered walk across the ditch of a town; and in mining to a narrow passage from one part of the mine to another.

Galley, the ancient and mediæval ship of the Mediterranean. The Venetian galleys were about 160 feet long above, and 130 feet by the keel, 30 feet wide, and 20 feet length of stern-post. They were furnished with three masts, and 30 banks of oars, each bank containing two oars, and every oar being managed by six or seven slaves, who were usually chained to it. In the fore part, after the invention of cannon, they had three small batteries of cannon, namely, two 36-pounders, two 24-pounders, and two 2-pounders. They had also three 18-pounders on each quarter, and carried from 1,000 to 1,200 men.

The term galley, as applied to the ships of the ancient Greeks and Romans, refers especially to their war-ships, which were propelled chiefly by oars.

The Greek or Græco-Etruscan vases show many illustrations of biremes, that is, galleys with two banks, or longitudinal rows, of oars. The invention of this form of vessel was a very important advance in naval construction, for it permitted of a large increase in rowing-power, in proportion to the bulk and weight of the vessel. It was the trireme, however, which formed the chief war-ship of Greece during her prime. It had three banks of oars on each side. The seats for the rowers, which were removable, were placed between the sides of the vessel and a series of upright and inclined timbers supporting the main deck. The stem of the vessel was generally curved, and terminated in an ornamental figure-head, and the stern-post was also usually curved upward and finished off ornamentally. At the stern there was an elevated quarter-deck, whence the helmsman and the trierarch or naval captain gave their orders. The latter had full command of the ship; the former acted as navigating officer, having the oarsmen and sailors under his command. The trireme had regularly two masts — a mainmast with one large sail, and a very small foremast.

The rowers formed much the largest portion of the crew, while an Attic trireme carried also 10 marines, 17 sailors, a sort of paymaster, two men in charge of the lines of towers, besides two boatswains, one with a flute, to give the time to the rowers. The total crew would thus be about 220. The total length of a trireme was about 120 feet, of which about 100 was devoted to the rowers; the breadth at the water-line was some 12 feet; and the draught about 6 feet. A speed of 8 or 9 knots was probably about the highest obtainable.

The Romans did not become important as a maritime nation till the period of their struggle with Carthage. They built large numbers of ships, chiefly of higher rates than the trireme. But the triumph of the bireme vessels, known as Liburnian galleys, at Actium led the way for a reversion to lower-rated ships.

Galli, găl'ī, the emasculated priests of the Greek goddess Rhea, afterward identified with the Asiatic Cybele, and worshipped as symbolizing the procreative powers of nature. Cybele was the "Great Mother" and inspired the arts of agriculture. The true home of this cult was Pessinus in Galatia, but it never obtained public recognition in Greece, where the excesses and mendicity of its priests exposed it to contempt. It was introduced into Rome 204 B.C., at the bidding of the Sibylline oracle, and for the purpose of expelling Hannibal from Italy. The Galli were permitted to pass in a procession through the streets of the city, led by an Asiatic priest and priestess, but Roman citizens were forbidden to participate in this service. The cult gained an increasing favor and popularity and in the 2d century A.D. other rites were added, such as baptism in the blood of bulls and rams, by which the devotee was supposed to be cleansed from pollution and regenerated. This baptism was undergone by the Emperor Julian, called the Apostate. The worship of Cybele was checked by Constantine and abolished by Theodosius.

Gallic Acid, $HC_7H_5O_5,H_2O$, is an acid which exists in small quantity in gall-nuts, in valonia (the acorn-cup of *Quercus ægilops*), in dividivi (the pod of *Cæsalpinia coriaria*), in sumach, and other vegetables. It is usually prepared from gall-nuts, which, in addition to gallic acid, contain a large proportion of tannin (tannic acid or gallo-tannic acid). When the gall-nuts are digested with water for some weeks fermentation takes place, and the tannic acid is gradually converted into gallic acid. The same result is obtained more quickly if sulphuric acid be present. To obtain pure gallic acid the gall-nuts are boiled with water, and the hot liquor separated. On cooling gallic acid crystallizes out, and is further purified by solution in hot water and treatment with animal charcoal. It forms delicate, silky, acicular crystals, nearly colorless, and having a sourish taste. It is soluble in three parts of boiling water, but only in 100 of cold water, and on this account it can be readily purified by recrystallization. With solution of iron salts (ferric) it produces a blue-black color, and finally yields a black precipitate on exposure to the air. Hence it may be used in the production of ink, for which purpose it has some advantages over tannin or gall-nuts. When the crystals are strongly heated pyrogallic acid is produced and sublimes over. Gallic acid is a useful astringent. As it does not coagulate albumen it is readily absorbed into the blood, and in this way it is efficacious in Bright's disease. Where a decided local astringent effect is desired tannic acid is much more powerful.

In medicine gallic acid is used as an astringent. In most respects its action is similar to that of tannic acid (q.v.), but it does not coagulate albumen, and therefore does not pos-

sess the local action as an astringent. It has been used in excessive sweating, and is useful for sweating feet and as a local spray and gargle in tonsilitis, pharyngitis, and similar affections of the nose and throat.

Gallican Church. See GALLICANISM.

Gal'licanism, the tendency to enlarge the prerogatives of a national Church in restriction of the authority of the Roman See. This term more especially describes the manifestation of that spirit in the history of the Church in France, and takes its derivation from the controversies between the French monarchy at various times and the Roman pontiffs in regard to ecclesiastical jurisdiction. It is a mistake to suppose that Gallicanism took its rise in France prior to the 13th century, or that the decrees of Louis IX., including the Pragmatic Sanction, were in any proper sense an attempt to restrict the authority of the Roman pontiffs. So far from this being true, their object was to assure the immunities and franchises accorded to the clergy from the exactions of the royal officers and feudal lords. In his ordinance of April 1228, Louis IX., or rather his mother, Blanche of Castile, the regent, says not a word about the relations of the clergy or the laity with the Roman pontiff, and Pope Innocent IV., in 1250, in a letter to the queen, thanks her for issuing it.

It was not until the time of Philip the Fair that Gallicanism in any proper sense can be said to have manifested itself. That monarch in his contest with the papacy sowed the seeds of the long controversy as to the question of papal jurisdiction, which so long agitated the French Church. As a result of his contest with Boniface VIII., and of the later declarations of the Councils of Constance and Basel, the principles began to be enunciated by the national party; one that the king of France was absolutely independent of the pope in all temporal matters; the other, that the papal power was not absolute, must be exercised within the limits of the canons, and was inferior to that of a general council. By the Pragmatic Sanction passed at Bourges in 1438, the Gallican Church, in union with the king, adopted the decrees of the Council of Basel abolishing papal reservations and expectatives, and restricting appeals to Rome to the *causæ majores.* Against this many popes protested, but it was not until the date of the concordat (1516) between Leo X. and Francis I. that it was abolished.

During the 16th century there were many customs and privileges of more or less ancient date still extant, which the national party delighted to call "Gallican liberties." The crisis came in the 17th century, during the reign of Louis XIV., over the question of the royal right of regalia (q.v.). Two bishops excommunicated the crown nominees to benefices in their dioceses. Their Metropolitans canceled their sentences; whereupon they made appeal to Rome, and the pope annuled the decisions of the Metropolitans. The crown resented the pope's decision as an intrusion upon its rights. Louis XIV. called an assembly of French bishops (1682) to confirm his position. This assembly formulated the famous Four Articles setting forth the "Gallican liberties." The first declared that the jurisdiction of Peter's successor did not extend to civil and temporal affairs, that kings were subject to no ecclesiastical power in temporals, and denied the deposing power of the popes. The second ratifies the third and fourth sessions of the Councils of Constance as regards the respective authority of the pope and general councils, and denies that these sessions refer only to times of schism. The third asserts the validity of the laws, customs, and constitutions of the realm, and of the Gallican Church. The fourth declares that although the pope has the principal share in questions of faith, and that his decrees regard all and particular Churches, still his judgment is not irreformable, unless the consent of the Church be added.

Afterward, at the command of the king, who subsequently realized the radical character of the Four Articles, the bishops who had signed them individually wrote to the pope retracting their *Declaration.* Later Louis himself wrote to Innocent XII., in 1693, stating that he had "given the necessary orders to the effect that the contents of my edict of 22 March 1682, concerning the *Declaration* emitted by the clergy of France, be not observed."

Nevertheless, the spirit of Gallicanism lingered on in France, finding fresh impetus in Jansenism. During the 18th century its strength rapidly waned, and by the time of the French Revolution (1789) it had ceased to have any vital significance.

Gallienus, găl-ĭ-ē'nŭs, **Publius Licinius Valerianus,** Roman emperor: d. 268 A.D. He received the title of Cæsar from the senate at the same time with his father, Valerianus, and associated with the latter in the empire on his accession in 253 A.D. His father having been defeated and taken prisoner by Sapor, king of the Persians, in 260, Gallienus showed complete indifference, and continued to reign alone without making any attempt to deliver his father. With a like indifference he saw his empire dismembered by numerous usurpers, and invaded in all parts by barbarians.

Gallifet, Gaston Alexandre Auguste, gäs-tôṅ äl-ĕks-ändr ō-güst gä-lē-fā, MARQUIS DE, French general: b. Paris, France, 23 Jan. 1830. He joined the army in 1848, serving in the Crimea, Mexico, and Algeria. He took part with the Army of the Rhine during the Franco-German War, being made prisoner at Sedan. During the second siege of Paris he commanded a brigade of the Army of Versailles, and was unenviably distinguished for his frightful severity to the Communard prisoners. Promoted to the rank of general of division 3 May 1875, he obtained the command of the 1st division of cavalry, and in February 1879, that of the 9th regiment. He became minister of war in 1899.

Gallin, in chemistry, gallin, $C_{20}H_{14}O_7$, or $O[C_6H_2(OH)_2]_2.CH.C_6H_4.CO.OH$. Obtained by long boiling gallein and zinc-dust and ammonia, then acidifying with dilute H_2SO_4 and shaking out with ether. It crystallizes out of ether in fine needles, and quickly reddens in the air. It can be used as a dye instead of logwood.

Gallinger, Jacob H., American politician: b. Cornwall, Ont., 28 March 1837. He studied medicine, which he practised from 1858 until his entrance upon public life as a member of the New Hampshire legislature in 1872–3. He was in the State Senate in 1878–80, and its president

during the last two years. In 1885–9 he was a representative in the Federal Congress, and in 1891–1903 senator. From 1882 to 1890 he was chairman of the Republican State Committee.

Gallinule. See MUD-HEN.

Gallio, găl'ĭ-ō, **Lucius Junius,** Roman proconsul of Achaia under Claudius when St. Paul was at Corinth, 53 A.D. He was brother of the famous Seneca, and had procured his name by adoption into the family of Gallio the rhetorician. The narrative in the 'Acts of the Apostles' tells how, with regard to the clamor of the Jews against Paul, he was "not minded to be a judge of these matters"; and how "Gallio cared for none of these things"; hence his name has become a synonym for a careless, easy-going, and indifferent man who keeps himself free from trouble and responsibility.

Gallipoli, gäl-lēp'ō-lē, Turkey, a seaport on the peninsula of the same name, at the extremity of the Dardanelles, 130 miles west of Constantinople. The ancient Kallipolis, of which some ruins remain, it was formerly the most important commercial town on the Hellespont, and still retains considerable trade. There are two harbors, extensive bazaars, and some manufactures. The town was taken by the Turks in 1356, and formed their earliest European possession; and here the allies disembarked during the Crimean war. Pop. 20,000.

Gallipoli, Peninsula of, Turkey, a tongue of land separating the Hellespont from the Ægean Sea and the Gulf of Saros, 62 miles long, by a varying breadth of from 4 to 12 miles. Lat. between 40° 3′ and 40° 38′ N., lon. between 26° 10′ and 27° E.

Gallipoli Oil, a coarse olive oil used in Turkey-red dyeing and for other purposes, and prepared from olives grown in Calabria and Apulia, the latter being considered the best. The oil is conveyed in skins to Gallipoli, where it is clarified and shipped in casks.

Gallipolis, găl-ĭ-pō-lēs, Ohio, city and county-seat of Gallia County; on the Ohio River, and on the Columbus, H. V. & Toledo, and the Ohio C. R.R.'s. It contains a United States Marine Hospital, Gallia Academy, the State Hospital for epileptics, Washington High School, and a private epileptic sanitarium. Pop. (1900) 5,432.

Gallitzin, gäl-lēt'sĕn, the name of a noble Russian family whose members have been equally prominent in war and diplomacy from the 16th century downward. VASILI, surnamed the Great (b. 1643; d. 1714); was the councilor and favorite of Sophia, the sister of Peter the Great, and regent during his minority. His great aim was to bring Russia into contact with the west of Europe, and to encourage the arts and sciences in Russia. His design to marry Sophia and plant himself on the Russian throne miscarried. Sophia was placed by her brother in a convent and Vasili banished (1689) to a spot on the Frozen Ocean, where he died. AMALIE, PRINCESS GALLITZIN (1746–1806), daughter of the Prussian general, Count von Schmettau. She was noted for her literary culture, her sympathetic relations with scholars and poets, but, above all, for her ardent piety, which found in Catholicism its most congenial sphere. Having separated from her husband, Prince Dimitri Alexievitch, she took up her residence in Münster, where she gathered round her a circle of learned companions. PRINCE DIMITRI ALEXIEVITCH, diplomat (b. 1738; d. 1803). He was ambassador to the court of France in 1763, and to The Hague in 1773, and was the author of several works relating to geology.

Gallitzin, Dimitri Augustine, PRINCE, American clergyman: b. The Hague 22 Dec. 1770; d. Loretto, Pa., 6 May 1841. He was a son of Prince Dimitri Gallitzin (q.v.), and became a Roman Catholic in his 17th year. He was ordained a priest in the United States in 1795; and betook himself to a bleak region among the Alleghany Mountains in Pennsylvania, where he was known as "Father Smith." Here he laid the foundation of a town called Loretto. He declined to return to Russia on his father's death, and as a Catholic priest was adjudged to have lost his right of inheritance. He was for some years vicar-general of the diocese of Philadelphia. He was austere in his mode of life, but liberal in the highest degree to others, and an affectionate and indefatigable pastor. In 1809 he resumed his original name. He wrote various controversial works, including a 'Defense of Catholic Principles' (1816); 'Letter to a Protestant Friend' (1820), and 'Appeal to the Protestant Public' (1834).

Gal'lium, a metallic element, symbol Ga, atomic weight 69.9. Gallium is a triad element. Specific heat 0.079. It was discovered by the French chemist, Lecoq de Boisbaudran by means of the spectroscope; but the Russian chemist Mendeléeff had shown in his periodic law (q.v.) that an element must exist having intermediate properties between aluminum and indium. He called this supposed element eka-aluminum. The metal is obtained by dissolving the blende in sulphuric acid and placing in the solution plates of zinc. A precipitate containing gallium as a hydrated oxide is thus obtained, and after further solution and precipitation metallic gallium is thrown down by zinc. Gallium is a hard metal, very slightly malleable, and leaves a bluish-gray trace on paper; when melted it adheres to glass; it does not tarnish in the air. Its specific gravity is 5.95. It gives a brilliant violet line in the spectrum. When heated in the air it oxidizes on the surface, and does not volatilize. It dissolves in hydrochloric acid with disengagement of hydrogen. It is scarcely attacked by nitric acid in the cold; when heated it dissolves slowly with evolution of nitrous fumes. It forms salts.

Gallium Chloride, in chemistry, $GaCl_3$ It is colorless, crystalline, and deliquescent.

Gallium Salts, salts precipitated by ammonia. If redissolved by hydrochloric acid, and again precipitated by ammonia, the precipitate is soluble in excess. If zinc is present the gallium is precipitated along with the zinc. Potassium ferrocyanide gives a yellow precipitate with strongly acid solutions of gallium chloride.

Gallon. See WEIGHTS AND MEASURES.

Gallotannic Acid. See TANNIN.

Gal'loway, Beverly Thomas, American horticulturist: b. Millersburg, Mo., 16 Oct. 1863. He was graduated from the University of Missouri, agricultural course, in 1884; was assistant in the horticultural department of the university in 1884–86, and in the United States De-

partment of Agriculture, division of vegetable physiology and pathology, in 1887–8. In 1900 he became director of the office of plant industry. His writings include works on plant diseases, botany, horticulture, and allied subjects.

Galloway, Charles Betts, American bishop of the Methodist Episcopal Church, South: b. Kosciusko, Miss., 1 Sept. 1849. In 1868 he entered the Mississippi conference, and for several years he was pastor of various churches in that State. From 1882 until 1886 he was editor of the New Orleans 'Christian Advocate.' He was also elected president of the board of education of his Church, and published a 'Life of Bishop Linus Parker'; 'Hand-book of Prohibition'; 'Open Letters on Prohibition,' written during his controversy with Jefferson Davis on that subject; 'Modern Missions: Their Evidential Value'; and 'Christianity and the American Commonwealth.'

Galloway, Joseph, American lawyer: b. near West River, Md., about 1729; d. Hertfordshire, England, 29 Aug. 1803. He was admitted to the bar in Philadelphia, and was a member of the Pennsylvania Assembly 1757–74. He held a seat in the Congress of 1774, where he suggested a plan of government headed by a president-general to be appointed by the king and to hold office during the latter's pleasure, and a grand council elected every three years by the assemblies of the several colonies. Before the conclusion of the Revolutionary War he removed to England; and in 1788 was charged with high treason by the Assembly of Pennsylvania, which ordered his estates to be sold. He was the author of: 'A Candid Examination of the Mutual Claims of Great Britain and the Colonies: with a plan of accommodation on Constitutional Principles' (1780); 'History and Political Reflections on the American Rebellion' (1780); etc. Consult: Balch (ed.), 'Examination of Joseph Galloway by a Committee of the House of Commons' (1855); Tyler, 'Literary History of the American Revolution' (1897).

Galls and Gall-makers. Galls are unnatural plant-growths caused by various forms of insects, more particularly by the hymenopterous family of gall-flies (*Cynipidæ*). Gall-gnats (*Cecidomyiidæ*, — minute two-winged midges or flies), many species of mites, some forms of caterpillars, and the larvæ of weevils and other beetles also cause galls. The formation of a gall is due to the puncturing of any portion of a plant, the surface of the leaf, stem, roots, or bark and the deposition of an egg in the cavity formed, or by the presence of the larvæ subsequently hatched from it. Within these excrescences the larvæ feed and grow, and either eat their way out while still grubs or remain till the pupa stage is past and emerge as adolescent insects. A gall may contain a single egg and larva or many, and both external form and internal structure vary widely. Each gall-fly has its favorite or exclusive host, and usually restricts its egg-laying to some special part of the plant. While most produce true galls, some members of the family utilize galls already formed.

Fig. 1.— Bedeguar Gall of Wild Rose.

The reproductive relations of gall-flies are very interesting: in many cases parthenogenesis undoubtedly occurs; in some species, for example, of Rhodites, no males have ever been found; in other forms the males when they occur are very few in proportion to the females. It must be emphasized that many gall-wasps distinguished by entomologists as separate species or even referred to different genera have turned out to be the parthenogenetic and the sexual forms of one species. A common life-

Fig. 2.— *a*, oak gall produced by *Cynips quercus-folii*; *b*, section of gall; *c*, gall-insect (*Cynips quercus-folii*).

history is as follows: (*a*) Out of a summer-gall male and female forms emerge; (*b*) the females lay their fertilized eggs and give origin to winter-galls in so doing; (*c*) from these winter-galls there arise parthenogenetic females which in their egg-laying produce the summer-galls from which we started.

Galls vary greatly in shape, and may be solid or spongy, and contain one or several cavities, in each of which a larva is lodged. Though galls are very generally distributed, they occur in commerce chiefly as Levantine articles of trade. The Aleppo nut-galls are spherical and tubercular: blue, black, and white varieties are recognized, the two former being picked before the escape of the larva, the latter after its exit. They are produced by a gall-fly (*Cynips gallæ-tinctoriæ*) on twigs of an oak (*Quercus infectoria*). The galls made on oak by the common British "ash-fly" (*C. quercifolia*), or by the hundred or more American species of Cynips, might serve the purpose of ink making, tanning, etc., just as well; the 70 to 80 per cent of tannin they contain is the principal element of value. Dead Sea Apples, or Mecca or Bussorah galls, or Apples of Sodom (*mala insana*, or *C. q. infectoriæ insana*), are varieties of this vegetable product. The artichoke or strobile galls consist of several pieces, and resemble the fruit (strobilus) of the hop; it is due to the abnormal development of the female involucre before fecundation; its insect is the *C. q. gemmæ*. The hairy galls, or bedeguars, or rose sponges, are chiefly found on *Rosa rubiginosa*; they are produced by *Rhodites rosæ*.

Consult Howard, 'The Insect Book' (New York, 1901), and accompanying bibliography.

Gallus, Caius Cornelius, Roman poet: b. Forum Julii (modern Fréjus), Gaul, about 66 B.C.; d. 26 B.C. He lived at Rome in intimate friendship with Vergil, Asinius Pollio, Varus, and Ovid, and was appointed by Augustus prefect of Egypt, but fell into disfavor and was banished, whereupon he ended his disgrace with his own sword. Gallus was reckoned the founder of the Roman elegy, from his four books of elegies on his mistress Lycoris, of which but a few slight fragments have come down to us. His name was adopted by W. A. Becker as the title of his well-known picture of Roman domestic life: 'Gallus: Roman Scenes from the Time of Augustus' (1838).

Gally, Merritt, American inventor: b. near Rochester, N. Y., 15 Aug. 1838. He was graduated at the University of Rochester in 1863; and later turned his attention to mechanics. His inventions include the "Universal" printing-press; a machine for making linotypes; electric, telegraphic, and philosophical apparatus; musical instruments, including the "Orchestrone," the "Black-Vent System" for tubular church organs; the "Counterpoise Pneumatic System" of the automatic musical instruments, etc.

Galois, Evariste, French mathematician: b. Bourg-la-Reine 1811; d. Paris 1832. He obtained his early education in the Collège de Louis-le-Grand and entered the Ecole Normale in 1830, while there writing a theorem on the solubility of irreducible equations of prime degree by radicals, six articles on the theory of equations and theory of numbers, and with others founded the theories of groups and functions. His works were published in Paris (1897). See EQUATIONS, GALOIS THEORY OF.

Galoparo, gäl-ō-pä'rō, or **Capo di Faro**, kä'pō dē fä'rō, the Charybdis of the ancients. It forms the whirlpool on the outside of the harbor of Messina, in the strait separating Italy from Sicily. Opposite, on the Italian coast, is the rock Scylla.

Galt, gâlt, SIR **Alexander Tilloch**, Canadian statesman: b. London, England, 6 Sept. 1817; d. Montreal 19 Sept. 1893. He was a son of John Galt (q.v.) and went to Canada while still a boy. He made a fortune in the service of the British and American Land Company; was Canadian minister of finance in 1858–62, 1864–6, and in 1867; and Canadian high commissioner to England in 1880–3. He published 'Canada from 1849 to 1859.'

Galt, John, Scottish novelist: b. Irvine, Ayrshire, 2 May 1779; d. Greenock, Scotland, 11 April 1839. In 1804 he went to London, and entered into a mercantile partnership, but the venture soon ended in bankruptcy. He then resolved to try the legal profession, and entered himself at Lincoln's Inn, but made small progress in his studies, and quitted England in 1809. He made a tour of the south of Europe and the Levant, and on his return in 1812 published 'Voyages and Travels in the Years 1809, 1810, and 1811,' and 'Letters from the Levant.' The same year appeared his 'Life of Cardinal Wolsey,' and also a volume of tragedies, which received a rough handling from the 'Quarterly Review.' Among his other literary labors of this period was the tragedy of 'The Witness,' a life of West the painter, and a romance on the legend of the 'Wandering Jew.' In 1820 and 1821 the 'Ayrshire Legatees,' a series of letters descriptive of a supposed visit by a Scottish minister's family to London, appeared in 'Blackwood's Magazine,' and attracted universal attention. Its success induced him to publish immediately afterward his 'Annals of the Parish,' which was received with no less approbation. 'The Provost,' 'The Steamboat,' 'Sir Andrew Wyllie,' and 'The Entail' appeared in rapid succession. These were all extremely popular, but his subsequent novels, 'Ringan Gilhaize,' 'The Spaewife,' and 'Rothelan,' did not sustain the reputation which he had acquired. From 1826–29 he was superintendent to the Canada Company. While in Canada he founded the town of Guelph. He wrote the novel of the 'Last of the Lairds.' After his return to England he set himself resolutely to work, however, at his literary tasks, and produced successively 'Laurie Todd'; 'Southennan'; 'Life of Lord Byron'; 'Autobiography of John Galt'; 'Literary Life and Miscellanies of John Galt,' in three volumes.

Galt, SIR **Thomas,** Canadian jurist: b. London, England, 17 Aug. 1815. He went to Canada 1832 in the employ of the Canadian Land Company, was admitted to the bar 1845 and practised in Toronto. He became Queen's Counsel 1858, Chief Justice of the Court of Common Pleas 1887, retiring in 1894. He was knighted in 1888.

Galt, Canada, town of Waterloo County, Ontario, on the Grand River, the Canadian P. and the Grand T. Rys., 25 miles northwest of Hamilton; named for John Galt (q.v.). The town is picturesquely situated on both sides of the river which is here crossed by several bridges. It is substantially built and lighted by gas and electricity; an important jobbing centre; the seat of a United States consular agent; and has manufactories of flour, axes, paper, woolens, leather, foundry products, wooden-ware, and paper. It has several churches, good schools, a collegiate institute, a public library and reading-room, banks, and daily and weekly newspapers. Pop. (1901) 7,866.

Galton, gâl'tọn, **Francis,** English scientist: b. Duddeston, England, 1822. He was educated at King Edward's School, Birmingham; studied medicine at the Birmingham Hospital and King's College, London; and graduated from Trinity College, Cambridge, in 1844. Having in 1846 traveled in North Africa, he explored in 1850 lands hitherto unknown in South Africa, publishing his experiences in his 'Narrative of an Explorer in Tropical South Africa' (1853), which obtained the gold medal of the Royal Geographical Society, and in 'Art of Travel' (1855). His investigations in meteorology are recorded in 'Meteorographica' (1863). A member of a Meteorological Committee of the Board of Trade, he was appointed one of the committee entrusted with the parliamentary grant for the Meteorological Office. Later he specially devoted himself to the problem of heredity, publishing: 'Hereditary Genius: its Laws and Consequences' (1869); 'Experiments in Pangenesis' (1871); 'English Men of Science: their Nature and Nurture' (1874); 'Life-History Album' (1884); 'Natural Inheritance' (1889); 'Finger Prints' (1893); 'Fingerprint Directory' (1895), etc. He was general secretary of the British Association in 1863–8; president of the An-

thropological Section in 1877 and 1885; and president of the Anthropological Institute in 1885–6.

Galuppi, Baldassare, bäl-däs-sä-rā gä-loo'pē, Italian composer: b. island of Burano, near Venice, 18 Oct. 1706; d. Venice 3 Jan. 1785. He was sometimes called "Il Buranello." From 1722 he was an organist in Venetian churches, and he early wrote an opera, 'Gli amici rivali.' After study of advanced composition as a pupil of Lotti, he again turned to writing, and achieved notable success with more than 70 comic operas, among them: 'Il mondo della luna,' and 'Il mondo alla rovescia.' He has generally been considered the originator of comic opera (opera buffa) in Italy. From 1741 he was for some time resident and active in London, in 1762 became maestro di capella at St. Mark's and director of the Conservatorie degli Incurabili, and in 1765–8 was in Russia as court composer and director of music. He wrote also some sacred works, but none of his compositions is known to-day save a harpsichord sonata which finds place in Pauer's 'Alte Klaviermusik.' He is apostrophized by Browning in 'A Toccata of Galuppi's.'

Galva, Ill., town in Henry County, on the Chicago, B. & Q. and the Rock I. & P. R.R.'s; 45 miles southeast of Rock Island and 48 miles north-northwest of Peoria. It is in a rich agricultural and coal region, on one of the highest points of the dividing ridge between the Mississippi and Illinois river-basins, and besides coal-mining, has considerable manufacturing interests. It has two banks and two weekly newspapers. Pop. (1900) 2,682.

Galvani, Luigi, loo-ē'jē gäl-vä'nē, Italian physiologist; the discoverer of galvanism: b. Bologna 9 Sept. 1737; d. there 4 Dec. 1798. He studied medicine, and in 1762 entered on the practice of his profession. His favorite studies were anatomy and physiology. He soon received the appointment of professor of anatomy in the celebrated institute of his native city, and published a treatise on the urinary vessels of birds. While engaged in these pursuits he was fortuitously led to the discovery which has immortalized his name. His wife, the daughter of Galeazzi, a medical professor under whom he had studied, and a woman of superior intelligence, having observed that the contact of the inanimate body of a skinned frog with a scalpel lying on the table produced in the frog a series of remarkable muscular convulsions, the knife being in contact with an electric machine, informed her husband of the fact, who instituted a series of experiments, and formed conclusions which led to a controversy with Volta. On a journey to Sinigaglia and Rimini he was so fortunate as to trace the cause of the electric appearances which are observed in the torpedo, and wrote a learned treatise on this subject. The loss of his beloved wife in 1790 rendered him inconsolable. Having refused to take the oaths to the Cis-Alpine Republic, he was deprived of his chair, and refused to resume it, when the government, in consideration of his celebrity, offered to allow him to do so unconditionally. In Rome a medal was struck with his effigy.

Galvanic Batteries. See PRIMARY BATTERIES.

Galvanism. See ELECTRICITY; GALVANIZATION, TREATMENT OF DISEASE BY.

Galvaniza'tion, Treatment of Disease by. Of the different forms of electricity used in medicine the galvanic current is perhaps the most widely employed. It may be administered either locally or centrally; local galvanization is used especially for the relief of pain. It is applied to the brain, eye, ear, sympathetic nervous system, spinal cord, urethra, bladder, and chest, either by what is known as "stabile" application, in which both electrodes are kept in a fixed position, or by "labile" application, in which one or both electrodes are slid over the surface, but not lifted from the skin. It is found that a greater sedative influence is obtained if the galvanic current is not interrupted. Labile and stabile interrupted currents are generally preferred for the galvanization of muscles of the head, spinal cord and nerve-tracts. Stabile continuous currents, either uniform or increasing, give the best results. When the galvanic current is interrupted it causes, as is well known, pronounced muscular contraction. This is of service as a tonic to poorly nourished and atrophied muscles.

By "central" galvanization is meant that mode of treatment by the galvanic current by which the entire central nervous system may be brought under the influence of the electrical fluid. In order to accomplish this, one electrode, usually the negative, is placed over the solar plexus, at the pit of the stomach, while the other is firmly pressed to the top of the head and passed gradually over the back of the head and along the inner border of the strong muscle that pulls the neck to one side, the sternoclidomastoid. From here the electrode is passed down the spine. It is thought to increase the electrical excitability of the central nervous system, inducing sleep and relieving general tire. It is a method, however, that should be used with great caution, as it may do more harm than good. See ELECTRICITY, MEDICAL USES OF.

Galvanized Iron, sheets of iron coated with tin by a galvanic process, and with a second metal, zinc, which is effected by preparing a bath of fluid zinc covered with sal ammoniac mixed with earthy matter. When the tin-coated sheet is plunged into this preparation the zinc is precipitated with a crystal-like diaper upon the tin. The term is sometimes improperly applied to sheets of iron which have been coated with zinc without recourse to the use of galvanism. The iron, after being thoroughly cleaned from all trace of oxydization, by a dilution of sulphuric acid, is then plunged into a bath of melted zinc and other substances such as sal ammoniac, or mercury and potassium.

Galvanocau'tery, the use of a cautery knife, loop, point, or blade heated by the passage of a galvanic current. It is of value wherever a limited cautery action is desired, and particularly valuable in being easy to control.

Galvanometer, an instrument for measuring the intensity, direction or length of duration of an electric current. The many types of indicating instruments such as voltmeters and ammeters, where the pointer is held at zero by some directive force, such as the earth's field, a spring or weight or a permanent magnet, come under this head. With very few ex-

ceptions, all galvanometers may be classed under two heads: (1) Those having a magnetized needle suspended so as to move freely in a horizontal plane, the needle being normally held at zero position by means of the earth's field or an external field produced by auxiliary magnets placed to accomplish this result. The needle is suspended on a pivot or a quartz fibre or fibre of silk or other appropriate material. (2) Those having a coil of wire in place of the needle in the first class. This is the type usually called the d'Arsonnal type, and has the coil suspended by means of a fine wire, which provides a way for leading current to the coil, and has another wire underneath the coil for conducting the current from it. The coil, with the conducting wires, is then suspended between the poles of a magnet, its axis being normally at right angles with the lines of the field. The second class of galvanometers, those having a moving coil, are to be preferred for most classes of work, all except those requiring the very greatest delicacy, for the following reasons: The readings are but very slightly affected by the presence of an external field or by magnetic substances in vicinity of the instrument, and are practically independent of the variable influence of the earth's field; this form of instrument may easily be made dead-beat, on account of the strong field in which the coil moves; many forms are portable, and much less affected by vibrations than those of the first class.

The figure of merit of a galvanometer may be expressed either as the current necessary to cause a deflection of one scale division, or as the resistance through which one volt will cause a deflection of one scale division when such resistance is inserted in the circuit. Such an expression of the delicacy of a galvanometer should be accompanied with the following data: The resistance of the instrument, the scale distance and size of one division of the scale. The sensitiveness of a galvanometer is expressed as the difference of potential across the galvanometer terminals necessary to cause a deflection of one scale division; and to be exact, should be accompanied with the same data as for the figure of merit. Of the moving needle class of galvanometers the tangent galvanometer and the Thomson astatic galvanometers are probably in most general use. The tangent galvanometer is constructed so that the inside diameter of the coil which surrounds the needle is at least 12 times the length of the needle. Under these conditions, the needle being held at zero by the earth's field, the current strength will vary directly as the tangents of the angle of deflection; hence the name of the instrument. Although at one time much used for the absolute determination of current strengths, it has of late been replaced by other types, on account of its many correction factors, some of which are of uncertain magnitude, a prolific cause of error being the necessity of knowing the exact value of the horizontal component of the earth's magnetism, which quantity is subject to continual change and is affected by large masses of iron or heavy electric currents in the vicinity.

The Thomson Galvanometer.— This type was designed by Lord Kelvin, and to him we are indebted for the most sensitive instruments as yet made. The moving system consists of a slender quartz rod to the centre of which is fastened a small mirror of glass. Above and below the mirror at each end of the quartz rod is fastened a complex of carefully selected magnetized needles, minute in size, placed parallel to the plane of the mirror. In the upper complex the north poles of the needles are all placed in one direction, and in the lower complex the north poles of the needles are placed in the opposite direction, the combination forming an astatic system, on which the earth's field exerts a very slight directive force. This directive force exerted by the earth's field would be zero if the two complexes could be made exactly equal in magnetic strength. Each complex of needles is enclosed by two coils, thus making four coils in an instrument. These coils are provided with binding posts for series or parallel connection, and are connected so that the current flowing through them will cause the magnetized needles to be deflected in the same direction in each complex. An adjustable magnet mounted on top of the instrument provides a directive action on the needles which may be modified to any extent, a weak directive force increasing the sensitiveness greatly, and also increases the period of oscillation, so that in the best instruments the sensitiveness is limited largely to the patience of the observer.

Moving Coil Galvanometers.— This type is most familiar in the d'Arsonnal galvanometers, and is to be preferred for most purposes within the limits of its sensitiveness. Its preference lies in the fact that it may easily be made dead-beat, and the readings are practically independent of the earth's field or magnetic substances in its vicinity. The construction also adapts itself to a portable type of instrument, and it may be so constructed as to be very slightly affected by vibrations. The sensitiveness of this class of galvanometers may be further increased by substituting an electro-magnetic field for that produced by permanent magnets. Consult: Nichols, 'The Galvanometer.'

J. E. Taylor,
Western Electric Company, Philadelphia.

Galveston, Texas, city, port of entry and county-seat of Galveston County, on Galveston Island, at the mouth of Galveston Bay. It is on the Southern Pacific, the Missouri, K. & T., the Gulf, C., & S. Fe, the International and Grtat Northern, the Galveston, Houston & Henderson, and the Gulf & Interstate Railroads. The city, which includes Pelican Island, has a total area of 13 square miles.

Trade and Commerce.— Galveston is the natural entry port for the great Southwest. The trade year beginning 1 September, showed for the year of 1902–03 the breaking of many records. Comparative figures are as follows: Cotton receipts (1902–03) 2,093,070 bales; (1901–02) 2,090,710 bales. Bank clearings $413,185,000, an increase of $40,946,200. Galveston has advanced from fourth to third place in its rank among exporting ports of the United States. The total value of foreign exports and imports for the trade year (1902–03) was $105,632,087; (1901–02) $97,691,312. Total value of goods handled over the Galveston wharves (1902–03), $447,910,707; (1901–02) $246,567,246. Cash receipts at the custom-house from all sources (1902–03), $448,519; (1901–02) $220,321. The

total value of foreign exports (1902–03) \$104,121,087; (1901–02), \$96,181,423. The foreign imports for 1902–03, were \$1,511,334; (1901–02), \$1,192,758. The total value of foreign goods imported over the Galveston wharves during 1902 was \$3,233,039. A statement of the total tonnage entered or cleared at the port for 1902 shows 1,340 vessels with a tonnage of 3,094,903, compared with a total of 1,042 vessels, with a tonnage of 2,222,928 for 1901. The coastwise trade during the year 1902–03 more than doubled that of the previous year. Galveston has 53 lines of steamships to foreign ports. There are two regular lines of coastwise vessels to New York and 9 lines of coastwise vessels to points in the gulf. During 1902–03 over 90,591 loaded cars were handled in the yards of the Galveston wharf company by the various railroads, compared with a total of 77,139 loaded cars handled during 1901–02. The domestic exports are cotton, wool, hides, oil cake and oil meal, cottonseed oil, fish oil, cement, and poultry. The domestic imports are drugs, boots and shoes, hats, dry goods, chemicals and like commodities. The foreign exports are cotton, cottonseed oil, oil cake and meal, wheat, corn, flour, copper and iron ores, cattle, lumber and timber, and provisions. The foreign imports include fire brick, tiles, chemicals, cement, liquors, earthenware, prepared vegetables, and fancy woods. There are four export grain elevators, with a storage capacity of 4,000,000 bushels and one clearing and conditioning elevator. There are six miles of completed wharfage covered with sheds and a complete railroad trackage system which covers about 50 miles.

Public Buildings.—Galveston has 31 churches for white people and 12 churches for colored people, two orphan asylums, a home for homeless children and a home for aged women; the School of Medicine of the State University, 12 private or sectarian schools, a Roman Catholic university, two Roman Catholic academies, a business college and public high school and five graded schools for white children. One high and two graded schools for colored children; a library building which cost \$150,000 endowed with a fund of \$400,000; a Masonic temple and a Scottish rite cathedral.

Finances and Industries.— The city has eight private and two national banks, 21 building, loan, abstract and real estate corporations. The waterworks, fire department, sewer system and street electric-light plants are owned by the city. The waterworks plant is valued at \$1,550,000. The supply of water comes from artesian wells on the mainland and is piped under the bay. Two daily papers and eight weekly papers are published here. The city has two thoroughly equipped hospitals; 12 hotels; a large jobbing trade; bagging mills, rope mills, brewery, cement and pipe works, ice plants, iron works, sash, door and blind manufactories, cotton presses, clothing, cotton oil, flour, meal, coffee, baking powder, spices, extracts, pickles, preserves, macaroni and mineral water manufactories, and rice-mills.

Here is the recognized finest beach in the world, 30 miles long, sea-bathing, fishing, boating, driving and riding facilities unsurpassed and semi-tropical winters and balmy summer breezes offer a delightful climate the year round. Annual average temperature 69 degrees. Average temperature for July 84 degrees. Average temperature for January 53 degrees. Average annual rainfall 46 inches. The rate of taxation for the city is \$1.70 on the \$100 and for the State and county \$1.44⅔. Total tax rate \$3.14⅔ on the \$100. The assessments of the city for 1903 were \$20,574,000 and for the county \$21,895,950.

Government.— The State legislature in 1901 placed the city under a commission. This government has proved most satisfactory and is being run on a basis of about \$100,000 a year cheaper than the previous municipal administration. The State legislature also provided for the refunding of the bonded floating indebtedness of the county and for grade raising bonds. Authority was also granted to issue bonds on the approval of two thirds of the tax-paying citizens for breakwater purposes. The city commission appointed a board of engineers and plans for protection calling for an expenditure of \$3,505,000 were adopted. The bonds were voted almost unanimously and more than \$1,000,000 of the \$1,500,000 voted for breakwater purposes were subscribed for by Galveston people. The State legislature granted Galveston for a period of 17 years the State's portion of taxes on city property. This amounts to about \$80,000 per year. The money thus derived is to be used for the purpose of raising the grade of the city.

The Sea Wall.— Work on the Galveston sea wall was begun in October, 1902. Half the work on the structure was completed in September 1903. The wall will be 17,593 feet long, 16 feet wide at the base and 17 feet high. (See Galveston Sea-Wall.)

History.—About the year 1782 a Spanish fleet made an examination of the coast of the Gulf of Mexico west of the Mississippi River, and named Galveston Bay and island in honor of Conde de Galvez, then governor of Louisiana. The explorers found on the island one white man who subsisted by hunting and fishing. Galvez was governor of Louisiana from 1780 to 1785. Until the year 1816 Galveston island remained in its primeval state, a low island formed in process of time by the sea throwing up sand and shells. The conjecture that La Salle visited Galveston island during his brief stay in Texas is without reasonable foundation. The island was long a favorite hunting ground for the Caroñkawas, the once powerful and warlike tribe which inhabited so much of the coast of Texas. Francisco Zavier Mina, a young Spanish soldier, resolved to lend the patriotic cause in Mexico his sword and aid the people of that country in their struggle for liberty. He determined to make Galveston island his base of operations. He worked in co-operation with Don Luis Aury, a naval officer. His plan was approved by Herrara, commissioner of the Mexican revolutionary or Morelos government to the United States. Herrera, with Aury, landed on Galveston island with an expedition in September 1816. A government was organized, Aury was made civil and military governor of Texas and Galveston island and took the oath of fealty to the Republic of Mexico. In November 1816, Mina arrived at Galveston with a few small vessels and about 200 men. Mina and Aury abandoned the island in March 1817. Just about the time they left Galveston island we have the first account of Lafitte coming to the

island. The pirate is supposed to have reached Galveston late in 1816. He held letters of marque from the revolutionary government of Venezuela authorizing him to prey upon the commerce of Spain. He had a number of vessels and quite a force of adventurers. He also assumed to be governor of Texas under the revolutionary government of Mexico, probably having received some such authority from Herrera, the Mexican commissioner in New Orleans. Lafitte's purpose was to capture Spanish vessels sailing under the flag of the Mexican republic. By the close of the year 1817 the population of Galveston had increased to nearly 1,000. The United States and Spain found cause for complaint against the pirates, but Spain feared the United States would claim the island if the pirates were dispersed by the American naval establishment, and the United States did not feel called upon to take action, owing to the attitude assumed by Spain, consequently Lafitte was left undisturbed. In 1820 an American vessel was taken by Lafitte's men. The United States government then dispatched an armed vessel under Lieut. Kearney to break up the establishment at Galveston. Lafitte left Galveston for good, but continued his depredations upon Spanish shipping until 1826. In 1820 Dr. James Long visited Galveston island to induce Lafitte, who was about leaving Galveston, to co-operate with him in the establishment of a government at Nacogdoches. Lafitte referred to the failure of all previous attempts to invade Texas and refused to join Long. Before Long left Bolivar Point a French sloop freighted with wine stranded on Galveston island. Caroñkawas to the number of 200 were encamped in the vicinity. They attacked and butchered the crew, plundered the sloop and engaged in a drunken jollification. Long determined to chastise them. After nightfall with 30 men he passed over to the island in small boats. In the fight the Caroñkawas outnumbered the whites seven to one. Long was compelled to retreat. Three of his men were killed; 32 Indians were left dead on the field.

Little is heard of Galveston island after Long's expedition until just previous to the battle of San Jacinto. The island was practically abandoned from 1820 until along in the thirties, when the Mexican government established a custom-house on the island. On the occasion of the preliminary meeting at Brazoria to declare the independence of Texas in 1835 there was no representative present from Galveston. The same is true of the more formal declaration of independence which was made on 2 March 1836, at Washington on the Brazos. Just prior to the battle of San Jacinto the new Texas government retreated from Washington to Harrisburg. As Santa Anna and his army approached Harrisburg, President Burnet and his cabinet sailed down to Galveston island, narrowly escaping capture. The news of the victory at San Jacinto reached President Burnet on Galveston island 26 April 1836. The provisional government of Texas under Governor Smith in 1835 had granted letters of marque and reprisal and had provided for the establishment of a small navy. The Liberty, one of the vessels of this navy, was at Galveston at the time of the battle of San Jacinto. Several prizes were taken by the Texas navy and brought into Galveston Bay. During the hostile period following the battle of San Jacinto the Mexican government proclaimed a blockade against the ports of Texas and in attempting to enforce it interfered with vessels of the United States. In 1837 the Texas navy was increased and several vessels were stationed at Galveston. The third congress of the Texas republic assembled at Houston in November, 1838. The County of Galveston was represented for the first time in the third house of representatives by Moseley Baker. After the annexation of Texas and the outbreak of the Mexican War the first Texas regiment to join General Taylor was composed of six months' men raised and organized in Galveston, commanded by Albert Sydney Johnston. Galveston County was created 15 May 1838. The battle of Galveston during the Civil War, occurred 1 January 1863. The first railroad begun in Texas was at Harrisburg in 1852. The Galveston, Houston and Henderson road was begun at Virginia Point in 1855. Trains were first run from Virginia Point to Houston in 1859 and in that year a contract was let for the first Galveston bay bridge, which was completed and trains were run into Galveston in 1860.

The jetties at Galveston were completed in 1896, since which time the water at the point where the bar existed has been slowly deepening. (See GALVESTON, JETTIES AT.) Galveston wharves are only one hour from the deep sea for a laden steamer. Galveston wharf and terminal facilities, as a system, have few equals in the country, being excelled in no particular except size.

In December, 1836, Colonel Michael B. Menard purchased of the Republic of Texas for the sum of $50,000 one league and labor of land on the east end of Galveston island. He associated with him a number of persons and they formed a joint stock company known as the Galveston City Company, which was incorporated in 1841. This company is still in existence, although its present holdings of real estate are not large. The city of Galveston was incorporated in 1839. The first mayor was John M. Allen.

Galveston has had three noted philanthropists. George Ball gave the city the Ball High School, which cost $100,000 and has been added to since his death by his widow and son. He also left $50,000, the interest of which is to be used for the poor and deserving of the city. John Sealy presented the city with the Sealy hospital, which has cost over $100,000. Henry Rosenberg left $30,000 for an orphans' home, $30,000 for Grace church, $30,000 for a home for aged women, $65,000 for a Y. M. C. A. building, $50,000 for a monument to the heroes of the Texas revolution of 1836, $30,000 for drinking fountains, $150,000 for a library and $400,000 with which to endow the same. He also presented the city before his death with a $100,000 school building, which is known as the Rosenberg school.

The property loss at Galveston occasioned by the storm of 8 Sept. 1900, was $17,058,275. The loss of life on the island is estimated at 6,000. The total cash receipts of donations made to flood sufferers amounted to $1,243,495.

Population.— (1880) 22,248; (1890) 29,084; (1900) 37,789. The population of Galveston,

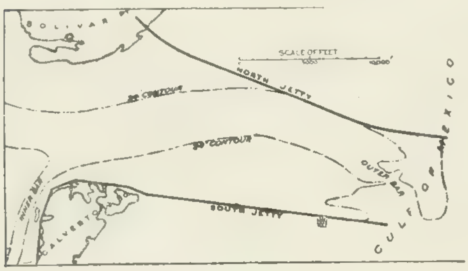
according to the City Directory for 1903-04 is 32,745.

R. G. Lowe,
Vice-President of the Galveston News.

Galveston Bay, an inlet of the Gulf of Mexico, extending northward from Galveston about 35 miles.

Galveston Island, an island off the coast of Texas on the northeastern end of which is Galveston. Length, about 28 miles.

Galveston, Texas, Jetties at. The entrance to Galveston harbor was originally obstructed by an inner bar upon which the depth of water was 9½ feet and an outer bar with a depth of 12 feet. The Federal government adopted the jetty system for improving the entrance to this harbor. Two jetties have been constructed of sandstone riprap and are covered with granite blocks weighing from 5 to 12 tons each. The south jetty is 35,603 feet in length and the north jetty 25,907 feet in length. They are to be built to a height of 5 feet above mean low tide and are from 12 to 15 feet in width at the top with a slope of about 1½ feet to each vertical foot in depth. The distance between the shore ends



of the jetties is about two miles, they converge until their sea ends are about 7,000 feet apart. There had been expended to 30 June 1902 on this work $8,519,684.42. The jetties, by confining the water, has increased the tidal scour and secured a depth of over 26 feet at mean low tide on both bars. These works were damaged by the hurricane of 8 Sept. 1900, but have been repaired with granite blocks of ten tons weight. There is every assurance of securing, when this work is completed, not less than 30 feet of water at mean low tide.

Walter Gresham.

Galveston, Military and Naval Operations at. In the summer of 1862 Farragut sent several light squadrons to cruise along the coast of Texas, and a blockade was maintained against Galveston, which was abandoned by the Confederate military forces, and 8 October surrendered by its civil authorities to Commander Renshaw of the United States Navy. Six United States vessels lay in the bay, commanding the city. 7 November Lieut. Jouen, with two launches, captured and burned the privateer Royal Yacht, carrying one heavy gun, and took 13 prisoners, with a Union loss of two killed and seven wounded. On 24 December, 260 men of the 42d Massachusetts regiment were landed and encamped on the city wharf. At daybreak, 1 Jan. 1863, Gen. Magruder, the Confederate commander in that department, made a combined naval and land attack upon the Union fleet in the bay and the military in the city. He secured four steamers from the adjacent rivers, used cotton-bales for armor, mounted them with guns and filled them with sharpshooters, and attacked the six United States vessels. The Westfield was blown up and destroyed by her officers to prevent capture; the Harriet Lane was boarded, and surrendered after her captain and executive officer had been killed. One of Magruder's boats went to the bottom in its encounter with the Harriet Lane. The land force was attacked by a largely superior force and, after a stout resistance, in which it had 20 men killed and wounded, surrendered. Magruder reported his loss as 26 killed and 117 wounded. The other United States vessels then abandoned the blockade, but Farragut quickly restored it, soon after which, 11 January, a strange vessel was seen outside and the Hatteras was sent to overhaul her. She proved to be the noted Alabama, and after a short and hot fight she sunk the Hatteras, saving her crew. Ten days later the Union gunboats Velocity and Morning Light, blockading Sabine Pass, were attacked by Confederate steamers, driven out to sea, and captured, with guns, prisoners, and a large amount of stores. Galveston remained in Confederate possession until the close of the war. Consult: 'Official Records,' Vol. XV.; Mahan, 'The Gulf and Inland Waters'; Maclay, 'History of the Navy,' Vol. II.; Lossing, 'Field Book of the Civil War,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

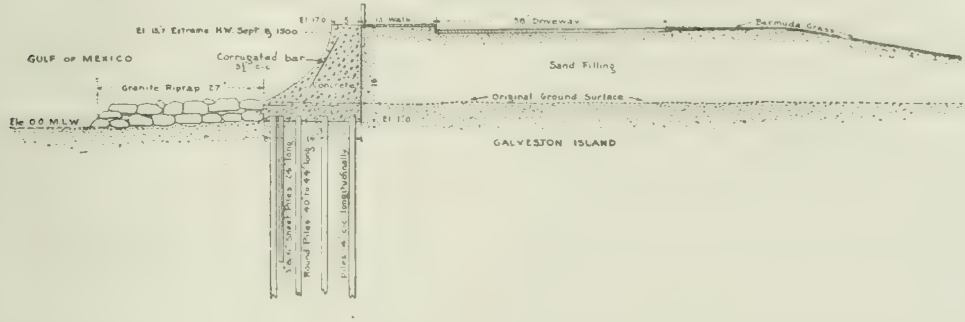
E. A. Carman.

Galveston Sea-wall. The date 8 Sept. 1900, in Galveston, Texas, will be referred to by its inhabitants for generations to come. The appalling loss of life and the destruction of property on that date, due to the terrific West Indian hurricane which drove the waters of the Gulf of Mexico over the oleander city, shocked the civilized world. Over 6,000 lives were sacrificed to satisfy the storm king's anger, and over $17,000,000 worth of property was completely destroyed. The city of Galveston is located on the east end of an island about 30 miles in length and from one to three miles in width. The entire south side of the island fronts on the Gulf of Mexico, while the north side fronts on Galveston Bay. As to the frequency of hurricanes, and the probability of Galveston being visited again, is a matter of mere conjecture. This city was settled in 1847, and since that time has been visited by six storms, none of which, however, caused the loss of exceeding three lives. In September 1875 a hurricane swept over the island, causing considerable damage to property. At this time the convention was in session which framed the present Constitution of the State of Texas. The impression produced by this hurricane led to the insertion of Sections 7 and 8, in Article XI. of the Constitution, granting all counties and cities bordering on the coast of Mexico the right to issue bonds and construct sea-walls, or breakwaters. Judge Wm. P. Ballinger, one of Galveston's most honored citizens and a lawyer of marked ability, was a member of this constitutional convention, and the author of the sections before named. On 28 Aug. 1886, having in mind a storm which swept the city on the 20th day of that month, Judge Ballinger addressed an open letter to the citizens of Galveston, calling to their attention

this constitutional provision and warning them of the great necessity for the construction of a sea-wall as a means of protection. This letter was a strong appeal, and while it provoked much newspaper discussion, no active steps were taken to carry out the plan offered. When the people of Galveston awoke from their night of death in September 1900, Judge Ballinger's plan was again brought to light, and, although the author had long since passed away, it required no new appeal to spur the then thoroughly aroused people to the point of action.

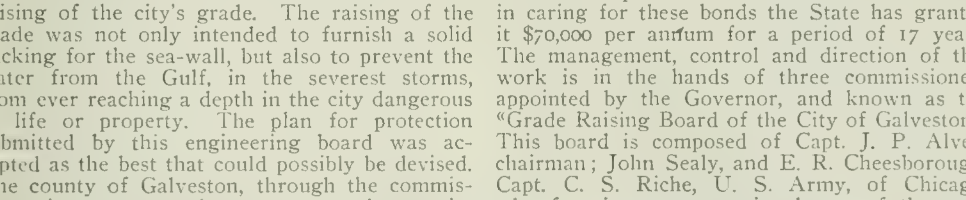
On 22 Nov. 1901, the Board of Commissioners of the city of Galveston appointed a Board of Engineers, consisting of Brig.-Gen. H. M. Robert, U. S. Army (retired), Alfred Noble, and H. C. Ripley, engineers of national renown, to devise a plan for the protection of Galveston against destructive overflows. On 25 Jan. 1902 this board submitted a plan calling for the construction of a solid concrete sea-wall and the raising of the city's grade. The raising of the grade was not only intended to furnish a solid backing for the sea-wall, but also to prevent the water from the Gulf, in the severest storms, from ever reaching a depth in the city dangerous to life or property. The plan for protection submitted by this engineering board was accepted as the best that could possibly be devised. The county of Galveston, through the commissioners' court, agreed to construct the granite concrete sea-wall, and provide a 150-foot right of way and filling for the same, with the understanding that the city proper, with aid from the State of Texas, would undertake the task of raising the grade.

Construction of the Sea-Wall.— This wall is now nearing completion. Its total cost, including the 150 foot right of way, will be $1,500,000. Its top is seven and one half feet above the extreme high water mark of September 1875, the highest ever known, excepting on 8 Sept. 1900, and it is one and three tenths feet higher than on that unprecedented occasion. The sea-wall, when completed, will be 17,593 feet in length, and is constructed on a piling foundation driven 43 feet in the ground, below mean low water, with a double thickness of sheet piling on the Gulf side. The wall is 16 feet at the base, 16 feet high, and 5 feet wide at the top, curving from the top to the base, as shown in sketch. The concrete is composed of one part of cement, three parts of sand and six parts of crushed granite. At intervals of three and one half feet, there is placed in the wall one and one half inch square, corrugated steel reinforcing rods 10 feet long. The rip rap in front of, or on the Gulf side of the wall is 27 feet wide, and from three to seven feet in thickness, and is composed of granite. The contract for constructing the wall was let to J. M. O'Rourke & Company, of Denver, Colo., on 9 Sept. 1902, with the provision that the work be completed in 15 months from date of contract.



CROSS SECTION OF GALVESTON SEAWALL & FILLING.

Raising the Grade.— In order to carry out the plan for raising the grade, the legislature of the State has authorized the city to issue bonds to the amount of $2,000,000 at a rate not to exceed five per cent. In order to aid the city in caring for these bonds the State has granted it $70,000 per annum for a period of 17 years. The management, control and direction of this work is in the hands of three commissioners appointed by the Governor, and known as the "Grade Raising Board of the City of Galveston." This board is composed of Capt. J. P. Alvey, chairman; John Sealy, and E. R. Cheesborough. Capt. C. S. Riche, U. S. Army, of Chicago, who for six years was in charge of the government engineer's office at Galveston, is the consulting engineer. The grade is to extend from the Bay eight feet above mean tide to seventeen feet at the sea-wall, thus forming a rise of one foot in 1,500 from the Bay to the Gulf. With this protection carried out, the city so protected will not be exposed to any danger from the waters of the Gulf.



Geo. W. Boschke,
Engineer in Charge of Sea-Wall Construction.

Galvez, gäl'väth, **Bernardo,** Count de, Spanish colonial administrator: b. near Malaga 1755; d. Mexico City 30 Nov. 1786. He entered the Spanish army in the Walloon guards, served also in the Cantabrian regiment of France (1772–5), and later fought with distinction un-

der Gen. O'Reilly in the war against Algiers. In 1776 he became lieutenant-governor of Louisiana, in the same year governor; and during the Revolutionary War, particularly after the Spanish declaration of hostilities against England in 1779, was of much service to the American cause. His capture of Pensacola and with it the Florida west coast (19 May 1781) was celebrated in verse by de Poydras. In 1783–5 he was captain-general of Cuba, and in 1785 was appointed viceroy of Mexico. His construction of a fortress-palace on the site of the castle of Montezuma at Chapultepec caused him to be misrepresented to the Spanish government as plotting the establishment of an independent Mexican kingdom. He improved the mines, increased the revenue, and alleviated the famine of 1785. He was one of the ablest of Spanish officials in the New World.

Galway, Ireland, a municipal and parliamentary borough, a seaport, and county of itself at the mouth of the river Corrib, on the north shore of Galway Bay, 50 miles north-northwest of Limerick. The old town is poorly built and irregular. The new town consists of well-planned and spacious streets, and is built on a rising ground which slopes gradually toward the sea and the river. Galway is the see of a Roman Catholic bishop, but is in the Protestant Episcopal diocese of Tuam. The principal buildings are the cruciform church (Episcopal) of Saint Nicholas (1320); St. Augustine's Roman Catholic church (1859), monasteries, nunneries, the county court-house, barracks, prison, infirmary, and Queen's College (1849). Galway has flour-mills, a distillery, a foundry, extensive salmon and sea fishing, a good harbor, with docks that admit vessels of 500 tons, and a lighthouse. During 1858–64 a line of steamers plied between Galway and the United States, but the service was abandoned in the last named year. The exports consist mainly of agricultural produce, wool, and black marble. It was taken by Richard de Burgh in 1232. From the 13th till the middle of the 17th century it continued to rise in commercial importance. In 1652 it was taken by Sir Charles Coote, after a blockade of several months; and in July 1691 it was compelled to surrender to General Ginkell. Pop. (1901) 13,244.

Galway Bay, a large bay on the west coast of Ireland, between County Galway on the north and County Clare on the south, about 30 miles in length and from 20 to 7 miles in breadth. Across its entrance lie the Aran Islands, and there are numerous small islands in the bay itself.

Gáma, gä'mä, **Antonio Leon de,** a Mexican scientist: b. City of Mexico 1735; d. 12 Sept. 1802. He was secretary to the supreme court for a number of years, and subsequently was a professor at the School of Mines. He is best known for his study of the celebrated Aztec calendar stone which was discovered in his time.

Gama, José, Basilio da, Brazilian poet: b. in the district of Rio-dos-Mortes, Brazil, 1740; d. Lisbon, Portugal, 31 July 1795. Educated by the Jesuits, he joined their order; but about 1786 renounced his allegiance to it, and published the poem 'Uruguay' to expose the alleged Jesuit design of forming an independent state among the Uruguay Indians. He was elected a member of the Academy of Lisbon. He also published 'Lenitivo da Sandade do Principe D. José' (1788), and 'Quitubia' (1791).

Gama, Vasco da, väs'kō dä, Portuguese navigator: b. Sines, Portugal, 1450; d. Goa, India, 24 Dec. 1524. He was the first navigator who made the voyage to the East Indies by the Cape of Good Hope. Bartholomew Dias, a Portuguese explorer, having visited the cape, which he called Cabo Tormentoso, or stormy cape, brought back such interesting accounts of his discoveries that the Portuguese sovereign Emanuel, following the policy of his predecessor, John II., determined to urge discovery beyond the point where Dias left it, and if possible to reach by sea the countries of the Indies. Accordingly an expedition was placed under the command of Vasco da Gama, a gentleman of the king's household, and a skilful and experienced mariner. The fleet consisted of the San Gabriel, flag-ship of 120 tons, the San Rafael of about 100 tons, a caravel of 50 tons, and a store-ship, with a total force of 160 men. The king presented Gama with the flag of the military order of Christ (a white cross within a red), also the journal of Covilham the navigator, who had 10 years before gone to India by way of the Red Sea, and with letters to all known potentates, and to the mysterious Prester John. On 8 July 1497 Gama's expedition departed from Lisbon for the Cape Verde Islands, whence it set sail on 3 August southward along the African coast. For three months the voyagers pursued their way, harassed, as an early English narrator says, with torments of wind and rain. On 7 November they put into a bay called St. Helena, near the cape, where they found the natives "lyttle men, ill favored in the face and of color blacke, and when they did speake it was in such manner as though they did alwayes sigh." Departing on the 16th, they encountered a succession of tempests such as had gained for the southern promontory of Africa the name of the Cape of Storms. The courage of Gama's companions failed, and they besought him to put back, which he not only refused to do, but put the ringleaders of the movement in irons, and held on his course into the stormy sea. When they were beating about off the promontory, Gama fancied that he saw the spirit of the cape. Camoens has sung this incident as a fact, while moderns, less poetical, say that the apparition could have been nothing more than that peculiar cloud whose sudden envelopment of the cape is the forerunner of a storm. On Wednesday, 20 November, they doubled the Cape of Storms, or rather, as Emanuel himself had named it ere the expedition set out, the Cape of Good Hope. Proceeding along the coast, they touched at various points, among others at Natal. Further north they discovered Mozambique, and came upon a country which exhibited a high stage of commercial advancement, the inhabitants having regularly built ports, with mosques. The natives were Mohammedans, carrying on a trade in pearls, rubies, silver, linen, and spices with Arabia and India. Gama took with him a pilot from this place. On 1 April the explorers discovered the island of Açoutado, which Gama so named from a flogging he gave to his pilot there; and on the 7th the island of Mombassa, where the people who inhabited it were bravely apparelled in silken

stuffs and jewelry. As these men tried to cut his cable, Gama seized a boat containing 17 of them, and carried them off to Melinda, 3° south of the equator, where the king of the place entered into the most friendly relations with the Portuguese, and gave them a pilot to conduct them across the Indian Gulf. Melinda was described as a regularly built city, with wide streets and houses of more than one story. The Melindese pilot is reported to have been acquainted with the astrolabe, compass, and quadrant. Under his guidance the voyagers steered 750 leagues across the open sea. In 23 days they arrived off the Malabar coast, and on 20 May 1498 they reached Calicut, the object of their search. Their mission was thus accomplished, and a new route to the East established. Gama's relations with the ruler of Calicut, who was called the Samoudri-rajah (abbreviated to Zamorin) were not of a cordial nature; and therefore, leaving the Indian coast on 15 October, Gama returned to Lisbon, calling at Melinda on the way to take on board an ambassador to Emanuel's court, and arriving in the Tagus September 1499, after an absence of two years and two months. He brought back only 55 men and one ship, a caravel which he had chartered at Cape Verde. The San Rafael had been lost on the coast of Africa, the store-ship burned according to Gama's instructions, the San Gabriel condemned at Cape Verde, and Nicolao Goelho had slipped away with the remaining vessel in order to be the first to tell the great news in Portugal. The king received Gama splendidly, and permitted him to bear the high-sounding title of "lord of the conquest of Ethiopia, Arabia, Persia, and India."

Emanuel immediately fitted out a second fleet of 13 ships, with 1,200 men, under the command of Pedro Alvarez Cabral, to establish trading posts; but failing in its ends, another fleet of 20 ships was placed under command of Gama. This expedition, which was warlike in its character, sailed early in 1502. On reaching Calicut, Gama immediately bombarded the town, enacting deeds of inhumanity and savagery too horrible to detail, and equaled only by the tortures of the Inquisition. From Calicut he proceeded in November to Cochin, "doing all the harm he could on the way to all that he found at sea," and, having made favorable trading terms with it and other towns on the coast, he returned to Lisbon in September 1503 with richly laden ships. He and his captains were welcomed with great rejoicings; "but to Dom Vasco the king gave great favors, and all his goods free and exempt; he granted him the anchorage dues of India, made him admiral of its seas forever, and one of the principal men of his kingdom." Soon after his return Vasco retired to his residence in Evora, and for 20 years took no part in public affairs, either from pique at not obtaining, as is supposed by some, so high rewards as he expected, or because he had in some way offended Emanuel. During this time the Portuguese conquests increased in the East, and were presided over by successive viceroys. The fifth of these was so unfortunate that Gama was recalled from his seclusion by Emanuel's successor, João III., created count of Vidigueira, and nominated viceroy of India, an honor which in April 1524 he left Lisbon to fill. Arriving at Goa in September of the same year, he immediately set himself to correct, with vigor and firmness, the many abuses and evil practices which had crept in under the rule of his predecessors. He was not destined, however, to prosecute far the reforms he had inaugurated, for on Christmas eve following his arrival he died, and was buried in the Franciscan monastery there. In 1538 his body was conveyed to Portugal and entombed in the town of Vidigueira, of which he was count, with all the pomp and honor due to one who had been the king's representative. The important discoveries of Vasco da Gama had the result of enriching Portugal, and raising her to one of the foremost places among the nations of Europe.

Gama'liel ("God is a reward"). Two persons of this name are mentioned in Bible history. The first, Gamaliel, the son of Pedahzur, in the book of Numbers, i. 10; ii. 20; vii. 54, 59; x. 23, as prince or head of the tribe of Manasseh. The other and better known Gamaliel is mentioned twice in the Acts of the Apostles. In both passages he appears as a learned doctor of the law, of the sect of the Pharisees. From the one we learn that he was the preceptor of St. Paul, who was brought up in Jerusalem, "at the feet of Gamaliel." In the other we find him advising the council of Sanhedrim in regard to their treatment of the apostles, and it is the advice given on this occasion which has rendered him famous. "If this counsel or this work," he said, "be of men it will come to naught, but if it be of God ye cannot overthrow it, lest haply ye be found to fight even against God." Ecclesiastical tradition makes Gamaliel become a Christian, and relates that he was baptized by St. Peter and St. Paul; but the story does not appear to be supported by any evidence. He has been identified by scholars with Gamaliel, the son of Simeon and grandson of Hillel, president of the Sanhedrim under Tiberius, Caligula, and Claudius.

Gamarra, gä mär'rä, **Augustin**, Peruvian general: b. Cuzco 27 Aug. 1785; d. Yngavi 20 Nov. 1841. He fought in the Spanish army in 1809–21, then joined the patriots, marched into Bolivia (1827), and effected the Treaty of Pisagua (1828). From 1829 to 1833 he was provisional president of Peru, and later was variously identified with the political disturbances of the time. In 1837 he took a leading part in Chilean opposition to the Bolivia-Peru confederation, and upon the conclusion of a successful campaign became president of Peru (1839). He was killed in battle during an invasion of Bolivia.

Gamba, a stringed instrument of the viol sort, called also viola da gamba, with six strings, weaker in tone and smaller in size than the violoncello, so called because it was held between the knees of the player, as distinguished from viola da braccia, played on the arm. Also an organ stop, the pipes of which are, in continental organs, generally cylindrical, of small scale, and well cut up, but sometimes conical in shape. Its tone is pungent, and not unlike that of a violin or violoncello.

Gambado, or **Gambade**, a leather legging for equestrians; it is wrapped round the leg, reaching from the knee to the foot, and is fastened at the side by clasps.

Gambetta, Léon Michel, lā-ôṅ mē-shĕl gän-bet-tä, or găm-bĕt'tä, French statesman: b. Cahors, France, 3 April 1838; d. Sevres,

France, 31 Dec. 1882. He was of Genoese extraction; was educated for the Church; but finally decided in favor of the law; and going to Paris became a member of the metropolitan bar in 1859. In November 1868 he gained the leadership of the republican party by his defense of Delescluze, a noted republican. In 1869, having been elected by both Paris and Marseilles, he chose to represent the latter city; and in the Chamber of Deputies showed himself an irreconcilable opponent of the empire and its measures, especially of the policy which led to the war with Prussia. On the downfall of the empire, after the surrender of Sedan in 1870, a government for national defense was formed, in which Gambetta was nominated Minister of the Interior. The Germans having encircled Paris, he left that city in a balloon, and set up his headquarters at Tours, from which, with all the powers of a dictator, he for a short time organized a fierce but vain resistance against the invaders. After the close of the war he held office in several short-lived ministries, and in November 1881 accepted the premiership. The sweeping changes proposed by him and his colleagues speedily brought a majority against him, and after a six weeks' tenure of office he had to resign. The accidental discharge of a pistol caused his death. See Reinach, 'Léon Gambetta' (1884); Harrison, 'Leon Gambetta, a Positivist' (1892); Tournier, 'Gambetta' (1893).

Gam'bia, (1) A British colony in West Africa, occupying portions of territory at the mouth of the river Gambia, some of its islands, and about six miles of land on either bank for a distance of 250 miles from the sea, and the navigable waters of the Vintang Creek. It thus forms a narrow strip running through French territory; total area, about 2,700 square miles. The principal settlement is Bathurst, at the mouth of the river. There is comparaively little fertile land, and agriculture is primitive. Gambia differs very little from the other West African settlements in point of unhealthiness. The position of Bathurst, the seat of government, is very unhealthy in the rainy season. There are a number of Anglican, Roman Catholic, and Wesleyan schools in the colony. Cotton cloth is manufactured to some extent by the natives, who also prepare palm-oil, build boats, etc. The principal exports are groundnuts, rubber, beeswax, ivory, hides, gold and palm-oil. The value of imports in 1900 was over $1,385,000 and the exports amounted to $1,410,000. Gambia is a crown colony under an administrator, who is assisted by an executive and a legislative council. The population of the entire region in 1901 was about 90,000, including about 200 whites, the remainder being chiefly negroes. (2) A river flowing through the above colony and giving to the colony its name. Rising in the mountains of Senegal, after a course of about 700 miles it expands into a broad estuary and at Bathurst enters the Atlantic Ocean. For nearly 300 miles it is navigable by seagoing vessels.

Gambier, găm'bēr, **James,** Baron, English naval officer: b. New Providence, Bahamas, 13 Oct. 1756; d. near Uxbridge, England, 19 April 1833. He entered the navy, and off Ushant fought with distinction as commander of the Defence under Lord Howe in 1794. As admiral he commanded the British fleet at the bombardment of Copenhagen in 1807, and was rewarded with a peerage. At the action in Basque Roads in 1809 he refused to act on the advice of Lord Cochrane, was tried by court-martial, and acquitted. He attained the rank of admiral of the fleet in 1830.

Gambier, Ohio, village of Knox County, on the Cleveland, A. & C. R.R., 50 miles north of Columbus. It is noted for its educational institutions, including Kenyon Episcopal College (q.v.), Kenyon Military Academy, Bexley Theological Seminary, and the Harcourt Female Seminary. Pop. (1900) 751.

Gambier Islands, a group of small islands of the South Pacific, about lat. 23° 8′ south, and lon. 134° 55′ W. The natives are a well-formed race, and have made some progress in civilization. On Mangareva, the largest of the group, some French missionaries settled in 1834, and the islands now belong to France. The total population is about 1,200.

Gambir, găm'bēr, or **Gambier,** called also *Terra japonica,* an astringent substance obtained from the *Uncaria gambir,* a tree of the family *Cinchonaceæ,* cultivated in Sumatra and other islands of the Malay archipelago. It is obtained from the leaves by boiling or infusing them in water, inspissating the resulting fecula, and forming into cakes. The Chinese use it for chewing, and in the western world, principally in Great Britain, it is employed in dyeing and tanning, also medicinally. It is mostly exported from Singapore. It is often considered as one of the articles of catechu (q.v.).

Gamble, Hamilton Rowan, American statesman: b. Winchester, Va., 1798; d. 1864. He was admitted to the bar in Virginia, settling in Missouri 1818, and being elected Secretary of State of that commonwealth 1823. Practising law at St. Louis he became judge of the Supreme Court and was elected a member of the Constitutional Convention 1861 and appointed by it governor, in place of C. F. Jackson, who had become a secessionist.

Gambling, or **Gaming,** the practice of playing for a money stake games depending solely on chance, like roulette, for instance, or those other games into which the element of skill enters, as in the cases of whist or billiards. Strictly speaking, gambling may be understood as gaming in its worst sense, and as implying professional play for a money stake by men who are unscrupulous adepts at so-called games of chance. Gambling has been common among most nations, civilized and uncivilized. The practice of civilized communities in regard to these acts has been far from uniform. The odium of gambling has sometimes been attached to games perfectly innocent in themselves, and these games have been prohibited to the manifest prejudice of the law, which has thus been brought into dishonor and contempt. At other times, governments, tempted by the facilities of sharing in the dishonest gain, have openly and shamelessly encouraged gambling by licensing gaming-houses, or instituting lotteries under their own authority. See Lottery. In England gambling was early made the subject of penal enactments. Statutory restrictions upon games and gaming go back as

far as Richard II. In France, public gaming-tables were suppressed from 1 Jan. 1838. Previous to the formation of the new German empire gambling was encouraged by official countenance in several of the principalities of Germany. Baden-Baden, a watering-place in the grand-duchy of Baden, and Homburg, then in the landgravate of Hesse-Homburg, were until comparatively recent times the two most famous resorts in Europe of the frequenters of gaming-tables. Since the suppression of gambling in these places, after the formation of the empire (31 Dec. 1872), the principality of Monaco in Italy has become the last public resort of this species of gambling in Europe.

In the United States the keeping of a gambling-house is indictable at common law as injurious to morals; and most States and Territories have passed laws against gambling, some of them severe and stringent. Yet till 1880 gambling was common and open in many parts of the United States; and it was left largely to societies for the suppression of vice, especially in New York, to stir up the authorities to put the laws in force. In 1881–4 prosecutions and convictions were very numerous; in 1885 almost all the chief cities in the Union followed the example of New York, and since that time the progress of legislation on this subject has been noteworthy in many of the States. Always there is difficulty in legally defining gambling and distinguishing in judicial practice between acts which violate the gambling laws and those which, while presenting some questionable appearances, are yet not obviously to be classed in the same category. As in so many other matters of public policy, there is also a loss of power to the regulative sentiment of the people through want of uniformity or any considerable degree of identity among the laws of various States and sections. Therefore it is scarcely strange that, in spite of all prohibitive legislation and repressive influences brought to bear by public opinion, gambling should, either through connivance of the authorities or by secrecy and evasion, continue to be practised in many of the large cities of the United States. As in all other matters of public interest, the moral sentiment of the community steadily seeks and no doubt gradually finds a controlling expression through its official representatives in the legislative field and in local and general administration. Consult: ‹Encyclopædia of the Laws of England›; Brandt, ‹Games, Gaming, and Gamester's Law›; Ashton, ‹History of English Lotteries›; Bishop, ‹On Statutory Crimes› (1901).

Gamboge, găm-bōj′ or -booj′, a gum-resin derived from *Garcinia hanburyi,* a member of an extremely large family of the eastern tropical countries. The gamboge tree itself is a native of Siam, Cochin-China, Cambogia, from which places the drug is imported to Europe and to the United States. Other forms of gamboge are found in India, China, and the Asiatic Islands that are rarely seen in the American market. The gum-resin is obtained by cutting or wounding the trunks of the trees causing a bright yellow juice to flow. This is collected, usually in bamboo joints and hardens naturally, or is dried over a fire, until a solid mass results, which generally takes the shape of the collecting vessel. In the drug market pipe gamboge, press gamboge, and cake gamboge are recognized. Pipe gamboge is preferred because it is usually clean. As a pigment for painting, gamboge has been known for centuries, and as a purgative it has been used in China as long as history gives any definite information.

The gum-resin contains a large amount of gum, 15 to 20 per cent, and 70 to 80 per cent of a yellow resin-gambogic acid, on which its purgative properties depend. Taken into the body in doses of from two to five grains, it acts as a very active hydragogue cathartic, producing numerous watery stools, with much griping. It is principally valuable when combined with some other drug that tends to diminish the pain, and it is one of the most important ingredients in the compound cathartic pill of the United States Pharmacopœia, which contains one quarter of a grain of the resin. Overdoses cause violent poisoning with intense prostration.

Gam′brell, James Barton, American Baptist minister and editor: b. Anderson County, S. C., 21 Aug. 1841. He was graduated at the University of Mississippi, and served as a captain of scouts in the Confederate army during the Civil War. He was ordained to the ministry in 1867 and held several pastorates. He served as editor of the ‹Southern Baptist Record› for many years, and was elected president of Mercer University, Georgia, 1893.

Gambrinus, găm-brī′nŭs, a mythical king of Flanders, inventor of beer, said, probably incorrectly, to have an original in Jan Primus (or Jan I.), duke of Brabant. He is represented in Germany as Saint Gambrinus, patron of drinking. His figure is familiar in German beer-cellars, often seated astride a cask, a foaming tankard in his hand.

Game-fowls. See Cock-fighting; Poultry.

Game Laws, are legislative enactments adopted by nations and states to prohibit or regulate the killing of wild animals, birds, and fishes. In Great Britain the game laws are a relic of the forest laws, which in the time of the Norman kings were so oppressive; it being under the Conqueror as great a crime to kill one of the king's deer as to kill one of his subjects. A certain rank and standing, or the possession of a certain amount of property, were for a long time qualifications indispensably necessary to confer upon any one the right of pursuing and killing game. By the Game Act of William IV., the game laws were greatly modified, the necessity for any qualification except the possession of a game certificate being then abolished, and the right being given to any one to kill game on his own land, or on that of another with his permission. Every uncertificated person selling game is also required to take a yearly license. The animals designated as game by this act are hares, pheasants, partridges, grouse, heath-game, or moor-game, black-game, and bustards. These animals (with the exception of hares) are not allowed to be killed at all times, there being a certain season of the year — the close season — during which all and sundry are prohibited from killing game. By an act of 1880 every occupier of land has a right, as inseparable from and incident to the occupation of the land, to kill and take ground game (hares and rabbits) thereon, concurrently with any other duly authorized person, all

agreements in contravention of this right being declared void. Game laws of greater or less strictness are in force in many other countries. In Canada the chief restrictions are in regard to killing wild animals during the breeding season.

In the United States wild game whether of forest, field, or stream is perhaps better protected than in any other country in the world. Although there are certain general national laws, 28 States have passed game laws of their own, and as many States have organized societies for the protection and preservation of game. There are 8 national organizations, the most important being the League of American Sportsmen; G. O. Shields, president, New York. The others are: the American Ornithological Union, the National Sportsmen's Association, the National Bird, Game and Fish Protective Association, Bird Protective Society of America, Boone and Crockett Club, International Forest, Fish, and Game Association and North American Fish and Game Protective Society. Nearly every State in the Union has now a Game and Fish Commission and numerous game wardens.
